8. In Canada's view, counter-cyclical payments "grant support to a specific commodity" under Article 13(b)(ii) of the Agriculture Agreement.[7] It is hard to see how a measure that grants support that is specific to a "specific commodity" would not be included in the assessment under Article 13(b). It is uncontested that the US measure provides payments in an amount determined by target prices that are specific to certain covered products.[8] The setting of commodity-specific target prices necessarily leads to different levels of support for different products. The cotton-specific support granted in this respect must be taken into account for the purposes of Article 13(b).

## III. US EXPORT CREDIT GUARANTEE PROGRAMMES

9. I now turn to US export credit guarantee programmes.

10. In Canada's written third party submission we set out the applicable standard for determining whether transactions under these programmes are subsidized within the meaning of Articles 1(e) and 10.1 of the Agriculture Agreement. Canada takes no position on the facts in this respect, but notes that USDA's own description of its guarantee programmes implies that a benefit is conferred. I quote: "The programmes encourage exports to buyers in countries where credit is necessary to maintain or increase US sales, but where financing may not be available without CCC guarantees."[9] The Panel should assess CCC premiums in the light of this admitted reality.

---

[3] US First Written Submission, paras. 58-63.

[4] US First Written Submission, para. 59.

[5] US First Written Submission, fn. 47.

[6] US First Written Submission, para. 67.

[7] See also Exhibit Br-27 ("Title I - *Commodity Programmes*"; "Counter-cyclical payments *for* wheat, feed grains, upland cotton, rice, and oilseeds" (emphasis added)).

[8] See US First Written Submission, para. 117.

[9] USDA, "Export Credit Guarantee Programmes", FAS Online at http://www.fas.usda.gov/excredits/exp-cred-guar.html, (second sentence) [Exhibit CDA-3].

11. Today, Canada addresses the two exemptions alleged by the United States in support of its assertion that the US programmes do not grant export subsidies in violation of US export subsidy commitments under Articles 8 and 10.1 the Agriculture Agreement. The claimed exemptions are the following:

- First, item (j) of the SCM Agreement sanctions any US export subsidy provided through CCC-guaranteed credit transactions because the programmes come within the scope of item (j) yet do not meet the standard it establishes. According to the United States, item (j) may be interpreted a contrario to allow subsidized export credit transactions. It follows for the United States that its programmes do not confer export subsidies within the meaning of Article 3.1(a) of the SCM Agreement and Article 1(e) of the Agriculture Agreement;

- Second, Article 10.2 of the Agriculture Agreement exempts outright any subsidized export credit transactions from US export subsidy commitments.

12. The panel in Brazil – Aircraft considered the first type of alleged exemption at length in its first implementation report. The United States was a third party in that case, and argued for an a contrario interpretation of the first paragraph of item (k) of the Illustrative List.[10] The panel rejected all arguments in this respect and concluded that the provision could not be used to establish that a prohibited export subsidy under the SCM Agreement is otherwise permitted.

13. The panel's reasoning in that case applies with equal force here. Briefly, the panel found that:

- First, Annex I is purely "illustrative" and does not purport to exhaustively list all export subsidy practices[11],

- Second, a measure that falls within the scope of Annex I is deemed to be a prohibited export subsidy such that where a Member demonstrates that the measure meets the standard in any of the listed items, it does not also have to demonstrate that the measure comes within the scope of Articles 1 and 3.1(a) of the SCM Agreement[12], and

- Third, footnote 5 of the SCM Agreement provides that practices described in Annex I may be properly considered not to constitute an export subsidy only in two situations. The first situation is where an affirmative statement in the Agreement provides that the measure in question is not an export subsidy; the second is where an affirmative statement in the Agreement provides that measures satisfying the conditions of an item in Annex I are not prohibited.[13] Footnote 5 reads "Measures referred to in Annex I as not constituting export subsidies shall not be prohibited under this or any other provision of this Agreement".

14. In its second implementation report in Brazil – Aircraft, the panel applied the same reasoning.[14] Applying this reasoning to the case at hand, footnote 5 to the SCM Agreement precludes reliance on an a contrario interpretation of item (j) as an implied exclusion to any finding of subsidized transactions under the US programmes.

---

[10] *Brazil – Export Financing Programme for Aircraft: Recourse by Canada to Article 21.5 of the DSU*, Report of the Panel, WT/DS46/RW, adopted 4 August 2000, paras. 6.24-6.67 [*Brazil – Aircraft, First Recourse*].

[11] *Ibid.*, para. 6.30.

[12] *Ibid.*, para. 6.31.

[13] *Ibid.*, paras. 6.37.

[14] *Brazil – Export Financing Programme for Aircraft: Second Recourse by Canada to Article 21.5 of the DSU*, Report of the Panel, WT/DS46/RW2, adopted 23 August 2001 at paras. 5.274 and 5.275.

15. Regarding Article 10.2 of the Agriculture Agreement, Canada's view is that the words of that provision speak for themselves. Members have undertaken to work towards internationally agreed disciplines to govern the provision of export credit guarantees. Nothing in that provision states that the export subsidy obligations in Article 10.1 of the Agreement do not apply to US export credit guarantee practices. Where Members have wanted to exempt measures from export subsidy obligations, they have been clear– such as in the second paragraph of item (k) of the SCM Agreement.[15]

16. In addition, the US interpretation of this provision does not accord with its object and purpose. Canada shares the views of other third party participants in this dispute that the ongoing work under Article 10.2 is expected to further elaborate on current disciplines regarding export credit practices and to perhaps more clearly identify when such practices shall or shall not be deemed to confer export subsidies within the meaning of Article 1(e) of the Agriculture Agreement.[16] The obvious precedent in this respect is the second paragraph of item (k) of the SCM Agreement.

## IV. CONCLUSION

17. In conclusion, Mr. Chairman and members of the Panel, the Panel should find that the United States rendered direct payments inconsistent with Annex 2 of the Agriculture Agreement by allowing the base period to be updated. This finding would be in addition to a finding that PFC payments and direct payments do not conform to Annex 2 because the amount of the payment is linked to the type of production after the base period. Regarding counter-cyclical payments, the Panel should find that this support to US producers of upland cotton must be counted as "support to a specific commodity" under Article 13(b)(ii) of the Agreement. Finally, regarding US export credit guarantee programmes, the Panel should confirm that neither the Agriculture Agreement nor the SCM Agreement contain an exemption for any US export credit guarantee subsidy found in this case. Were the Panel to find that such subsidies exist – which in Canada's view is the most likely outcome to the Panel's assessment of the facts – then the Panel must conclude that the United States grants export subsidies in violation of its export subsidy commitments under Articles 8 and 10.1 the Agriculture Agreement and that Article 13(c)(ii) therefore does not apply.

# ANNEX C-9

## ORAL STATEMENT OF CHINA AT THE THIRD PARTY SESSION

24 July 2003

1. Thank you, Mr. Chairman, and members of the Panel. China is appreciative of this opportunity to present its views on the issues raised in this Panel proceeding. In its third party written submission of 15 July, China explained its views in relation to three issues. In this statement, I will summarize China's major points.

2. The first issue that China would like to have this Panel's attention is about the burden of proof issue under the Peace Clause.

3. China agrees with Brazil's argument that the Peace Clause is an affirmative defence in nature. If the United States claims that defence, the burden of proof is on the United States.

4. Contrary to what the United States see, China believes that the Peace Clause does not impose positive obligations. Stand-alone, Annex 2 and Article 6 of the *Agreement on Agriculture* may have positive obligations; but when they are cross-referred to by the Peace Clause, they become part and parcel of conditions that must be met before a Member can move under its safety.

5. China believes the US errs on seeing no distinction between "obligation" and "condition". The Peace Clause requirement for full conformity with Article 6 and Annex 2 does not create new obligations because Members have to comply with Article 6 and Annex 2 whether Article 13 exists or not. Within the Peace Clause, these requirements do not stand to impose obligations on Members, but to set conditions precedent for a Members intending to invoke Peace Clause protection. Positive obligations to comply with these requirements, if there is any, lie under where they are, i.e. under Article 6 and Annex 2, but not under the Peace Clause.

6. China does not see any "absurdity" as described by the United States in its written submission. No such "absurdity" would be instilled into the process if at the first stage, the party alleging protection of Peace Clause for its measures is required to discharge its burden to prove that such measures do conform to the relevant Peace Clause conditions; if it cannot so prove, the measures would lose Peace Clause protection. A second stage will follow for the party claiming against the measures to establish its substantive case, without the Peace Clause shield.

7. With respect, China submits that the burden of proof issue must be resolved first. China also hopes that the above two-step approach will help this Panel and the parties to move the procedures on towards resolution of the case.

8. The second point that China made in its written submission relates to proper categorization of US Direct Payments (shortened as "DP") under the US Fair Security and Rural Investment Act of 2002 (shortened as "FSRI"). Allow me to shorten that act to FSRI. Without repeating the issue of burden of proof, preponderance of evidence suggests that such Direct Payments are not "Green Box" in nature.

9. One of the requirements for "Green Box" Direct Payment support measures lies under Para. 6(a) of Annex 2 to the *Agreement on Agriculture*. The paragraph provides to the effect that eligibility shall be determined by "clearly-defined criteria" "in a defined and fixed base period".

10. The word "in" requires a link between the "criteria" and the "defined and fixed base period". In other words, to qualify for "Green Box" direct payment measure under Para. 6(a), a criterion adopted by a Member must be tied, in a chronological sense, to a starting time frame that cannot be moved up on the calendar.

11. As the United States has explained, 2002 FSRI DP allowed landowners to retain PFC base acreage under the 1996 Federal Agriculture Improvement and Reform Act (shortened as "FAIR") and "add 1998-2001 acres of eligible oilseeds or simply declare base acreage for all covered commodities" (including upland cotton). In addition, while a landowner may elect to simply utilize acres devoted to covered commodities during the 1998-2001 period for purpose of DP, a landowner need not do so; base acres may remain those under FAIR of 1996, implying no cotton production need have occurred since the 1993-1995 period for a landowner to have "cotton base acres" Consideration the progression from PFC to DP, one can see that contrary to the US argument that "base acres are defined in the 2002 [FSRI] Act and fixed for the duration of the legislation", the requisite link between the programme acreage as a criterion and the starting time frame under the DP is broken. The change of legislation from FAIR to FSRI and the replacement of PFC with DP were utilized to for producers to leap from their previous coverage acreage, which should have been tied to the base period, to a new updated acreage in 2002.

12. Therefore, in China's opinion, preponderance of evidence proves that the US direct payments under the FSRI shall be properly categorized as non-"Green Box" measures.

13. The last issue that China considers important is about export subsidy support granted by US "Foreign Sales Corporations" for upland cotton export sales under the "FSC Repeal and Extraterritorial Income Act of 2000". Its short name is ETI Act.

14. The ETI Act has previously been found to violate the *Agreement on Agriculture* and the *Subsidies Agreement* by both the panel and the Appellate Body in *US – FSC (21.5)* case. On 29 January 2002, the DSB adopted the panel and Appellate Body reports. Following US failure to withdraw such export subsidy support, on 7 May 2003, the DSB authorized the EC to impose countermeasures against the US.

15. China believes that the panel and the Appellate Body's reasoning and their conclusion in *US – FSC (21.5)* should be considered and taken by this Panel.

16. The measures challenged by Brazil in the current proceeding are exactly the same challenged by the EC in *US – FSC (21.5)*. Reasoning and conclusion by the earlier panel and the Appellate Body are more than relevant to the current case. Their reports, once adopted by DSB not only create legitimate expectations, but also reflect the collective will of the WTO membership.

17. In that respect, allow me to quote the panel in *India – Patent Protection for Pharmaceutical and* Agricultural *Chemical Products*, for this Panel:

> [I]n the course of "normal dispute settlement procedures" required under Article 10.4 of the DSU, we *will take into account the conclusions and reasoning* in the Panel and Appellate Body reports in WT/DS50. Moreover, in our examination, we believe that we *should give significant weight to both Article 3.2 of the DSU*, which stresses the role of the WTO dispute settlement system in providing security and predictability to the multilateral trading system, *and to the need to avoid inconsistent rulings* (which

concern has been referred to by both parties). In our view, these considerations form the basis of the requirement of the referral to the "original panel" wherever possible under Article 10.4 of the DSU.

18. This concludes my oral presentation. China welcomes questions from the Panel regarding these issues.

# ANNEX C-10

## ORAL STATEMENT BY THE EUROPEAN COMMUNITIES

24 July 2003

TABLE OF CONTENTS

## I. INTRODUCTION

1. Mr. Chairman, Distinguished Members of the Panel, the European Communities is grateful for the opportunity to express its views in this third party session.

2. We would first like to welcome the involvement of Benin in this procedure. The European Communities is of the view that the involvement of least developed countries in dispute settlement is highly desirable. We hope that other least developed countries follow Benin's lead.[1]

3. This is a complex case which raises many difficult and important interpretative issues. Those responsible for drafting Article 13 of the *Agreement on Agriculture* have left you with some difficult questions. Despite those difficulties, Article 13 in particular, and the *Agreement on Agriculture* more generally, represent a finely balanced and much fought over package of rights and obligations assumed by WTO Members. The European Communities is confident that this Panel will undertake a careful examination of these very precise terms and preserve the delicate balance of rights and obligations which has been negotiated.

4. This dispute raises a large number of issues. In our interventions, we have concentrated on those issues of principle which we consider are of systemic concern. Today, we will largely address issues which were not addressed in our written submission. At the same time, we also consider it necessary to revisit some issues which we have already addressed in order to rebut some of the arguments raised by other parties.

5. The European Communities starts by setting out its conception of the role of the peace clause (section II). We will then address several questions of interpretation relating to the peace clause (section III). We then turn to consider the interpretation of Annex 2 of the *Agreement on Agriculture* (the Green Box) (Section IV) before considering the status of domestic content subsidies and export credits under the *Agreement on Agriculture* (Section V). We conclude with some comments on one of the requests for preliminary rulings raised by the United States (Section VI).

## II. THE ROLE OF THE PEACE CLAUSE

6. We turn first to consider the role of the Peace Clause (Article 13).

7. The European Communities views Article 13 as one element regulating the interface between the *Agreement on Agriculture* and the *SCM Agreement*. It defines, in some cases, how subsidies granted pursuant to the *Agreement on Agriculture* should be treated for the purposes of countervailing duty investigations, and in other cases exempts such subsidies from actions under the *SCM Agreement*. The European Communities disagrees with both Brazil and the United States as to how the term "exempt from action" should be understood. However, while we disagree with the United States' logic, we do not disagree with the practical result of the application of its logic.

8. The term "exempt from action" cannot mean, as Brazil claims, that, even if the peace clause is applicable, the Panel must examine Brazil's claims under the *SCM Agreement*, and that if the Panel finds that the United States has acted inconsistently with the *SCM Agreement*, the DSB should somehow "refrain" from recommending the United States to bring itself into conformity with the *SCM Agreement*. The European Communities finds it difficult to imagine how the DSB, operating under the negative consensus rule, could refrain from recommending the United States bring itself into conformity should the Panel find that the United States had acted inconsistently with the *SCM Agreement*. Moreover, the United States can reasonably argue that it is not required to bring itself

[1] This text was not in the written statement circulated at the third party session, but reflects unscripted comments made during that session.

into conformity with the *SCM Agreement* by withdrawing measures which it is perfectly entitled to maintain under the *Agreement on Agriculture*, pursuant to both Article 13 and Article 21. The only answer to this question is that if the United States is entitled to peace clause protection, the Panel cannot find in favour of Brazil's *SCM Agreement* claims.

9. The European Communities does not agree with the United States that Article 13 prevents a Member from requesting consultations or the establishment of a panel with respect to a measure which might be entitled to Article 13 protection. It is not, as the US argues, the mere fact that the defendant Member is unable to block a request for consultations, or for establishment of a panel, that the applicability of the peace clause has come before this Panel. The need for the Panel to adjudicate this issue flows from the fundamental principle underlying the WTO Agreement that every question of interpretation of the WTO Agreements which "affects the operation of any covered agreement" must be subject to the DSU.[2] However, as we have noted, if the Panel determines that the US measures in question are protected by Article 13, it cannot find in favour of Brazil's claims under the *SCM Agreement*.

## III. INTERPRETATION OF THE PEACE CLAUSE

10. The Panel has a number of challenging questions before it on the interpretation of various aspects of Article 13(b). The European Communities turns now to set out its position on some of the issues before the Panel.

### A ARTICLE 13 IS NOT AN AFFIRMATIVE DEFENCE

11. The European Communities will only briefly touch upon the issue of the burden of proof for Article 13. The European Communities has yet to hear a credible response to the argument that putting the burden of proof on the defendant has perverse effects. As the European Communities and the United States have pointed out, when a complainant brings a case only under the *Agreement on Agriculture* (for instance alleging breach of Article 6) it will bear the burden of proof. However, if Article 13 is considered an affirmative defence, when a complainant brings a dispute under Articles 5 and 6 of the *SCM Agreement* and, for instance, Article 6 of the *Agreement on Agriculture*, the complainant would be required to prove a breach of Article 6 while at the same time the defendant would also be required to prove that it had not infringed Article 6 of the Agreement. The burden of proof cannot switch between parties simply on the basis of whether the complainant cites the *SCM Agreement* or not, but this would be the result of interpreting Article 13 as an affirmative defence.

12. Further confirmation that Article 13 is not an affirmative defence can be drawn from the fact that Article 13 also regulates the application of countervailing duties on agricultural subsidies. In this context, a determination that the subsidy in question is not protected by Article 13 must be taken by an investigating authority before it may impose countervailing duties. Article 13 is consequently a pre-condition for an individual Member in taking action against subsidised exports. It cannot, in that context, be considered as a defence for exporters co-operating in an investigation and may, as the United States have pointed out, be used as the foundation for a claim in a WTO dispute by the exporting Member that countervailing duties have been illegally imposed. There is no reason why that conception of Article 13 should change simply because the issue arises in WTO dispute settlement.

[2] Article 4.2 DSU.

B. RELEVANT COMPARISON FOR THE PURPOSES OF ARTICLE 13

13. Brazil has argued that any breach of the 1992 level during the 9 year implementation period removes the protection of Article 13.[3] The European Communities agrees with the United States that this is incorrect.[4] The present tense of the phrase "do not grant support" makes this clear. The comparison for the purpose of Article 13(b) must be between the level of support decided in the 1992 marketing year and that granted by virtue of the measures being challenged. This would typically mean the most recent marketing year.

C. THE MEANING OF "DECIDED DURING THE 1992 MARKETING YEAR"

14. We now turn to consider the meaning of the phrase "decided during the 1992 marketing year". Brazil argues that the term "decided" refers to a decision to budget a specific amount of domestic support over a number of years.[5] Brazil then goes on to suggest that because the United States did not make a "decision" during marketing year 1992 with respect to upland cotton, the only decision which the United States can be said to have made during marketing year 1992 was the continued funding of its programmes for upland cotton. Brazil then calculates the US' budgetary outlays in respect of upland cotton in 1992; in other words, Brazil looks at the support actually granted.[6]

15. The European Communities is concerned that Brazil appears to consider that the support "decided" in the sense of Article 13 can be equated with the support granted as Brazil has done in its use of US budgetary outlays. Such an interpretation ignores the meaning of the word "decided". That the use of the word "decided" cannot be equated with the term "granted" is illustrated by the following.

16. First, the use of the word "decided" itself is notable. It is, however, notable primarily for what it is not. WTO Members did not use the word "granted" which is the word which one would expect to be used had this phrase been intended to refer only to the domestic support actually used during the 1992 marketing year. The use of the word "decided" stands out particularly when it is compared to the use of the word "grant" in the very same sentence. The United States has made the same point with respect to the decision not to use the word "provided".[7] If WTO Members had intended that the support granted in the most recent period was to be compared to that granted in marketing year 1992 the word "decided" would not have been used. For this reason, Brazil's use of US budgetary outlays for marketing year 1992 is clearly flawed.

17. Second, the word "decided", meaning "settled, certain",[8] also implies a one-off decision. It would be odd to talk of an administration "deciding" countless applications for support under a particular programme. However, this is what Brazil's use of US budgetary outlays implies.

18. Finally, the use of the word "during" confirms that WTO Members intended that the decision need not be of application only in marketing year 1992 but may also cover future periods. The use of the word "during" (meaning "in the course of"[9]) implies a one-off decision, and does not suggest that the period of application of the decision must be limited to marketing year 1992. Had WTO Members intended a limitation to the support provided or granted in 1992 the word "for" would have been used

[3] Brazil's First Written Submission, paras.142 and 146-150.
[4] US First Written Submission, para. 79 and 90.
[5] Brazil's First Written Submission, paras. 139 and 140.
[6] Brazil's First Written Submission, paras. 141-145.
[7] US First Written Submission, paras.83-84.
[8] The New Shorter Oxford English Dictionary, 1993.
[9] The New Shorter Oxford English Dictionary, 1993.

in place of "during". This further confirms that Brazil's use of US budgetary outlays cannot be considered correct.

19. Consequently, Article 13(b)(ii) and (iii) are intended to set up as a benchmark an amount of support adopted by some form of decision (be it political, legislative or administrative) in which support for a specific product is decided and allocated for future years. It is clearly not intended to set up a comparison between domestic support granted in 1992 and domestic support granted in a more recent period. The European Communities respectfully requests the Panel not to follow Brazil's equation of the term decided with the term granted.

20. For the European Communities, the question of what decision was adopted during 1992 by the United States is a question of fact which we do not take a position on, especially as we are not fully aware of all the elements which might be relevant.

### D. THE MEANING OF THE TERM "SUPPORT TO A SPECIFIC COMMODITY"

21. The United States has argued that the term "support to a specific commodity" is synonymous with the term "product-specific support".[10] Brazil had, in its First Written Submission, taken all support which was specific to cotton, and added to it a proportion of generally available support intended to represent the amount of such support which could be attributed to cotton.[11]

22. The European Communities shares the approach of the United States. Quite simply, support which is provided to a number of crops cannot at the same time be considered "support to a specific commodity". Such support is "support to several commodities" or "support to more than one commodity".

23. With respect, Brazil and New Zealand are wrong to suggest that the word "specific" was added to make clear that the applicable benchmark under Article 13 was not the overall level of subsidies decided but rather was to be undertaken on a product-by-product basis.[12] A brief glance at the *SCM Agreement* finds it replete with references to "a product" or "a subsidised product".[13] Consequently, it could make no sense to interpret Article 13 as being based on overall support. The word "specific" was not, therefore, inserted to differentiate the use of Article 13 in respect of specific products to the application of Article 6 to overall agricultural support, but rather as a qualifier to the word "support".

24. Consequently, the Panel should conclude that the correct comparison is between product specific support decided in 1992 and product specific support currently provided.

## IV. THE INTERPRETATION OF ANNEX 2 OF THE *AGREEMENT ON AGRICULTURE* (THE "GREEN BOX")

### A. FIRST SENTENCE OF THE FIRST PARAGRAPH OF ANNEX 2[14]

25. Australia has argued in its comments today that the European Communities is incorrect to consider that the first sentence of the first paragraph of Annex 2 does not impose a separate obligation. The European Communities notes, however, that Australia does not comment and does not

[10] US First Written Submission, paras. 77-78.
[11] Brazil's First Written Submission, para. 143.
[12] Brazil's First Written Submission, para. 136; New Zealand Third Party Submission Para. 2.22.
[13] See, in particular, Article 6.3.
[14] This section was not in the written statement circulated at the third party session, but reflects unscripted comments made during that session.

attempt to rebut the compelling contextual arguments that the European Communities has made in its written submission.[15] The European Communities pointed out that in several instances that the *Agreement on Agriculture* refers to the "criteria" for inclusion in the green box, specifically in Articles 6 and 7, and most importantly, in paragraph 5 of Annex 2. There is no such reference to the "fundamental requirements". The European Communities recalls that a panel is obliged to follow the accepted canons of interpretation of international law, and therefore, to view the ordinary meaning of the words concerned in light of their context and objective. Consequently, it is clear that the first sentence of paragraph 1 of Annex 2 is not, in and of itself, an independent obligation. This does not render it inutile, as Australia charges. The first sentence sets out an objective and indicates the type of effects which respect for the criteria in the green box is deemed to create. The European Communities urges the Panel to reject Australia's unsubstantiated arguments.

B. TYPE OF PRODUCTION

26. Brazil has argued that the fact payments are reduced where fruits and vegetables, and certain other crops are grown on contract acreage for the purposes of PFC and direct payments means that the "amount of such payments [is] related to or based on, the type or volume of production [ ..] in any year after the base period" (Paragraph 6(b) of Annex 2). However, Brazil also appears to recognise that farmers claiming the benefit of direct payments may plant crops other than the programme crops, and may even not produce any crops.[16] The United States asserts that no current agricultural production is required in order to benefit from direct payments.[17]

27. Assuming the US' assertion to be correct (as seems to be acknowledged by Brazil) the Panel is faced with a dilemma. Is the amount of funding provided by a programme, from which a farmer can benefit without producing anything, to be considered to be "based on or linked to a certain type of production", when payments under that programme can be reduced by growing certain crops? Brazil and some third parties simply assume that where payments can be reduced by growing certain crops, the programme is based on or linked to a certain type of production. Such a view does not, however, take account of the complexity of the situation.

28. In the view of the European Communities, reducing payments under a programme, where a farmer grows fruit or vegetables does not mean that the amount of the payment is linked to type of production. This is because the farmer is free to produce a whole range of other crops, or even not to produce at all and receive the full payment.

29. What Brazil and other third parties fail to realise is that the reduction in payment for fruits and vegetables, if the European Communities understands correctly, is in fact designed to avoid unfair competition within the subsidising Member. Brazil and the other third parties have not challenged the right of a subsidising Member to decide decoupled payments based on past production of, or acreage utilised for, certain crops. Indeed, this is permitted in paragraph 6(a) of Annex 2. However, in the case where, for instance, upland cotton production enjoyed support, while fruit and vegetable production did not, decoupled payments based on past cotton production would allow subsidised former cotton farmers to grow fruit and vegetables, and thus unfairly compete with pre-existing fruit and vegetable producers who could not benefit from the decoupled payments because they had not produced cotton or other supported products in the base period. Thus, the reduction in payments is a necessary element in ensuring that the equilibrium established by the market for the production of fruit and vegetables is not artificially disturbed by the introduction of decoupled support.

[15] EC's First Third Party Submission, paras. 15-25 and in particular paras. 22 and 23.
[16] Brazil's First Written Submission, para. 49.
[17] US First Written Submission, para. 68.

30. Furthermore, finding that Brazil and the other third parties are correct would have perverse effects. The whole *Agreement on Agriculture* is geared at gradually reducing certain types of domestic support. However, if a Member could not reduce decoupled payments when certain types of products which had previously not enjoyed any support are grown, the net effect would be that WTO Members wishing to provide decoupled support would have to increase overall support, and provide producers previously excluded with support which they had not previously enjoyed. This is clearly not an effect which the negotiators of the *Agreement on Agriculture* intended.

31. In this light, this potential reduction of payment is very different from the prohibition set down in paragraph 6(b) of Annex 2. Paragraph 6(b) is intended to prevent an artificial pressure to produce certain crops in order to obtain decoupled payments. Reducing payments where fruit and vegetables are produced does not act to pressure farmers into growing a particular type of crop. Rather, it prevents internal unfair competition. At the same time, as we understand the US measure, it does not oblige a farmer to produce any particular type of crop, in fact requires no production, and therefore should not be considered inconsistent with paragraph 6(b).

### C. A DEFINED AND FIXED BASE PERIOD

32. The European Communities would also like to comment briefly on the arguments raised by Brazil and some of the third parties with respect to the updating of the base periods in the 2002 FRSI Act. We take note of the US statement that the updating of the base period was necessary in order to bring support for oilseeds production under the direct payments scheme.[18] In order to ensure the progressive movement of production distorting subsidies to decoupled subsidies we consider that it must be possible to have different reference periods where eligibility is based on previous eligibility for production distorting subsidies. We see nothing in paragraph 6 of Annex 2 which might prevent this. At the same time, however, the European Communities is concerned that continued updating of reference periods in respect of the same already decoupled support, creating an expectation that production of certain crops will be rewarded with a greater entitlement to supposedly decoupled payments, tends to undermine the decoupled nature of such payments.

## V. INTERPRETATION OF THE *AGREEMENT ON AGRICULTURE* /RELATIONSHIP WITH THE *SCM AGREEMENT* AND GATT 1994

### A. ARE DOMESTIC CONTENT SUBSIDIES EXPRESSLY PERMITTED BY THE AGREEMENT ON AGRICULTURE ?

33. Brazil has argued that US Step 2 payments, which it alleges are conditional upon use of domestic goods, are inconsistent with Article 3 of the *SCM Agreement* and Article III.4 GATT 1994. New Zealand supports this claim. However, as with other claims, their analysis does not take fully into account the complexities of the situation. The European Communities agrees with the United States that subsidies contingent upon the use of domestic goods, which are maintained consistently with the *Agreement on Agriculture* are not inconsistent with either the *SCM Agreement* or GATT 1994.

34. The first question is whether subsidies contingent upon the use of domestic goods are consistent with the *Agreement on Agriculture*. The answer is a clear yes. Article 3.2 of the *Agreement on Agriculture* requires Members not to:

> "…provide support <u>in favour of</u> domestic producers in excess of the commitment levels specified in Section I of Part IV of its Schedule." (emphasis added).

[18] US First Written Submission, para. 60.

35. We have emphasised the phrase "in favour of". This is significant because it does not require that support be "to" domestic producers. The same term is used in Article 1(a) (the definition of AMS) and in Article 1(h) (definition of Total AMS). Moreover, it is established with respect to Article 1 of the *SCM Agreement* that a financial contribution and benefit need not be bestowed on the same person.[19] Consequently, it is simply logical that support may be provided in favour of domestic producers through the provision of funds to processors of the product concerned, and consequently that access to such subsidies be limited to domestic produce, in order to ensure that it is domestic producers who benefit from this subsidy. Indeed, WTO Members, in their wisdom, recognised precisely this possibility in Annex 3 to the *Agreement on Agriculture* where they explained how the AMS was to be calculated. Paragraph 7 thereof explicitly contemplates that:

> "measures directed at agricultural processors shall be included to the extent that such measures benefit the producers of the basic agricultural products."

36. Consequently, it is clear that a Member has a right to provide subsidies contingent upon use of domestic products under the *Agreement on Agriculture*. On this, the US and the European Communities agree.

37. The second question for the Panel is how does that right relate to the prohibition in Article 3 of the *SCM Agreement* and the national treatment obligation in Article III.4 of GATT. Here, again, we agree with the United States.

38. Article 21.1 of the *Agreement on Agriculture* provides that the other goods agreements will apply "subject to" the provisions of the *Agreement on Agriculture*. That is, the other Annex 1A Agreements will be subordinated to the *Agreement on Agriculture*.[20] A finding that a measure was a domestic content subsidy would mean that such a subsidy would be prohibited under Article 3.1(b) of the *SCM Agreement* and would (in all likelihood) be inconsistent with Article III.4 GATT. In such an event, the consequences of such a finding would have to be subordinated to the right to adopt such measures under the *Agreement on Agriculture* (provided reduction commitments are respected). Moreover, the chapeau of Article 3.1 of the *SCM Agreement* clearly exempts from the scope of that Article domestic content subsidies which are maintained consistently with the *Agreement on Agriculture* and Article III.8 may be relevant to any claim under Article III.4. GATT.

39. Consequently, Brazil's claims that domestic content subsidies maintained consistently with the *Agreement on Agriculture* can be found to be inconsistent with the *SCM Agreement* and Article III.4 GATT should be dismissed.

## B. EXPORT CREDIT GUARANTEES WHICH OPERATE AS EXPORT SUBSIDIES ARE SUBJECT TO AGREEMENT ON AGRICULTURE OBLIGATIONS ON EXPORT SUBSIDIES

40. The United States maintains, in its first written submission, that Article 10.2 of the *Agreement on Agriculture* operates so as to exclude export subsidies in the form of export credits or export credit guarantees. This is not borne out by the text of Article 10.2. Article 10.2 provides for disciplines to be negotiated on the provision of export credits and export credit guarantees; it does not provide an exemption to the export subsidy obligations of the *Agreement on Agriculture*.

41. The United States provides numerous examples of instances in which the WTO has foreseen further negotiations. However, none of these examples support the United States argument that there are no disciplines for export credit guarantees which operate as export subsidies.

---

[19] See, Appellate Body Report, *United States – Countervailing Measures Concerning Certain Products from the European Communities*, WT/DS212/AB/R, adopted 8 January 2003, para. 110.

[20] The New Shorter Oxford English Dictionary, 1993.

42. The best example to illustrate this point is the agreement to negotiate disciplines on harmonised rules of origin. The fact that it was agreed to have negotiations on rules of origin simply means that there is no requirement for a WTO Member to apply an as yet un-finalised set of harmonised rules of origin. However, this does not imply that a WTO Member is exempted from other WTO obligations when it comes to apply rules of origin. A WTO Member must, for instance, in applying its rules of origin, respect the most-favoured nation principle set out in Article 1 GATT. Similarly, while there may not be disciplines on the provision of export credits and export credit guarantees, clearly export credits or export credit guarantees which operate as export subsidies are subject to the export subsidy disciplines of the *Agreement on Agriculture* and the *SCM Agreement*.

43. Other examples are equally illustrative. The US cites provisions in the GATS providing for negotiations on government procurement, emergency safeguards and subsidies on trade in services. However, it does not point out the fact that these subjects are clearly not subject to GATS disciplines, and thus negotiations are required to develop even minimal disciplines. Government procurement in services is the best example – GATS disciplines are explicitly excluded by Article XIII GATS. In contrast, there is no clear exclusion of export credits or export credit guarantees which operate as export subsidies from the *Agreement on Agriculture*.

44. Finally, contrary to the US suggestions, such an interpretation does not render Article 10.2 meaningless. Article 10.2 is not intended to regulate export credits and export credit guarantees as export subsidies but rather to provide for a general set of disciplines comparable to the OECD guidelines for export credits for industrial goods. That the Harbinson text (which of course has yet to be agreed) contains provisions on export credit and export credit guarantees is a recognition that disciplines must be negotiated and that clarification must be provided as to which export credits or export credits guarantees are, in the case of agricultural products, to be considered export subsidies, but is not a recognition that such support which operates as an export subsidy are not currently subject to the obligations of the *Agreement on Agriculture*.

## VI. MEASURES BEFORE THE PANEL (FSC REPLACEMENT SCHEME)

45. The United States has argued that Brazil has failed to make a prima facie case of the inconsistency of the FSC Replacement scheme (the ETI) with the covered agreements. The European Communities must admit to being surprised that the United States considers that Brazil has to present a prima facie case of inconsistency. According to Article 17.14 of the DSU parties to a dispute must "unconditionally accept" adopted Appellate Body Reports as "a final resolution to that dispute."[21] Given that the United States must be assumed to have unconditionally accepted the findings of the Appellate Body in the FSC 21.5 dispute, which, by definition also included a finding that the United States was illegally providing export subsidies to unscheduled agricultural products such as upland cotton, the European Communities fails to see how the United States can argue that Brazil needs to establish a prima facie case. On the contrary, Brazil simply needs to assert a claim.

## VII. CONCLUSION

46. This brings us to the end of our statement today. Thank you for bearing with us through a statement which was inevitably long, given the complexity of the issues, and the very short time we had to prepare our written submission.

47. There are a few central points which we would like to leave you with:

- The peace clause is not an affirmative defence;

[21] Appellate Body Report US- Shrimp (21.5 – Malaysia) para. 97.

- The term "decided" cannot be equated with "granted";

- Reducing payments where certain crops are grown for reasons of internal competition does not amount to basing payments on a certain type of production;

- Domestic content subsidies in favour of domestic producers are permitted under the *Agreement on Agriculture*, and can be maintained irrespective of other provisions; and,

- Export credit guarantees which operate as export subsidies are subject to the *Agreement on Agriculture*.

48. Thank you for your attention. We are, of course, happy to answer your questions, here or in writing.

# ANNEX C-11

## INDIA'S ORAL STATEMENT

Mr. Chairman and Members of the Panel,

I thank you for the opportunity to present India's views in this third party session. India has a few short comments to make on the issues in the dispute.

1. Brazil has challenged the US Subsidy programme relating to cotton. The main schemes challenged are

(i) Step 2 export payments
(ii) US export credit guarantee programmes, and
(iii) Extra Territorial Income (ETI) Act export subsidies.

2. These schemes do not conform to the provisions of Part V of the Agreement on Agriculture and thus have no "peace clause" protection from claims under the Subsidies Agreement. These schemes also violate Article 3.1(a) & 3.2 of the Subsidies Agreement.

3. The scheme relating to Step 2 export payments constitutes an export subsidy within the meaning of the Agreement on Agriculture. It also violates the Subsidies Agreement as

(i) It involves grants within the meaning of the Subsidies Agreement as the US Government pays money to its exporters
(ii) These grants involve direct transfer of economic resources for which the US Government receives no consideration
(iii) The scheme confers a benefit within the meaning of Article 1.1(b) of the Subsidies Agreement as they constitute "free money" for which exporters incur no corresponding obligations and they are made for " less than full consideration" and
(iv) The Scheme is also export contingent within the meaning of Article 3.1(a) of the Subsidies Agreement because exporters are only eligible for payments if they produce evidence that they have exported an amount of US upland cotton.

4. The three Export Credit Guarantee Programmes (GSM 102, GSM 103 & SCGP) are export subsidies within the meaning of the Agreement on Agriculture (AOA) as

(i) They are operated " at premium rates which are inadequate to cover the long term operating costs and losses of the program" as per item (j) of the illustrative list of export subsidies in ASCM.
(ii) They involve financial contributions that confer "benefits" and are contingent upon export performance within the meaning of Article 1.1 & 3.1(a) of the Subsidies Agreement. The US itself treats them as subsidies in its budget.

5. The ETI Act constitutes export subsidies within the meaning of Article 10.1 of the Agreement on Agriculture. This Act operates to circumvent the US export subsidy commitments by providing an export subsidy to upland cotton while the US does not have any export subsidy reduction commitments for cotton in violation of Articles 10.1 & 8 of the AOA.

6. The Step 2 Domestic Payment Scheme grants are direct transfers of funds and constitute a financial contribution by a Government within the meaning of Article 1.1(a)(1)(i) of the Subsidies Agreement. They also confer a "benefit" within the meaning of Article 1.1(h) of the Subsidies Agreement because the domestic user of US upland cotton receives the financial contribution on terms more favourable than those available in the market. Moreover these payment are contingent upon the use of domestic over imported goods.

Mr. Chairman, Members of the Panel,

7. Brazil has provided the legal arguments as to why the US has no basis to assert a "peace clause" defence against Brazil's claims on actionable/prohibited subsidies being given by the US.

8. According to Brazil, the "peace clause" of AOA Article 13 is in the nature of an affirmative defence. The US has indicated that it will invoke a "peace clause" defence in the matter. This means that the burden of proof will be on US to show that the US domestic support and export subsidies to upland cotton are provided in conformity with the requirements of the "peace clause".

9. Brazil has argued that US has no "peace clause" protection under AOA Article 13(c) as the US while invoking an affirmative defence must demonstrate that its export subsidies confirm fully to the provisions of Part V of the AOA. Part V of the AOA consists of Articles 8 to 11. A member violates Part V of the AOA if it provides export subsidies for products for which it has not undertaken any export subsidy reduction commitments.

10. Issues relating to affirmative defence and peace clause defence are mainly legal in nature and should be subject to interpretation under the Vienna Convention on the Law of Treaties and the WTO jurisprudence as seen through Appellate Body findings.

11. As regards subsidies contingent upon export performance, export credit guarantees and premiums, and use of domestic over imported inputs, Mr. Chairman, India believes that they all fall in the category of prohibited subsidies and are actionable under the ASCM.

Thank you for your kind attention.

# ANNEX C-12

## NEW ZEALAND'S ORAL STATEMENT

24 July 2003

1. Mr Chairman, Members of the Panel, New Zealand's views on the issues of concern in this dispute are set out in our Third Party Submission of 15 July and in the time available today it is clearly not possible to canvass all of those views. Accordingly, and as suggested by you in your opening remarks Mr Chairman, I will focus only on some key points.

**(i) New Zealand's systemic interest in the dispute**

2. First, as outlined in our Third Party Submission, New Zealand has joined this dispute because of our systemic interest in ensuring the continued integrity of WTO disciplines applicable to agricultural trade. In particular we are concerned to ensure that trade-distorting or "amber box" measures cannot be used contrary to the "peace clause" in a manner that negatively affects other Members.

3. It is equally important that where the requirements of the "peace clause" have not been respected Members are able to utilise their rights under the *SCM Agreement* and *GATT 1994* to take action in respect of domestic support measures and export subsidies.

**(ii) Brazil's demonstration that the United States cannot claim "peace clause" protection for domestic support provided in marketing years 1999, 2000, 2001 and 2002**

4. Second, Brazil has demonstrated that the level of domestic support for upland cotton granted by the United States in each of the marketing years in question did in fact exceed the level decided during the 1992 marketing year and that there is therefore no "peace clause" protection for those support measures.

5. The United States argues that this is not the case, on the basis that the comparison required by the "peace clause" should be between the 'per pound' rates of support set by the relevant domestic support measures and that certain domestic support measures should be excluded from the comparison.

6. Turning first to the United States claim that the relevant comparison should be between 'per pound' rates of support, in New Zealand's view such an interpretation would be inconsistent with the object and purpose of Article 13(b)(ii). Instead, Article 13(b)(ii) requires a comparison that takes into account the totality of payments to upland cotton producers in order to reflect the true nature of the support that is being granted, including for example, total budgetary outlays. This is especially so when those budgetary outlays have been increasing because of falling world market prices. And those prices are falling due, at least in part, to the fact that United States producers are shielded from true price signals by the guaranteed 'per pound' rates.

7. Furthermore, New Zealand sees no basis for excluding certain domestic support measures from the calculation required by the "peace clause" as requested by the United States.

8. The "counter-cyclical" payments are plainly not "green box" support measures in accordance with Annex 2 of the *Agreement on Agriculture*, as the amount of the payment is linked to current prices for upland cotton, in direct contravention of Annex 2 paragraph 6(c).

9. Nor is the scope of support to be measured under Article 13(b)(ii) limited to "product-specific" support in the sense proposed by the United States. There is no basis for such an interpretation in either the wording or the intent of Article 13(b)(ii). [Just to depart from the prepared statement for a moment, the EC has reminded us this morning of the importance of taking context into account when interpreting WTO Agreements. We would note that it is also important to consider the ordinary and natural meaning of the actual words appearing in the Agreements. Here the words used are "support to a specific commodity" – the text does not say "product-specific support". If the drafters had intended to mean "product-specific support", they surely would have said so. After all, the phrase "product-specific support" is used at least five times elsewhere in the *Agreement on Agriculture*. Returning now to the prepared text,] even if such an interpretation as suggested by the US, could be supported, "counter-cyclical" payments are in any event product-specific support because, as Brazil has demonstrated, there is a strong linkage between those payments and production of upland cotton.

10. New Zealand also considers that there is no basis for excluding the Production Flexibility Contract payments or Direct Payments from the required calculation. The ability of farmers to update the base acreage used for calculation of Direct Payments rules out inclusion of those payments in the "green box", which contemplates only one base period that is fixed and unchanging. To permit a Member to avoid this limitation by simply changing the names of its domestic support programmes would seriously undermine the requirement that there be no link between production and the amount of support.

**(iii) Brazil's demonstration that the United States cannot claim "peace clause" protection in respect of export subsidies;**

11. Looking now at export subsidies, New Zealand agrees with Brazil that the three types of export subsidies applied to upland cotton and other commodities by the United States (the Step 2 Export Programme, the Export Credit Guarantee Programme, and the FSC Replacement Programme) violate Articles 3.3, 8 and 10.1 of the *Agreement on Agriculture*.

12. New Zealand rejects the argument made by the United States that Step 2 export payments are not export subsidies because payments are available to domestic users as well as exporters of upland cotton. The Appellate Body (in *US-FSC Recourse to Article 21.5*) has made it clear that the fact that payments are also able to be made to domestic users of upland cotton does not 'dissolve' the export contingency of the payments that are made to exporters.

13. New Zealand also finds no basis for the assertion by the United States that export credit guarantee programmes are not subject in any way to the export subsidy disciplines of the *Agreement on Agriculture*. In fact the inclusion of reference to such programmes in the context of Article 10 supports the opposite conclusion and demonstrates that Members were in fact concerned at the potential for such programmes to circumvent Members' export subsidy reduction commitments.

14. In summary Brazil has demonstrated that the export subsidies to upland cotton do not have "peace clause" protection, and also that they are prohibited subsidies under Article 3.1(a) and 3.2 of the *SCM Agreement*.

**(iv) The request by the United States for a Preliminary Ruling**

15. Finally Mr Chairman, New Zealand does not consider that the Panel should grant the preliminary ruling requested by the United States.

16. First, New Zealand believes that measures no longer in effect are not outside the scope of the Panel's consideration, particularly where the programmes in question, while renamed, in fact continue in a slightly different form. Furthermore, the nature of serious prejudice claims means that Panels may need to consider data beyond a single year and consider trends over a number of years.

17. Second, New Zealand considers that export credit guarantee measures relating to eligible United States agricultural commodities (other than upland cotton) are within the Panel's terms of reference. To determine otherwise would be to allow a lack of transparency in the operation of particular measures to shield them from scrutiny by Members taking disputes.

**Conclusion**

18. In conclusion, Mr Chairman, New Zealand believes that Brazil has demonstrated that the "peace clause" has not been respected in relation to domestic support and export subsidies provided by the United States to upland cotton in the marketing years 1999, 2000, 2001 and 2002, and that accordingly Brazil is entitled to bring actionable and prohibited subsidy claims against the United States under the *GATT 1994* and the *SCM Agreement*. New Zealand looks forward to the next phase of the case which will examine those claims.

# ANNEX C-13

## ORAL SUBMISSION BY PARAGUAY

24 July 2003

Mr Chairman, members of the Panel:

1. Paraguay is grateful for the opportunity to participate in these proceedings and to present its views on the matter at issue in this dispute.

2. Because Paraguay is a firm believer in a fair system of multilateral trade, it feels that it should explain its position on this issue as a third party because it is an issue of particular interest to its economy.

3. Paraguay considers that the subsidies and support granted by the United States to its cotton production are inconsistent with the Agreement on Subsidies and Countervailing Measures, the Agreement on Agriculture and the rules and principles of the GATT 1994, and that for the purposes of this dispute it is therefore essential to take account of WTO legislation, which was carefully drafted to avoid causing distortions in international trade and prejudice to developing countries such as Paraguay.

4. WTO jurisprudence and the principles of interpretation of international law applied to the various cases suggests that the applicable rules should be read cumulatively, taking account of all elements applied to the case in order to support the system as an integrated whole.

5. With respect to the applicability of Article 13(b)(ii) concerning domestic support measures that conform fully to the provisions of Article 6 of the Agreement including direct payments that conform to the requirements to paragraph 5 thereof, as reflected in each Member's Schedule, as well as domestic support within *de minimis* levels and in conformity with paragraph 2 of Article 6, Paraguay considers they shall be exempt from actions based on paragraph 1 of Article XVI of GATT 1994 or Articles 5 and 6 of the Subsidies Agreement, provided that such measures do not grant support to a specific commodity in excess of that decided during the 1992 marketing year.

6. This implies that it is not limited or confined to specific products. Thus, it can be concluded that the United States does not enjoy protection from actions relating to subsidies using 1999, 2001 and 2002 as a basis, as Brazil duly proved.

7. In interpreting the Peace Clause, account must be taken of the serious prejudice that Member economies could suffer, and an assessment made of the overall significance of all of the agreements relating to the case.

8. Regarding inconsistency with the Agreement on Agriculture, the Step 2 programme introduced by the United States to stimulate exports and the competitiveness of its products on the international market is inconsistent with Articles 3.3 and 8 of the Agreement on Agriculture.

9. Article 3 of the Agreement on Agriculture refers to the incorporation of concessions and commitments. Paragraph 3 thereof stipulates that:

> *3.3 "Subject to the provisions of paragraphs 2(b) and 4 of Article 9 of this Agreement, a Member shall not provide export subsidies listed in paragraph 1 of Article 9 in respect of the agricultural products or groups of products specified in Section II of Part IV of its Schedule in excess of the budgetary outlay and quantity commitment levels specified therein and shall not provide such subsidies in respect of any agricultural product not specified in that Section of its Schedule."*

10. The above paragraph enables Members to provide the subsidies listed in Article 9.1 of the Agreement on Agriculture subject to fulfilment of the commitments assumed.

11. Similarly, Article 8 of the said Agreement regulates export competition commitments, stipulating that:

> *"Each Member undertakes not to provide export subsidies otherwise than in conformity with this Agreement and the commitments as specified in that Member's Schedule."*

12. For the above reasons, and because it does not consider the provisions of the Agreement on Agriculture to have been complied with, Paraguay believes that the export subsidies granted by the United States to its cotton industry are inconsistent with Articles 3.3, 8 and 9.1 of the Agreement on Agriculture.

13. The agricultural subsidies cause "serious prejudice" to the domestic industry of other Members under Articles 5 and 6 of the Agreement on Subsidies and Countervailing Measures.

14. The introductory paragraph of part III, Article 5 of the said Agreement provides that no Member should cause, through the use of any subsidy – specific and not exempted under the Agreement – adverse effects to the interests of other Members, more specifically, as categorically stated in the indents that follow, (a) injury to the domestic industry of another Member and (c) serious prejudice to the interests of another Member.

15. Article 6 specifically refers to cases in which "serious prejudice" is deemed to exist in the sense of paragraph (c) of Article 5.

16. Agricultural subsidies have effects on world trade, and measures such as those applied by the United States have a significant impact on developing countries like Paraguay.

17. Paraguay has a total population of approximately 5,300,000, of which more than 500,000 are linked to cotton production. If we add the related industries and activities, the figure reaches an estimated 1,500,000, or approximately 30 per cent of the country's total population.

18. Any slump in the cotton trade causes an exodus of rural population towards the urban areas which do not offer any relief or solution, and this further undermines the economic situation of a country that depends on its agriculture.

19. As regards exports, in 1991, the foreign exchange revenue generated by sales of cotton and byproducts thereof reached US$318,912,000, approximately 43 per cent of the total for the country's exports that year. At the time, of a total of 299,259 farms, 190,000 were cultivating cotton.

20. By 2001, the figures had changed considerably. Export revenue had fallen to US$90,505,000, a 72 per cent drop in the value of exports. The number of farms producing cotton decreased to about 90,000, representing a 52 per cent decrease in farms, employment and small farmer income. In other words, the impoverishment was real.

21. Regarding international cotton fibre prices, in 1991, the price per ton of Paraguayan type fibre was quoted on the New York Exchange at US$1,624, while in 2001, it was quoted at US$934.

22. In Paraguay, some 60 per cent of cotton is produced on farms of less than 10 hectares, making it the main or only source of income for small farmers and the main source of employment for the rural workforce in the most disadvantaged segment of society where access to capital and technology is more restricted and the leading socio-economic welfare indicators are lower than anywhere else.

23. In spite of its marked decline, cotton continues to be an important cash crop for the "capitalized" farms, and the main – if not only – cash crop of the farms that are on the decline.

24. The agricultural sector is fundamental to the Paraguayan economy, accounting for 90 per cent of exports, 35 per cent of employment and 25 per cent of GDP, in addition to which it supports an agro-industry that accounts for 11 per cent of GDP and 10 per cent of total employment.

Mr Chairman, members of the Panel:

25. The importance of cotton for Paraguay, both in social and economic terms, is such that an increase in international cotton fibre prices as a result of the elimination of significant market distortions such as subsidization of production would not only bring about a general improvement in the standard of living of the country's inhabitants, in a very fragile sector in particular, but it would also lead to an improvement in macroeconomic conditions, balance-of-payments, monetary reserves, etc. that would enable Paraguay to be more reliable in meeting its international financial commitments.

26. For the above reasons, and because it does not consider that the provisions of the Agreement on Agriculture have been complied with, Paraguay believes that the export subsidies granted by the United States to its cotton industry are inconsistent with Articles 3.3, 8 and 9.1 of the Agreement on Agriculture.

27. Paraguay therefore considers that the measures adopted by the United States cause serious prejudice to world trade, affecting Paraguay in particular, and that the necessary steps should be taken to eliminate the adverse effects and seek to achieve a balance in world trade.

28. Finally, Paraguay respectfully requests the Panel to conclude that the measure applied by the United States is inconsistent with its WTO obligations under various provisions of the Agreement on Agriculture, the GATT 1994 and the Agreement on Subsidies and Countervailing Measures.

# ANNEX C-14

## ORAL STATEMENT BY THE SEPARATE CUSTOMS TERRITORY OF TAIWAN, PENGHU, KINMEN AND MATSU AS A THIRD PARTY ON THE CASE OF THE UNITED STATES SUBSIDIES ON UPLAND COTTON

The Separate Customs Territory of Taiwan, Penghu, Kinmen and Matsu is pleased to be here as a third party in this case. We have a systemic interest in the particular question of the burden of proof required by Article 13 of the AOA, and would like to focus on this issue in our remarks. We have previously submitted our views in writing accordingly.

**The Burden of Proof (the "Peace Clause")**

In the case in point, Brazil asserts in its first written submission that Article 13 is by nature an "affirmative defence" or "exception" and "not itself a positive obligation", therefore the United States carries the burden of proof on whether its subsidies are in conformity with Article 13.

Our view, in summary, is that it is inappropriate to label Article 13 as an "affirmative defence" or "exception". Indeed this would mean the Article having much less than its originally intended effect. Article 13 in itself confers rights and imposes positive obligations on Members. It is not there simply for the convenience of resolving the question of the burden of proof. The right that it confers of entitlement to being "exempt from actions", for example, would be rendered pointless if the burden of proof were on the respondent. It is surely for Brazil, therefore, as a complainant, to prove a breach of a positive obligation by demonstrating non-conformity, rather than for the United States to bear the burden of proof.

In our written submission, we suggest that in arriving at a proper interpretation of the burden of proof in Article 13, it might also be helpful to make some comparisons with the different types of exceptions, exemptions and defences that exist in other Articles of WTO Agreements.

We mention, for example, disputes arising in connection with agreements not covered by the DSU, where the complaining party would bear the burden to prove that the issue in dispute falls within the purview of the DSB.

Also, where a matter is specifically excluded from the dispute settlement procedures by certain relevant agreements – such as Article 6 of the TRIPS agreement - the provision concerned allows the Member applying it to prevent dispute settlement procedures and the burden of proof falls on the complaining party.

And by way of further comparison, we refer to other cases where exceptions or exemptions are granted under relevant agreements providing specific obligations.

While Article 13 of the AOA is clearly in this case not dealing with a matter under a non-covered agreement or a matter that is specifically excluded from the dispute settlement procedures as in Article 6 of TRIPS, it is also not typical of the type of exception contained in a number of the GATT Articles. By its singular nature, Article 13, in our view, falls between these examples, therefore the procedures for applying its provision should be interpreted separately and differently.

And finally, as far as the burden of proof is concerned, we submit that requiring the respondent to prove that the subsidy measure in question is in conformity with the Agreement on Agriculture will, to a certain extent, offset the respondent's right to claim for the exceptions provided by the Article 13 provisions, which is surely contrary to the drafters' intent.

# ANNEX D

## REBUTTAL SUBMISSIONS OF PARTIES

# ANNEX D-1

## BRAZIL'S REBUTTAL SUBMISSION TO THE PANEL REGARDING THE "PEACE CLAUSE" AND NON-PEACE CLAUSE RELATED CLAIMS EXECUTIVE SUMMARY

TABLE OF CONTENTS

## 1. The United States Has No Peace Clause Protection for Non-Green Box Domestic Support Measures to Upland Cotton for MY 1999-2002

### 1.1. Production Flexibility Contracts and Direct Payments Are Non-Green Box Domestic Support

#### 1.1.1. The Amounts of PFC and Direct Payments Depend on the "Type" of Production

1. PFC payments and direct payments are non-green box support because both limit the "amount" of payment based on the "type" of production inconsistent with the requirements of Annex 2, paragraph 6(b) of the Agreement on Agriculture. The relevant text of paragraph 6(b) prohibits any linkage of the "amount of payments" to any "type of production" of an agricultural product. The "amount" of payments under the PFC and direct payment programmes *falls* when base acres are used to produce fruits, vegetables and wild rice. Thus, the undisputed evidence demonstrates that PFC and direct payments do not meet the policy-specific criteria for "de-coupled income support" in Annex 2, paragraph 6(b).

2. Prohibiting payments if *certain* types of crops are produced while at the same time permitting payments if *other* types of crops are produced violates Annex 2, paragraph 6(b). Contrary to the US argument, requiring no production, *i.e.*, prohibiting production, does not relate the amount of payments to the "type" of production, as no individual "type" of production would be eligible to payments. The notion of "type of production" in paragraph 6(b) is necessarily linked to the amount of payment to some "type" of commodity that is "produced" and not to a production requirement itself.

3. In addition, Brazil also presented evidence that the US restrictions on fruits, vegetables and wild rice prevent producers with PFC and direct payment base acreage from growing these alternative crops. This restriction, therefore, channels production into particular "types of production" by prohibiting *other* "types of production" and, therefore, violates Annex 2, paragraph 6(b).

#### 1.1.2. Direct Payments Are Not Green-Box Because the Base Periods for Determining Eligibility Have Been Updated in the 2002 FSRI Act

4. Direct payments are also not properly in the green box because the amount of payments are based on an updated "base period" and not on a "fixed" base period as required by Annex 2, paragraphs 6(a) and (b). Paragraphs 6(a) and (b) require a fixed and, therefore, unchanging base period for de-coupled domestic support measures with the same structure, design, and eligibility criteria. The evidence demonstrates that there are no significant changes in the payment eligibility criteria between the PFC programme and its direct successor, the direct payment program. Indeed, PFC payments made during 2002 were deducted from the amount of direct payments due in 2002.

5. Further, the updating permitted under the 2002 FSRI Act for direct payments was significant – one-third of eligible farms updated their PFC base acreage as of June 2003 in order to *increase* the base acreage – and payments – under the direct payment programme. This updating creates production-distorting effects because it creates expectations of future updates and will incite farmers to produce more of the programme crops that qualify for support.

6. The United States interprets the word "fixed" in Annex 2, paragraph 6(a) and (b) as being "fixed" only for the life of a particular legal measure. A Member could change a measure every year, update the "base period" to reflect the prior year's acreage, increase current payments to reflect the updated (and increased) "historical" acreage, and label it differently under a new law. Thus, the US interpretation would permit payments to be completely "coupled" to production, just with a one-year time lag. It would render any disciplines reflected in the use of the term "a" and "fixed" "base

period" in Annex 2, paragraph 6(a) a nullity. This is contrary not only to the ordinary meaning of the term "fixed" but also to the object and purpose of Annex 2, paragraph 6(a) to not permit Members to increase payments over time in a manner linked to increases in production over time. The re-linkage of payments to production is also inconsistent with the "fundamental requirement" in Annex 2, paragraph 1.

### 1.2. PFC, Market Loss Assistance, Direct and Counter-Cyclical Payments (CCP) and Crop Insurance Subsidies Are "Support To" Upland Cotton

7. The narrow US specificity test of "tied to production" seeks to impose a "form" of specificity on the text of Article 13(b)(ii) that is not there. It further contradicts the only analogous criteria to Article 13(b)(ii) for calculating annual levels of support – the AMS calculation criteria of Annex 3. In addition, it contradicts the broad definition of "in favour of" in defining AMS in Article 1(a) of the Agreement on Agriculture, and the "in general" language of the same provision. The "substance" the United States seeks to avoid with this unjustified interpretation is the $12.9 billion dollars in payments for the production of upland cotton from MY 1999-present.

8. Applying its narrow specificity criteria, the United States argues that PFC, market loss assistance, direct and counter-cyclical payments as well as crop insurance subsidies are not "support to" upland cotton. Brazil presents evidence that all five domestic support measures provide "support to" the production of upland cotton between MY 1999-2002.

#### 1.2.1. Production Flexibility Contract Payments

9. Brazil has presented considerable evidence demonstrating that PFC payments to holders of upland cotton base acreage in MY 1999-2001 are support to upland cotton. The 1996 FAIR Act established a specific payment formula permitting those upland cotton farmers who had traditionally farmed upland cotton to continue to receive payments following the elimination of the deficiency payment program. The 1996 FAIR Act singled out upland cotton and only six other crops for such PFC payments. Recipients were "producers" who "shared in the risk of producing a crop", and who farmed one of the seven crops in the three immediate years prior to the 1996 FAIR Act (MY 1993-95). Only a small minority of the producers of crops in the United States received PFC (and market loss assistance) payments. Brazil has demonstrated that between MY 1999-2001, the seven types of programme crops receiving PFC represented on average between MY 1999-2001 only 14.19 per cent of total US farm revenue. In addition, the total acreage of the seven PFC and market loss assistance crops in MY 2001 represented only 22 per cent of total US farmland. Thus, PFC payments were not provided to US producers *in general*.

10. The best available evidence demonstrates that upland cotton producers during MY 1999-2001 received PFC (and market loss assistance) payments. USDA reported that 97 per cent of farms producing upland cotton representing 99 per cent of upland cotton acreage from MY 1993-95 signed up to receive upland cotton PFC payments for MY 1996-2001. Upland cotton base acreage under the PFC (and market loss assistance) programme was 16.2 million acres. Between MY 1999-2001, the average acreage planted to upland cotton was 15.24 million acres. In addition, USDA reported that 95.7 per cent of the 16.2 million US upland cotton base acreage was planted to PFC programme crops in MY 2001 – a higher percentage than for any of the other 6 types of PFC programme crops. Thus, the evidence suggests that upland cotton producers in MY 1999-2001 were receiving PFC (and market loss assistance) payments.

11. Brazil has presented evidence demonstrating that PFC payments have production and trade distorting effects that arise from the prohibition on planting fruits, vegetables, and wild rice, as well as from the various "wealth effects" that result from the size of the subsidy averaging more than 15 per cent of the market value of upland cotton between MY 1999-2001. These effects provide further

confirming evidence that the selected, targeted PFC (and market loss assistance) payments are support to upland cotton.

### 1.2.2. Market Loss Assistance Payments

12. The evidence provided by Brazil with respect to PFC payments is also relevant to market loss assistance payments because these payments were made only to farmers with PFC contracts for the seven PFC crops, and additionally to soybeans. Thus, historic upland cotton producers (producing upland cotton in MY 1993-1995) received "upland cotton-specific" market loss assistance payments in MY 1998-2001. Even with the addition of soybeans, these 8 crops only represented on average 20.75 per cent of total US farm revenue in MY 1999-2001. PFC crop base acreage and soybean acreage in MY 2001 represented only 29 per cent of total US farmland. Thus, as with PFC payments, market loss assistance payments were not paid to US agricultural producers *in general* but rather to only a select group of US producers.

13. The evidence presented by Brazil indicates that while producers holding PFC/market loss assistance base acreage had the legal "freedom to farm" different crops, if they produced upland cotton, they would suffer adverse financial consequences *unless* they produced upland cotton on *upland cotton*, *corn* or *rice* base acres. The evidence highlights the practical impossibility of growing upland cotton without any type of PFC and market loss assistance payment in MY 2001. This evidence confirms NCC statements and supports a conclusion that any upland cotton produced in MY 1999-2001 – as a matter of economic reality and viability – needed and received PFC and market loss assistance payments to meet the high cost of production.

14. Further evidence that market loss assistance payments are support to upland cotton stems from the fact that the United States notified these subsidies as trade and production distorting amber box support. The evidence demonstrates that the targeted market loss assistance payments triggered by market price declines have even more trade and production-distorting effects than PFC payments. Further, as with PFC payments, production and trade distortions occurred because of the prohibition or restriction on receiving such payments based on growing fruits, vegetables, or wild rice. The production and trade-distorting effects on upland cotton are further confirmed by the fact that market loss assistance payments represented on average 17.87 per cent of the market value of upland cotton between MY 1999-2001. Thus, even though upland cotton producers were not *required* to produce upland cotton to receive market loss assistance payments, the record demonstrates that they continued to produce upland cotton between MY 1999-2001, and they continued to benefit from the 17.87 per cent subsidies represented by these payments.

### 1.2.3. Direct Payments

15. Direct payments are targeted support to "producers" farming, *inter alia*, on upland cotton base acreage. The eligible upland cotton producers who grew upland cotton in MY 1998-2001 (or in MY 1993-95) – together with eligible producers of only nine other crops – are a select group, who grew crops representing only 23.49 per cent of total farm cash receipts and 30 per cent of total US farm acreage. Thus, direct payments are *not* available to the great majority of US producers of agricultural commodities, *i.e.*, they are not provided to US agricultural producers *in general.*

16. The United States argues that direct payments and CCP payments are not "support to upland cotton" because there is no *legal requirement* under the 2002 FSRI Act for holders of upland cotton base acreage to grow upland cotton. However, Brazil has demonstrated that the theoretical legal *planting flexibility* in the 2002 FSRI Act is not reflected in the *economic* reality of growing high-cost crops like upland cotton. Farmers who did plant the 14.2 million acres of upland cotton for MY 2002 could only have covered their costs by receiving *upland cotton*, *rice* or *peanut* direct payments and counter-cyclical payments. This evidence strongly confirms what the NCC officials have stated

repeatedly, that their members need, rely on, and *receive* direct payment and counter-cyclical payment support. And this evidence refutes the United States argument that the *legal* flexibility to grow other crops – or not produce at all – is the single relevant fact justifying a finding that direct payments and CCP payments did not support upland cotton in MY 2002.

17. Further evidence that direct payments are support to upland cotton is derived from the effects on upland cotton production caused by the updating of the base acreage between the PFC and the direct payment programmes. Brazil has presented evidence indicating that this updating creates a re-linkage between production and the direct (and counter-cyclical) payments. Production effects are also caused by channeling the payments into crops other than fruits, vegetables, and wild rice. Further, the size of the subsidy (over 15 per cent of the current upland cotton market value) also contributes to wealth creation that has production effects. These production effects demonstrate that the direct payments (and CCP payments) are not de-linked from production – as argued by the United States – and support a conclusion that they are support to upland cotton.

### 1.2.5. Counter-Cyclical Payments

18. The United States argues that because producers receiving CCP payments are not required to produce upland cotton to receive payments, these payments cannot, as a matter of law, be considered support to upland cotton within the meaning of Article 13(b)(ii). Nevertheless, the evidence provided by Brazil demonstrates that CCP funds in MY 2002 paid to "historic" (i.e., 1998-2001 or 1993-1995) upland cotton producers are paid to a tiny fraction of total US producers of agricultural commodities and not to US producers of agricultural products "in general". Further, the evidence supports the conclusion that the recipients of these payments in MY 2002 needed these payments to continue producing upland cotton. They constitute "support to upland cotton".

19. Moreover, CCP payments create additional production effects due to the "base-update" permitted under the 2002 FSRI Act for both base yields and base acreage compared to market loss assistance payments. Further, the fruits, vegetables, and wild rice prohibitions or restrictions channel production into upland cotton. This evidence collectively supports a conclusion that CCP payments are "support to upland cotton".

### 1.2.6. Crop Insurance Payments

20. Brazil has demonstrated that upland cotton farmer benefit from specialized and specific crop insurance policies provided under the 2000 Agricultural Risk protection Act. Premium subsidies are directly tied to the amount of acreage planted by an upland cotton farmer. Also the participation rate, the share of policies at higher buy-up levels and the crop insurance loss ratio are higher for upland cotton than for other crops. This is confirmed by USDA's own economists, who have found that crop insurance subsidies cause much higher production and export effects for upland cotton than for other crops. In sum, crop insurance subsidies tied directly to the production of upland cotton are "support to a specific commodity" for the purposes of Article 13(b)(ii).

## 1.3. The US Support to Upland Cotton in MY 1999-2002 Exceeded the Support Decided in MY 1992

21. The United States has raised a number of *post hoc* arguments related to a supposed "rate of support" decision it alleges to have made during MY 1992. In the SAA, the United States stated that Members would have peace clause protection from adverse effects and serious prejudice challenges in the WTO "*unless the AMS for the particular* commodity exceeds the level decided in the 1992 marketing year". The phrase "AMS for the particular commodity" is an explicit recognition by the United States of the test in Annex 3, paragraph 6 which states: "For each basic agricultural product, a specific AMS shall be established *expressed in total monetary terms.*" The US "rate of support"

methodology is not an expression in "total monetary terms," nor does it permit such a calculation. There are only two types of methodologies that would allow an expression in monetary terms of a decision (or decisions) taken by the United States in MY 1992 regarding its level of support to upland cotton: "using budgetary outlays" or the "gap between the fixed reference price and the applied administered price multiplied by the quantity of production eligible to receive the administered price".

22. Brazil disagrees with the United States' assertion that it did not "decide" on budgetary outlays. The alleged US decision to provide a rate of support must necessarily be accompanied by a decision to authorize whatever budgetary outlays would be necessary to meet the rate of support. The United States took specific administrative decisions which meant that the United States decided on the payment rates that resulted from the "rate of support" and, therefore, on the amount of budgetary outlays it would use from its unlimited spending authority. For the United States to argue, *post hoc,* that these decisions did not also include expenditures is inconsistent with its SAA interpretation of the peace clause that the 1992 decision must be expressed in "total monetary terms."

23. Brazil has demonstrated that expenditures for MY 1992 are lower than they are for any of the marketing years from 1999-2002. Therefore, under this methodology, the United States has no peace clause exemption for MY 1999-2002. While Brazil does not believe that calculating the upland cotton AMS based on the AMS methodology in Annex 3 is the appropriate methodology – based on the absence of the terms "AMS", "product-specific" and "non-product-specific" in Article 13(b)(ii) – Brazil has provided evidence that by using this methodology the United States support to the basic agricultural commodity "upland cotton" exceeded the support decided during the 1992 marketing year in all marketing years from 1999-2002.

24. In the event the Panel decides not to use a "total monetary value" methodology, then there are two "rate of support" methodologies: (1) budgetary outlays per pound of support, and (2) the expected guaranteed income rate of support set out in Professor Sumner's analysis. Brazil has provided extensive analysis of each of these two methodologies. However, Brazil does not endorse either methodology.

25. Brazil has demonstrated that the preferable methodology would be to rely on budgetary outlays per pound of upland cotton production. Professor Sumner's approach should be used only as an alternative to the simplistic US "72.9 methodology" because it is much more accurate than the United States approach accounting for eligibility criteria, effective programme limitations and costs that the US ignores. In any event, Brazil has demonstrated that also under both rate of support methodologies the US support in MY 1999-2002 exceeds the support decided during MY 1992

26. Any methodology that does not account for eligibility and effective participation criteria is inconsistent with Article 13(b)(ii). It is also inconsistent with the context of Article 13(b)(ii) which includes Annex 3, paragraphs 8 and 10 requiring calculation of the monetary value of support by factoring in "*production eligible to receive the administered price*." And it is also inconsistent with object and purpose of the Agreement on Agriculture, which is – after all – "correcting and preventing restrictions and distortions in world agricultural markets."

### 1.4. Challenges to Actionable Subsidies under Article 5 and 6 of the SCM Agreement and Article XVI of GATT 1994 Are Not Limited to the Marketing Year in which a WTO Panel Is Established

27. The United States argues that the Panel may only count *current* US non-green box support in determining whether the United States enjoys peace clause exemption under Article 13(b). Applying a strict "statute of limitations" approach, the United States argues that Brazil (1) cannot challenge any US trade and production-distorting agricultural support for MY 2001 (or MY 2000, or MY 1999) because it did not ensure that the Panel was established during MY 2001 (or MY 2000, or MY 1999), and (2) it cannot challenge *all* of the trade and production-distorting support for all of MY 2002 because it did not ensure that the Panel was established by 31 July 2003 – the last day of the 2002 marketing year. The United States goes so far as to argue that the Panel may only compare MY 1992 support decided with *partial* MY 2002 data through 18 March 2003 – the date the Panel was established. According to the US theory, the only date the Panel could have been established to ensure comparison with full MY 2002 data would have been 31 July 2003 – the last day of MY 2002.

28. Brazil has demonstrated that the United States has constructed an irrational interpretation of Article 13(b)(ii). It is bizarre to interpret Article 13(b)(ii) in a way that requires Members to carefully "time" a request for establishment of a panel to maximize the amount of support to be counted for the "current" marketing year. Nothing in the "present tense" of Article 13(b)(ii) compels this result. The Panel must interpret Article 13(b)(ii) according to its ordinary meaning and with regard to its context. The relevant context is Articles 1(h)(ii) and 6.3 of the Agreement on Agriculture. The *Korea – Beef* dispute exemplifies that a Member can challenge violations of "Current Total AMS" at any time after a marketing year ends. The ability of challenging Current Total AMS violations in later years by analogy suggests that non-conformity with the peace clause requirements in much the same way leads to lifting the peace clause exemption also for marketing years other than the current marketing year. Thus, the proper interpretation of Article 13(b)(ii) permits actionable subsidy challenges under the SCM Agreement and GATT Article XVI:1 for any marketing year for which peace clause exemption does not exist – under either its chapeau (Current Total AMS) or the proviso of Article 13(b)(ii).

### 2. The GSM 102, GSM 103 and SCGP Export Credit Guarantee Programmes Constitute Export Subsidies in Violation of Articles 10.1 and 8 of the Agreement on Agriculture, and Item (j) and Articles 3.1(a) and 3.2 of the SCM Agreement

29. Brazil has demonstrated that the GSM 102, GSM 103 and SCGP export credit guarantee programmes administered by the CCC constitute export subsidies within the meaning of Articles 10.1, 1(e) and 8 of the Agreement on Agriculture, Article 3.1(a) of the SCM Agreement, and item (j) of the Illustrative List of Export Subsidies attached as Annex I to the SCM Agreement. Brazil also demonstrated that those export subsidies circumvent, or threaten to circumvent, the United States' export subsidy reduction commitments, in violation of Articles 10.1 and 8 of the Agreement on Agriculture. Additionally, because they violate the Agreement on Agriculture, these programmes are not exempt from actions by Article 13(c)(ii) of the Agreement on Agriculture, and constitute prohibited export subsidies within the meaning of item (j) and Articles 3.1(a) and 3.2 of the SCM Agreement.

30. Article 10.2 does not, as the United States asserts, carve out export credit guarantees from the general export subsidy disciplines of the Agreement on Agriculture, including the anti-circumvention provisions of Article 10.1. The Appellate Body concluded that exemptions and carve-outs from general obligations must be provided for explicitly in the text of an agreement. Article 10.2 includes no such explicit carve-out or exemption. Rather, Article 10.2 announces Members' intent to work toward negotiations on specific disciplines for export credits. In the meantime, the general disciplines on export subsidies included in the Agreement on Agriculture apply to export credits.

### 2.1. CCC Export Credit Guarantees Constitute Export Subsidies under Articles 1 and 3.1(a) of the SCM Agreement

31. Brazil notes that CCC export credit guarantees are "financial contributions" within the meaning of Article 1.1(a)(1)(i) of the SCM Agreement. Since CCC export credit guarantees are unique financing vehicles for agricultural commodity transactions that are not available on the commercial market, let alone on terms consistent with the market, they confer "benefits" within the meaning of Article 1.1(b) of the SCM Agreement. Brazil presents the affidavit of Marcelo Pinheiro Franco from the Brazilian Export Credit Insurance Agency who confirms that no

> comparable market-based export credit guarantees or financing instruments for international transactions involving agricultural commodities [exist] that provide these same terms [as the GSM and SCGP programmes].

32. Further, the United States compares agricultural export credit guarantees to export credit insurance for agricultural commodities, which it asserts is available on the private commercial market. However, it acknowledges that insurance coverage is structured altogether differently from guarantee coverage. Thus, even if the United States had proven its assertion with evidence, it acknowledges that the market for private insurance cannot serve as a benchmark against which to determine whether CCC guarantees confer "benefits".

33. Finally, CCC guarantees are contingent in law on export performance and therefore constitute prohibited export subsidies under Article 3.1(a) of the SCM Agreement.

34. Lastly, Brazil recalls that since the United States surpassed its quantity commitment levels, Article 10.3 of the Agreement on Agriculture allocates the burden to the United States to prove that its excess exports did not benefit from export subsidies, including export credit guarantees.

### 2.2. The CCC Export Credit Guarantee Programmes Constitute Export Subsidies under Item (j) of the Illustrative List of Export Subsidies

35. Brazil has demonstrated that the GSM 102, GSM 103 and SCGP programmes also constitute export subsidies because they charge premium rates that are inadequate to cover the long-term operating costs and losses of the programmes, within the meaning of item (j) of the Illustrative List. Item (j) does not require the Panel to endorse any particular methodology or formula for determining whether the CCC programmes cover their long-term operating costs and losses, or to decide by precisely how much those costs and losses exceed premiums collected. Rather, Brazil has provided the Panel with numerous alternatives, each of which demonstrates that long-term operating costs and losses for the GSM 102, GSM 103 and SCGP programmes outpace premiums collected, including data under the FCRA, Brazil' constructed formula, data from CCC's 2002 financial statements reporting large uncollectible amounts on post-1991 and pre-1992 guarantees, among others.

36. The United States criticizes the FCRA cost formula as inappropriate because it allegedly relies on "estimated" rather than "actual" data about the costs of the programmes. It is not true that the FCRA cost formula reflects only "an *estimate* of the long-term costs to the Government". A significant portion of the inputs into the FCRA cost formula reflect actual historical experience with borrowers, and actual contract terms such as interest rates, maturity, fees and grace periods.

37. Moreover, the results of the FCRA cost formula are modified throughout the lifetime of a cohort, pursuant to the "reestimation" process. The results of the reestimate process demonstrate that CCC has "los[t] money" during the period 1992-2002. When these total lifetime reestimates for all

cohorts of guarantees disbursed since 1992 are netted against the total *original* subsidy estimates adopted each budget year during the period 1992-2002, *the resulting loss is nearly $1.75 billion*.

38. The implication of the United States' position concerning "estimated data" is that it is impossible to judge whether premiums for the GSM 102, GSM 103 and SCGP programmes have covered operating costs and losses until all guarantee cohorts for a period constituting the "long term" are closed, so that purely "actual" rather than partial "estimate" data are available. Because all cohorts disbursed since the inception of federal credit reform remain open, the United States effectively argues that it is impossible for this Panel to judge whether the CCC guarantee programmes satisfy the elements of item (j). Brazil notes however that the US Congress and the President have endorsed the use of the FCRA cost formula as the principal way to "measure more accurately the costs of Federal credit programmes", *even in the budget year column of the US budget*, let alone several years out, when cohorts have been subject to successive rounds of reestimates.

39. In closing, Brazil reminds the Panel that the US criticism regarding the use of "estimated" data does not address the many other bases apart from the FCRA formula on which Brazil has demonstrated that the long-term operating costs and losses of the GSM 102, GSM 103 and SCGP programmes exceed premiums paid.

### 2.3. The CCC Export Credit Guarantee Programmes Threaten to Circumvent US Export Subsidy Reduction Commitments

40. At paragraphs 295-305 of its First Submission, Brazil demonstrated that with respect to both unscheduled and scheduled commodities, the GSM 102, GSM 103 and SCGP export subsidy programmes result in, or threaten to lead to, circumvention of the United States' export subsidy commitments, in violation of Article 10.1 of the Agreement on Agriculture. For the same reason, the United States violates Article 8, which requires a Member not to provide export subsidies otherwise than in conformity with the Agreement on Agriculture and with its scheduled commitments. The threat of circumvention for scheduled commodities is further enhanced by the fact that CCC is exempt from the requirement in the FCRA that a programme receive new Congressional budget authority before it undertakes new loan guarantee commitments. Mandatory programmes like the CCC export credit guarantee programmes must be available to all eligible borrowers, without regard to appropriations limits. In an important sense, this resembles the United States' FSC regime, which the Appellate Body found is available without limit. The Appellate Body considered that the unlimited nature of the regime posed a significant threat, under Article 10.1, that the United States would surpass its agricultural export subsidy reduction commitments.

### 2.4. The GSM 102, GSM 103 and SCGP Export Credit Guarantee Programmes Constitute Export Subsidies in Violation of Item (j) and Articles 3.1(a) and 3.2 of the SCM Agreement

41. Since the CCC export credit guarantee programmes violate Articles 10.1 and 8 of the Agreement on Agriculture, the United States is not entitled to the "peace clause" exemption. Therefore, GSM 102, GSM 103 and SCGP programmes constitute prohibited export subsidies, in violation of item (j) of the Illustrative List of Export Subsidies, and of Articles 3.1(a) of the SCM Agreement.

## 3. The Step 2 Export and Domestic Subsidies Are Prohibited Subsidies in Violation of Articles 3.1(a) and 3.1(b) of the SCM Agreement

42. The United States asserts that all US upland cotton is eligible to receive Step 2 payments and that this removes the export and local content contingency. Brazil refutes the US assertion both as a

matter of law as well as fact. The Step 2 export provisions are not, as the United States now argues, simply domestic support payments made to US producers of upland cotton. Brazil again emphasizes that the *US – FSC* and *Canada – Aircraft* Appellate Body decisions are relevant jurisprudence and apply to the facts of the two situations set out in the regulations to Section 1207(a) of the 2002 FSRI Act. Thus, even if all US production since 1990 or even during MY 1999-2002 received Step 2 payments – which the United States has failed to document with any data – it would not remove the export and local content contingencies mandated by those regulations that violate SCM Agreement Articles 3.1(a) and (b).

43. US domestic Step 2 subsidies are prohibited local content subsidies in violation of Article 3.1(b) of the SCM Agreement. There is no explicit derogation of Article 3.1(b) built into the Agreement on Agriculture. The United States argues that there is an inherent conflict between Annex 3, paragraph 7 and Article 6.3 of the Agreement on Agriculture with Article 3.1(b) of the SCM Agreement because in the view of the United States, there can be no payments to processors of agricultural products included within AMS that do *not* violate Article 3.1(b) of the SCM Agreement. Brazil demonstrates that this is not true and that there are subsidies to agricultural processors that do not violate Article 3.1(b) and presents various examples to that respect.

44. Finally, Brazil notes the EC argument that applying Article 3.1(b) of the SCM Agreement "would lead to stricter disciplines being applied to domestic subsidies than are applicable for industrial goods". Local content subsidies – whether for agricultural and industrial products – are prohibited by Article 3.1(b). As "prohibited" subsidies, they are subject to the ultimate discipline – they cannot legally exist. The two packages of disciplines for agricultural and industrial products have both been negotiated during the Uruguay Round. The resulting rules have to be interpreted according to the customary rules of treaty interpretation as contained in the *Vienna Convention*. This interpretation results in agricultural local content subsidies being prohibited. Whether that results in there being more or less strict disciplines than would be applicable to industrial subsidies is not a relevant consideration for the interpretation of the disciplines.

### 4. The ETI Act Subsidies Violate Articles 10.1 and 8 of the Agreement on Agriculture and Are Prohibited by Articles 3.1(a) and 3.2 of the SCM Agreement

45. Brazil has made a *prima facie case* with respect to its claims against the ETI Act. Brazil challenges exactly the same measure based on the same claims asserted by the EC that the panel and the Appellate Body in *US – FSC (21.5)* held to violate the Agreement on Agriculture and the SCM Agreement. The sole difference is that Brazil limits its claims to ETI Act subsidies benefiting the export of upland cotton only.

# ANNEX D-2

## EXECUTIVE SUMMARY OF THE REBUTTAL SUBMISSION OF THE UNITED STATES

### Introduction and Overview

1. The comparison under the Peace Clause proviso in Article 13(b)(ii) must be made with respect to the support as "decided" by those measures. In the case of the challenged US measures, the support was decided in terms of a rate, not an amount of budgetary outlay. The rate of support decided during marketing year 1992 was ***72.9 cents*** per pound of upland cotton; the rate of support granted for the 1999-2001 crops was only ***51.92 cents*** per pound; and the rate of support that measures grant for the 2002 crop is only ***52 cents*** per pound. Thus, in no marketing year from 1999 through 2002 have US measures breached the Peace Clause.[1]

2. Brazil has claimed that additional "decisions" by the United States during the 1992 marketing year to impose a 10 per cent acreage reduction programme and 15 per cent "normal flex acres" reduced the level of support below 72.9 cents per pound. However, the 72.9 cents per pound rate of support most accurately expresses the revenue ensured by the United States to upland cotton producers. Even on the unrealistic assumption that these programme elements reduced the level of support by 10 and 15 per cent, respectively (that is, the maximum theoretical effect these programme elements could have had), the 1992 rate of support would still be ***67.625*** cents per pound, well above the levels for marketing years 1999-2001 and 2002.

3. Although such a comparison would not conform to the text, the result of the Peace Clause comparison is no different if one compares the support via an Aggregate Measurement of Support calculation. Using the price gap methodology (as provided under Annex 3 of the Agriculture Agreement) for US price-based deficiency payments and marketing loan payments, the upland cotton Aggregate Measurement of Support (in US $, millions) for these years is MY1992: 1,079; MY1999: 717; MY2000: 484; MY2001: 264; MY2002: 205. Again, in no marketing year from 1999 through 2002 have US measures breached the Peace Clause.

4. Finally, the analysis presented by Brazil's expert at the first panel meeting actually supports the United States, not Brazil. Removing the non-product-specific support that Brazil erroneously tries to pass off as support to upland cotton, Brazil's own expert calculates the total support per unit

[1] Brazil has asserted that the United States' approach does not provide any way of taking Step 2 payments into account. Because the availability of Step 2 payments is contingent on certain price conditions existing during the marketing year, the level of support decided must relate to the payment parameters. These have remained the same for Step 2, with the exception of the suspension, through 2006, of the 1.25 cent price difference threshold and payment availability at slightly higher market prices. However, because Step 2 merely provides an alternative avenue of providing support (through processors rather than directly to producers), these minor adjustments do not alter the revenue ensured for producers by the marketing loan rate of 52 cents per pound. In addition, these minor adjustments cannot overcome the greater than 20 cents per pound difference in product-specific support between marketing years 1992 and 1999-2002. Similarly, and without prejudice to whether these measures are within the Panel's terms of reference, we note that cottonseed payments in 1999, 2000, and 2002 ranged in value between 0.6 to 2.3 cents per pound (factoring expenditures over production); thus, they too do not materially affect the comparison between marketing year 1992 and any other year.

(cents/lb.) as MY1992: 60.05; MY1999: 53.79; MY2000: 55.09; MY2001: 52.82; MY2002: 56.32. Again, in no marketing year from 1999 through 2002 have US measures breached the Peace Clause.

5. Thus, whether gauged via the rate of support decided by US measures (whether or not adjusted for the acreage reduction programme and normal flex acres), *or* via the AMS for upland cotton (calculated through a price gap methodology), *or* via the calculations of Brazil's expert (limited to product-specific support), the result is exactly the same: in no marketing year from 1999 through 2002 have US measures breached the Peace Clause.

**US Green Box Measures are "Exempt from Actions" Pursuant to Article 13(a)(ii)**

6. A measure shall be deemed to meet the "fundamental requirement" of the first sentence of Annex 2 if it meets the basic criteria of the second sentence plus any applicable policy-specific criteria. As suggested by the use of the word "fundamental" ("from which others are derived") and the structure of Annex 2 (that is, beginning the second sentence with the word "accordingly"), compliance with the requirement ("something called for or demanded") of the first sentence will be demonstrated by conforming to the basic criteria of the second sentence plus the applicable policy-specific criteria of paragraphs 6 through 13.

7. ***Direct Payments:*** Eligibility for direct payments under the 2002 Act is based on criteria in a "defined and fixed base period " (paragraph 6(a)) in the ordinary meaning of those terms: a base period that is "definite" (set out in the 2002 Act) and "stationary or unchanging in a relative position" (does not change in relative position for the six-year duration of the 2002 Act).

8. Paragraph 6(a) establishes that eligibility for payments under a decoupled income support measure shall be determined by clearly-defined criteria in "*a* defined and fixed base period," not "*the* base period" (as in paragraph 9 of Annex 3, which is defined in that same paragraph as "the years 1986 to 1988"). Brazil's reading of "a defined and fixed base period" would read into that text the term "unchanging", language Brazil has proposed in the ongoing WTO negotiations but is not currently found in the Agreement.

9. Annex 2, by its terms, sets out the fundamental requirement and basic and (if applicable) policy-specific criteria to which green box "*domestic support measures*" must conform. Other provisions in the Agreement similarly establish that the criteria set out in Annex 2 apply to "domestic support measures". Thus, with respect to a given decoupled income support measure, eligibility for payments must be determined by criteria in a "defined and fixed base period".

10. Brazil argues that a *new* decoupled income support measure must be based on the same base period as a previous measure if the new measure "is essentially the same" or "[i]f the structure, design, and eligibility criteria have not significantly changed." There is no provision in Annex 2 or the Agreement on Agriculture that supports Brazil's approach. It is thus irrelevant whether two decoupled income support measures are "essentially the same".

11. Brazil would read paragraph 6(b) as requiring a Member to make support available for *any* type of production; a Member could not preclude a recipient from producing certain crops.[2] While direct payments are reduced if certain crops are produced, a recipient need not produce any "type of"

[2] Brazil's reading would also seemingly require a Member to make payments even if the recipient's production was illegal – for example, the production of narcotic crops such as opium poppy or the production of unapproved biotech varieties or environmentally damaging production (for example, planting on converted rain forest or wetlands) – because, under Brazil's approach, by reducing or eliminating payments for any of these production activities, a decoupled income support measure could be understood to base or relate the amount of payment to the "type" of production undertaken.

crop in particular in order to receive the full payment for which a farm is eligible; the recipient need merely refrain from producing the forbidden fruit or vegetable. Thus, it is not any "type . . . of production . . . undertaken by the producer" that results in the full direct payment but rather production *not* undertaken by the producer – that is, *ceasing* certain production.

12. ***Production Flexibility Contract Payments:*** Production flexibility contract payments (now expired) were made with respect to farm acreage that was devoted to agricultural production in the past, including acreage previously devoted to upland cotton production. The payments, however, were made regardless of whether upland cotton was produced on those acres or whether anything was produced at all. As with direct payments, because production flexibility contract payments were decoupled from production, they met the five policy-specific criteria set out in paragraph 6 for decoupled income support measures.

13. Brazil has failed to make a *prima facie* case that US green box measures do not satisfy the fundamental requirement of Annex 2.[3] In fact, Brazil's "evidence" consists simply of selectively quoting and emphasizing conceptual and theoretical statements from the economic literature. *None of the papers Brazil cites concludes that these payments in particular, or decoupled income support measures in general, have more than "minimal[] trade-distorting effects or effects on production."*

14. The Agreement on Agriculture does not define a numerical threshold on what degree of effects will be considered "minimal[] trade-distorting effects or effects on production". However, given that *no study has found that these payments have effects on production of more than one per cent*, it would appear that direct payments have and production flexibility contract payments had no more than "minimal[] trade-distorting effects or effects on production". Thus, not only has Brazil failed to present a *prima facie* case, but the United States has affirmatively shown that these payments satisfy the fundamental requirement of the first sentence of Annex 2.

**US Non-Green Box Domestic Support Measures are not in Breach of Article 13(b)(ii)**

15. **: Peace Clause Proviso – Support was "Decided" During Marketing Year 1992 Using a Rate, Not a Budgetary Outlay**: The Peace Clause proviso requires a comparison to the product-specific support "decided" during the 1992 marketing year. A Member cannot "decide" world market prices or actual production or any other element outside a government's control. Yet Brazil would read the Peace Clause as though Members were omnipotent and could "decide" every factor influencing support.

16. Brazil lists nine different "decisions taken by the United States in relation to MY 1992 upland cotton support programmes". At least three of these "decisions" relate to the rate of support and *not a single decision relating to budgetary outlays or market prices.* Thus, Brazil's own answer confirms that the proper analysis of the support "decided" by US measures is to look to the terms of the US measures, which set a rate of support.

17. The use of the term "grant" in the Peace Clause proviso with respect to challenged measures does not compel an examination of budgetary outlays. The ordinary meaning of "grant" is to "bestow as a favour" or "give or confer (a possession, a right, etc.) formally". Thus, the use of the term "grant" would permit an evaluation of the rate of support that challenged measures "give or confer . . . formally". Members did not choose to use the word "granted" in place of "decided," and a valid

[3] If, as Brazil has argued, the first sentence is "fundamental" and has independent force, then presumably if a measure meets that "fundamental requirement", it will be deemed to be green box, irrespective of whether it meets the subordinate basic and policy-specific criteria. Thus, on Brazil's reading, if a measure does not conform to the criteria in Annex 2, it still could meet the "fundamental requirement", and the complaining party would bear the burden of proof to demonstrate a measure's inconsistency with that provision.

interpretation must make sense of that choice rather than reading it out of the Agreement. In addition, had Members intended the Peace Clause comparison to be made *solely* on the basis of budgetary outlays, they could have used that term, which is a defined term in Article 1(c) and used frequently in the Agreement.

18. **Peace Clause Proviso – "Support to a Specific Commodity" Means Product-Specific Support**: The phrase "support to a specific commodity" means "product-specific support". That the Peace Clause does not use the phrase "product-specific support" is neither surprising nor telling. The basic definition of product-specific support is given in Article 1(a), as "support . . . provided for an agricultural product in favour of the producers of the basic agricultural product." Article 1(h) also refers to the concept but does not use the exact phrase "product-specific support"; in fact, the language this provision uses ("support for basic agricultural products") is strikingly similar to the Peace Clause proviso ("support to a specific commodity"). Neither Article 1(a) nor 1(h) *even uses the term "specific"* whereas the Peace Clause *contains all three elements of that phrase* (product, specific, and support).

**19. Brazil Simply Ignores the Definition of Product-Specific Support in the Agreement on Agriculture**: Brazil argues that certain challenged US measures are *not* "non-product-specific" and therefore must be "support to a specific commodity." Brazil focuses on the definition of "non-product-specific" support in Article 1(a) but simply fails to interpret that definition in light of the definition of product-specific support that immediately precedes it. The universe of domestic support measures under Article 1(a) consists of product-specific support and non-product-specific support; these two parts must be read together and in harmony.

20. The definition of product-specific support consists of two elements: First, the support must be provided "*for an agricultural product*," that is, the subsidy is given "in favour of" a product and not in respect of criteria not related to the product or in respect of multiple products. Second, such support is "in favour of the *producers of the basic agricultural product*", which suggests that subsidy benefits those who produce the product – that is, production is necessary for the support to be received. *Both* of these elements must be present for support to be product-specific since, should either be missing, the definition would not be satisfied.

21. The second category of support in Article 1(a) is defined as "non-product-specific support provided in favour of agricultural producers in general." The ordinary meaning of "in general" is "in general terms, generally". Non-product-specific support *cannot* be interpreted as support provided "for *an* agricultural product in favour of the *producers* of the basic agricultural product" because to do so would reduce the first half of the Article 1(a) definition to redundancy or inutility. Thus, non-product-specific support is support in favour of agricultural producers "generally" – that is, a residual category of support covering those measures that do not fall within the more detailed criteria set out in the definition of product-specific support.

22. **Counter-Cyclical Payments are Non-Product-Specific Support:** Counter-cyclical payments are non-product-specific support. The payment formula for counter-cyclical payments demonstrates that these payments are not "provided for an agricultural product" because a recipient need not currently produce upland cotton (or any other crop) to receive payment. In addition, it is not "the producers of the basic agricultural product" – that is, current upland cotton growers – that are entitled to receive the counter-cyclical payments but rather persons (farmers and landowners) on farm acres with *past histories* of producing covered commodities, including upland cotton, during the base period. Thus, counter-cyclical payments satisfy neither element of the definition of product-specific support and do not form part of the Peace Clause comparison.

23. Despite Brazil's attempts to mischaracterize the two as similar, counter-cyclical payments and deficiency payments differ in crucial respects. To receive a deficiency payment, a producer was

*required* to plant upland cotton for harvest and would be paid on the *acres planted to upland cotton for harvest* up to the maximum payment acreage. Thus, deficiency payments were support for an agricultural product (upland cotton) in favour of the *producers* of the product. By contrast, to receive the counter-cyclical payment a person with "upland cotton base acres" *need not plant for harvest or produce upland cotton* (nor any other crop nor any crop at all). Thus, counter-cyclical payments do not provide support for "an agricultural product" in favour of " the producers" of the basic agricultural product and do not form part of the Peace Clause comparison under the proviso in Article 13(b)(ii).

24. **Crop Insurance Payments Provide Non-Product-Specific Support**: Crop insurance is not support "provided for *an* agricultural product". For marketing year 2002, crop insurance payments are available to approximately 100 agricultural commodities, representing approximately 80 per cent of US area planted and greater than 85 per cent of the value of all US crops. Support which is provided to a number of crops is not "support to a specific commodity"; it is ' support to several commodities' or 'support to more than one commodity' and does not form part of the Peace Clause comparison. The United States notifies crop insurance as non-product-specific "amber box" domestic support subject to US reduction commitments. *No WTO Member has notified crop insurance programmes as product-specific*; in fact, Hungary, Canada, the EC, and Japan have notified crop insurance programmes as non-product-specific support. The United States is not aware of any other Member's crop insurance programme that has as broad product coverage as the US programme.

25. **Market Loss Assistance Payments are Non-Product-Specific Support**: As indicated in the US 1999 WTO domestic support notification (G/AG/N/USA/43), the expired market loss assistance payments were non-product-specific support. As with production flexibility contract payments, market loss assistance payments were made to persons with farm acres that previously had been devoted to production of certain crops, including upland cotton, during an historical base period. A recipient was not required to produce upland cotton or any other crop in order to receive payment, and no production was required at all. Thus, these payments are not product-specific support and would not form part of the Peace Clause proviso comparison.

26. **Direct Payments**: Were the Panel to conclude that direct payments do not conform fully to the provisions of Annex 2, direct payments would be non-product-specific support. As with counter-cyclical payments, direct payments are based on quantities of acreage that historically produced cotton, and there is no requirement to produce upland cotton (or any other crop) to receive these payments. Thus, direct payments would not be product-specific support.

27. **Production Flexibility Contract Payments**: Were the Panel to consider that these payments are within its terms of reference, the United States has explained that they would be green box support. Were the Panel to conclude further that production flexibility contract payments do not conform fully to the provisions of Annex 2, these payments would also be non-product-specific support for the reasons given with respect to direct payments. As such, they would not form part of the Peace Clause proviso comparison.

28. **Cottonseed Payments**: The Agricultural Assistance Act of 2003 and the cottonseed payment made pursuant to it is not within the Panel's terms of reference because the legislation authorizing the payments had not even been enacted at the time of Brazil's panel request, much less its consultation request. The "legal instruments" pursuant to which prior cottonseed payments were made, moreover, do not appear in Brazil's consultation or panel requests. Thus, it would appear that cottonseed payments for the 1999 and 2000 crops of cottonseed also do not form part of the Panel's terms of reference.

29. **Peace Clause Comparison – The Product-Specific AMS for Upland Cotton Also Demonstrates That Challenged US Measures Do Not Breach the Peace Clause**: The United States believes the Peace Clause compels comparing the rate of support decided by US

measures, whether or not adjusted for the acreage reduction programme and normal flex acres, with the current rate of support. Were the Panel to determine to use an Aggregate Measurement of Support calculation, however, the price gap methodology is the only appropriate one for Peace Clause purposes.

30. The price gap methodology eliminates the effect of prevailing market prices on the calculation of support. Instead, paragraphs 10 and 11 of Annex 3 designate that the support be calculated by multiplying the quantity of eligible production by the gap between the applied administered price (for example, the marketing loan rate) and the *fixed reference price* (that is, the actual price for determining payment rates for the years 1986 to 1988). Thus, by holding the reference price "fixed", support measured using a price gap calculation shows the effect of changes in the level of support (applied administered price) decided by a Member, rather than changes in outlays that result from movements in market prices that a Member does *not* control. In fact, the United States has calculated an AMS for upland cotton using the price gap methodology for both deficiency payments and marketing loan payments (marketing loan gains, certificate exchange gains, and loan deficiency payments) and using budgetary outlays for all other payments. The result is exactly the same as a rate of support comparison: in no marketing year from 1999 through 2002 is the support US measures grant in excess of the 1992 marketing year level.

**US Export Credit Guarantee Programme**

31. **The Negotiating History of Article 10.2 Reveals that the Negotiators Explicitly Deferred the Application of All Export Subsidy Disciplines on Export Credit Guarantees**: The GATT/WTO negotiating history regarding export credits and export credit guarantees in agriculture supports the US interpretation of Article 10.2. On 24 June 1991, Chairman Dunkel circulated a Note on Options in the Agriculture Negotiations requesting decisions by the principals on "whether subsidized export credits and related practices . . . would be subject to reduction commitments". Subsequently, on 2 August 1991, he circulated a proposed "Illustrative List of Export Subsidy Practices." Item (h) is explicitly "Export Credits provided by governments or their agencies on less than fully commercial terms." Similarly, item (i) is "Subsidized export credit guarantees or insurance programmes."

32. On 20 December 1991, the "Draft Final Act Embodying the Results of the Uruguay Round of Multilateral Trade Negotiations" was issued. Article 10.2 of the Draft Final Act states: "Participants undertake *not* to provide export credits, export credit guarantees or insurance programmes *otherwise than in conformity with* internationally agreed disciplines" (emphasis added). This draft text would clearly prohibit the use of export credit guarantees *except* in conformity with agreed disciplines. Such internationally agreed disciplines would include those contemplated by the SCM Agreement. This would be precisely the language necessary to support Brazil's reading.

33. Ironically, Brazil's interpretation would require export credit guarantees in agriculture to be subject to *greater* disciplines than any other practice addressed in the Agreement on Agriculture. Under Brazil's view, not only would export credit guarantees constitute export subsidies and be subject to *all* of the export subsidy disciplines, but Members would also be specifically obligated to work toward and then apply *additional* disciplines.

34. **Brazil's approach would result in gross injustice**: As part of the negotiations, the parties had to prepare and submit schedules of quantities and budget outlays during a base period to derive the export subsidy reduction commitments ultimately reflected in the respective schedules of the Members. Had Members' export credit guarantees been considered export subsidies for these purposes from the outset, then the export credit guarantee activity during the base period would also have to have been added to the base figures from which each Member's export subsidy reduction commitments were calculated. For example, the United States has no export subsidy reduction

commitment with respect to corn, yet during the 1986-1990 base period an average of over *5.5 million tons* of corn were exported *each year* under the GSM-102 and GSM-103 programmes. The United States would have reduction commitments for many more products than currently and would have had significantly increased commitments for the 13 products that are scheduled. However, Brazil would have the Panel impose the disciplines now but deny Members the corresponding changes in reduction commitments. Brazil's approach would be grossly inequitable and the Panel should reject it.

35. **The Application of Government-Wide Accounting Rules Indicates that the Export Credit Guarantee Programmes are Covering Long-Term Operating Costs and Losses:** The application of the Federal Credit Reform Act of 1990 ("FCRA") over time to the export credit guarantee programmes as a whole currently indicates that the net result of all activity associated with export credit guarantees issued in fiscal years 1994 and 1995 is a total net receipt to the United States of $29 million. The experience of 1994 and 1995 is viewed as representative, and the United States expects that the net results for other years will be similar to the experience for 1994 and 1995. Re-estimates thus far have resulted in a net reduction in the estimated costs of these programmes of over $1.9 *billion* since the inception of credit reform budgeting in fiscal year 1992. Based on those results, the Brazilian claim that "operating costs and losses for GSM 102, GSM 103, and SCGP have outpaced premiums collected in every single year since the United States started applying the formula in 1992" is not supportable.

36. The United States has gathered cumulative reestimates on a cohort basis: For example, for cohort 1992 (not yet closed) the current data reflects an estimate of a *profit* to the United States of approximately $124 million; for 1993 (not yet closed), the corresponding current figure is a *profit* of approximately $56 million; and, as indicated, cohorts 1994 and 1995 together project a *profit* of $29 million. With the exception of 2002, for which only very recent data is necessarily available, the Panel will note that the trend for all cohorts is uniformly favourable as compared to the original subsidy estimate.

37. Brazil asserts that "historically, the majority of GSM support that is rescheduled is 'in arrears'" and that this increases costs. Brazil largely relies, however, on a 1990 government report that is dated and precedes FCRA itself. No rescheduling applicable to export credit guarantees issued in fiscal year 1992 or later is in arrears.

38. **Brazil's Suggestion to Use Estimated Data to Determine Long-Term Costs and Losses Supports the View that the Export Credit Guarantees Do Not Provide Export Subsidies**: The United States notes Brazil's statement that "a certain degree of estimated data would be perfectly acceptable in an analysis of the costs and losses of guarantee programmes under item(j)" for two reasons. First, the re-estimate process for fiscal years 1994, 1995, and virtually every other year since fiscal year 1992 indicates a very strong net positive trend with respect to the programmes and that therefore current premium rates do cover long-term operating costs and losses. Second, it is relevant with respect to Brazil's reliance on the significant losses that the United States admittedly incurred with respect to Poland and Iraq. Presumably, to attempt to recover such losses in any practical time frame would require such a prohibitive fee increase that few, if any, exporters would take advantage of the program. Consequently, the United States would be whipsawed by a prohibition on the export credit guarantee as currently constituted because of the large losses incurred between 10 and 20 years ago, and the inability to create a conforming programme because the fee structure necessary to compensate for such historical losses would foreclose use of the programme. Item (j) cannot be reasonably interpreted to require an examination of all activity since the beginning of a programme, no matter how old it may be. The data provided with respect to fiscal years 1994 and 1995 and for the programmes as a whole indicates that current premium rates are presently adequate to cover long-term operating costs and losses as currently projected. The United States is also in a net positive position with respect to cotton transactions in the ten years commencing with fiscal year 1993.

39. **The Export Credit Guarantee Programmes Are Not Applied in a Manner which Results in or which Threatens to Lead to, Circumvention of Export Subsidy Commitments**: Brazil has challenged the export credit guarantee programmes, GSM 102, GSM 103, and SCGP, as such. Brazil has failed, however, to demonstrate that these programmes as such mandate a violation of US WTO obligations. It is well established under GATT and WTO jurisprudence that legislation of a Member violates that Member's WTO obligations only if the legislation *mandates* action that is inconsistent with those obligations or precludes action that is consistent with those obligations. If the legislation provides discretion to administrative authorities to act in a WTO-consistent manner, the legislation, as such, does not violate a Member's WTO obligations. This distinction has continued under the WTO system.

40. The Commodity Credit Corporation ("CCC") has complete statutory and regulatory discretion at any time not to issue guarantees with respect to any individual application for an export credit guarantee or to suspend the issuance of export credit guarantees under any particular allocation. This is in marked contrast to the situation in *US- FSC*, in which the Appellate Body found a threat of circumvention because the FSC legislation created a legal entitlement to the payment. There is no statutory legal entitlement to an export credit guarantee. Furthermore, even if an application and fee are received, the applicant is not necessarily entitled to receive the guarantee. Issuance is discretionary.

41. Finally, Brazil has alleged that the United States has exceeded its quantitative export subsidy reduction commitments during the period July 2001-June 2002. Even if the export credit guarantee programmes were deemed export subsidies, the United States would be in compliance with the quantitative reduction commitments for that period with respect to wheat, coarse grains, butter and butter oil, skim milk powder, cheese, other milk products, bovine meat, live dairy cattle, and eggs. This may also be true with respect to vegetable oil. In fiscal year 2002, it would also be true for poultry meat. The United States did not use the GSM-102 or GSM-103 programmes during 2001-2002 with respect to butter and butter oil, skim milk powder, cheese, other milk products, or eggs.

42. **Financial Arrangements Analogous to the CCC Export Credit Guarantee Programmes are Available in the Marketplace**: In light of Article 10.2, it is neither appropriate nor necessary to analyze the export credit guarantees with respect to Article 1.1(b) of the SCM Agreement. However, we note that financing is available in the marketplace that is analogous to export credit guarantees. A prominent example in the commercial market would be "forfaiting." It would appear, then, that a competitive marketplace exists for trade financing even in emerging markets where more conventional financing is not available. The United States is not privy to the precise terms at any time available in forfaiting transactions because those terms can vary by country, commodity, bank risk, size of transaction and numerous other factors. In addition, like most private financial activity, that information is ordinarily held confidentially by the parties.

**The Step 2 Programme is not Contingent on Export Performance**

43. Brazil apparently does not contest that all uses of upland cotton are eligible for the Step 2 subsidy. Instead, Brazil suggests, erroneously, that not the entire universe of users of upland cotton is eligible for the subsidy. First, the requirement that a recipient must be "regularly engaged" in the use of cotton is simply an anti-fraud provision to preclude an attempt to receive a payment with respect to cotton on which a payment has already been made. Brazil also correctly notes that "the eligible domestic user criteria exclude all firms that are domestic cotton brokers or simple resellers". These parties are not using the cotton and are therefore ineligible. Brazil suggests a third category of persons who are users but are not eligible to receive the payment: "firms that have not entered into CCC contracts" as either manufacturers or exporters. It is true that CCC cannot pay parties that

choose to remain unknown to it, but this requires an assumption of economic irrationality and does not diminish the point that all who use cotton have it entirely within their power to receive the subsidy.

# ANNEX D-3

## BRAZIL'S COMMENTS ON US REBUTTAL SUBMISSION

27August 2003

1. Pursuant to the Panel's ruling of 23 August 2003, Brazil presents the following comments on the paragraphs listed below relating to the Rebuttal Submission of the United States of America. In addition, Brazil offers comments on Question 67a posed to the United States by the Panel's Communication of 25 August 2003.

**Paragraph 43**

2. In paragraph 43 of its Rebuttal Submission, the United States argues that "Brazil's reading would seemingly require a Member to make payments even if the recipient's production was illegal, for example the production of narcotic crops such as opium poppy or the production of unapproved biotech varieties or environmentally damaging production." The United States claims this would have "potentially far reaching results." This new argument has no merit.

3. The two examples provided by the United States involving the growing of illegal plants/crops are, by definition, situations in which a national (or state/regional) domestic criminal (or civil) law would prohibit or regulate the growing of such plants/crops. The criminal (or civil) law would operate separately from any de-coupled direct payment to prohibit or regulate all forms of such production. There would be no reason in that situation to have a further statute limiting the payment if such illegal plants (or illegal production methods) – the activity would already be illegal. That is exactly the case with the 1996 FAIR Act and the 2002 FSRI Act regarding PFC and direct payments respectively. Neither limits the amount of payments for the growing of plants that would be illegal under US law. There is no need to because US federal and/or State law already prohibits such activity.

4. In addition, the US example in paragraph 43 about a restriction on "environmentally damaging production" is not relevant because such a restriction does not relate to the "type" of production (*i.e.*, the type of crop) but rather the "manner" of production.[4] Therefore, Annex 2, paragraph 6(b), which focuses on the "type" of production related to the "amount" of payment, it does not address the manner in which production is conducted. The context of Annex 2, paragraph 6(b) includes Annex 2, paragraph 12 ("Payments under environmental programmes") which permits Members to impose specific conditions on the growing of crops in order to receive environmentally related direct payments.

5. Thus, the "potentially far-reaching results" [5] from Brazil's text-based approach to the ordinary meaning of "the amount of such payments" related to or based on the "type of production " do not and

[4] *See* First Submission of Brazil, para. 157 in which Brazil makes the distinction between Paragraph 6(b) in which the word "type" relating to the type of crop produced contrasted with Paragraph 6(d) which is concerned with the type of production process. The United States has never contested this distinction.

[5] The United States reference to "potentially far-reaching results" appears also to include its additional new argument in paragraph 43 relating to the EC's possible CAP reform imposing, *inter alia*, fruits and vegetable restrictions. That potential "reform" is obviously not at issue in this case. The EC will have to make a decision how to notify any such measure when it is required to do so under Article 18 of the Agreement on Agriculture. It goes without saying that an improperly categorized green box measure of one Member cannot be justified by relying on a possible future improperly categorized green box measure of another Member.

will not exist. Brazil further notes that in the extraordinary situation in which one Member could theoretically seek to challenge a de-coupled direct payment limiting payments for growing plants such as opium poppy as an actionable subsidy, the Member restricting the "type" of production of such plants could, for instance, assert defences under Article XX(b) or (d) of GATT 1994.[6]

**Paragraphs 96-98**

6. The United States raises the new argument that "no other WTO Member has notified crop insurance programmes as product-specific."[7] At the outset, Brazil notes that it is the US crop insurance programmes and the detailed record of the product-specific nature of the US crop insurance programmes that is at issue in this dispute – not those of other WTO Members.

7. None of the WTO notifications of the EC, Canada, or Japan cited by the United States reflect the existence of the type of special product-specific policies or special treatment for certain crops within a broader insurance programme. In particular, there is no indication that these Members provide any specific crop insurance provisions for a specific crop, such as the insurance programmes provided by the United States for upland cotton.[8] For example, while Canada appears to have a similar programme for "crops" as the United States, there is no indication that Canada provides special polices or groups of policies within its broader programme for individual crops. Thus, in contrast to the evidence of other Member's insurance policies, the *nature, type, value,* and *participation rate* of the crop insurance policies provided by the United States differs widely among commodities. As Brazil has explained, it is simply not a "one size fits all" programme. The EC agrees. It has argued before the Committee on Agriculture that the US crop insurance programme is product-specific support.[9]

8. The United States further argues that it "is not aware of any crop insurance programme maintained by any other Member" that covers as many commodities as the United States.[10] However, the Article 13(b)(ii) test is whether a specific commodity receives support from a domestic measure identified in the *chapeau* and whether there is some sort of a link between the support measure and the specific commodity. Evidence of such a link in the case of crop insurance exists, as with the US crop insurance programme, when particular commodities are provided special policies, coverage, or additional subsidies compared to other commodities covered by the crop insurance programme. There is no such evidence reflected in the notifications of Mexico whose notification states that "insurance premium subsidy [is] available for all producers."[11] Japan's "Agricultural Insurance Scheme" also includes subsidies for policies covering all crops (except vegetables), all livestock (except poultry) and sericulture.[12] By contrast, the US insurance programmes challenged by Brazil do not provide subsidies for any insurance for livestock or many other commodities. Indeed, the commodities *not* covered by the US 2000 ARP Act and relevant regulations represent more than half of the value of US farm cash receipts.[13]

---

[6] These same exceptions would be available in the unlikely event a Member challenged a direct de-coupled payment for any of the three scenarios posed by the United States in paragraph 43.

[7] Rebuttal Submission of the United States, para. 96-98.

[8] *See* Rebuttal Submission of Brazil, paras 54 (special irrigation-related policies for upland cotton), para. 55 (upland cotton producers have much larger pool of insurance subsidies than other types of crops), para. 56 (specific upland cotton income protection policies and catastrophic risk protection), para 57 (much greater use of insurance subsidies than other crops), para. 58 (reinsurance payments for upland cotton).

[9] Exhibit Bra-144 (G/AG/R/31, para. 31).

[10] Rebuttal Submission of the United States, para. 98.

[11] G/AG/N/MEX/7, p. 4.

[12] Rebuttal Submission of the United States, para. 98.

[13] Rebuttal Submission of Brazil, para. 59 (Excluded agricultural commodities from US insurance programme represent 52 per cent of the value of all US farm cash receipts).

9. Finally, as the United States recognizes, more than half of the notifications (which include part of Japan's) cited by the United States refer to insurance programmes as green box support.[14] Members so notifying are not obliged to make a determination under Article 6 of the Agreement on Agriculture whether such support is product-specific or not because it is exempt from any reduction commitments. The United States has not provided evidence suggesting these green box categorizations are incorrect. For these reasons, these notifications are also irrelevant.

**Paragraphs 114-117**

10. The United States argues for the first time in paragraphs 114-117 of its Rebuttal Submission that using the "price-gap" methodology is the appropriate way to calculate the portion of upland cotton AMS that stems from marketing loan gains, certificate exchange gains, and loan deficiency payments (collectively known as "marketing loan payments"). The effect of applying the price gap methodology would be to transform the $2.5 billion in budgetary expenditures for marketing loan payments in MY 2001 into a "negative" amount for purposes of total current AMS.[15] The United States bases its new argument on an alleged statement by Brazil and "agrees" that "Brazil is correct when it states that a non-exempt direct payment dependent on a price gap may be calculated using a price gap methodology, rather than budgetary outlays. . .."[16]

11. The United States refers to Brazil's 11 August Answer to Question 67, paragraph 130, as the basis for its assertion. Brazil's statement cited by the United States reads as follows:

> Brazil notes that the United States has notified the deficiency payments using the price gap methodology provided for in Annex 3. [footnote citing Exhibit Bra-150 (G/AG//N/USA/10)] Brazil considers it appropriate to follow the US decision and will therefore, calculate the amount of support to upland cotton provided by the deficiency payment programme by using the "price gap" approach detailed in Annex 3 paragraph 10 and 11.

Contrary to the US interpretation of this statement, Brazil's point was that any calculation of AMS for deficiency payments (and for the other programmes that require such calculation) must be consistent with the actual choice of methodology originally made by the United States for calculating its domestic support reduction commitments as well as its yearly current AMS notifications. Indeed, the United States' entire argument in paragraphs 114-117 of its Rebuttal Submission is based on the alleged obligation for Brazil "to be consistent."[17] As demonstrated below, it is Brazil's AMS calculation, not that of the United States, that is "consistent."

12. Members are required to notify annually their current total AMS to provide other Members the opportunity to review the consistency with their domestic support reduction commitments pursuant to Article 6.3 of the Agreement on Agriculture.[18] The total AMS reduction commitments were negotiated during the Uruguay Round based on a calculation of "total AMS" provided in marketing years 1986-1988. The initial AMS calculation used for the purposes of the reduction commitments was performed pursuant to Annex 3 of the Agreement on Agriculture with Members choosing either budgetary expenditures or a "price-gap" methodology expressed in total monetary terms. Like Article 13(b)(ii), the comparison between *current* total AMS and the AMS ceiling, *i.e.*,

[14] Rebuttal Submission of the United States, para. 97.

[15] The United States even claims credit for being conservative by not netting the negative support by the marketing loan benefits against the positive support provided by the other domestic support programmes, Rebuttal Submission of the United States, para. 116 and note 148.

[16] Rebuttal Submission of the United States, para. 114.

[17] Rebuttal Submission of the United States, para 114 (last sentence).

[18] *See* Article 18.2 of the Agreement on Agriculture and various US notifications cited herein.

the reduction commitment, must allow for an "apples to apples" annual comparison in accounting for the same measures. It follows that once a Member uses a budgetary approach for one measure to establish the AMS ceiling, it cannot use a price gap approach for that same measure in calculating total *current* AMS. Instead, a Member is required to report *current* total AMS consistently with the choice it made for that particular type of support in its *original* total AMS calculation.

13. This interpretation of Annex 3 and Article 6.3 of the Agreement on Agriculture is consistent with its context and object and purpose. Opting for a methodology that would permit Members to change their original methodology (*i.e.*, from budgetary to price-gap) could sanction what the United States proposes – the covering up of billions of dollars of marketing loan payments (originally calculated on a budgetary basis) and turns them into "negative support" by using a "price-gap" formula. This would be inconsistent with the entire reason for the reduction commitments of Article 6 of the Agreement on Agriculture.

14. Brazil's calculation of AMS for, *inter alia*, marketing loan payments followed the actual decision of the United States during the Uruguay Round[19] as reflected in its notifications.[20] During the Uruguay Round, the United States calculated the upland cotton portion of what would eventually become its domestic support reduction commitment by using the following methodologies: it used the price gap formula for upland cotton deficiency payments[21] and used budgetary outlays for all other domestic support measures.[22] In its MY 1995 notification to the Committee on Agriculture the United States similarly notified deficiency payments using the price-gap formula and using budgetary outlays for all other domestic support measures subject to reduction commitments[23] consistent with its AMS calculation during the Uruguay Round. After the termination of the deficiency payment programme in 1996, all later domestic support (current total AMS) notifications of the United States for upland cotton only use budgetary outlays. Thus, Brazil's approach to calculating upland cotton AMS for MY 1992 and 1999-2002 is entirely consistent with the US approach as evidenced in its domestic support notifications[24] and with the US obligations under the Agreement on Agriculture.

15. The United States accounted for the marketing loan payments in the same manner as in its notifications when it answered Question 67 in its 11 August submission.[25] This is, furthermore, the methodology the Panel indicated the United States should use – referring to the US notification of MY 1999 domestic support in G/AG/N/USA/43, in which the United States – in line with its obligation – used budgetary outlays.[26]

16. In sum, like many other US arguments in this phase of the dispute, this US argument is designed to cover-up expenditures and support to upland cotton that increased significantly since the US Uruguay Round commitments came into effect. Therefore, the Panel should reject it.

[19] Exhibit Bra-191 (G/AG/AGST/USA, p. 20)
[20] Exhibit Bra-150 (G/AG/N/USA/10, p. 18)
[21] Exhibit Bra-191 (G/AG/AGST/USA, p. 20 and supporting tables on p. 21-22).
[22] Exhibit Bra-191 (G/AG/AGST/USA, p. 20).
[23] Exhibit Bra-150 (G/AG/N/USA/10, p. 18).
[24] The United States entire argument in paragraphs 114-117 is premised on the alleged need for Brazil "to be consistent" as stated in the last sentence in paragraph 114. As noted, it is Brazil who has been consistent in using actual US notifications and the US calculation method during the Uruguay Round, not the United States who now seeks to ignore them.
[25] US 11 August Answer to Question 67, para. 128-134.
[26] Exhibit Bra-47 (G/AG/N/USA/43, p. 20).

**Paragraphs 124-127 and Exhibit US-24**

17. The United States presents an additional critique of Professor Sumner's analysis in Exhibit US-24 prepared by Dr. Joseph W. Glauber, the Deputy Chief Economists of USDA, as well as in paragraphs 124-127 of its Rebuttal Submission.

Marketing Loan Benefits

18. Dr. Glauber notes that the analysis of Professor Sumner did not include in the upland cotton acres eligible for marketing loans 447,164 acres of upland cotton planted on Flex acres from other programme crops.[27] Dr. Glauber is correct that any such acreage would be eligible for receiving marketing loan payments and therefore should be included in the calculation.[28] Dr. Glauber refers to "Acreage Reduction compliance reports" as his source of this number. Dr. Glauber does not provide a citation for these compliance reports and the United States has not made them available to Brazil. Therefore, Brazil cannot confirm the actual number of acres. Brazil also notes that the number listed is planted acres not harvested acres.[29]

19. Dr. Glauber further rests his finding that 100 per cent of US upland cotton production in MY 1992 benefited from marketing loan payments on his statement that upland cotton farmers "often" report land that had been planted and abandoned as land left idle and therefore never planted. No citation, authority or reference is provided for this assertion. The assumption in this assertion is that farmers report one thing to the US Federal Government, yet actually do something else. Thus, Dr. Glauber's presumption appears to be that farmers engage in what would appear to be widespread misrepresentation. Brazil does not know if such assumed large-scale misrepresentations were legal under the 1992 US programme, but it certainly contradicts "programme" expectations.

20. Professor Sumner concluded that 1.99 million acres used to produce upland cotton in MY 1992 were not eligible for the marketing loan payments because they did not participate in the deficiency programme. Dr. Glauber confirms Professor Sumner's general approach on non-participating acreage in footnote 1 on page 2 where he acknowledges that "some base building occurred during the early 1990's." What this means is that a substantial amount of upland cotton must have been planted outside the programme to accommodate expansion of upland cotton base by 200,000 acres in 1993, as identified by Dr. Glauber. This acknowledgement supports Professor Sumner's analysis that a significant amount of upland cotton must have been grown *outside* the deficiency programme. The basis for this analysis is as follows:

21. Under the rules existing in MY 1992, in order to "build" base a farm was required to plant all of its upland cotton outside the programme.[30] The expansion of upland cotton base is equal to one-

[27] Exhibit US-24, p. 1.

[28] Neither Brazil nor Professor Sumner were aware of any flex acres from other programme crops planted to upland cotton or of data concerning any such plantings.

[29] Dr. Glauber raises in the first sentence of paragraph 2 what he called "statistical problems in comparing planted acres to programme acres." He points out that "planted acres" information was collected and reported by NASS, while "programme acres" are reported by the Farm Service Agency. (In 1992 this part of USDA was known as the Agricultural Stabilization and Conservation Service.) Dr. Glauber goes on to explain that a significant amount of cotton acreage is planted and abandoned each year. But the relevance of this information in critiquing Professor Sumner's analysis remains unclear. Brazil notes that contrary to Dr. Glauber's assumption, Professor Sumner's calculations do *not* rely on data published by NASS, but instead on published information in the Farm Service Agency's "Fact Sheet: Upland Cotton" (Exhibit Bra-4). This Farm Service Agency source provides data on planted acres, the abandonment rate as well as harvested acres of upland cotton for MY 1992.

[30] Exhibit US-3 (7 CFR 1413.7(c)). ("[T]he crop acreage base shall be equal to the average of the acreage planted and considered planted to such crop for harvest on the farm in each of the 3 crop years

third of the amount of additional cotton acres planted in each of the previous three years. An acre of base is added if an additional acre of cotton is planted for three consecutive years.[31] In order to plant more than the current base, a farm was required to leave the programme *altogether* so that current base acres would also be planted outside the programme. For example, assume a farm had 1000 acres of upland cotton base and wanted to add – over the two-year period 1991-1992 – 200 acres of base by 1993. That farm would withdraw from the programme for those two years and plant 1300 acres of cotton (300 acres more than the previous base) in 1991 and 1992. The 1993 upland cotton base would than be calculated as follows: (1000 acres + 1300 acres + 1300 acres) / 3 equalling 1200 acres, thus 200 acres more than previously. Therefore, to add the 200,000 acres of base in 1993 (which Dr. Glauber stated were actually added) a much larger amount of upland cotton would have been required to be planted *outside* the programme in 1992. In addition to building of additional base, farmers planted upland cotton outside the programme because they did not comply with payment limit rules and for some more idiosyncratic reasons.

22. In summary, the evidence of an expanding base is consistent with the assessment of Professor Sumner that a substantial amount of acreage was planted to upland cotton outside the programme. This evidence is not consistent with Dr. Glauber's undocumented or unsubstantiated claim that *all* upland cotton harvested was eligible for marketing loans.

23. To summarize, if the Panel were to accept the undocumented assertion by Dr. Glauber that 447,164 acres of cotton were planted on flex acres from other programme crop base acreage, then there would be 1.54 million acres (1.99 million acres – 0.45 million acres) that were planted to upland cotton but were not eligible for marketing loan payments. This 1.54 million represents 12 per cent of planted acreage.[32] Thus, adjusting 52.35 cents per pound by 0.88 results in a support from the marketing loan programme of 46.1 cents per pound. This is an increase of 1.76 cents over the marketing loan level of support set forth in Appendix Table 1 to Professor Sumner's 22 July 2003 Statement.

Deficiency Payments

24. Brazil has already rebutted the US argument that it is inappropriate to adjust the support provided by the deficiency payment programme by non-participation and the resulting non-eligibility to receive payments.[33]

25. The various "decisions" in MY 1992 with respect to the deficiency payment programme were calculated to establish rules that encouraged some producers to forego eligibility of the programme. Furthermore, the record establishes that US policy makers had relatively precise prior knowledge of how many acres would remain out of the programme based on their policy choices on required land idling and loan rates.[34]

26. Dr. Glauber criticizes Professor Sumner for relying on a programme yield of 531 pounds per acre to calculate the ratio of payment yield to expected yield and states that the true programme yield

---

preceding such crop year"). For a farmer within the programme the acreage could never change, as all the acreage was planted (or if idled or – in case of flex acreage – if planted to other crop, it was "considered" planted to upland cotton). Thus, an increase of acreage could only take place, if a farmer withdrew from the programme and exceeded the planting limits imposed by the programme. Thus, MY 1992 base acreage is constitutes the 3-year average of acreage planted and considered planted in MY 1989-1991.

[31] Or of 3 additional acres are planted in the previous year, among other possible constellations.

[32] *Compare* Annex 2 to Exhibit Bra-105, p. 3.

[33] Brazil's 22 August Comment on Question 66, para. 81.

[34] Brazil's 22 August Comment on Question 66, para. 81.

in MY 1992 was 602 pounds per acre.[35] Dr. Glauber references a USDA press release that is not available to those outside the US government as his source of the payment yield information.[36] Assuming that the figure of 602 pounds per acre used by Dr. Glauber is correct, he incorrectly continues to rely on Professor Sumner's calculation of the expected yield by stating that the "expected yield based on an average of the upland cotton yields over the five preceding crop years is 601 pounds per acre." Professor Sumner estimated the payment yield based on actual yields per *planted* acre, whereas the payment yields that Dr. Glauber cites appears to be the approximate average yields per *harvested* acre. To achieve an apples-to-apples comparison, Brazil has re-calculated the expected yield for MY 1992 as the average yield per *harvested* acre during the 1990 to 1994 based on USDA's "Fact Sheet: Upland Cotton" (656.4 pounds per acre).[37] Thus, the relevant adjustment factor is not 1.002 as suggested by Dr. Glauber, but 0.917 (603 / 656.4).

27. Dr. Glauber offers no critique of Professor Sumner's analysis of the mandatory land idling cost component in the calculation of deficiency payment support. However, Dr. Glauber neglected to include these costs associated with the participation in the programme. As Professor Sumner explained, such costs are properly subtracted from the gross benefits of the cotton deficiency payment programme.

28. Brazil provides a revised calculation below, taking account of the revised yield adjustment factor of 0.917 – reflecting the deficiency payment yield as provided by Dr. Glauber's and the expected comparable yield for MY 1992 that Dr. Glauber erroneously did not correct. In addition, Brazil continues to deduct the cost figure calculated by Professor Sumner from the deficiency payment programme. The revised formula is as follows:

> Deficiency payment support = 20.55 cents per pound * 0.75 * 0.917 – 0.84 cents per pound = 13.29 cents per pound

Using the new payment yield and the new expected yield that is comparable to it, results in a 0.04 cents per pound upward adjustment to the 13.25 cents per pound presented by Professor Sumner in his 22 July Statement.

Other Payments

29. Brazil has already responded at length to Dr. Glauber's claims endorsing the arguments of the United States that PFC, market loss assistance, direct and CCP payments, as well as crop insurance payments are not "support to" upland cotton. Dr. Glauber's statement simply restates assertions in the legal briefs of the United States and offers no economic analysis to support his assertions.

30. Dr. Glauber asserts that it is relevant that Step 2 payments are not paid directly to producers.[38] As Brazil explains in its 11 August Answer to Question 18, a basic principle is that the effect of a subsidy is independent of who initially receives the subsidy.[39] That is the economic common sense behind the United States notifying Step 2 payments as product-specific support to upland cotton. And it is the basis for including such payments as "support to a specific commodity" "decided" by a

[35] Exhibit US-24, p. 3.

[36] The United States has not made this document available and thus we are unable to evaluate its applicability to the current situation. Professor Sumner had relied on the best information available to him and Brazil, which was the average upland cotton yield per planted acre during the reference period of MY 1981-1985.

[37] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

[38] Exhibit US-24, p. 3.

[39] Exhibit Bra-140 (Pindyck, Robert S. and Rubinfeld, Daniel L. , *Microeconomics*, 5th edition (2002), Prentice Hall, New Jersey, p. 313-317).

Member with respect to MY 1992. The text of Article 13(b)(ii) requires, under any methodology, the calculation of a level of support *to upland cotton*, not *to producers* of upland cotton.

31. Dr. Glauber's assertions about "double counting" are also incorrect. All the support programmes Dr. Glauber discusses (marketing loan payments, CCP payments and deficiency payments) have production and trade effects largely independent of Step 2 payments. But the purpose of calculating a rate of support under Article 13(b)(ii) is not to assess the *amount* of production, export, and price effects of the simultaneous application of all measures of support. Brazil will present an equilibrium analysis of the full economic effects of these support programmes simultaneously for Brazil's "Further Submission." Such an analysis is, however, not required for the purposes of calculating the rate of support under Article 13(b)(ii). The fact that the United States notified Step 2 as "product-specific" support indicates its position that the Step 2 programme provides additional support to upland cotton. This has certainly been the strongly held view of the US National Cotton Council.[40] Thus, it was appropriate for Professor Sumner to include this production and trade-distorting subsidy in the total rate of support.

32. Brazil notes that Dr. Glauber does not criticize any other calculation made by Professor Sumner. For the convenience of the Panel, Brazil reproduces the chart containing Professor Sumner's calculation as amended following the detailed US critique of Professor Sumner's methodology. As the Panel will note, the results do not materially change. The support granted by the United States in MY 1999-2002 exceeds the support decided in MY 1992. Thus, even under this methodology, the United States does not enjoy peace clause exemption from actions based on Articles 5 and 6 of the SCM Agreement or Article XVI:1 of GATT 1994.

**Paragraphs 135-146, and Exhibits US-25 through US-29**

33. Brazil has demonstrated that under the ordinary meaning of Article 10.2 of the Agreement on Agriculture, in its context and according to the object and purpose of Article 10 and the Agreement on Agriculture overall, export credit guarantees are subject to the general export subsidy disciplines contained in that Agreement.[41] Article 10.2 announces Members' intent to work toward negotiations

[40] Brazil Rebuttal Submission, para. 127.

[41] *See* Brazil Statement at the First Panel Meeting, paras. 100-115; Brazil 11 August Responses to Panel Questions 70 (para. 138); Brazil 22 August Rebuttal Submission, paras. 99-100; Brazil 22 August Comments on Answers to Panel Questions 74 (paras. 89-90), 80 (para. 98), 88(b) (paras. 117-119).

on specific disciplines for export credits. In the meantime, the general disciplines on export subsidies included in the Agreement on Agriculture apply to export credits, if those export credits constitute export subsidies.[42]

34. The United States asserts that Article 10.2 carves out export credit guarantees from the general export subsidy disciplines of the Agreement on Agriculture, including the anti-circumvention provisions of Article 10.1. The Appellate Body has, however, concluded that to exempt or carve-out particular categories of measures from general obligations such as the export subsidy obligations in the Agreement on Agriculture, the exemption or carve-out must be *explicit* in the text of an agreement.[43] Article 10.2 includes no such explicit carve-out or exemption. The negotiators knew how to make such an exemption or carve-out explicit, as evidenced by, for example, Article 13 of the Agreement on Agriculture, footnote 15 to Article 6.1(a) of the SCM Agreement, and the second paragraph of item (k) of the Illustrative List of Export Subsidies.[44]

35. In support of its interpretation, the United States appeals to "subsequent practice in the application of the treaty which establishes the agreement of the parties regarding its interpretation," within the meaning of Article 31(3)(b) of the *Vienna Convention*.[45] According to the United States, negotiations on agricultural export credit issues that have taken place in the OECD subsequent to the effective date of the WTO Agreement, and a statement by the OECD Secretariat, constitute "subsequent practice" establishing the agreement of WTO Members that Article 10.2 of the Agreement on Agriculture exempts export credits from any and all disciplines.

36. The United States is wrong. The United States has not established "a 'concordant, common and consistent' sequence of acts or pronouncements which is sufficient to establish a discernible pattern implying the agreement of the parties [to a treaty] regarding its interpretation," which is the standard adopted by the Appellate Body to establish "subsequent practice" under Article 31(3)(b) of the *Vienna Convention*.[46] It is evident from the positions taken by Canada, the European Communities and New Zealand in this dispute that *not even those WTO Members that participated in the OECD negotiations* agree with the United States' interpretation of Article 10.2.[47] Nor is there any evidence of "subsequent practice" signifying agreement on the United States' interpretation amongst the 136 WTO Members that did not participate in the OECD negotiations.

37. Brazil notes, moreover, that the WTO Secretariat, which is in a better position to address interpretations of the covered agreements than is the OECD Secretariat, does not appear to agree that

[42] Export credit guarantees are not *per se* subject to these disciplines, as they would be if they were included in Article 9.1 of the Agreement on Agriculture (*See e.g.*: Brazil's 22 August Comment, para. 97, New Zealand's Answer to Third Party Question 35, EC's Answers to Third Party Questions 35, para. 70). Brazil has demonstrated that the GSM 102, GSM 103 and SCGP programmes constitute export subsidies under Articles 1(e) and 10.1 of the Agreement on Agriculture, under Articles 1.1 and 3.1(a) of the SCM Agreement, and under item (j) of the Illustrative List of Export Subsidies annexed to the SCM Agreement.

agricultural export credits are exempt from the general export subsidy disciplines of the Agreement on Agriculture by virtue of Article 10.2.[48]

38. The United States also argues that the negotiating history of Articles 9.1 and 10.2 of the Agreement on Agriculture supports its argument that export credit guarantees are exempt from the general export subsidy disciplines of the Agreement on Agriculture. The United States raises three arguments in this regard.

39. *First*, the United States addresses the negotiating history of Article 9.1.[49]

40. In the DeZeeuw framework agreement, the United States points to paragraph 20(e), which contemplated Members providing "data on financial outlays or revenue foregone . . . in respect of export credits provided by governments or their agencies on less than fully commercial terms."[50] The United States apparently considers that since paragraph 20(e) was not carried over into the Agreement on Agriculture, export credits are not subject to the export subsidy disciplines in the Agreement.

41. Brazil notes, however, that paragraph 20(g) addressed "export performance-related taxation concessions or incentives." This provision was also not carried over into the Agreement on Agriculture. Nonetheless, panels and the Appellate Body have ruled that export performance-related taxation concessions or incentives like the United States' FSC and ETI measures are subject to the general export subsidy disciplines of the Agreement on Agriculture, including Article 10.1.

42. Similarly, the United States points to Addendum 10 of Chairman Dunkel's Note on Options, which includes an illustrative list of export subsidy practices.[51] A number of the items on that illustrative list were eventually included, with modifications, in Article 9.1 of the Agreement on Agriculture.[52] Others were not, including item (h), which refers to "[e]xport credits provided by governments or their agencies on less than fully commercial terms," and item (i), which refers to "[s]ubsidized export credit guarantees or insurance programmes." The United States apparently considers that since items (h) and (i) were not carried over into the Agreement on Agriculture, export credits, including export credit guarantees and insurance programmes, are not subject to the export subsidy disciplines in the Agreement.

43. Brazil notes, however, that item (g) of Chairman Dunkel's illustrative list refers to "[e]xport performance-related taxation concessions or incentives other than the remission of indirect taxes." This provision was also not carried over in Article 9.1 of the Agreement on Agriculture. Nonetheless, as Brazil has already noted, panels and the Appellate Body have ruled that export performance-related taxation concessions or incentives like the United States' FSC and ETI measures are subject to the general export subsidy disciplines of the Agreement on Agriculture, including Article 10.1.

44. Brazil assumes that the United States simply overlooked paragraph 20(g) of the DeZeeuw framework agreement and item (g) from Chairman Dunkel's illustrative list when it states, in paragraph 143 of its Rebuttal Submission, that

[48] G/AG/NG/S/13 (26 June 2000), para. 44 ("[A]s matters currently stand the only rules and disciplines on agricultural export credits are those of the Agreement on Agriculture but only to the extent that such measures constitute export subsidies for the purposes of the Agreement on Agriculture.").

[49] Rebuttal Submission of the United States, paras. 136-138.

[50] *See* Exhibit US-25.

[51] Exhibit US-27.

[52] Paragraph 48(a) corresponds to Article 9.1(a), paragraph 48(e) to Article 9.1(e), paragraph 48(f) to Article 9.1(d), paragraph 48(j) to Article 9.1(f), paragraph 48(k) to Article 9.1(c).

> the negotiating history reveals that the Members very early specifically included export credits and export credit guarantees as a subject for negotiation and specifically elected *not* to include such practices among export subsidies. In contrast, the negotiating history reveals no comparable discussion involving FSC.

45. In light of these facts, it is evident that the negotiating history of Article 9.1 does not offer support for the United States' argument that export credit guarantees are exempt from the general export subsidy disciplines of the Agreement on Agriculture.

46. *Second*, the United States argues that changes introduced to the text of Article 10.2 between the Draft Final Act and the final version of the Agreement on Agriculture mean that export credits are not subject to the export subsidy disciplines included in the Agreement.[53]

47. The version of Article 10.2 included by negotiators in the Draft Final Act read as follows:

> Participants undertake not to provide export credits, export credit guarantees or insurance programmes otherwise than in conformity with internationally agreed disciplines.

The United States argues that this version of Article 10.2 "would clearly prohibit the use of export credit guarantees except in conformity with [internationally] agreed disciplines," which it asserts "would include those contemplated by the SCM Agreement."[54]

48. The version of Article 10.2 included in the Agreement on Agriculture reads as follows:

> Members undertake to work toward the development of internationally agreed disciplines to govern the provision of export credits, export credit guarantees or insurance programmes and, after agreement on such disciplines, to provide export credits, export credit guarantees or insurance programmes only in conformity therewith.

The United States argues that having changed the draft, "[t]he Members clearly subsequently decided *not* to condition the use of export credit guarantees on conformity with the export subsidy disciplines of the Agreement on Agriculture or the SCM Agreement."[55]

49. The United States' interpretation of the negotiating history requires the Panel to accept that the version of Article 10.2 included in the Draft Final Act would have imposed a *greater burden* on Members than does the version of Article 10.2 ultimately included in the Agreement on Agriculture. In fact, however, Article 10.2 of the Draft Final Act was amended to make it clear that negotiators expected Members actually *to pursue* negotiations on specific disciplines. Whereas the version of Article 10.2 included in the Draft Final Act did not include an undertaking to pursue those negotiations, the final version of Article 10.2 does include such an undertaking. The amendment did not *relieve* the Members of any burden, but instead *increased* the burden.

50. At least some Members understood this to be the case, since soon after the conclusion of the Uruguay Round, they launched negotiations in the OECD on specific export credit disciplines.[56] The

[53] Rebuttal Submission of the United States, paras. 140-142.
[54] Rebuttal Submission of the United States, para. 140.
[55] Rebuttal Submission of the United States, para. 141.
[56] The United States' assertion that the phrase "internationally agreed disciplines" in Article 10.2 of the Draft Final Act referred to those disciplines "contemplated by the SCM Agreement of the Draft Final Act" is not credible. Where negotiators meant to refer to pending WTO agreements outside of the draft Agreement on

United States implies that Brazil's "admission" that those negotiations have not yet resulted in agreement on specific disciplines for export credits is fatal to its claims. Brazil has demonstrated elsewhere, however, that while those negotiations are pending, nothing in Article 10.2 (or Article 1(e)) exempts export credits from the general disciplines on export subsidies included in, for example, Article 10.1 of the Agreement on Agriculture. If export credits constitute export subsidies, they are subject to those disciplines. As noted above, the Appellate Body has concluded that to exempt particular categories of measures from general obligations such as Article 10.1, the exemption must be explicit.[57] The negotiators knew how to make exemptions explicit, but did not do so in the case of export credits.[58]

51. *Third*, the United States argues that "Brazil's interpretation would require export credit guarantees in agriculture to be subject to more disciplines than any other practice addressed in the Agreement on Agriculture," since "not only would export credit guarantees constitute export subsidies and be subject to all of the export subsidy disciplines, but Member's [sic] would also be specifically obligated to work toward and then apply *additional* disciplines."[59] This statement is incorrect for several reasons:

- As clarified by Brazil, New Zealand and the European Communities, since export credits are not included in Article 9.1, they do not necessarily "constitute export subsidies."[60] They only constitute export subsidies if they are financial contributions that confer benefits and are contingent on export, or if they satisfy the elements of one of the items on the Illustrative List of Export Subsidies annexed to the SCM Agreement.

- Export credits are only "subject to all of the export subsidy disciplines" of the Agreement on Agriculture if they lead to circumvention of a Member's export subsidy reduction commitments.

- It is not clear that any specific disciplines resulting from negotiations undertaken pursuant to Article 10.2 will be "additional" to those already included in the Agreement on Agriculture or the SCM Agreement. Those negotiations are not yet completed. Depending on the agreement negotiated, it is presumably possible that the resulting text could replace the disciplines included in the Agreement on Agriculture.

52. Therefore, the United States' argument is inaccurate, and does not support its assertion that export credit guarantees are exempt from the general export subsidy disciplines in the Agreement on Agriculture, even if they meet the definition of "export subsidy."

---

Agriculture, they cited those WTO agreements by name. For example, Article 5.8 of the Draft Final Act (regarding special agricultural safeguards) refers specifically to the GATT and the Safeguards Agreement. Similarly, the final version of Article 13 of the Agreement on Agriculture includes numerous specific citations to the SCM Agreement.

[58] *See, e.g.*, Article 13 of the Agreement on Agriculture, footnote 15 to Article 6.1(a) of the SCM Agreement, and the second paragraph of item (k) of the Illustrative List of Export Subsidies.

[59] Rebuttal Submission of the United States, para. 142.

[60] *See e.g.*: Brazil's 22 August Comment, para. 97, New Zealand's Answer to Third Party Question 35, EC's Answers to Third Party Questions 35, para. 70.

**Paragraphs 147-152**

53. The United States argues that it did not include the quantities exported under the CCC programmes in its calculation of average export subsidies during 1986-1990 (the base period from which export subsidy reduction commitments were calculated during the Uruguay Round)[61] because it did not consider that CCC export credit guarantees are export subsidies subject to reduction commitments.[62] According to the United States, subjecting export credit guarantee programmes to export subsidy reduction commitments in the Agreement on Agriculture would therefore lead to "gross injustice."[63]

54. This is not the logical conclusion to be drawn, however. It appears that during the Uruguay Round negotiations the United States took the same position as it has taken in this dispute – that CCC export credit guarantee programmes do not constitute export subsidies within the meaning of item (j) and Articles 1.1 and 3.1(a) of the SCM Agreement and that CCC export credit guarantees are, therefore, not subject to the general export subsidy disciplines included in the Agreement on Agriculture.[64] The United States did not feel compelled to include the CCC export credit guarantees in its calculation of export subsidy reduction commitments because it did not consider that they constituted export subsidies under those provisions. Brazil agrees that not all export credit guarantees are export subsidies and that, therefore, not all export credit guarantees are subject to export subsidy reduction commitments. However, if those guarantees meet the criteria of item (j) or constitute subsidies contingent upon export performance under Articles 1.1 and 3.1(a) of the SCM Agreement, they are export subsidies.[65] (Brazil has demonstrated that the GSM 102, GSM 103 and SCGP programmes are export subsidies. It follows that GSM 102, GSM 103 and SCGP are subject to reduction commitments and, in fact, circumvent or threaten to circumvent the US export subsidy commitments.)

**Paragraphs 156-157, 160-162 and Exhibits US-31 and US-32**

55. The United States argues that it would not give an accurate picture to compare the reestimates made in any given year (and recorded in the US budget) with the cohort-specific subsidy estimates for guarantees disbursed in that year. Specifically, the United States argues that "upward reestimates and downward reestimates reflected in a single budget cannot necessarily be applied against each other for a notional 'net reestimate.'"[66] Brazil has never argued otherwise. In the chart included in paragraph 115 of its 22 August Rebuttal Submission, Brazil compares *cohort-specific* original subsidy estimates to *cohort-specific* reestimates, cumulated over the period 1992-2002, to give a picture of the long-term operating costs and losses of the "programmes," as required by item (j) (rather than costs and losses for a particular cohort). The United States itself uses this same method (albeit with different data) in paragraph 161 of its 22 August Rebuttal Submission.

56. With respect to FCRA-related data, it would in fact only be inappropriate to attempt to tie a cohort-specific subsidy estimate for one year to fiscal year, non-cohort-specific reestimates recorded in the budget for any one year. Brazil has never made this comparison. As the United States notes,

[61] Rebuttal Submission of the Untied States, para. 148.
[62] Rebuttal Submission of the United States, para. 149.
[63] Rebuttal Submission of the United States, paras. 147-153, *see* the heading to that section.
[64] Rebuttal Submission of the United States, para. 151. The arguments of the United States in this case demonstrate that it continues to be of the view that its programmes do not constitute export subsidies within the meaning of Articles 1.1 and 3.1(a), including item (j) of the SCM Agreement, nor within the meaning of Articles 1(e), 10.1 and 8 of the Agreement on Agriculture.
[65] Brazil's 22 August Comment on Question 80, para. 98. *See* also EC's 11 August Answer to Third Party Question 30, para. 65. New Zealand's 11 August Answer to Third Party Question 35.
[66] Rebuttal Submission of the United States, para. 160.

this would be inappropriate because reestimates recorded in the budget as made in a year do not necessarily relate to subsidy estimates for guarantees disbursed in that year. If the data is presented cumulatively over a period constituting the long term, however, and does not purport to *tie* cohort-specific subsidy estimates to fiscal year, non-cohort-specific reestimates recorded in the budget for any one year, a comparison is perfectly acceptable. Specifically, comparing the cumulative subsidy estimates to the cumulative reestimates shows whether the "programme" is loss-making or profit-generating over the long term. Making a comparison of the cumulative figures does not require that the estimates and reestimates recorded in the budget for any year correspond.

57. For example, this approach can be applied to the data included in Exhibit US-31 to the United States' 22 August Rebuttal Submission. The "subsidy" column included in Exhibit US-31 lists the subsidy estimate from the "prior year" column of the US budget for each cohort during the period 1992-2003. Subtracting cumulative annual downward reestimates from and adding cumulative annual upward reestimates to the cumulative original subsidy amount *yields a positive subsidy of $500 million*.[67] Adding administrative expenses over the period 1992-2003 increases this amount by a further $43 million.[68] Taking the data provided by the United States in Exhibit US-31 at face value demonstrates that the CCC guarantee programmes are losing money. This result is not tainted by the "apples-to-oranges" criticism levied in paragraph 160 of the United States' 22 August Rebuttal Submission.

58. Nor does Brazil's treatment of the data included in the chart at paragraph 165 of its 11 August Answers to Questions suffer from an "apples-to-oranges comparison" between fiscal year and cohort-specific data, as the United States alleges at paragraph 160 of its 22 August Rebuttal Submission. The chart at paragraph 165 is wholly unrelated to the FCRA cost formula. It tracks the results of a formula Brazil has constructed to verify, by alternative means, that long-term operating costs and losses for the CCC export guarantee programmes outpace premiums collected. The data in that chart are not FCRA-related subsidy estimates that are recorded on a cohort basis or that are subject to reestimates mandated by the FCRA. Instead, the left-hand column of that chart records revenue collected on a fiscal year (not a cohort-specific) basis, and the right-hand column of that chart records costs incurred on a fiscal year (not a cohort-specific) basis. Over the period 1993-2002, total revenue in the left-hand column is significantly less than total costs in the right-hand column. This entails no "apples-to-oranges comparison," and demonstrates that the CCC export guarantee programmes constitute export subsidies under item (j) of the Illustrative List of Export Subsidies.

59. In the chart included at paragraph 161 of its 22 August Rebuttal Submission, the United States nets cumulative reestimates on a cohort basis against the original, cohort-specific subsidy estimate from the US budget. There are some factual problems with the US data.[69]

---

[67] (2,737 – 297) – (2,629 + 870) + (1,262 + 297) = 500. Since no reestimates have yet been made for 2004, Brazil has reduced the original subsidy amount included in Exhibit US-31 by the $297 million estimate included in the 2004 budget. Had the United States subtracted downward reestimates from and added upward reestimates to the *original* subsidy estimate included in the "budget year" column of the "guaranteed loan subsidy" line of the annual US budget, it would have yielded a positive subsidy, and thus a loss, of $2.038 billion. *See* Exhibit Bra-192.

[68] *See* paragraph 132 of Brazil's 22 July Statement at the First Panel Meeting, and accompanying citations.

[69] First, the United States has offered no documentation verifying the accuracy of the reestimate figures provided in the chart for the period 1993-2000. In contrast, the chart included in paragraph 115 of Brazil's 22 August Rebuttal Submission provides cumulative reestimates on a cohort basis that are taken directly from Table 8 of the Federal Credit Supplement included with the 2004 US budget. *See* Exhibit Bra-182. Second, although the United States asserts that it has netted cumulative reestimates against the "*original* subsidy estimate," it has in fact netted cumulative reestimates against the "guaranteed loan subsidy" figure included in the "*prior year*" column of the US budget, which yields a lower number. Using, subsidy data from the US budget for "prior year," the chart included at paragraph 115 of Brazil's 22 August Rebuttal Submission would

Resolving these problems is not particularly important, however, since the chart included at paragraph 161 of the United States' 22 August Rebuttal Submission itself shows a cumulative positive subsidy for the programmes of over $381 million for the period 1992-2002.[70] This positive subsidy is consistent with CCC's 2002 financial statements, which provide a cumulative, running tally of the subsidy figure for all post-1991 CCC export credit guarantees in the amount of $411 million.[71] The CCC export guarantee programmes have lost money over the period 1992-2002.

60. The United States' point seems to be that because subsidy reestimates are generally downward, the CCC programmes generate profits over the long term. However, all this means is that CCC's original estimates were too high.[72] The real test is the result when cohort-specific reestimates are netted against the original subsidy estimates for each cohort and cumulated over a period constituting the long term, so that the long-term costs and losses of the programmes can be determined, as required by item (j). Netting reestimates against original subsidy estimates on a cohort-specific basis yields a positive subsidy, revealing that over the long term, the CCC is losing money with its export guarantee programmes. This result is obtained whether the Panel accepts the chart at paragraph 161 of the United States' 22 August Rebuttal Submission, the chart at paragraph 115 of Brazil's 22 August Rebuttal Submission,[73] or the cumulative subsidy figure included in CCC's 2002 financial statements.[74]

61. The United States may be suggesting that reestimates will always, eventually, result in negative subsidies and profits. The data shows that this is not the case, however. Netting reestimates against original subsidy estimates does not consistently yield a negative subsidy, or profits, on a cohort basis. The charts included at paragraph 161 of the United States' 22 August Rebuttal Submission and at paragraph 115 of Brazil's 22 August Rebuttal Submission demonstrate this. Nor is it even relevant to focus on the results of individual cohorts, since item (j) require an analysis of the "long-term" costs and losses of export guarantee "programmes," rather than cohorts. That is why Brazil, and presumably the United States, has calculated cumulative results for the charts included at

---

still yield a positive subsidy of $211 million, to which the $43 million in administrative expenses should be added, for a total loss of $254 million over the period 1992-2002. *See* Exhibit Bra-193. Third, the United States has not included administrative expenses for the CCC export guarantee programmes, which amount to $43 million for the period 1992-2003.

[70] Even accepting the validity of the data entered in the US chart, Brazil notes that summing up those figures yields a result different from the $381.35 million total provided by the United States. Using the US data, Brazil reaches a subsidy figure net of reestimates of $230,127,023.

[71] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 19).

[72] Brazil notes that according to USDA's Inspector General, CCC estimates are in fact *understated*. In audit reports for fiscal years 1999, 2000 and 2001, CCC's estimates and reestimates were found to have "understated" costs and losses by amounts ranging from to $11 million to $430 million. Exhibit Bra-194 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report, Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC, February 2002, p. 11); Exhibit Bra-195 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report, Audit Report No. 06401-14-FM, Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, June 2001, p. 9); Exhibit Bra-196 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report, US Department of Agriculture Consolidated Financial Statements for Fiscal Year 1999, Report No. 50401-35-FM, February 2000, p. 9).

[73] Again, using "prior year" subsidy figures for this chart results in a positive subsidy of $211 million over the period 1992-2002. *See* Exhibit Bra-193 (Net Lifetime Reestimates of Guaranteed Loan Subsidy by Cohort)

[74] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 19).

paragraph 161 of the United States' 22 August Rebuttal Submission and at paragraph 115 of Brazil's 22 August Rebuttal Submission.

62. In any event, if CCC considered that it would eventually make money on its guarantees on a cohort basis, why does it continue to offer original estimates that are so high? While some factors included in the estimation process are dictated by the FCRA and the US Office of Management and Budget, the original subsidy estimate is primarily driven by CCC's historical experience with its guarantees. Brazil has elsewhere noted that according to the US Federal Accounting Standards Advisory Board, the Government-Wide Audited Financial Statements Task Force on Credit Reform, the Office of Management and Budget and the Department of Agriculture itself, "[m]ethods of estimating future cash flows for existing credit programmes need to take account of past experience,"[75] "[a]ctual historical experience of the performance of a risk category is a *primary factor* upon which an estimation of default cost is based,"[76] and technical assumptions underlying subsidy calculations reflect "historical cash reports and loan performance."[77] If historical experience dictated that CCC would consistently make profits, CCC would reflect that historical experience in its subsidy estimates. Actual historical experience is, after all, a "primary factor" on which those estimates are based. That CCC continues to provide significant positive original subsidy estimates demonstrates that its actual historical experience does *not* suggest that it will make money on its loan guarantees. Since those estimates are calculated and recorded on a *net present value basis*, CCC apparently continues to consider that it will incur significant net costs at the time the cohorts are closed.

63. CCC's apparent views regarding its historical experience with the export guarantee programmes are justified. Evidence regarding CCC's actual historical experience confirms that the long-term operating costs and losses for the CCC guarantee programmes outpace premiums collected. At paragraph 109 of its 22 August Rebuttal Submission, Brazil summarizes this evidence.[78] Although, the United States implies at paragraph 172 of its 22 August Rebuttal Submission that Brazil's evidence is all "between 10 and 20 years" old, a cursory review of the evidence, which includes data from the 2004 US budget and CCC's 2002 financial statements proves otherwise. Therefore, even if the Panel agrees with the United States' conclusion, at paragraph 162 of its 22 August Rebuttal Submission, that the FCRA cost formula is not an ideal way to determine the costs of the CCC export guarantee programmes, Brazil has established by alternative means that CCC premiums fail to meet the long-term operating costs and losses of the programmes.

---

[75] Exhibit Bra-162 (Government-Wide Audited Financial Statements Task Force on Credit Reform, ISSUE PAPER, *Model Credit Programme methods and Documentation for Estimating Subsidy Rates and the Model Information Store*, 96-CR-7 (1 May 1996), p. 2).

[77] Exhibit Bra-163 (Office of Management and Budget Annual Training, Introduction to Federal Credit Budgeting, 24 June 2002, p. 9).

[78] Contrary to the United States' assertion at paragraph 170 of its Rebuttal Submission, Brazil has not misread Note 5 to CCC's 2002 financial statements. The amounts in the "subsidy allowance" column are in fact the amounts of receivables associated with post-1991 CCC guarantees that CCC considers uncollectible. The Panel will recall that under the FCRA, the subsidy allowance is recorded on a net present value basis, which means that it represents the cost CCC considers it will incur on a guarantee cohort at the time that cohorts is closed. The $770 million listed in the "subsidy allowance" column in the receivables table for post-1991 guarantees is therefore as uncollectible as the $ 2,567 billion listed in the "uncollectible" column of the pre-1992 CCC guarantee receivables table (*See* Notes to Financial Statements contained in Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, Commodity Credit Corporation's Financial Statements for Fiscal Year 2002, Audit Report N° 06401-15-FM (December 2002) p. 14).

**Paragraph 169 and Exhibit US-33**

64. The United States has asserted that there are no "arrearages" with respect to debt reschedulings.[79] Brazil has two comments. First, the United States does not state the source of the data it included at Exhibit US-33. Second, Brazil maintains that it is not appropriate to treat rescheduled debt as recoveries.[80] The US assumption that there will be no arrearages not only ignores the cost of rescheduling but also the fact that there may be further defaults on rescheduled debt.[81] Although rescheduled debt is treated as a receivable, CCC acknowledges in its financial statements that not all receivables are deemed collectible.[82] Moreover, Brazil presumes that rescheduled debt is subject to the FCRA estimation or reestimation process, which involves calculations of net present value of what the CCC expects to lose (or gain) on the rescheduled debt. The CCC does not assume that all rescheduled debt will be collected.

**Paragraphs 172, 174-175**

65. The United States has argued that Brazil improperly relies on CCC losses incurred *via* Iraqi and Polish defaults. The United States implies that these defaults occurred between 10 and 20 years ago.[83] This is incorrect. The US General Accounting Office ("GAO") reports that the losses in Iraq occurred over the period 1990-1997.[84] (The United States makes no specific challenge to the $2 billion in Polish defaults.) Thus, defaults and losses did not occur as long ago as the United States suggests.

66. Moreover, the United States argues that the Panel should only look into the question whether "*current*" premium rates are adequate to cover the long-term operating costs and losses of the programmes.[85] The United States relies on a "present tense" argument to exclude major defaults in Iraq and Poland that occurred in the recent past. Even if the Panel only looks to "current" premiums, item (j) calls for an analysis of "long-term" operating costs and losses.[86] The United States apparently agrees, since it looks to the performance of the CCC programmes in such years as 1994 and 1995 (a time period even longer ago than part of the defaults in Iraq[87]) to claim that premium rates charged were adequate to meet costs,[88]

67. If the United States believes that it is only appropriate to look at *current* premiums, given the present tense of the term "are" in item (j), then the FCRA cost formula is useful. The FCRA cost formula measures the *net present value* "of the following cash flows: (i) payments by the Government

[79] Rebuttal Submission of the United States, para 169.

. . . and (ii) payments to the Government" of guarantees at the time they are disbursed.[89] In other words, it measures the amount CCC expects today to lose (or gain) on a guarantee cohort at the time the cohort is closed tomorrow. Even if this involves some estimates, the United States has noted that those estimates are acceptable.[90] In fact, the US budget for fiscal year 2004 demonstrates that current premiums paid for guarantees disbursed in fiscal years 2002-2004 will generate losses worth hundreds of million of dollars.[91] Thus, current premiums are inadequate to cover the long-term operating costs and losses of the CCC export credit guarantee programmes. These programmes constitute export subsidies.

**Paragraphs 186-191 and Exhibits US-34 through US-37**

68. Brazil has argued that since CCC export credit guarantees from the GSM 102, GSM 103 and SCGP programmes are unique financial instruments for agricultural commodity transactions that are not available on the commercial market – certainly not for terms longer than the marketing cycles of the eligible commodities – they confer "benefits" within the meaning of Article 1.1(b) of the SCM Agreement.[92] The United States asserts that "financing is available in the marketplace that is analogous to the export credit guarantee programmes" – namely, forfaiting.[93]

69. The United States' assertion should be rejected. As discussed below, the two instruments are not "analogous," and are, in fact, different.

70. Brazil begins with a very rough sketch of the role a forfait can play in a typical transaction involving agricultural commodities. In a typical transaction, an importer will issue a promissory note to an exporter for the agreed price. The exporter will generally demand that the note be backed by a guarantee (or an aval) from the importer's bank and/or, as the United States points out in paragraph 187 of its 22 August Rebuttal Submission, by a guarantee from the importer's government export credit agency.

71. A forfait comes into play because, while both the exporter and the importer want the transaction to occur, they have different interests. The exporter wants to get paid immediately on a cash basis, and the importer wants credit that it can repay on a deferred basis. Even with a guarantee from the importer's bank or a government export credit agency, the exporter bears responsibility for collecting the receivables (in the absence of default). A forfaiter (which could be the exporter's own bank) will step in and purchase the promissory note at a discount to face value, without recourse to the exporter.[94] The exporter will receive payment immediately from the forfaiter. The forfait essentially enables the exporter to convert a credit sale into a cash sale.

72. A forfaiter will generally demand that the importer's obligation is backed by a guarantee from a bank or the importer's government export credit agency.[95] Rather than *substituting* for a guarantee,

[95] United Rebuttal Submission of the United States, para. 187. *See also* Exhibit Bra-198 (Vincent Whittaker, "The Quick Buck, International Finance, and Forfaiting," 23 *Thomas Jefferson Law Review* 249, 258 (Spring 2001) ("In most cases, the forfaiter requires the obligation of the importer to be guaranteed by a bank in the importer's country because of the impossibility of evaluating the credit risk of every importer in

therefore, guarantees and forfaiting are *complementary* instruments. For this reason alone, the US assertion that the two instruments are analogous is incorrect.

73. There are other differences between the two instruments. The importer realizes a tangible and extremely valuable benefit from a CCC guarantee; namely, the bank prices financing to the importer based on the credit rating of the United States, rather than the credit rating of the importer itself. Importantly, the CCC guarantee allows the importer to secure financing in the first place. As the regulations for the GSM and SCGP programmes state, the programmes operate in cases where banks "would be unwilling to provide financing without CCC's guarantee."[96] Forfaiting helps an exporter accept deferred payment terms for the importer, but does not otherwise beneficially affect the price for the financing secured by the importer. Nor would a bank require that forfaiting be involved in a transaction as a prerequisite for it to provide financing to the importer.

74. As a further distinction between the two instruments, while there is a secondary forfaiting market,[97] there is no secondary market for CCC guarantees.[98] Purchasers in the secondary market for forfaiting instruments assume that forfaited promissory notes will yield more at maturity than the purchaser paid for them in the secondary market.[99] Since no secondary market exists for CCC guarantees, apparently no such assumption can be made with respect to CCC guarantees (which itself reveals much about the quality of those guarantees).

75. Most importantly, the pricing for forfaiting instruments is substantially different than pricing for CCC guarantees. As noted above, a forfaiter purchases an exporter's trade receivables at a discount to face value. The discount rate and associated commitment fees are driven by the risks involved – country risk, political risk, currency risk, entity risk (essentially, the risk of the guarantor), etc., and by the length of the underlying credit.[100]

76. Brazil has attached as Exhibit Bra-199 a list of indicative forfaiting rates that vary greatly from market to market.[101] In contrast, the United States has confirmed that country risk "has no impact on the premiums payable" under the GSM 102, GSM 103 and SCGP programmes.[102] Brazil provided the Panel with evidence documenting that GSM and SCGP fees were the same whether guarantees were for transactions with the Dominican Republic, Ghana, Japan, South Korea or Vietnam (among others).[103]

77. Moreover, the *very lowest rate* in the forfaiting rate list included in Exhibit Bra-199 is 1.6638 per cent (6-month tenor). The rates for GSM 102 and GSM 103 guarantees are prohibited by law from being greater than 1 per cent,[104] and are currently (as they have been at least since 1994)[105]

no greater than 0.663 per cent for GSM 102 (36-month tenor)[106] and 0.05 per cent for GSM 103 (120-month tenor).[107]

78. Furthermore, although the United States' assertion that the tenor of forfaiting instruments can range from six months to 10 years is accurate, forfaiting instruments *for agricultural commodities* will not exceed tenors of 360 days, or in other words will not exceed a tenor "matching the typical period of consumption of most commodities."[108] This is consistent with Brazil's statement that commercial financing for exports of agricultural goods that exceeds the marketing cycles of the agricultural good is not available on the marketplace.[109]

79. Under Article 10.3 of the Agreement on Agriculture, the United States bears the burden of demonstrating that no export subsidies have been granted in respect of quantities of agricultural commodities exported in excess of its reduction commitments.[110] Although it is not its burden to do so, Brazil has demonstrated that CCC export credit guarantees are financial contributions that confer benefits and are contingent on export, within the meaning of Articles 1.1 and 3.1(a) of the SCM Agreement. With respect to "benefit," CCC regulations concerning the GSM and SCGP programmes demonstrate that the programmes grant better-than-market terms *per se*.[111] Brazil has also demonstrated that CCC export credit guarantees confer benefits *per se* since they are unique financial instruments for agricultural commodity transactions that are not available on the commercial market – and certainly not for terms longer than the marketing cycles of the eligible commodities.

80. The United States has not established that forfaiting is analogous to CCC export credit guarantees. Even if it had done so, and the market terms for forfaiting instruments could theoretically serve as a benchmark against which to judge whether CCC export credit guarantees confer "benefits," the United States has not: (i) established the terms on which forfaiting is provided on the market; or, (ii) demonstrated that CCC export credit guarantees do not provide terms better than those provided for forfaiting instruments. The United States acknowledges, at paragraph 191 of its 22 August Rebuttal Submission, that it has not provided market terms for forfaiting instruments that could serve as a benchmark. Thus, the United States has not met its burden under Article 10.3 of the Agreement on Agriculture.

**Brazil's Comment on Question 67a posed by Panel to the United States**

81. While Brazil obviously does not know how the United States will ultimately respond, Brazil offers the following information supporting Brazil's calculations of the amounts provided to these four crops as "support to upland cotton."

82. First, to the extent that the United States criticizes Brazil's calculations made to determine the different per acre payments for direct payment and CCP crops in paragraph 42 of its Rebuttal Submission, Brazil notes that these calculations are confirmed by the Food Agricultural Policy Research Institute at the University of Missouri (FAPRI).[112] As Brazil further notes that the FAPRI

The information on CCP and direct payment per acre payments in US dollars for each of the programme crops is found in the last two lines of pages 55 (wheat), 57 (rice), 59 (corn), 61 (sorghum), 63 (barley), 65 (oats), 69

baseline itself and FAPRI analysis has often been influential in US policy formation process, including in analysis of the FSRI Act of 2002, for which FAPRI won the USDA's highest honour.[113]

83. Second, FAPRI's 2003 US Baseline is a long-run scenario projecting what would happen to various elements of US agriculture under the 2002 FSRI Act. In this analysis, FAPRI includes all of the different types of support provided by the 2002 FSRI Act into its projections of, *inter alia*, upland cotton planted acreage, production, exports, prices, revenue, costs, etc. In doing so, the FAPRI economists assume that, *inter alia*, upland cotton producers were holding upland cotton base acreage and receiving upland cotton CCP and direct payments.[114] These CCP payments and direct payments are reflected in their analysis of "Gross Market Revenue" to upland cotton producers on page 79 of their report, which constitutes the sum of LDP (marketing loan), CCP revenue, and direct payments.[115]

84. In addition, FAPRI states that "US cotton producers do not benefit from the projected price increases. Higher prices are offset by lower payments from the loan programme and the CCP programme."[116] This reflects the FAPRI economists' assumption that upland cotton producers receive upland cotton direct and CCP payments.

---

(soybeans), 75 (peanuts) and 79 (upland cotton). Brazil notes that its figures for soybeans and peanuts differ slightly. The underlying reason for this difference is that Brazil had to base its figures on its estimates about the payments yields and it appears that FAPRI's figures for payment yields are slightly different from Brazil's.

# ANNEX D-4

## COMMENTS OF THE UNITED STATES ON NEW MATERIAL IN BRAZIL'S REBUTTAL FILINGS AND ANSWER OF THE UNITED STATES TO THE ADDITIONAL QUESTION FROM THE PANEL

27 August 2003

TABLE OF CONTENTS

## I. Introduction

1. The United States thanks the Panel for its prompt reply to the US request of 25 August 2003, granting an opportunity to comment on new material in Brazil's rebuttal submission and Brazil's comments on the US responses to questions. We also thank the Panel for its additional question. We present both the US comments on new material in Brazil's submissions and our answer to that additional question below.

2. As the United States notes in these comments and answer, Brazil's Peace Clause argument depends on three issues:

- First, Brazil relies on budgetary outlays that reflect prevailing market prices that could not have been "decided" by the United States. Brazil ignores the fact that "support" does not mean "budgetary outlays"; in fact, Annex 3 recognizes that an "Aggregate Measurement of

Support" for price-based support either shall[117] or can[118] be calculated using a price gap methodology, which does not rely on budgetary outlays.

- Second, Brazil conflates "non-product-specific support" with "support to a specific commodity" by attempting to allocate certain payments to upland cotton. To do so, however, Brazil relies on a reading of the definition of "non-product-specific support" in Article 1(a) that ignores the most relevant context for this term – that is, the (immediately preceding) definition of product-specific support in that same article. Indeed, Brazil's approach would appear to render the concept of "non-product specific support" so narrow that it becomes almost, if not completely, meaningless.

- Third, Brazil mischaracterizes US direct payments and production flexibility contract payments as non-green box support. Brazil has not established that these measures fail to conform to the policy-specific criteria in Annex 2. In fact, Brazil has not even established – pursuant to Brazil's own reading of the first sentence of Annex 2, paragraph 1, as a stand-alone obligation – that these payments have more than "minimal[] trade-distorting effects or effects on production."[119]

3. The weakness of Brazil's interpretation that "support" in the Peace Clause means "budgetary outlays" can be seen in this example. Even if US measures were *exactly* the same in *every year* of the implementation period as they were in the 1992 marketing year (that is, the same deficiency target price, same marketing loan rate, same acreage reduction percentage, same normal flex acres with planting flexibility[120], etc.), under Brazil's interpretation, US measures would have breached the Peace Clause in each and every year in which outlays increased due to external factors, for example, whenever market prices dipped below the 1992 level.

- Would 1999-2002 US measures *identical in every respect* to those in 1992 "grant support in excess of that decided during the 1992 marketing year"?

- In other words, if a Member had decided its support during 1992 for the period through 2004 and never changed its decision, could the Member be deemed to grant support in excess of the

[117] In the case of market price support. In fact, Annex 3, paragraph 8, states: "Budgetary outlays made to maintain this gap, such as buying-in or storage costs, shall not be included in the AMS."

[118] In the case of non-exempt direct payments dependent on a price gap. *See* Agreement on Agriculture, Annex 3, paragraph 10.

[119] Of course, the US view is that the "fundamental requirement" of the first sentence is met by a measure that conforms to the basic criteria and any applicable policy-specific criteria. In this regard, Brazil errs in claiming that the United States has "acknowledged that such effects can be presumed if the specific criteria in paragraph 6 of Annex 2 are not complied with." Brazil's Rebuttal Submission, para. 8 fn. 13. In fact, we believe the opposite. Meeting the basic and policy-specific criteria of Annex 2 establishes that a measure meets the "fundamental requirement" of paragraph 1. However, the converse is not necessarily true. So, according to Brazil's approach, Brazil would bear the burden of establishing that a measure that did not comply with the basic and policy-specific criteria in Annex 2 failed to meet the "fundamental requirement" of paragraph 1 of Annex 2.

[120] Recall that "under 1992 programme provisions, producers of non-cotton programme crops (i.e., wheat, corn, barley, grain sorghum, oats, and rice) could plant up to 25 per cent of their [non-cotton] crop programme base to cotton as Normal Flex Acres or Optional Flex Acres. Acreage Reduction Programme compliance reports indicate that, in 1992, 447,164 acres of cotton were planted on a much larger quantity of available Normal Flex Acres and Option Flex Acres of non-cotton programme base.") Exhibit US-24 (Report by Dr. Joseph Glauber, Deputy Chief Economist, US Department of Agriculture). In 1992, there were 153.9 million acres of non-cotton "complying base" and 197.2 million acres of non-cotton "effective base." *See* Exhibit US-39. Thus, the marketing loan was effectively available with respect to all upland cotton production.

> level decided during 1992 just because outlays increased, for example, because market prices changed?[121]

We believe the answer must be "No" because market prices are not "decided" by a Member (as paragraphs 8 and 10 of Annex 3 recognize). And yet, the situation in this dispute is analogous: the United States has changed its measures to *reduce* the product-specific level of support (by eliminating deficiency payments) since 1992, and yet Brazil claims that the Peace Clause has been breached simply because lower market prices resulted in increased price-based outlays.

4. Market prices are beyond the control of the United States, and therefore the United States cannot "decide" them. Removing the effect of market prices beyond the control of the United States from the measure of support demonstrates that US measures do not and did not grant support in excess of that decided during the 1992 marketing year. In fact, whether gauged (as the United States believes is compelled by the Peace Clause) via the rate of support expressed by US measures[122], *or* via the AMS for upland cotton (calculated through a price gap methodology), *or* via the erroneous calculations of Brazil's expert (but limited to product-specific support), the result is exactly the same: in no marketing year from 1999 through 2002 have US measures breached the Peace Clause.

## II. Brazil's AMS Calculation Is Flawed and, Had It Consistently Reflected a Price Gap Calculation, Would Demonstrate No Peace Clause Breach

5. We recall that Brazil has argued that budgetary outlays are the only measurement of "support" for purposes of the Peace Clause proviso comparison, without any foundation in the Peace Clause text and despite the context provided by Annex 3, which explicitly indicates that Members have agreed "support" *can* be measured without using budgetary outlays. Brazil itself concedes that US measures do not decide support on the basis of budgetary outlays:

> Brazil acknowledges that *the United States could not possibl[y] determine its expenditures* as they would depend to a certain extent on *market prices* that were also influenced by factors *outside the control of the US Government*.[123]

The United States agrees with this statement by Brazil and believes that this statement demonstrates that Brazil's approach to the Peace Clause comparison is not based on the text nor is it realistic. Instead, in order to hope to succeed, Brazil's claims *require* Brazil to use budgetary outlays and so to take into account low prevailing market prices. An Aggregate Measurement of Support calculation using a price gap methodology – that is, that eliminates the effect of market prices and reflects instead the eligible production and applied administered price decided by a Member – reveals that in no year from 1999-2002 have US measures breached the Peace Clause.

6. Brazil has argued that "there are only two types of methodologies that would allow an expression in monetary terms of a decision (or decisions) taken by the United States in MY 1992 regarding its level of support to upland cotton. The first is budgetary expenditures. The second is the calculation of AMS for a particular commodity."[124] In both its table of expenditures[125] and its AMS

[121] Other factors beyond a Member's control could also influence outlays, such as whether some additional producers chose to begin participating in the support programmes.

[122] Even taking into account the maximum theoretical effect on the deficiency payment effective price of the 1992 acreage reduction percentage (10 per cent) and normal flex acres (15 per cent) for the 1992 marketing year. Since the acreage reduction percentage was lower for 1993 marketing year (7.5 per cent versus 10 per cent) support, which was also decided during the 1992 marketing year, the adjusted level of support (68.27625 cents per pound) was even higher for the 1993 marketing year.

[123] Brazil's Comments on US Answers, para. 66 fn. 49.

[124] Brazil's Rebuttal Submission, para. 71.

table[126], Brazil has attempted to allocate non-product-specific support to a specific commodity. There is no basis in Annex 3 to do so. Annex 3, paragraph 1, explicitly requires an AMS to be calculated "on a product-specific basis for each basic agricultural product" and separately requires that non-product-specific support be calculated and "totalled into one non-product-specific AMS in total monetary terms." The point bears emphasis: "for each basic agricultural product," Annex 3 states that an AMS "shall be calculated on a product-specific basis." Similarly, were "support to a specific commodity" (upland cotton) to be calculated using an Aggregate Measurement of Support, it *must* be calculated "on a product-specific basis."

7. As a result, both Brazil's expenditure table and its AMS table run counter to the terms of Annex 3. Were the Panel to calculate an AMS for upland cotton for marketing years 1992 and 1999-2002, the United States has set forth a calculation consistent with Annex 3 in its rebuttal submission.[127] By using a price-gap methodology for both deficiency payments and marketing loan payments[128], the upland cotton AMS in 1992 is far higher than in any marketing year from 1999 to 2002, reflecting the US decision to move away from the high support levels of product-specific deficiency payments.

8. In fact, we note that the AMS data presented in paragraph 115 of the US rebuttal submission understates the AMS for marketing year 1992. For example, the United States reduced the price gap calculation for 1992 basic deficiency payments by an adjustment factor (approximately .875) to replicate the calculation used in G/AG/AGST/USA, p. 18. Without the adjustment, which is not called for by paragraphs 10 and 11 of Annex 3, the 1992 deficiency payment calculation would have been $858 million, rather than $755 million as reported in paragraph 115.[129] (In case of interest, we also present below the deficiency payment calculation in more detail, reflecting more accurate data, which would increase the deficiency payment calculation slightly, to $867 million.)[130] This

---

[125] Brazil's Rebuttal Submission, para. 73.

[126] Brazil's Rebuttal Submission, para. 76.

[127] US Rebuttal Submission, paras. 114-118.

[128] Brazil has stated (with respect to deficiency payments) that "the formula approach under Annex 3, paragraphs 10-11 of the Agreement on Agriculture [is] warranted for upland cotton AMS calculations." Brazil's Rebuttal Submission, para. 73 fn. 172. Because the Peace Clause proviso comparison must compare the support that challenged measures grant to "that decided during the 1992 marketing year," the price gap methodology is the only AMS approach that reflects only the United States' decisions and not market prices beyond the United States' control. For the same reason, it is equally appropriate to use the price gap methodology for marketing loan payments.

[129] Total deficiency payments calculated via the price gap methodology equal unadjusted basic deficiency payments ($724 million / 0.875) + 50/92 deficiency payments ($30 million) – that is, $858 million. *See* US Rebuttal Submission, para. 115 fn. 144.

[130] To calculate the deficiency payment support using the price gap methodology and consistent with the 1995 US WTO notification and G/AG/AGST/USA, we made the following calculations.

Total deficiency payments are equal to basic deficiency payments plus 50/92 payments. Basic deficiency payments are equal to eligible production times a price gap measured as the difference between the target price and a fixed reference price. Eligible production is measured as eligible base acreage times average programme yield. Eligible base acreage is equal to participating base acreage minus Acreage Conservation Reserve acres minus Normal Flex Acres minus acres enrolled in the 50/92 programme. The fixed reference price is the1986-88 average of the higher of the market price or loan rate for each year.

Payments for the 50/92 programme were calculated in a similar fashion by multiplying base acres in the 50/92 programme times the average programme yield times 92 per cent of the price gap.

In 1992, the target price was 72.9 cents per pound and the fixed reference price for 1986-88 was 57.9 cents per pound. This gives a price gap of 15.0 cents per pound. Eligible production for basic deficiency payments in 1992 was equal to 5,544 million pounds (9.226 million acres times the average programme yield of 601 pounds per acre). Multiplying the price gap times eligible production gives basic deficiency payments equal to $832 million.

The same formula is used to calculate deficiency payments under the 50/92 programme. For 1992, the price gap is the same as that calculated for the basic deficiency payments (15 cents per pound). Eligible

calculation, moreover, uses the actual payment acreage (that is, acres planted for harvest or participating in the 50/92 programme on which payment was received) to calculate the "eligible production." Using instead the base acreage minus the 10 per cent acreage reduction figure and the 15 per cent normal flex acres (14.9 million effective base acres[131] *x* .75 = 11.175 million acres) and multiplying by the programme yield (602 pounds per acre), the "quantity of production eligible to receive the administered price"[132] is 6,727 million pounds, yielding a price gap deficiency payment calculation of $1,009 million. Thus, the figure in paragraph 115 of the US rebuttal reflected a conservative approach that understated the support resulting from a price gap calculation.

9. In this regard, the United States notes Brazil's argument with respect to the 1995 Statement of Administrative Action, which explained that Peace Clause protection would apply "unless the AMS for the particular commodity exceeds the level decided in the 1992 marketing year."[133] We agree with Brazil that this reference to "AMS" is "non-textual[]" because the Peace Clause uses the term "support decided" and not "AMS."[134] However, to the extent that the Panel were to examine "the AMS for the particular commodity" – that is, the upland cotton AMS – the United States has demonstrated that in no year from 1999-2002 does that AMS exceed the 1992 level.

## III. The US Level of Support Argument Does Take Into Account All Product-Specific Support That Challenged US Measures Grant

10. Brazil has argued that "the United States '72.9 methodology' does not – and cannot account for cottonseed payments, Step 2 payments, storage payments and interest rate subsidies," which the United States has identified as product-specific support.[135] Brazil then alleges that the US methodology "would sanction the cover-up of hundreds of millions – if not billions – of dollars of expenditures."[136] Over-heated rhetoric aside, Brazil's argument is simply erroneous.

---

production under the 50/92 programme was 254 million pounds (404 thousand acres times the average programme yield of 50/92 participants of 628 pounds per acre). Deficiency payments under the 50/92 programme were thus equal to $35 million (0.92 times 254 million times $0.15).

Total deficiency payments under the price gap methodology were thus equal to $867 million ($832 million plus $35 million). *Sources:* US Department of Agriculture, Compliance Report for 1992 Acreage Reduction Programme (1993) (Exhibit US-39); Commodity Credit Corporation Commodity Estimates Book for the FY 1995 President's Budget (February 1994); G/AG/AGST/USA, p. 18.

[131] *See* Exhibit Bra-105, Annex 2 (1st source document: US Department of Agriculture, *Provisions of the Federal Agricultural Improvement and Reform Act of 1996*, at 142) (giving 1992 effective base acreage of 14.9 million acres); *id.*, Annex 2 (2nd source document: Daniel A. Sumner, *Farm Programmes and Related Policy in the United States*, at 4) (same).

[132] Agreement on Agriculture, Annex 3, para. 10.

[133] We also note that Brazil never quotes that passage in full since the first half reflects the US view throughout this dispute that "exempt from actions" means not liable to a legal process or suit. *See* 1995 Statement, at 68 ( "Under Article 13(b)(ii) and (iii), governments *may not initiate* adverse effects, serious prejudice or non-violation nullification and impairment *challenges* in the WTO . . . .") (emphasis added). There are numerous other statements in the 1995 Statement that Brazil similarly does not draw to the Panel's attention. *See id.* at 67 ("Article 13, commonly referred to as the peace clause, reflects *an agreement among WTO countries to refrain from challenging* certain of each other's agricultural subsidy programmes . . . *through WTO dispute settlement procedures* . . . .") (emphasis added); *id.* ("*Article 13(b) addresses possible challenges* to domestic support measures falling outside the green box in circumstances in which the WTO member providing the subsidy is meeting its total AMS commitments.") (emphasis added).

[134] Brazil's Opening Statement, para. 35; Brazil's Rebuttal Submission, para. 75; *see also* 1995 Statement of Administrative Action, at 68 (subsequently in same paragraph quoted by Brazil stating "a WTO Member will not be protected by the Peace Clause if its support for the product is above that decided during the 1992 marketing year.") (emphasis added).

[135] Brazil's General Comment on US Answers to Questions 47-69 from the Panel (para. 55).

[136] Brazil's General Comment on US Answers to Questions 47-69 from the Panel (para. 56).

11. Brazil argues that the United States has not accounted for Step 2 payments. The United States directs the Panel's attention to the US rebuttal submission, paragraphs 111 and 113, and the US first written submission, paragraph 111. The United States has noted that, because the availability of Step 2 payments is contingent on certain price conditions existing during the marketing year, the level of support decided must relate to the payment parameters. While these have changed slightly with the 2002 Act, these minor adjustments do not alter the revenue ensured for producers by the marketing loan rate of 52 cents per pound because Step 2 merely provides an alternative avenue of providing support (through processors rather than directly to producers). In addition, these minor adjustments cannot overcome the greater than 20 cents per pound difference in product-specific support between marketing years 1992 and 1999-2002.

12. Brazil argues that the United States has not accounted for cottonseed payments. The United States directs the Panel's attention to the US rebuttal submission, paragraph 111 fn. 136, 137 and paragraph 113. While the United States maintains that these measures are not within the Panel's terms of reference[137], we note that cottonseed payments for the 1999, 2000, and 2002 crops ranged in value between 0.6 to 2.3 cents per pound (factoring expenditures – the way these measures were decided – over production). Thus, given the greater than 20 cents per pound difference in product-specific support between marketing years 1992 and 1999-2002, cottonseed payments too do not materially affect the comparison between marketing year 1992 and any other year.

13. With respect to storage payments and interest rate subsidies, we note that these are US Government estimates of support provided through activities relating to operating the upland cotton marketing loan programme.[138] This support is already captured, however, in the level of support expressed by the marketing loan rate. Were these costs not borne by the United States, the costs to the producer would reduce the guaranteed revenue below the loan rate. In fact, Annex 3 of the Agreement on Agriculture explains that, for purposes of market price support calculated using a price gap, "[b]udgetary payments made to maintain this gap, such as buying-in or storage costs, shall not be included in the AMS." Similarly, where the support provided by marketing loans is measured using a price gap methodology (the only appropriate AMS calculation for purposes of the Peace Clause)[139], "payments made to maintain this gap," such as storage payments and interest rate subsidies, should not be counted separately.

## IV. Brazil's New Green Box Arguments Are in Error

14. In its rebuttal submission and comments on US answers to questions from the Panel, Brazil advances two novel arguments. First, Brazil for the first time responds to the US argument that Brazil's interpretation of paragraph 6(b) would create an inconsistency between that provision and the fundamental requirement of the first sentence of Annex 2, paragraph 1.[140] Second, Brazil argues that the US interpretation of Annex 2, paragraph 6(b), would render paragraph 6(e) of that Annex a nullity. Neither of these arguments withstands scrutiny.

15. First, Brazil misunderstands the US argument that Brazil's reading of paragraph 6(b) creates an inconsistency between that paragraph and the fundamental requirement of the first sentence of Annex 2, paragraph 1, and therefore its arguments go astray. The United States has noted that if payments under a decoupled income support measure were reduced or eliminated if a recipient were to produce any commodity, then the amount of payments would be (on Brazil's reading) linked to the type of production and therefore inconsistent with paragraph 6(b), even though such a measure would

[137] *See* US Rebuttal Submission, paras. 106-09.
[138] For example, for storage payments we estimate expenses incurred with respect to upland cotton put under loan and pledged as collateral.
[139] *See* US Rebuttal Submission, paras. 114-17.
[140] Brazil's Rebuttal Submission, paras. 4-9.

meet the fundamental requirement of Annex 2. Brazil does not contest that such a measure would meet that fundamental requirement but instead argues that "requiring no production, *i.e.*, on all base acres is not a 'type of production'" because "[t]he notion of 'type of production' in paragraph 6(b) is necessarily linked to the amount of payment to some 'type' of commodity that is 'produced' and not to a production requirement itself."[141]

16. With respect, if one were to credit this argument, then Brazil would appear to have misunderstood its own objection to US direct payments and production flexibility contract payments. That is, in the US example, payments are reduced or eliminated if a recipient produces *any type* of commodity. Similarly, Brazil's objection to US green box payments is that payments are reduced or eliminated if a recipient produces *certain types* of commodities. Thus, in the former example, the amount of payment is "based on" (in the sense of being reduced by) "the type" of production undertaken by the producer – for example, production of upland cotton, fruits, vegetables, or wild rice – just as in Brazil's argument on US green box payments, the amount of payment is "based on" (in the sense of being reduced by) "the type" of production undertaken by the producer – that is, fruit, vegetable, or wild rice production. Brazil's objection to US green box payments under paragraph 6(b) would therefore apply with equal force to the US example,[142] again, posing an inconsistency between Brazil's interpretation of paragraph 6(b) and the fundamental requirement of Annex 2.[143]

17. Brazil also argues that the US interpretation of paragraph 6(b) "would render Annex 2, paragraph 6(e)[,] a nullity" because the "US interpretation of paragraph 6(b) as not requiring the production of 'certain crops' is the same as 6(e)'s prohibition on not requiring production of 'any crops.'"[144] Brazil's own re-phrasing of the US argument, however, points to the distinction between the obligations contained in these two provisions. Paragraph 6(e) establishes that under a green box measure: "No production shall be required in order to receive such payments." Thus, there can be no production requirement "in order to receive such payments," but the provision is silent with respect to the *amount* of such payments at any particular time and any links to the "type or volume of production." That is, were paragraph 6(e) alone part of Annex 2, a Member could arguably link the amount of payments to requirements on the "type or volume of production" so long as payment eligibility were not contingent on production.

18. Paragraph 6(b) forecloses that option by prohibiting a green box measure from linking the "amount of such payments in any given year" to "the type or volume of production." That is, not only may a green box measure not require production, but the measure may not require a particular "type or volume of production" in order to obtain a payment amount. As the United States has noted, both direct payments and production flexibility contract payments meet that test because no "type or volume of production" is required to receive payments. For example, with respect to the fruits, vegetables, and wild rice planting flexibility issue, a payment recipient need not undertake any "type or volume of production" in order to receive the full "amount of payments" to which the farm's base acres are entitled. Rather, the recipient need only *desist* from planting certain commodities. Thus, Brazil's objection is nothing more than a statement that, under US green box measures, the amount of payments is linked to production *not* undertaken by the producer.

---

[141] Brazil's Rebuttal Submission, para. 6. Brazil concludes the thought: "Otherwise, it logically could not be a 'type' of production. It would be nothing at all."

[142] *See* Brazil's Rebuttal Submission, para. 4 ("The relevant text of paragraph 6(b) prohibits any linkage of the 'amount of payments' to *any* 'type of production' of an agricultural product.") (emphasis added).

[143] Brazil's reference to paragraph 6(e) does not answer this objection. Brazil argues that "negotiators addressed any possible misunderstanding in this regard by including the very concept of prohibiting the requirement to produce in paragraph 6(e)." Brazil's Rebuttal Submission, para. 6. However, as Brazil immediately points out, conformity with paragraph 6(e) "does not exempt . . . payments from conforming to the requirement of paragraph 6(b)."

[144] Brazil's Comment on US Answer to Question 32 from the Panel (para. 44).

19. Finally, we note that Brazil's reading of paragraph 6(b) could prevent Members from imposing on decoupled income support payment recipients any conditions relating to the type of production – for example, the planting of illegal crops or production of unapproved biotech varieties or environmentally damaging production. As a practical matter, no Member could accept not being able to impose any such conditions on payment recipients. The result of Brazil's reading, then, would be to read decoupled income support out of Annex 2. This may be a favourable result from the Brazilian perspective, but the Panel should not adopt an interpretation of paragraph 6(b) not required by the text, not consistent with its context (in particular, the fundamental requirement of Annex 2), and with such potentially far-reaching results.

## V. Answer to Additional Question 67*bis* from the Panel

**67*bis*. Please state the annual amount granted by the US government in each of the 1999, 2000, 2001 and 2002 marketing years (as applicable) to US upland cotton producers, per pound and in total expenditures, under each of the following programmes: production flexibility contract payments, market loss assistance payments, direct payments and counter-cyclical payments.**

20. The Panel's question would require ascertaining for each programme the amount of upland cotton produced by recipients of payments under the programme. However, the United States does not maintain and cannot calculate this information – that is, it does not maintain information on the amount of expenditures made under the cited programmes to US upland cotton producers. This is because the payments do not relate to, and do not depend on, what crop, if any, is actually produced. Instead, each of these programmes makes payments with respect to *past* production on base *acreage* in a fixed and defined base period, not with respect to whether one is currently a producer.

21. Thus, the United States did track total expenditures with respect to base acres of wheat, corn, barley, grain sorghum, oats, upland cotton, and rice under the expired production flexibility contract payments and market loss assistance payments and does track total expenditure with respect to base acres of wheat, corn, barley, grain sorghum, oats, upland cotton, rice, peanuts, soybeans, sunflower seed, canola, rapeseed, safflower, flaxseed, mustard seed, crambe, and sesame seed under the direct payments and counter-cyclical payments.[145] However, the fact that a recipient at one time produced one of these crops says nothing about what crops the recipient is currently producing, if any. In other words, payments made on the basis of past production of upland cotton do not tell anything about whether the recipient is currently producing cotton, corn, livestock, hay, or any other crop or is not producing at all. As a result, it is not possible to derive from these payments whether the payment is being received by an upland cotton producer.

22. The Panel's question points to a fundamental difficulty with Brazil's approach. Brazil would have the Panel allocate "support to a specific commodity" – upland cotton – on the basis that certain of these measures determine payment amounts (for base acres) based on current or recent market prices for that commodity. However, how could the payment be "support to a specific commodity" (support "provided for an agricultural product in favour of the producer of the basic agricultural product") if there need be no production of upland cotton in order to receive payment?

23. Brazil attempts to avoid this result by arguing that various US payments (direct, counter-cyclical, production flexibility contract, and market loss assistance payments) are *not* non-product-specific support because they are not payments to "producers in general." The United States has addressed this erroneous interpretation in detail in its rebuttal submission. In short, Brazil's reading requires ignoring the definition of product-specific support in Article 1(a) (that is "support . . .

[145] *See* US First Written Submission, para. 57 fn. 46.

provided for an agricultural product in favour of the producers of the basic agricultural product"), which Brazil has not interpreted, in over 450 pages of submissions and statements, even once.[146] In fact, Brazil's reading of the definition of non-product-specific support ("support provided in favour of agricultural producers in general") reads the phrase "in general" as meaning "in a body; universally; without exception." However, this dictionary definition is considered "obsolete"[147] and so would hardly be the "ordinary meaning" of the term.

24. As Brazil has conceded, moreover, payments made with respect to upland cotton base acres are not necessarily in favor of upland cotton producers since those acres may not be planted to upland cotton – indeed, may not be planted at all. We note that Brazil has adjusted its entire AMS calculation to reflect its belated realization that, under its own theory, "only the portion of . . . payments [on "upland cotton" base acres] that actually benefits acres planted to upland cotton can be considered support to upland cotton."[148] But Brazil's adjustment is not enough. Brazil simply takes the ratio of actual upland cotton acreage to "upland cotton" base acreage under a given programme. However, there is no reason why upland cotton acreage need be planted on "upland cotton" base acreage. Consider this example:

- One farm could have 100 base acres of upland cotton and currently plant those 100 acres to corn; direct and counter-cyclical payments would be made on those 100 "upland cotton" base acres that actually are planted to corn.

- Another farm could have 100 base acres of corn and currently plant those 100 acres to upland cotton; direct and counter-cyclical payments would be made on those 100 "corn" base acres that actually are planted to upland cotton.

- Brazil's approach (dividing upland cotton planted by upland cotton base acres) would simply say that *all* of the direct and counter-cyclical payments on "upland cotton" base acres are "support to upland cotton" because there are 100 "upland cotton" base acres on which payments were made and 100 acres currently planted to upland cotton, even though these are found on completely separate farms.

Thus, Brazil's ratio does not identify, *even on Brazil's own terms*, the alleged support to upland cotton (that is, "payments that actually benefit[] acres planted to upland cotton") under these programmes.[149]

25. Brazil's own approach would require Brazil to match up payments for upland cotton base acres with the amount of upland cotton production on those base acres, but Brazil has not done so.[150]

---

[146] *See, e.g.*, Brazil's Rebuttal Submission, para. 19 (again misquoting the definition of product-specific support in Article 1(a) by eliminating the phrase support provided "for an agricultural product" and failing to interpret that definition according to the customary rules of interpretation of public international law); Brazil's Comments on US Answer to Question 43 from the Panel (paras. 58-60) (criticizing US interpretation of product-specific support but failing to interpret that definition according to the customary rules of interpretation of public international law); Brazil's Comments on US Answer to Question 38 from the Panel (paras. 48-49) (same).

[147] *See The New Shorter Oxford English Dictionary*, vol. 1, at 1073 (first definition of "in general": "† (*a*) in a body; universally; without exception"); *id.*, vol. 1, at xv (sec. 4.5.2: Status symbols) ("The dagger [†] indicates that a word, sense, form, or construction is obsolete. It is placed before the relevant word(s) or relevant sense number.").

[148] *See, e.g.*, Brazil's Answer to Question 67 from the Panel (table, fn. 2, 3, 4, 5).

[149] We also would reiterate that such payments would not be "support to a specific commodity" as explained in Article 1(a) and reflected in Annex 3.

[150] For example, Brazil admits that "this acknowledged legal flexibility to grow other crops does not answer the question of whether the producers planting 14.2 million aces of upland cotton in MY 2002 received direct and counter-cyclical payments. Nor does it answer the question of whether the 14.2 million acres planted

At best, Brazil speculates as to the *likelihood* of a person with cotton base acres actually producing upland cotton on those base acres, and even that speculation is flawed.[151] However, such an approach amounts to little more than speculation and, even if Brazil's erroneous interpretation were used, does not meet Brazil's burden of establishing a *prima facie* case.

26. In addition, under Brazil's own approach, the payments made in relation to corn base acres would be support for *corn* even if planted to upland cotton. However, Brazil's approach would appear to result in double counting the support – the same payment would be support to corn (because it was related to corn base acres) and support to upland cotton (because cotton was produced on base acres eligible for payments). In other words, Brazil is trying to have it both ways:

- First, Brazil argues that payments made based on production on base acres during a base period is support to the crop that was produced during that base period, regardless of what is actually produced currently (that is, payments made for upland cotton base acreage is support to upland cotton even if the producer is now growing corn on that acreage).

- Second, Brazil argues that payments made under these programmes are support to the crop that is currently being produced, even if the crop being produced is different from the base crop (that is, payments made for corn base acreage is support to upland cotton if upland cotton is being produced on the corn base).

27. Furthermore, because payments under the cited programmes are made with respect to historic acres and yields during a base period, it is not possible to calculate the "annual amount granted by the US government . . . to US upland cotton producers, per pound." Counter-cyclical payments, for example, determine the payment rate for base period production as the difference between a target price and the sum of the direct payment rate plus the higher of the market price or the loan rate. However, the per pound payment rate for upland cotton base acres applies only for base period production (base acres *x* payment yields), not current production. Thus, to express these payments per pound begs the question: "Per pound of what?" Any production figure used – whether base period production or production in any year from 1999 through 2002 – results in a highly artificial per pound

---

to upland cotton in MY 2002 were planted on *upland cotton* base acreage." Brazil's Rebuttal Submission, para. 38 (emphasis in original). The United States agrees completely, and while Brazil's approach would require that these questions be answered, Brazil has not answered them, even though under Brazil's approach, Brazil would have the burden of proof in this regard. Rather, Brazil tries to construct a series of assumption based on what Brazil considers "likely" or "maybe" or "probably."

[151] *See* Brazil's Rebuttal Submission, paras. 24-50. Brazil makes a lengthy presentation of new data and calculations, including some with respect to crops other than upland cotton, to assert that these four payments are support for upland cotton because without them upland cotton farmers could not cover their costs. However, Brazil's approach is flawed in terms of its facts and the premises on which it relies. In the time available we have not been able to identify and describe all the flaws and inaccuracies in Brazil's presentation of the data. Simply by way of example, however, we note that (1) Brazil includes a figure for cottonseed payments in its graph purporting to show MY 2001 market revenue and government support (Rebuttal Submission, paragraph 30), but Brazil's own table at paragraph 84 of its rebuttal submission reflects that there were no cottonseed payments for the 2001 marketing year; (2) Brazil's theory would appear to be that cotton production on cotton base acres are "necessary" because without government payments costs of production would not be covered, but Brazil presents information only with respect to one year, marketing year 2001, with record low prices - Brazil does not explain its theory or present any data with respect to other years with more typical prices; (3) Brazil asserts that upland cotton production "is produced only in particular regions . . . and producers tend to specialize and not readily switch to other crops" – whereas cotton is produced in 17 of the 50 United States and, for all US cotton farms, average cotton area is approximately 38 per cent of a farm's acres (469 of 1,222 acres) (US Department of Agriculture, Characteristics and Production Costs of US Cotton Farms (October 2001).)

rate since (as noted above) these payments will be or were (as the case may be) received by a recipient regardless of whether he or she produced any upland cotton production.

28. We are able to provide to the Panel the total outlays under the cited programmes with respect to upland cotton base acreage:

| **Total Outlays Under Certain Programmes with respect to Upland Cotton Base Acres (millions US$)** | | | | |
|---|---|---|---|---|
| Payments[152] | MY1999 | MY2000 | MY2001 | MY2002 |
| Production flexibility contract | 614 | 575 | 474 | 452 |
| Market loss assistance | 613 | 612 | 524 | NA |
| Direct | NA | NA | NA | not yet available[153] |
| Counter-cyclical | NA | NA | NA | not yet available[154] |

## VI. Payments With Respect to Base Period Production of Certain Commodities But Not Others Are Not Inherently Product-Specific Support

29. Brazil has argued that production flexibility contract payments, market loss assistance payments, direct payments, and counter-cyclical payments are product-specific support. The United States had addressed some infirmities in Brazil's approach in response to Additional Question 67*bis* from the Panel and in previous submissions.[155] The United States now briefly addresses two arguments presented by Brazil.

30. First, Brazil argues that each of these payments is product-specific because base acreage is defined as acreage on which only some commodities were historically produced during a defined and fixed base period. This argument, again, rests on an "obsolete" definition of "in general" (in the definition of non-product-specific support) as "universal" or "without exception" and a determined refusal to quote accurately and interpret the definition of product-specific support in Article 1(a).[156]

[152] *See* Exhibit US-38 (http://www.fsa.usda.gov/dam/BUD/bud1.htm) (for crop years 1999, 2000, and 2001).

[153] The US Department of Agriculture estimates that direct payments for the 2002 marketing year with respect to upland cotton base acres will total $173 million. Exhibit US-18 (www.fsa.usda.gov/dam/BUD/estimatesbook.htm).

[154] The US Department of Agriculture estimates that counter-cyclical payments for the 2002 marketing year with respect to upland cotton base acres will total $873 million. Exhibit US-18 (www.fsa.usda.gov/dam/BUD/estimatesbook.htm).

[155] *See, e.g.*, US Rebuttal Submission, paras. 79-92, 99-105.

[156] We note that, once again, Brazil has misquoted the definition of product-specific support in Article 1(a). Brazil quotes that definition as follows: "For support not provided to agricultural producers *in general*, the test is whether the support is 'provided in favour of the producers of the basic agricultural product.'" Brazil's Rebuttal Submission, para. 19. The actual text of Article 1(a), in pertinent part, reads:

That these payments are made with respect to base acreage for only some commodities is not relevant to the question whether they are support "provided for an agricultural product in favour of the producers of the basic agricultural product."[157] None of these payments satisfies either part of this definition: they are neither provided "for an agricultural product" (rather, they are made with respect to historic production of several products) nor "in favour of the producers of the basic agricultural product" (no production is necessary for payments to be made).

31. Brazil also appears to now argue that the requirement under paragraph 6(a) of Annex 2 that eligibility for payments under a decoupled income support measure "shall be determined by clearly-defined criteria such as income, status as a producer or landowner, factor use or production level in a defined and fixed base period" requires that these payments be made to *all* producers for *all* commodities. This approach would seriously limit the ability of Members to move to decoupled income support. It is not clear that any Member would be willing to switch to decoupled income support if it required expanding support to whole new classes of producers or commodities. We can find no basis for this approach in the text of paragraph 6(a). This definition does not require comprehensive coverage of all or nearly all production in "a defined and fixed base period"; it merely requires "clearly-defined criteria." Thus, under Brazil's reading, a measure could satisfy the requirement of Annex 2, paragraph 6(a), and yet qualify as product-specific support under Article 1(a).

32. Second, Brazil again selectively quotes the statutory definition of "producers" to suggest that recipients of these payments had to be growers who "shared in the risk of producing a crop."[158] As the United States has previously noted, the statute defines "producers" (those eligible in the first instance to receive payment) as persons who "would have shared had the crop been produced."[159] Thus, both the 2002 and 1996 Acts make clear that a payment recipient need not produce any crop (including upland cotton) to receive payment. It is thus a serious error to imply that a payment recipient is necessarily a "producer" in the Agreement on Agriculture rather than a "producer" (meaning "recipient") in the statutory sense.

33. Nowhere in Brazil's submission is there any suggestion of how its approach can be found in the Agreement on Agriculture. It does not make sense of the definitions of product-specific support and non-product-specific support in Article 1(a), which Brazil has recognized guide the interpretation of the phrase "support to a specific commodity" in the Peace Clause. In sum, Brazil's argument

---

"support . . . provided *for an agricultural product* in favour of the producers of the basic agricultural product" (emphasis added). What Brazil describes as "the narrow US Article 13(b)(ii) specificity standard" in fact flows from an interpretation of Article 13 that makes sense of the *entire* text of Article 1(a) and not just selected parts of it.

[157] Indeed, Brazil's argument in paragraph 36 of its rebuttal submission rests on a *non sequitur*. Brazil's statement is that: "Thus, direct payments are *not* available to the great majority of US producers of agricultural commodities, *i.e.*, they are not provided to US agricultural producers *in general*." (Emphasis in original.) The illogic in Brazil's statement is that, by removing the requirement to produce any particular crop or any crop at all in order to receive these payments, the United States does in fact make the payments available to producers in general. Recipients are free to produce a broad range of commodities, and so are producers of agricultural commodities "in general." Brazil appears to acknowledge that the payments are not in fact tied to current production when, in paragraph 50, Brazil concedes that the payments are made to "upland cotton base acreage holders" rather than to upland cotton *producers*.

[158] *See* Brazil's Rebuttal Submission, paras. 24 (quoting first half of definition), 29 ("Thus, as with PFC payments, market loss assistance payments were not paid to agricultural producers *in general* but rather to only a select group of US producers), 36 ("Direct payments are targeted support to "producers" farming, *inter alia*, on upland cotton base acreage."), 48 ("But the evidence demonstrates that CCP funds in MY 2002 paid to "historic" (i.e., 1998-2001 or 1993-1995) upland cotton producers are paid to a tiny fraction of total US producers of agricultural commodities.").

[159] US Rebuttal Submission, paras. 36-38.

provides ample evidence that the phrase "support to a specific commodity" in the Peace Clause must be interpreted in the context provided by the Agreement on Agriculture. To divorce it from that context may result in an unworkable and illogical interpretation along the lines suggested by Brazil.

## VII. Brazil's New Arguments Relating to Crop Insurance Do Not Demonstrate that Crop Insurance Payments Are Product-Specific Support

34. Brazil presents a number of arguments claiming that crop insurance payments are "support to a specific commodity." In part, this argument relies on the notion that such payments are not support provided to agricultural producers "in general" and, hence, not non-product-specific support. We note, however, that in making these arguments Brazil avoids any reference to the definition of product-specific support in Article 1(a). This is a fundamental interpretive error: Brazil cannot claim that payments are not support to "agricultural producers in general" under Article 1(a) without providing an interpretation of the other component of support in Article 1(a), namely, product-specific support (support "provided for an agricultural product in favour of the producers of the basic agricultural product"). In fact, given that crop insurance support is available to approximately 100 agricultural commodities, representing approximately 80 per cent of US area planted and greater than 85 per cent of the value of all US crops, crop insurance payments are not support "provided for *an* agricultural product."[160] The support to these approximately 100 commodities is the same: that is, the crop insurance premium subsidies do not vary by commodity or plan of insurance.

35. Brazil's specific arguments fail to address the definition of product-specific support in Article 1(a); thus, each fails to demonstrate that crop insurance payments are "support to a specific commodity" rather than "support to several commodities."

36. First, Brazil argues that certain policies (and accompanying premiums) on irrigation failures are available only to upland cotton and a few other commodities. The United States has previously addressed this argument and directs the Panel's attention to that argument.[161]

37. Second, Brazil argues that a larger pool of types of insurance policies are offered to upland cotton than most other crops. Brazil has not explained how the types of crop insurance policies offered by private companies[162] can affect whether US crop insurance payments (premium subsidies that do not vary by commodity or insurance plan) are product-specific or not. Brazil's "facts" are also misleading in some instances and erroneous in others. For example, Brazil suggests that "in many instances, the policies available for cotton enterprises are not available for other crops."[163] However, we note that commodities other than upland cotton can be insured under the same types of policies as upland cotton.[164]

---

[160] US Rebuttal Submission, paras. 93-98.

[161] *See* US Rebuttal Submission, para. 54.

[162] Under the Agricultural Risk Protection Act, new insurance products must be developed by the private sector and approved by the Board of Directors of the Federal Crop Insurance Corporation. The US Department of Agriculture is expressly prohibited from conducting research and development on new products. Thus, the variety and availability of insurance products reflects the fact that private companies, not the US Government, have developed and offered these products.

[163] Brazil's Rebuttal Submission, para. 55.

[164] Upland cotton producers can insure their crops under the following types of policies: Actual Production History, Group Risk Plan, Income Protection, Crop Revenue Coverage, and Revenue Assurance. Other crops that are eligible for the policies include:

for Actual Production History – Alfalfa seed, all other grapefruit, almonds, apples, avocados, barley, blueberries, cabbage, canola, cigar binder tobacco, cigar filler tobacco, cigar wrapper tobacco, corn, cotton, ELS cotton, crambe, cranberries, cultivated wild rice, dry beans, dry peas, early and midseason oranges, figs, flax, forage production, fresh apricots, fresh freestone peaches, fresh market tomatoes, fresh nectarines, grain sorghum, grapefruit, grapes, green peas, late oranges, lemons, macadamia nuts, mandarins, Maryland tobacco,

38. Third, Brazil argues that are there specific upland cotton provisions in certain policies.[165] This is true – an insurance product offered by a private company must be tailored for the situation and desires of the insurance purchasers – but also irrelevant as the policies are generally similar in underwriting rules and share the same subsidy schedule.

39. Fourth, Brazil argues that upland cotton producer participation rates in the crop insurance programme "is much higher that for other crops."[166] We first note that Brazil neglects to mention that participation rates for the major field crops are generally quite high (over 75 per cent of insurable acres). Any producer who received disaster assistance was required to purchase federal crop insurance in the following year; cotton participation may be slightly higher because of droughts that have hit cotton regions in recent years. More importantly, that cotton producers may choose to take up crop insurance more than producers of other commodities might is irrelevant to whether the payments are provided "for an agricultural product." Again, the crop insurance premium subsidy is identical for all commodities and for each plan of insurance.

40. Fifth, Brazil argues that tracking the cost of reinsurance provided to private companies is "further evidence that USDA treats crop insurance for upland cotton separately from crop insurance provided to other crops."[167] Of course, the way the US Department of Agriculture "tracks cost[s]" is irrelevant to the analysis of whether crop insurance payments provide support "for an agricultural product." Brazil also misinterprets the Standard Reinsurance Agreement between the US Government and private insurers. Under that Agreement, net underwriting gains and losses for each insurer are calculated *at the state level* over *all crops*, not separately for individual crops (such as upland cotton).[168] Thus, Brazil errs when it claims that reinsurance provides evidence that crop insurance for upland cotton is treated separately from crop insurance provided to other crops.

41. Sixth, Brazil claims that "the 2000 ARP Act denies subsidies to producers of other agricultural products."[169] It is true that there are certain products for which policies have not been developed. However, development of new policies is ongoing; for example, provisions of the Agricultural Risk Protection Act of 2000 allow for the development of livestock insurance products. A number of livestock products are currently available on a pilot basis, including price insurance for hogs and feeder cattle and gross margin insurance. We also note that producers may currently insure livestock and dairy revenue as part of whole farm insurance offered through the Adjusted Gross Revenue Insurance.[170] Finally, Brazil's argument here again reads domestic producers "in general' to mean "universally" or "without exception"; as noted above, that definition is now considered obsolete.

[168] The provisions of the Standard Reinsurance Agreement are available on the Risk Management Agency website at: http://www.rma.usda.gov/pubs/ra/98SRA.pdf.

[169] Brazil's Rebuttal Submission, para. 59.

[170] More information on Adjusted Gross Revenue Insurance can be found on the Risk Management Agency website at: http://www.rma.usda.gov/pubs/2003/PAN-1667-06rev.pdf.

42. Finally, with respect to Brazil's references to the literature on the effects of crop insurance on production,[171] the findings are (contrary to what Brazil has claimed) mixed. While several studies (such as those cited by Brazil) have suggested crop insurance payments may have a slight effect on acreage, the effects on *production* are less clear.[172] If crop insurance encourages moral hazard problems (as claimed by Brazil), crop yields will be adversely affected as producers attempt to increase crop insurance indemnities. If moral hazard and adverse selection problems are severe, crop insurance support could potentially have a *negative* effect on production.[173] The potential production effects of crop insurance payments, moreover, goes to whether such payments are "amber box" support but does not figure in the question whether such payments (which are offered at the same rate across commodities and policies) can be support "for an agricultural product."

## VIII. Brazil May Not Act Unilaterally on Procedural Matters

43. The United States takes note of Brazil's statement in its 25 August 2003 letter to the Panel[174] that, concerning paragraph 20 of the Panel's determination of 20 June 2003, "Brazil interpreted this ruling as permitting it to provide no later than 22 August all of its evidence and argument that had not already been provided in its earlier submissions. This is the manner in which it treated the new evidence and arguments presented by the United States in its Rebuttal Submissions." The United States is unable to reconcile Brazil's position concerning its own ability to provide evidence and arguments at any time up through August 22 with Brazil's repeated assertions that the United States "should have" provided particular material in its replies to the Panel's questions.[175] There is of course no basis for Brazil's assertions that particular material "should have been" provided in replies to questions rather than in a rebuttal submission. There is no basis for Brazil to dictate to another Member what it may or may not include in its rebuttal submission. Brazil is fabricating an obligation and attempting to impose it on the United States at the same time that it exempts itself from this obligation. In this, Brazil's approach is similar to its repeated attempts in this dispute to add to the obligations in the Agreement on Agriculture and the Subsidies Agreement.

[171] Brazil's Rebuttal Submission, paras. 60-67.

[172] The US Department of Agriculture, Economic Research Service, studies cited by Brazil only examine the effects of crop insurance subsidies on acreage. They do not consider effects on crop yields.

[173] Recent studies by Smith and Goodwin (1996), Babcock and Hennessy (1996) and Goodwin and Smith (2003) suggest that farms with more insurance tend to use less inputs like fertilizer and pesticides and vice versa. This demonstrates a potential moral hazard problem with crop insurance that suggests that crop insurance participation may have a negative effect on yields. *See* Babcock, B. and D. Hennessy. "Input Demand Under Yield and Revenue Insurance" *American Journal of Agricultural Economics* 78(1996):416-27; Goodwin, B. and V. Smith. "An Ex Post Evaluation of the Conservation Reserve, Federal Crop Insurance, and other Government Programmes: Programme Participation and Soil Erosion." *Journal of Agriculture and Resource Economics* 28(2003):201-216; Smith, V. and B. Goodwin. "Crop Insurance, Moral Hazard and Agricultural Chemical Use." *American Journal of Agricultural Economics* 78(1996):428-38.

[174] The United States also notes that the Panel's communication of 19 August 2003 had not indicated that the parties would have an opportunity to comment on each other's requests to comment. Had there been such an opportunity, the United States would have been happy to comment on Brazil's request of 23 August 2003. Perhaps Brazil could reconsider whether it has a basis to assert a right to decide that it may unilaterally provide comments to the Panel while denying the United States the same procedural rights. Under Brazil's approach, it would not have needed to request permission from the Panel to file comments on Wednesday, August 27, but could have simply provided those comments, unsolicited, while denying equal access for the United States. The United States is grateful that the Panel's extremely prompt reply to the US request obviated any need to respond to Brazil's unauthorized and out of order comments on that request.

[175] *See* Brazil's 23 August 2003 letter to the Panel.

## IX. Conclusion

44. The United States has demonstrated that using any measurement that reflects the support "decided" by the United States rather than factors (such as market prices) beyond the United States' control, US support to upland cotton in marketing years 1999-2002 has not exceeded the 1992 marketing year level. The question then is whether the Panel will find that the United States has breached the Peace Clause simply because market prices were lower in some recent years than they were in 1992.

45. The United States submits that the Peace Clause must be interpreted in a way that permits Members to comply in good faith – that is, Members must be able to tell if they will breach the Peace Clause or not. Brazil's budgetary outlays approach does not do that. Brazil's approach would mean that Members could not know if they had complied with the Peace Clause until it was too late to do anything about it. The best way to interpret the Peace Clause in a way that allows Members to comply is to use the "support" as "decided" by a Member during the 1992 marketing year as the basis for comparison. Recognizing, as the United States believes is required by the Peace Clause text, that "decided" and "grant" cover only those parameters over which Members exercise control would also be consistent with this approach of allowing "good faith" compliance since it would permit Members to control whether their measures conformed to their obligations.

46. The United States has disciplined itself to grant support not in excess of that decided during the 1992 marketing year. Therefore, we are entitled to the protection of the Peace Clause, and we respectfully request the Panel to find that Brazil may not maintain this action challenging these conforming US measures.

## BRAZIL'S FURTHER SUBMISSION TO THE PANEL

### EXECUTIVE SUMMARY

#### Summary Of The Argument Regarding Brazil's Further Claims

1. Brazil demonstrates in its Further Submission that US subsidies from MY 1999-2007 supporting the production, use and export of US upland cotton cause or threaten to cause serious prejudice to the interests of Brazil within the meaning of Article 5(c), 6.3(c) and 6.3(d) of the SCM Agreement as well as violate GATT Article XVI.

2. The measures challenged by Brazil comprise domestic support subsidies including the marketing loan programme[1], crop insurance subsidies, market loss assistance payments and their successor counter-cyclical payments, production flexibility contract payments and their successor direct payments, cottonseed payments and "other payments".[2] The measures also include prohibited export and local content subsidies including Step 2 export and domestic payments, and the subsidies provided by the US GSM 102 export credit guarantee programme. These collective subsidies are referred to as "the US subsidies".

3. Table 1 summarizes the amounts of US subsidies in terms of US dollar and as a percentage of subsidization in terms of the market value of US upland cotton:

[1] Brazil uses the phrase "marketing loan programme" or "marketing loan payment" to encompass marketing loan gains, loan deficiency payment (or "LDP's") and certificate exchange gains. *See* US 11 August Answer to Question 67, para. 133.

[2] The United States qualified "other payments" as product-specific support to upland cotton. *See* US 11 August Answer to Question 67, para. 130-133.

| Programme | 1999 | 2000 | 2001 | 2002 |
|---|---|---|---|---|
| | Amount of Payment | Amount of Payment | Amount of Payment | Amount of Payment |
| | Rate of Subsidization | Rate of Subsidization | Rate of Subsidization | Rate of Subsidization |
| Marketing Loan Gains and LDP's | $1,545 million | $573 million | $2,541 million | $918 million |
| | 43.71per cent | 14.06 per cent | 82.5 per cent | 28.23 per cent |
| Crop Insurance | $169.6 million | $161.7 million | $262.9 million | $194.1 million |
| | 4.79 per cent | 3.97 per cent | 8.53 per cent | 5.97 per cent |
| Step 2 | $422 million | $236 million | $196 million | $217 million |
| | 11.94 per cent | 5.79 per cent | 6.36 per cent | 6.67 per cent |
| PFC Payments/ Direct Payments | $547.8 million | $541.3 million | $453.0 million | $485.1 million |
| | 15.5 per cent | 13.28 per cent | 14.7 per cent | 14.92 per cent |
| Market Loss Assistance/ Counter-Cyclical Payments | $545.1 million | $576.2 million | $625.7 million | $998.6 million |
| | 15.42 per cent | 14.14 per cent | 20.31 per cent | 30.71 per cent |
| Cottonseed Payments | $79 million | $185 million | No payments | $50 million |
| | 2.23 per cent | 4.54 per cent | No payments | 1.54 per cent |
| Other Payments | $216 million | $63 million | $68 million | $65 million |
| | 6.11 per cent | 1.54 per cent | 2.20 per cent | 1.99 per cent |
| **Total Payments** | **$3,524.5** | **$2,336.2** | **$4,146.6** | **$2,927.8** |
| **All programmes** | **97.69 per cent** | **57.32 per cent** | **134.6 per cent** | **90.03 per cent** |
| **Value of US Production** | $3,534 million | $4,073 million | $3,080 million | $3,252 million |
| **Average Rate of Subsidization** | **94.91 per cent** | | | |

Table 1[3]

4. Brazil's actionable subsidy claims fall into two basic temporal and legal categories: first, claims of *present* serious prejudice resulting from subsidies provided in MY 1999-2002; second, claims of *threat* of serious prejudice from subsidies that are required to be paid by USDA to the US upland cotton industry during MY 2003-2007 under the Farm Security and Rural Investment Act of 2002 (2002 FSRI Act) and the Agricultural Risk Protection Act of 2000 (2000 ARP Act).

5. Because Brazil's claims involve the adverse effects of "subsidies", Brazil first establishes that each of the US domestic and export programmes is a "subsidy" within the meaning of Article 1.1 of the SCM Agreement. As Table 1 above indicates, each provides a "financial contribution" which confers a "benefit".

[3] The amount of payments reflects the amount presented by Brazil in its 22 August Rebuttal Submission, para. 173. The value of the US upland cotton production has been taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p.5). The value of the US production in MY 2002 has been calculated by multiplying the amount of US production as reported in Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p.4) (16.73 million bales * 480 pounds per bale) with the average price received by US farmers of 40.50 cents per pound (*see* Exhibit Bra-202 (Agricultural Outlook Tables, USDA, August 2003, Table 5). Differences between the sum of individual rates of subsidization and the total rate of subsidization are due to rounding effects.

6. Each of the subsidies is "specific" within the meaning of Article 2.1(a) and/or (c) of the SCM Agreement. The United States and Brazil agree that the specificity test of Article 2.1 was not intended to function as a loophole through which narrowly focused subsidies provided to or used by discrete segments of an economy could escape review. The four direct subsidies – the PFC, direct payment, market loss assistance, and CCP payments are *de jure* specific because the 1996 FAIR Act and the 2002 FSRI Act explicitly limit access of payments to holders of upland cotton base acreage. The per acre upland cotton base acreage payments of the four programmes are single specific subsidies because the payments are based on individual cotton-based criteria and are significantly higher than payments to most other base acres in each program. Alternatively, even if the total payments to all base acres for each of the four direct subsidies are treated as single subsidies, they are specific because the payments are excluded from the significant majority of US farmland and the value of the crops produced with such payments is less than one-quarter the value of total US commodities.

7. Crop insurance subsidies are specific because there are specific policies and groups of policies available only for upland cotton (or a few other crops) and not for the majority of crops in the programme. Alternatively, crop insurance is not specific because the 2000 ARP Act denies benefits to commodities representing more than half of the value of US agriculture. Further, US crops represent only 0.8 per cent of total US GDP.

8. Within each of the *present* serious prejudice and *threat* of serious prejudice claims, Brazil has asserted three different claims regarding the application of these actionable subsidies.

9. **Present Significant Price Suppression – Article 6.3(c) of the SCM Agreement:** The US subsidies provided during MY 1999-2002 cause present significant price suppression in the world and Brazilian market, as well as in markets where Brazilian producers export. Brazil first establishes that Brazilian upland cotton is "like" US upland cotton based on common tariff classification, USDA's designation of upland cotton as a separate commodity, and the interchangeability and treatment by the markets of US and Brazilian cotton as like products.

10. The bulk of Brazil's price suppression analysis involves establishing the causal link between the US subsidies and suppressed prices in the US, world, Brazilian, and other markets. Most of this evidence is also relevant for Brazil's other present and threat of serious prejudice claims. The enormous size of the MY 1999-2002 US subsidies in terms of amount ($12.9 billion) and percentage as market value (95 per cent) coupled with the dominating US world market share of 41.6 per cent of a fungible commodity create a *de facto* presumption of production, export, and price-suppressing effects. The effects of the subsidies are also seen in the significant increase of US production, exports, and world market share in MY 1999-2002 while US, A-Index, and Brazilian prices fell to record lows and remained suppressed. The causal link is further confirmed by the fact the average total US upland cotton costs of production was 77 per cent higher than market prices received by US farmers in MY 1999-2001, at the same time that US production and exports increased remained at high levels. Another demonstration of the causal link is the 15 per cent increase in the value of the US dollar between MY 1999-2001 at the same time that US export market share increased 68 per cent and A-Index prices declined by 21 per cent.

11. The link between US subsidies and suppressed A-Index, Brazilian, and other third country upland cotton market prices is further confirmed by the fact that the nature, size and global impact of the US market permits it to drive and suppress world prices. The large size of the US world market share of 41.6 per cent that is generated and sustained by the US subsidies suppresses world market prices. Production and export developments in the US market are widely publicized and impact the New York Cotton Exchange's futures market, which in turn directly influence and impact A-Index and Brazilian prices.

12. The link between the US subsidies and significant price suppression is also confirmed by USDA and other economists' findings of the individual production, export and price-suppressing effects of each of the US subsidies have . USDA and other economists have identified the US marketing loan payments as having the greatest production, exports and A-Index price-suppressing effects. Crop insurance subsidies, like marketing loan payments, are directly tied to production, and have been found to create similar types of effects by USDA and other economists, as they eliminate risk and induce farmers to put marginal land into production. CCP payments (and to a lesser extent market loss assistance, PFC and direct payments) have production impacts as a result of additional income and wealth effects that keep land in production and maintain base acres in production in anticipation of future base updating like that permitted under the 2002 FSRI Act. Step 2 export payments directly stimulate US exports and permit US exporters to export high-cost US upland cotton with the effect of suppressing A-Index prices. The GSM-102 export credit guarantee programme facilitated the export of more than $1 billion worth of US upland cotton between FY 1999 and the present, thereby increasing US exports and suppressing world prices.

13. A number of econometric studies found that the US subsidies collectively have the effect of increasing US production, exports and suppressing world prices. The ICAC found that world prices would increase by 11 cents per pound price from the removal of US subsidies in MY 2001 and 6 cents in MY 2000. The University of Tennessee found an average 11.4 per cent price suppressive effects from removing US subsidies during MY 2003-2007. The IMF estimated world prices would increase by 4 per cent based on removing $1 billion of US subsidies in MY 1998. The World Bank/IMF found a 25-30 per cent increase in world prices from elimination of US upland cotton subsidies in MY 2003-2007. The Centre for International Economics found an increase of world price by 13.4 per cent by eliminating US and Chinese subsidies in MY 1998. Professor Daniel Sumner determined that removing the US subsidies in MY 1999-2002 results in an average increase in the A-Index price of 12.6 per cent.

14. Further, Brazilian prices for domestic Brazilian sales as well as Brazilian export sales are suppressed by the effects of the US subsidies. The small size of the Brazilian market and low applied tariffs mean that Brazilian producers are price takers, not price makers. Negotiations to determine Brazilian domestic and export prices are heavily influenced by New York Cotton Exchange's futures prices and A-Index prices. The movements in prices between the Brazilian prices and prices in these international markets are closely tied. Prices in other third country markets also show a close linkage with Brazilian, New York futures, US spot, US A-Index and other prices included in the A-Index calculation.

15. Finally, the amount of price suppression between MY 1999-2002 as reflected in various econometric studies of world prices varies from 6 cents per pound to 11 cents per pound. Professor Sumner found the A-Index price suppression to be 6.5 cents per pound between MY 1999-2002. This estimated worldwide price suppression is "significant" because it materially affects producers in Brazil and throughout the world. Total income loss from the price suppression is $3.587 billion and Brazilian producers lost an estimated $478 million from suppressed prices.

16. **Increasing World Market Share in MY 2001 – Article 6.3(d) of the SCM Agreement:** The US subsidies for upland cotton contributed significantly to the production and export of large quantities of upland cotton in violation of Article 6.3(d) of the SCM Agreement. The three-year average US world market share in MY 1998-2000 was 22.3 per cent. In MY 2001, the subsidy-enhanced US world market share increased to 38.3 per cent. This MY 2001 increase follows a consistent trend since the 1996 FAIR Act was enacted with US world market share increasing from 25 per cent to 38.1 per cent. The evidence linking US subsidies and increasing production and exports in the price suppression analysis is also relevant for the Article 6.3(d) claim. Professor

Sumner finds that *but for* the US subsidies, US exports between MY 1999-2001 would have declined on average by 39 per cent.

17. **Inequitable World Export Share - 1999-2002: Articles XVI:1 and 3 of GATT 1994:** US subsidies provided from MY 1999-2002 contributed significantly to the United States having more than an equitable share of world export trade within the meaning of GATT Article XVI:3. The US share of world exports increased from 17.93 per cent in MY 1998 to 38.3 per cent in MY 2001 and increased further to 41.6 per cent in MY 2002. The causal link between the US subsidies and the increased US export market share is based on the evidence of production and export effects of US subsidies set out in the price suppression analysis. Professor Sumner concluded that *but for* the US subsidies US exports would be 41.2 per cent lower and US production would decline by 28.7 per cent on average between MY 1999-2002. The current US share of world exports of upland cotton is not "equitable" because producers from countries competing with the United States do not receive any or at most only small amounts of subsidies and have costs of productions are far lower than the United States. *But for* the effects of the US subsidies, these producers, including producers in Brazil, would have increased their share of the world export trade.

18. **Threat of Serious Prejudice:** Brazil's second set of adverse effects claims involves the demonstration of a *threat* of serious prejudice under Article 5(c), 6.3(c), and 6.3(d) of the SCM Agreement and GATT Articles XVI:1 and 3. The record shows that five US subsidies – marketing loan payments, crop insurance subsidies, Step 2, CCP and direct payments – have no production or expenditure limitations and either no or at best no practical payment limitations. These unlimited subsides are required to be paid by USDA and eligible US producers, users and exporters. These eligible recipients have an enforceable entitlement to receive the payments – regardless of the effect of US subsidies on the world upland cotton market. Based on the *EC – Sugar Exports* GATT panel decisions and the *US – FSC* Appellate Body decision, these facts support a finding of a threat of serious prejudice in the form of significant price suppression, increases in US world market share, and inequitable share of world export trade.

19. A threat of serious prejudice is confirmed by fact that the level of US subsidies has increased by up to 10 cents per pound between MY 2001 and 2002 with the passage of the 2002 FSRI Act. Having established *present* price suppression, increased world market share and inequitable share of world export trade, this evidence also confirms the existence of a *threat* of serious prejudice for MY 2003-2007. A University of Tennessee study predicts removal of the US subsidies will increase US prices by 11.4 per cent between 2003-2007. The IMF predicts that removal of US subsidies would increase world market prices by 25-30 per cent in the short term. Professor Sumner predicts that removal of US subsidies would increase world A-Index prices by 5.9 cents per pound, decrease US production by 4.5 million bales, and decrease exports by 4.4 million bales.

20. A threat of serious prejudice also exists because the US costs of production will increase between MY 2003-2007 with USDA and FAPRI not expecting the large cost-market revenue gap to decline significantly. The most recent FAPRI baseline suggests that marketing loan and CCP payments will be made throughout MY 2003-2007. Additional evidence of a threat of serious prejudice exists from USDA and FAPRI baselines (reflecting mandatory payments under the 2002 FSRI Act) that project that US acreage, production, and exports will continue at existing high levels given the existence of the US subsidies. The increasing export orientation of US production, as US domestic textile production declines, also increases the threat of significant price suppression, increased world market shares, and inequitable shares of world export trade.

21. The evidence demonstrates that the threat of an increased US world market share in MY 2002 has already materialized, as the US world market share continued to increase in MY 2002 to 41.6 per cent, well above the MY 1999-2001 three-year average of 29.1 per cent. The threat also exists for MY 2003 as recent USDA projections of US exports indicate that the likely US share will be 38.8 per

cent in MY 2003 – an increase over the three-year (MY 2000-2002) average of 34.9 per cent. This evidence further supports the finding of a threat that the US share of world export trade will continue to be inequitable for MY 2003-2007.

22. **Per Se Challenges to 2002 FSRI Act and 2000 ARP Act:** Brazil also challenges certain provisions of the 2002 FSRI Act and the 2000 ARP Act – in as far as they relate to upland cotton – as *per se* violations of Articles 5(c), 6.3(c), 6.3(d) of the SCM Agreement and GATT Article XVI:3. In particular, Brazil challenges the mandatory provisions requiring the executive branch of the US Government to make marketing loan, Step 2 domestic and export, crop insurance, direct and counter-cyclical payments to eligible upland cotton producers, users and exporters. There is no statutory mechanism in any of the challenged statutes or regulations to limit the guaranteed payments when these payments cause serious prejudice or a threat of serious prejudice. The absence of any statutory upland cotton circuit breaker threatens to cause serious prejudice, including price suppression, increased US export and an inequitable US share of world upland cotton exports.

# ANNEX E-2

## EXECUTIVE SUMMARY OF THE FURTHER SUBMISSION OF THE UNITED STATES

1. **Brazil Has Failed to Demonstrate that Crop Insurance Payments Are "Specific".** The United States reiterates that the subsidy to any agricultural producer is the premium subsidy paid by the US Government, which is common to all commodities at a chosen coverage level. Thus, Brazil's repetition that certain policies are not available to all commodities is in part true but wholly irrelevant: the particular *policies* offered to growers of different commodities are issued by private insurers but the *subsidy* by the US Government on the premiums remains the same. Crop insurance subsidies are available to the US agricultural sector as a whole. It is the position of the United States (reflected in domestic law) that such a widely available subsidy does not satisfy the specificity requirement of Article 2. Thus, pursuant to Article 1.2 of the Subsidies Agreement, US crop insurance payments are not "subject to the provisions of . . . Part III" of the Subsidies Agreement, including Articles 5 and 6 on serious prejudice.

**2. Brazil Has Failed to Demonstrate that Challenged US Measures Caused the Decline in World Upland Cotton Prices Because It Simply Ignores Key Factors Behind Those Price Movements.** Brazil has failed to make a *prima facie* case on its claims on the basis of the mere assertion that large US outlays during marketing years with low prevailing upland cotton prices necessarily establishes causation. Brazil has failed to explain to the Panel key factors that affected world cotton markets during the marketing year 1999 - marketing year 2002 period. These factors and not US subsidies were the causes of the dramatic plunge in cotton prices experienced in recent years.

3. – **Persistent weakness in world demand for cotton due to competing, low-priced synthetic fibres and weak world economic growth.** The production of competing, synthetic fibres exploded during the 1990's, putting downward pressure on world cotton prices. Asian countries added more polyester production capacity between 1991 and 2001 than existed in the entire world in 1990. Asian polyester prices remained below world cotton prices from 1990 to 2001. By 2002, cotton lost the position as the world's dominant fibre and slipped below polyester's market share. Consumer purchases outside the United States added over 40 million bales to textile fibre consumption since 1990 but virtually the entire amount was claimed by polyester. Consumers outside the United States buy no more cotton today than they did in 1990.

4. In addition to the price pressure from synthetic production, the world economy grew more slowly since 1997 than any time for many years. Clothing is a semi-durable good, and when income growth slows consumers cut back on current purchases, and postpone replacing clothing until incomes rise more rapidly. Cotton consumption can decline even while income growth remains positive. The 2001-2002 decline in world income occurred just as world cotton production was increasing because of good weather, severely pressuring world prices.

5. – **Burgeoning US textile imports, reflecting the strong US dollar and declining US competitiveness in textile and apparel production, have fundamentally shifted the disposition of US cotton production from domestic mills to export markets.** The United States has supported world cotton prices through its huge demand for cotton textiles and apparel. Imported textile and apparel products continue to displace US mill use of cotton fibre. From 1997 to 2002, US mill use of cotton dropped 32 per cent. For 2002, US cotton textile and apparel imports rose for the 14th consecutive year, while exports remained essentially unchanged for the fifth straight year. This huge

trade deficit in textiles and clothing has fundamentally changed the pattern of how US-grown cotton is used. As domestic mill use has fallen drastically, more US cotton has been available for use by foreign mills, which then comes back to the US in the form of cotton products.

6. – **China, the world's largest cotton producer and consumer, released 14 million bales of government stocks between 1999 and 2002, equalling as much as 7 per cent of world consumption in crop year 2000/01.** China's policies were strongly correlated to world cotton price movements through the late 1990's and early 2000's. Through the mid-1990's the Chinese Government was concerned with maintaining farmers' income and directed the state marketing organization to maintain cotton procurement prices at high levels, causing stocks to grow rapidly. At the beginning of the 1999/2000 marketing year, China announced a policy of auctioning cotton from these stockpiles, with the central government accepting the financial loss. China auctioned 11.6 million bales over August 1999 to July 2002 (3 million bales in 1999/2000, 6.5 million in 2000/01, and 2.1 million in 2001/02). Over the entire marketing year in 2000/01, China's auctions equalled 7 per cent of world consumption that year.

7. – **Factors Affecting US Cotton Production.** Cotton planting decisions are driven by numerous factors, including the expected price of cotton, prices of competing crops, farm programme benefits, technological factors and input costs. Contrary to Brazil's claims, US cotton producers have been responsive to world price movements and are not insulated from the world market. Changes in production technology can affect both the risk and the expected returns from cotton production. In recent years, the boll weevil eradication programmes and the introduction and adoption of genetically modified varieties of cotton have lowered production costs, increased yields, and increased net returns for US cotton production.[1]

8. Since 1994 there have only been 2 years when US harvested acres changed from one year to the next in a different fashion than growers in the rest of the world. Those 2 years, 1998 and 1999, are specific to severe drought in the United States. In 1998, US harvested area fell, largely due to disastrous conditions across much of Texas; in 1999, weather was more normal and US harvested acres increased by almost exactly the acres lost in the previous year.

9. In early calendar year 2000, the futures price for cotton had fallen from the previous year's level while corn and soybean prices had risen on the year. US and world cotton growers reduced harvested acreage from the level in 1999 by virtually identical proportions. While cotton harvest futures prices again declined on the year from 2000 to 2001, soybean and corn harvest futures prices fell by a greater per cent. As a result, US and world cotton growers saw an increase in cotton harvested acres in 2001. In considering planting in 2002, growers saw soybean and corn harvest futures prices showing greater percentage increases than cotton. Thus, both US growers and growers in the rest of the world saw harvested acres of cotton decline from the previous year's level.

10. **Brazil Has Not Established a *Prima Facie* Case With Respect to US Decoupled Income Support Measures Because These Measures Have No More than Minimal Effects.** With respect to US green box measures, namely direct payments under the 2002 Act and expired production flexibility contract payments under the 1996 Act, Annex 2 of the Agriculture Agreement makes clear that these payments have no, or at most minimal, trade-distorting effects or effects on production. Under Article 21.1 of the Agriculture Agreement, the Subsidies Agreement applies "subject to" the Agriculture Agreement. Accordingly, Annex 2 makes it clear that US green box measures do not

[1] Studies indicate that the boll weevil eradication program has lowered the costs of producing cotton and has made cotton a more attractive cropping alternative. US producers have also rapidly expanded plantings of biotech cotton, rising from 25 per cent of plantings during the 1997 crop year, to an estimated 73 per cent of plantings in 2003. Studies suggest that biotech cotton has increased yields and net returns while decreasing pesticide use.

cause serious prejudice. Income payments that vary in amount with market prices, such as counter-cyclical payments under the 2002 Act and expired market loss assistance payments, are also decoupled in the sense of not being linked to current production. Because (according to the economic literature on decoupled payments) the effect on production is negligible, these payments can have no "effect" for purposes of Subsidies Agreement Article 6.3 nor operate to increase exports under GATT 1994 Article XVI:3.

11. Finally, because no production of upland cotton (or any other crop) is necessary to receive these payments, it would be erroneous to attribute to "upland cotton" or "upland cotton producers" all decoupled payments made with respect to upland cotton base acreage. Those acres may be planted to alternative crops or may be growing no crops at all. Accordingly, there is no basis to include those payments in an analysis of whether "subsidies provided to US producers, users and/or exporters of upland cotton" have caused serious prejudice.

12. **Brazil Has Failed to Demonstrate that Challenged US Measures Have Caused Serious Prejudice to Brazil's Interests Within the Meaning of Article 5(c) and 6.3(c). – "Serious Prejudice . . . May Arise":** The introductory sentence of Article 6.3 establishes that serious prejudice "may arise" if "one or more" of four specific circumstances is found, indicating that serious prejudice need not arise even if they are found. As serious prejudice "may" arise if one or more of the four conditions under Article 6.3 are satisfied, Brazil must first show that *at least one* of those conditions is met. Second, if Brazil demonstrates one or more of the criteria in Article 6.3 is met, Brazil must then demonstrate "serious prejudice." In this dispute, Brazil has not established that any prong of Article 6.3 is met.

13. – **The "Effect of the Subsidy":** Brazil has not made a *prima facie* case that "the effect of the subsidy" was significant price suppression or depression. Brazil's argument on causation fails because Brazil has simply not demonstrated the causal connection between the US measures and the price effects. Brazil has not even shown there is a necessary correlation between the measures and the effects it claims, let alone that there is a genuine and substantial link between the US measures and the effects claimed. Brazil has failed to separate and distinguish all the different effects from the various factors at play during the marketing year 1999 - marketing year 2002 period and has erroneously attributed to the US measures the effects of these other causes.

14. – **"Significant price suppression".** The Agreement does not define "significant". The ordinary meaning of significant is "important, notable; consequential," which suggests that the price suppression must reach a level at which it is important, notable, and consequential in order to be inconsistent with Article 6.3(c). The United States further notes that the term "significant" modifies "price suppression or depression"; therefore, it is the effect on *prices* that must be "significant" and not the direct effect on *producers,* as Brazil argues.

15. Under Brazil's interpretation price suppression would be significant at a level of even 1 cent per pound because this could still "meaningfully affect" producers. Brazil's interpretation, however, collapses the concept of "significant price suppression or depression" with the concept of "serious prejudice". It would also greatly expand the effect of Article 6.3(c), which falls under Part III of the Subsidies Agreement on "Actionable Subsidies" rather than Part II on "Prohibited Subsidies", to encompass *any* subsidy with any production and therefore price effect. Members agreed, however, that any theoretical price effect would not suffice to satisfy Article 6.3(c); they accomplished this by stating that the price suppression or depression had to be "significant" in order to create a situation in which serious prejudice may arise.

16. Brazil's theory would also create two sets of subsidy rules: one for widely traded products, such as most agricultural products, and another for more differentiated products. The more widely traded a product is, the more *any* price effect could be deemed to "meaningfully affect" producers.

There is no basis in the text of the Agreement for creating such a distinction. Where Members intended a particular rule to apply to a particular type of product – such as a "subsidized primary product or commodity" (Article 6.3(d)) – they said so explicitly.

17. **– "In the Same Market":** Article 6.3(c) requires that the "significant price suppression [or] depression" that is the "effect of the subsidy" occur "in the same market". The use of the same "in the same market" phrase as in the price undercutting portion of this Article suggests that the significant price suppression or depression must occur when "the subsidized product" is found "in the same market" as "a like product of another Member". That is, "in the same market" is meant to require identification of a particular market in which price effects are alleged to have occurred so as to allow a comparison in that market. If a complaining party could merely assert price suppression or depression in the world market, the word "same" in the phrase "the same market" would be rendered inutile because the subsidized and non-subsidized products could always be deemed to be in the same "world market".

18. **– Time Period for Demonstrating Causal Effects:** The "appropriate representative period" for demonstrating present serious prejudice will depend on the nature of the challenged subsidies. Normally, the most recent period for which data are available will be the appropriate period. In the case of recurring subsidies such as those under the 1996 Act and the 2002 Act, moreover, a past subsidy no longer exists as of the time a new subsidy payment in respect of current production is made and can have no "effect" within the meaning of Article 6.3. As a result, the period for which Brazil must demonstrate present serious prejudice is marketing year 2002. None of the provisions cited by Brazil, moreover, say that the effect of a subsidy 1, 2, or 3 years ago is presently being felt. Thus, at a minimum, the effect of the subsidy must be demonstrated in each year and for each year in which Brazil has alleged effects.

19. **Brazil Has Failed to Demonstrate that Challenged US Measures Have Caused Serious Prejudice to Brazil's Interests Within the Meaning of Article 5(c) and 6.3(d) – "World Market Share":** Contrary to Brazil's interpretation, Article 6.3(d) does not use the phrase "world market for exports"; it uses the phrase "world market share . . . in a particular subsidized primary product or commodity". This broad term would appear to encompass all consumption of upland cotton, including consumption by a country of its own cotton production. Context supports reading "world market share" as distinct from "world export share". In fact, GATT 1994 Article XVI:3 uses the phrase "world export trade", and Brazil interprets Article 6.3(d) and GATT 1994 Article XVI:3 both as applying to "world export trade". Had Members intended that "world export trade" be the relevant concept to apply in Article 6.3(d), one would have expected use of that phrase. Because Brazil has misinterpreted "world market share", and all of Brazil's evidence goes to a comparison of the "world export share" of the United States, Brazil has failed to make a *prima facie* case.

20. **– Appropriate Time Period for Showing Present Serious Prejudice:** Brazil has limited its claim under Article 6.3(d) to "the increased US world market share for MY 2001". Thus, there can be no finding that subsidies under the 2002 Act or marketing year 2002 subsidies presently cause serious prejudice. As the United States has previously noted, to demonstrate the "effect of the subsidy" it would normally be appropriate to look to the subsidy provided in the most recent year. Brazil has not explained why it challenges marketing year 2002 subsidies (in addition to 1999-2001) under Article 6.3(c) but only marketing year 2001 under Article 6.3(d). Brazil has stated that the 1996 Act introduced a new subsidy scheme; at a minimum, Brazil should demonstrate that in fact there is a "consistent trend" over a period when subsidies have been granted (1996-2001).

21. **– Causation: "The Effect of the Subsidy":** Brazil has simply not demonstrated the causal connection between the US measures and the effects on world market share. As explained above, Brazil has failed to separate and distinguish other factors that drove prevailing upland cotton prices to historically low levels.

22. **Brazil Has Failed to Demonstrate any Inconsistency with GATT 1994 Article XVI:3 – "More than Equitable Share:** Brazil argues that in determining what is an "equitable" share, the Panel must look at what the US share of world export trade would have been in the absence of subsidies. Brazil cites to no textual basis for its approach, nor could it since the text does not contain one. There is nothing in Article XVI:3 that says that a Member is banned from using any subsidies, let alone that a Member is denied the ability to have any share in world markets if the Member employs subsidies. Any consideration of what is an "equitable" share needs to take into account the fact that Members are generally permitted to provide subsidies. However, any subsidy that has a production effect may increase exports; if so, according to Brazil, the resulting export share would be "inequitable". This interpretation would turn Article XVI:3 into a prohibition on subsidies that potentially could increase exports. Rather than imposing a prohibition, Article XVI:3 states only that Members "should seek to avoid" export subsidies on primary products, with additional conditions if inequitable shares result.

23. In considering the difficulties inherent in applying the "more than equitable world market share" language, the United States recalls the discussion of the Tokyo Round Subsidies Code panel on *Wheat Flour* on the "more than equitable world market share" language. The panel's enumeration of difficulties associated with this concept are the types of considerations that led to the negotiation of the Subsidies Agreement. Brazil now would have the Panel believe that these negotiations were unnecessary, that the disciplines it seeks were all in the language of Article XVI:3 all along. Brazil's approach is in error and should be rejected.

24. **– "Any Special Factors":** Brazil considers that one "special factor[]" that may be affecting trade or that may have affected trade is the low level or even absence of domestic support in other supplying countries. Again, Brazil's proposed rule would suggest that where no other Member were subsidizing (each because of its own sovereign choice not to use resources in that way), a Member would be prevented from subsidizing in any amount that results in increased exports. However, Article XVI does not contemplate a prohibition on agricultural subsidies, even on export subsidies: under Article XVI:3, Members "should seek to avoid" use of export subsidies on primary products. Therefore, "any special factors" should not be interpreted in a way that introduces a meaning that the provision itself avoids.

25. **Brazil Has Failed to Demonstrate a Threat of Serious Prejudice:** Brazil argues that there is no explicit standard for threat of serious prejudice in the Subsidies Agreement nor guidance in WTO reports. The United States considers that the first standard articulated by Brazil is incorrect. Brazil's proposed rule would seemingly transform Articles 5(c) and 6 from actionable subsidy provisions into prohibited subsidy provisions. That is, Brazil's approach would produce a threat determination wherever "subsidies by a large exporter have no effective production or export limitations". There is no such *per se* threat rule in the Subsidies Agreement, however; a finding of serious prejudice requires a fact-intensive demonstration.[2]

[2] The United States also considers that this proposed standard has not been met by Brazil. First, as explained above, Brazil has not established a *prima facie* case of present serious prejudice, and therefore one cannot presume that there is a threat such prejudice will continue. Second, the Appellate Body report in *United States – FSC* cited by Brazil involved export subsidies under the Agriculture Agreement and a completely separate standard. Under the serious prejudice provision of the Subsidies Agreement, the question is the much more complicated issue of what is the clearly foreseen and imminent effect of measures on a Member's interests, which may depend on future market conditions, world prices, and other factors. Third, Brazil has not demonstrated that the challenged measures are mandatory in the sense that they must be given if an application is made. Even though the Department of Agriculture has the obligation to make such payments available, the obligation only attaches when certain market conditions prevail. Thus, to show that the threat of serious prejudice is (in Brazil's words) "real, clear, and imminent," Brazil would have to show predicted prices over the future period complained of (marketing years 2003-07) and the likelihood of that occurring.

26. The United States believes the second standard proposed by Brazil is correct. To demonstrate a threat of serious prejudice a complaining party must show a clearly foreseen and imminent likelihood of future serious prejudice. The use of the elements of serious prejudice set out in Article 6.3 ensures that a complaining party come forward with sufficient credible evidence.[3]

27. **– Threat of Serious Prejudice Via Price Suppression:** In addition to the reasons just given, the United States notes that price developments over the past several months and expected price movements do not support a conclusion of a clearly foreseen and imminent likelihood of future serious prejudice. Brazil claims that "[b]ase[d] on MY 2002 prices, current prices in August 2003 and price levels projected by FAPRI's baseline, it is likely that marketing loan and CCP payments will be made during MY2003-2007". However, current market and futures prices (not reflected in Brazil's submission) already indicate that the baseline projection of low prices is wrong.[4] Thus, current prices and futures prices do not suggest any clearly foreseen and imminent likelihood of future serious prejudice.

28. **Threat of Serious Prejudice Via Price Suppression:** Brazil again reads "world market share" in Article 6.3(d) as the equivalent of "world export share". Thus, Brazil 's threat analysis is wrong for the same reason as its serious prejudice analysis, and Brazil has not established a *prima facie* case of threat of serious prejudice under Article 6.3(d).

29. **GATT 1994 Articles XVI:1 and XVI:3.** Brazil asserts that the 2002 Act and 2000 Agricultural Risk Protection Act threaten a high and inequitable share of world exports between MY2003-07. Brazil nowhere cites the text of GATT 1994 Article XVI:3 (or of the Subsidies Agreement) that would support the notion that there is a valid cause of action for "threat" of a "more than equitable share of world export trade". In the absence of any text relating to Article XVI:3, Brazil's claim of a "threat" of a "more than equitable share" must be rejected.

30. **Brazil Has Failed to Demonstrate that Challenged US Measures Are *Per Se* Inconsistent with US WTO Obligations.** Brazil argues that the marketing loan, counter-cyclical, direct, and step 2 payments as well as the crop insurance subsidies are *per se* inconsistent with US WTO obligations because they threaten to cause serious prejudice at price levels that require the payment of marketing loan and CCP payments (that is, below 52 cents per pound). For all the reasons set out with respect to Brazil's present serious prejudice claims and its threat of serious prejudice claims, Brazil's argument is in error.

31. Brazil also argues that even at high price levels where only direct payments and crop insurance payments would be made, there is necessarily a threat of serious prejudice because these payments necessarily will keep marginal land in production because producers face no down-side revenue risk. Brazil has presented no evidence on the extent of any alleged effect of these two subsidies in keeping marginal production on-line at a time of high prices (as the market currently expects). Second, that some marginal lands may be kept in production cannot alone suffice to

[3] A similar concern is addressed for purposes of threat of material injury in countervailing duty investigations by Subsidies Agreement Article 15.7; under this article, "[t]he change in circumstances which would create a situation in which the subsidy would cause injury must be clearly foreseen and imminent." We note the relationship between threat of serious prejudice and threat of material injury, both of which make up part of adverse effects under Article 5.

[4] Instead of continued low prices, the A-Index *average* for September 2003 has risen to 64.06 cents per pound. New York Cotton Exchange futures prices demonstrate that market participants expect cotton prices to climb even further through the 2003 marketing year, strengthening beyond their 20-year average of 67.86 cents per pound (1983-2002) within the current 2003 marketing year. In fact, if cotton prices reach the levels (over 70 cents per pound) indicated by the futures market, prices would be very close to what Brazil calculates as the A-index average (74 cents per pound) for the period *before* Brazil alleges serious prejudice.

demonstrate a *per se* threat of serious prejudice. Otherwise, any subsidy with any production effect would be found to pose a threat, transforming actionable subsidies into prohibited subsidies. Thus, Brazil has not demonstrated that these subsidies *per se* present a real, clear, and imminent threat of serious prejudice.

32. **Export Credit Guarantees – The Negotiating History of Article 10.2 Reveals that the Negotiators Explicitly Deferred the Application of All Export Subsidy Disciplines on Export Credit Guarantees:** The negotiating history of Article 10.2 of the Agreement on Agriculture reveals the explicit deferral by the drafters of the application of export subsidy disciplines on export credit guarantees. In particular, the plain difference between the language of the Draft Final Act and that of Article 10.2 shows that the negotiators specifically opted not to impose the disciplines that Brazil now seeks to impose through litigation. The earlier version was an unambiguous prohibition, unless permitted under internationally agreed disciplines. The latter – and current – version imposes no such prohibition. It only requires Members to work toward the development of yet-to-be-agreed disciplines, and only upon agreement on such disciplines are export credit guarantee programmes required to adhere to them.

33. Brazil's interpretation of Article 10.2 would require export credit guarantees in agriculture to be subject to more disciplines than any other practice addressed in the Agreement on Agriculture. Under Brazil's view, not only would export credit guarantees constitute export subsidies and be subject to all of the export subsidy disciplines, but Members would *also* be specifically obligated to work toward and then apply additional disciplines. Brazil's argument would require an interpretation that the negotiators viewed export credits, credit guarantees, and insurance programmes as more malign than the recognized export subsidies themselves. This implausible conclusion is nowhere manifest in the text of the negotiating history.

34. To the contrary, the text indicates that export credits, credit guarantees, and insurance programmes were not considered export subsidies, because they were explicitly excluded from Article 9.1 of the Agreement on Agriculture, despite their inclusion in negotiating documents culminating in the current text. Brazil argues that the same is true of "[e]xport performance-related taxation concessions or incentives other than the remission of indirect taxes", and yet the Appellate Body has ruled the FSC and ETI measures are subject to the export subsidy disciplines of the Agreement on Agriculture. With respect to those measures, however, no provision like Article 10.2 exists. Export credits, credit guarantees, and insurance programmes were not only removed from the illustrative list evident in Article 9.1 but received the explicit commitment to negotiate disciplines set forth in Article 10.2.

35. **– The Application of Government-Wide Accounting Rules under the Federal Credit Reform Act Indicates that the Export Credit Guarantee Programmes are Covering Long-Term Operating Costs and Losses:** The United States has demonstrated that over time, as indicated by the government-wide accounting rules mandated under the Credit Reform Act, with respect to those years for which nearly complete experiential data is available, programme revenues exceed operating costs and losses. In those years for which the accounting books are nearest to closing (1994 and 1995), the operation of the programme shows a profit. Similarly, current data for 1992, 1993, 1996, and 1999 also indicate a profit. All of this data is on a cohort-specific basis, a methodology with which Brazil agrees.[5]

[5] Brazil misapplies the cohort-specific accounting methodology, however, to erroneously argue that "when [the] total lifetime reestimates for all cohorts of guarantees disbursed since 1992 are netted against the total *original* subsidy estimates adopted each budget year during the period 1992-2002, *the resulting loss is nearly $1.75 billion*". To arrive at this fanciful figure Brazil begins not with the estimates based on the "actual" level of guarantees issued, but rather with the original subsidy estimate in the budget year, well before virtually any activity in the programmes has occurred in that fiscal year. The "actual" figure is simply a reflection of the

36. The United States has repeatedly noted that CCC has complete discretion at any time not to issue guarantees with respect to any individual application for an export credit guarantee or to suspend the issuance of export credit guarantees under any particular allocation. In addition, the authorizing statute prohibits CCC from making credit guarantees available in connection with sales of agricultural commodities to any country that the Secretary of Agriculture determines cannot adequately service the debt associated with such sale. Third, availability of export credit guarantees is governed by allocations in effect at any one time for specific commodities and specific destinations. Fourth, the ability of CCC to issue guarantees is constrained by the apportionment process of the President's Office of Management and Budget.

37. **– Forfaiting is Analogous to the CCC Export Credit Guarantee Programmes:** Brazil's argument that forfaiting transactions and CCC export credit guarantee transactions are dissimilar illustrates the comparability of the financing available in these transactions. As Brazil points out, in both cases "the exporter wants to get paid immediately on a cash basis, and the importer wants credit that it can repay on a deferred basis". From the importer's perspective, the export credit guarantee transactions are *less* favourable than forfaiting, because although the importer's bank can repay its obligation over time, the CCC has no control over the terms of the arrangement between the importer and its bank, which may not extend the deferred payment terms to the importer. In forfaiting, the importer "can repay on a deferred basis". In both cases, the transaction (in Brazil's words) "enables the exporter to convert a credit sale into a cash sale." Brazil recognizes that as the complaining party it carries the burden of demonstrating that a "benefit" is conferred with respect to the GSM-102 programme. Brazil has failed to carry this burden.

38. **The Step 2 Programme Does Not Violate Article 3.1(b) of the Subsidies Agreement or Article III:4 of GATT 1994:** Brazil has rotundly stated: "There are no circumstances in which a 'local content subsidy' would comply with Article 3.1(b)". In effect, Brazil's argument would delete the application of the introductory clause of Article 3 to Article 3.1(b) entirely. But the phrase "except as provided in the Agreement on Agriculture" by its terms applies to both export subsidies under Article 3.1(a) and local content subsidies under Article 3.1(b).

39. Brazil would require the Step 2 programme to permit payments for the use of all cotton, whether domestic or imported, but only payments for domestic cotton would be included in the AMS. Such a programme would no longer be in favour of domestic producers. The Step 2 programme provides a benefit to producers because it serves to maintain the price competitiveness of US cotton vis-a-vis foreign cotton through a payment to capture some differential between prevailing foreign and domestic cotton prices. Brazil's hypothetical programme would cause the benefit to US producers to evaporate. Rather than a subsidy "in favour of agricultural producers", the programme would become a simple input subsidy in favour of textile manufacturers outside the coverage of the Agreement on Agriculture altogether. Brazil's interpretation would render Paragraph 3 of Annex 7 of the Agreement on Agriculture inutile.

---

actual level of guarantees issued in the particular fiscal year. The original subsidy estimate, in contrast, begins with what is an historically overly optimistic projection of actual use of the programme and then is required to use the government-wide estimation rules without regard to the actual experience specific to the CCC export credit guarantee programmes.

Actual guarantee issuance can first be reflected only in the budget two fiscal years after the original subsidy estimate. Once the actual use of the program is determined all subsequent reestimates are based on that figure, not on the original subsidy estimate. Other than with respect to interest (because of independent market forces), a downward reestimate never occurs based on the original subsidy estimate. It only occurs subsequent to establishment of the actual program use. Consequently, it is wholly inappropriate to calculate net reestimates based on the original subsidy estimate for a particular cohort, as Brazil has done. For these reasons, the United States' calculation indicating increasing profitability within the program is accurate, and the Brazilian calculation is not.

40. Brazil argues that since the Peace Clause provisions for domestic subsidies do not reference Article 3, the Agreement on Agriculture envisioned that local content subsidies would be prohibited. Brazil's conclusion does not necessarily follow from the structure of the text. Indeed, a contrary conclusion is more appropriate. Article 13(b) does not refer to Subsidies Agreement Article 3 because the substantive obligation of Article 3.1(b) does not apply in the case of domestic content subsidies in favour of agricultural producers. Article 13(b) applies to "domestic support measures that conform fully to the provisions of Article 6 of this Agreement". The character of the domestic subsidy is not relevant to the disciplines. The Agriculture Agreement never defines "domestic support", which is permitted in any form so long as the Member adheres to its reduction commitments.

# ANNEX E-3

## SECOND WRITTEN THIRD-PARTY SUBMISSION BY ARGENTINA

3 October 2003

TABLE OF CONTENTS

## I. INTRODUCTION

1. Argentina thanks the Panel for the renewed opportunity to present its views as a third party to these proceedings.

2. Argentina reaffirms the arguments put forward in its written Third-Party Submission and at the meeting of the Panel with the third parties, of 15 and 24 July respectively. It accordingly reiterates its position that the United States has no basis for claiming protection under Article 13 of the Agreement on Agriculture (AoA) and that the US subsidies are therefore actionable under Article XVI of the GATT 1994 and Articles 3, 5 and 6 of the Agreement on Subsidies and Countervailing Measures (SCM Agreement). Argentina further reiterates that the US cotton export subsidies are inconsistent with Articles 3.3, 8 and 10.1 of the AoA and constitute prohibited subsidies within the meaning of Article 3.1(a) and (b) and 3.2 of the SCM Agreement.

3. Argentina will now address the claims put forward by Brazil in its recent Further Submission dated 9 September, regarding the inconsistency of the US cotton subsidies[1] with Articles 5(c) and 6.3(c) and (d) of the SCM Agreement to the extent that, in the case of the subsidies provided in marketing years (MY) 1999-2002, they cause serious prejudice to the interests of other Members, including Argentina. Argentina further proposes to argue that such subsidies threaten to cause serious prejudice[2] in MY 2003-2007.

[1] The US subsidies the consistency of which is being challenged include both the domestic support measures and the prohibited subsidies and export credit guarantee programme cited at paragraph 7 of Brazil's Further Submission to the Panel of 9 September 2003.

[2] Within the meaning footnote 13 of the SCM Agreement.

4. Given the little time available between the receipt on 30 September of the responding party submission of the United States and the date fixed for this third-party submission, Argentina will comment on the US submission at the meeting of the Panel with the parties and third parties scheduled on 8 October next.

## II. IMPACT OF THE US SUBSIDIES ON THE WORLD COTTON MARKET SITUATION

5. In the first line of the Introduction to its Further Submission of 9 September, Brazil points out that this is a case involving basic economic principles of supply and demand. Indeed, according to the basic principles of a market economy, in an open market prices would follow the costs of the more efficient producers. Thus, higher-cost (i.e. less efficient) producers are gradually compelled to reduce production. In the world cotton market, however, these principles are turned on their head: many highly efficient global producers have been cutting production, while the less efficient US producers are insulated from changes in market prices. Worse still, there is an inverse relationship between the world price of cotton and US production.

6. In the words of US Senator Fred Thompson,

> "*These policies defy logic and they defy the most basic laws of economics. The result is that farmers know that they are guaranteed to receive a certain price regardless of market conditions, so they ignore market signals and overproduce. The overproduction further depresses commodity prices, leading to the need for ever increasing government subsidies*".[3]

7. Argentina already emphasized this point in the consultations held in December of last year when it addressed the following questions, *inter alia*, to the United States:

> *Could the US explain the reasons behind the fact that in 2001 -fifth year of falling prices- US cotton producers did obtain a record harvest of 20.3 million tons -an increase of 42 per cent compared to 1998- and that the cotton planted area did increase by 6 per cent during the same period?*
>
> *Why does the USDA estimate a 10 per cent drop in the world production for 2002 -reflecting the impact of world prices in investment-, and at the same time estimates for this year another record harvest in the U.S. -the fourth biggest ever recorded-?*
>
> *Could the US please explain the reasons for the increase in the volume of US exports from 946,000 tons in 1998 to 1.8 million tons in 2001, while there is a drop in the international prices?*
>
> *According to international standards, the US is not a low-cost producer*[4]*. Additionally, US productivity levels are lower than those of other exporting countries*[5]*. However, while international prices fell about 54 per cent since the mid-1990s, the US did expand its cotton area and did increase the production: Could the*

[3] Exhibit Bra-200 (Congressional Record 107th Congress, Senate) S3990; Brazil's Further Submission, 9 September 2003, Section 4.9.

[4] The USDA estimates the average production cost in the USA at about US$0.73 per pound. Nevertheless, one third of its production has higher production costs. On the other hand, the average production cost in Burkina Faso, for instance, is US$0.21 per pound (Data from *International Cotton Advisory Committee, "Survey of the Cost of Production of Raw Cotton", 2001*).

[5] About 20 per cent lower than in Brazil or China, for instance.

*US please explain the lack of correlation between world price for cotton and US production?*

8. At the time, the United States' only response to Argentina's questions was that production was affected by a multiplicity of factors, including the development of fibres, biotechnology, demand, quality, technical progress, the price of inputs, and so forth, without in any way explaining how it could achieve such expansion amidst such a spectacular fall in international cotton prices and high domestic production costs.

9. In this respect, Argentina has already extensively discussed the impact of the decline in international cotton prices on its own cotton economy. As already mentioned, since 1997/98 slumping international prices and increased US government support have consistently driven cotton producer prices down, which in turn has entailed ongoing reductions in cultivated acreage and production.[6]

10. As Argentina stated at the 61st Plenary Meeting of the International Cotton Advisory Committee[7] (ICAC), planted and harvested acreage in MY 2001/02 plummeted to its lowest level since MY 1933/34 – that is, the lowest in the past 68 years – as a result of the continuing fall in international prices.

11. Argentina believes that without the subsidies granted by the United States to its cotton sector, U.S. cultivated acreage and production would diminish, as would US exports, and that there would be an ensuing rise in international prices.

12. Argentina further believes that if the United States – being one of the world's leading suppliers – had not increased its world market share as a result of the subsidies, the international price of cotton would have been higher, and hence third-country producers, including in Argentina, would not have been so adversely affected by artificially depressed prices.

13. The following table shows the steady increase in US cotton exports since 1995, whereas Argentina's cotton exports have been shrinking in a general context of declining world cotton prices, as discussed in paragraphs 23 to 25 below.

[6] Since 1997/98, cultivated acreage has in fact shrunk by 76 per cent, with 174,000 hectares planted to cotton, and production by 63 per cent, with an estimated 73,000 tons of fibre produced. *Argentina: Economic Injury to the Cotton Sector as a Result of Low Prices*, Working Group on Government Measures of the International Cotton Advisory Committee, 2002.

[7] Held in Cairo, Egypt, from 20 to 25 October 2002.

| Marketing Year | US Exports (in 1,000 metric tons) | Argentine Exports (in 1,000 metric tons) |
|---|---|---|
| 1995/96 | 1,671 | 274 |
| 1996/97 | 1,495 | 269 |
| 1997/98 | 1,633 | 202 |
| 1998/99 | 946 | 213 |
| 1999/00 | 1,481 | 70 |
| 2000/01 | 1,467 | 97 |

## III. INCONSISTENCY WITH ARTICLES 5(C) AND 6.3(C) AND (D) OF THE SCM AGREEMENT

### III.1 ARTICLE 5(C) OF THE SCM AGREEMENT

14. Argentina contends that the United States has failed to meet its obligations under Article 5(c) of the SCM Agreement, which stipulates that "[*n*]*o Member should cause, through the use of any subsidy referred to in paragraphs 1 and 2 of Article 1, adverse effects to the interests of other Members, i.e.: ... serious prejudice to the interests of another Member...*".

15. In fact Argentina contends that through the granting of subsidies – understood in the sense of paragraphs 1 and 2 of Article 1 of the SCM Agreement[8] – the United States has caused and is threatening to cause serious prejudice to the interests of other Members, including Argentina.

### III.2 ARTICLE 6.3(C) OF THE SCM AGREEMENT

16. Article 6.3(c) establishes that "[s]erious prejudice in the sense of paragraph (c) of Article 5 may arise in any case where... the effect of the subsidy is a significant... price suppression, price depression...".

17. Thus, the existence and threat of serious prejudice to the interests of other Members – including Argentina – is based on the fact that, as established in Article 6.3(c) of the SCM Agreement, the effect of the subsidies provided by the United States to its cotton sector is and will be significant suppression and depression of international cotton prices.

18. Argentina fully concurs with Brazil that the sheer magnitude and percentage of U.S. cotton subsidization suggests a *de facto* presumption that the cotton subsidies are the decisive factor for the high levels of US production and exports as well as the low international cotton prices.[9] Argentina emphasizes that such was precisely the presumption implicit in its questions to the United States during the consultations. (See paragraphs 7 and 8 above.)

[8] As Brazil demonstrates in Section 3.2 of its Further Submission of 9 September 2003.
[9] On the basis of information in the USDA's *Fact Sheet: Upland Cotton*, January 2003, Exhibit Bra-4, Brazil points out that the total amount of US cotton subsidies was nearly US$13 billion, with an average subsidization rate of 95 per cent. Brazil's Further Submission, 9 September 2003, Section 3.3.4.1.

19. Argentina also agrees that there is a strong temporal link between the increase in the US subsidies over the MY 1999-2002 period and the significant suppression and depression of international cotton prices during that period.[10]

20. Argentina believes that but for the US subsidies international cotton prices would have been higher in MY 1999-2002. By stimulating US cotton production[11] and exports, the subsidies drove international prices down through excess, low-priced US supply – not in fact generated by efficient low-cost production but precisely thanks to the distorting effect of the subsidies.

21. It should be noted in this respect that Argentina (like or perhaps to an even greater extent than Brazil) is a "price-taker" in the world cotton market, which is heavily influenced by the enormous US subsidies that generate a growing world supply.

22. It should also be emphasized that the price movements of US, Cotlook "A" Index and third country (e.g. Brazilian and Argentine) market prices are directly interconnected. US – as indeed Brazilian – cotton forms part of Cotlook's "A" Index "basket". Likewise, US – as indeed Brazilian and Argentine – cotton forms part of Cotlook's "B" Index "basket".[12] Moreover, US, Brazilian and Argentine cotton are varieties of the same species, namely *Gossypium hirsutum*.

23. As in the Brazilian market, domestic price quotes for cotton have suffered a significant downturn.

24. The table below shows the direct relationship between the decline in the "A" Index world price of cotton and the drop in the domestic price quotes for cotton issued by the *Cámara Algodonera Argentina* (CAA) for the MY 1995/96-2001/02 period (in US cents/lb):

| **Marketing Year** | **"A" Index World Price*** | **CAA Price Quote**** |
|---|---|---|
| 1995/96 | 0.86 | 0.72 |
| 1996/97 | 0.79 | 0.69 |
| 1997/98 | 0.72 | 0.65 |
| 1998/99 | 0.59 | 0.55 |
| 1999/00 | 0.53 | 0.54 |
| 2000/01 | 0.57 | 0.49 |
| 2001/02 | 0.42 | 0.37 |

*** CIF Northern European ports**
****** FREE MILL, grade C 1/2

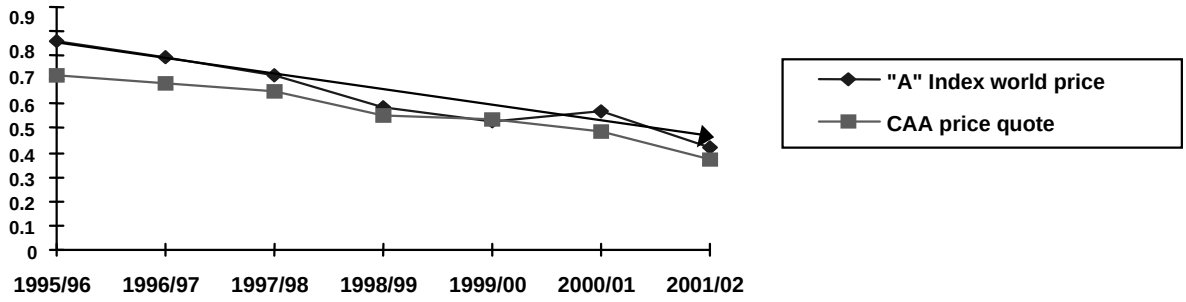
25. The following chart clearly shows the trends in the "A" Index world price of cotton and the domestic price quotes for cotton in recent years:

[10] Brazil's Further Submission, 9 September 2003, Section 3.3.4.2.

[11] Argentina agrees with Brazil (Section 3.3.4.7.7) that without the additional income provided by the subsidies granted by the US to its cotton farmers, acreage devoted to cotton would have been, and would be, much smaller, since US cotton production costs are among the highest in the world. (See Third-Party Submission by Argentina, 15 July 2003, para. 17.)

[12] In addition, the average values of national standards for the technical characteristics of Argentine cotton fibre show that the length, strength and micronaire value of the fibre are considered in the median range at international level.

26. The similarity in the trends in world prices and domestic price quotes for cotton further



supports Brazil's point[13] that the US subsidies have a suppressing and depressing effect on international cotton prices. In other words, in the absence of US subsidies that generate excess global supply, international cotton prices would have been higher, as would the domestic price quotes for cotton in Argentina, which are entirely influenced by the former.

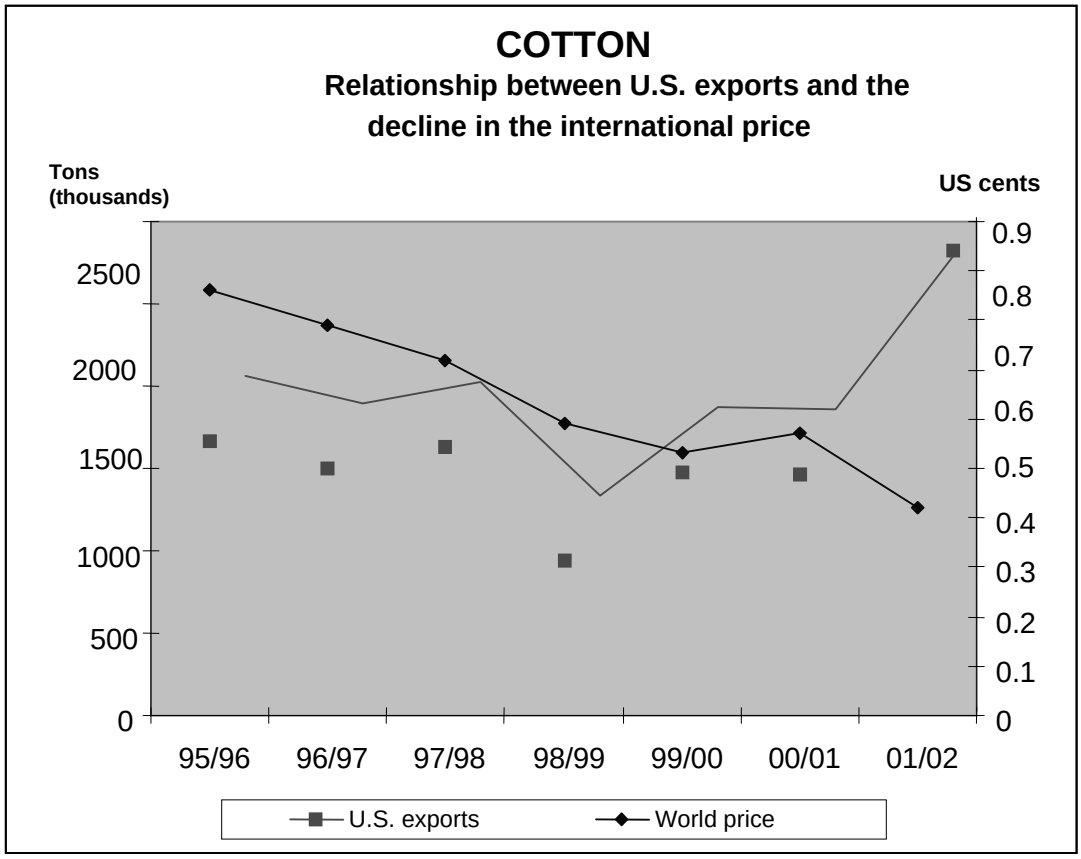
27. To an even greater extent than Brazil because of the smaller scale of its cotton economy, Argentina is basically a "price-taker" in the international cotton market, unlike the United States, which, given the size and global impact of the US cotton market and its 41.6 per cent world market share, is the international market "price-setter" *par excellence.*

28. In concrete terms, the amount of the US cotton subsidies and the scale of US production and exports are decisive when it comes to determining the extent to which the subsidies impact the fixing of both international and third market prices.

29. As economic theory would suggest and Brazil points out, increased supplies of US cotton in the world market tend to lower international prices since demand remains relatively inelastic.[14]

30. The chart below illustrates the relationship between US cotton exports and the international price of cotton:

[13] Brazil's Further Submission, 9 September 2003, Section 3.3.4.2.
[14] Brazil's Further Submission, 9 September 2003, Section 3.3.4.6; Exhibit Bra-I, para.22.



31. According to a study carried out by the Brazilian National Cotton Exporters' Association (ANEA),[15] the impact of the US subsidies is one of the reasons why cotton production in Argentina has dropped by more than 60 per cent.

32. The study reinforces Brazil's view that an increase in the world price of cotton would enable least-developed and developing countries such as Argentina, Brazil, Benin, Burkina Faso and Chad, *inter alia*, to recover the historically competitive position they enjoyed in the international market.

33. As Argentina indicated previously, the present collapse of the Argentine cotton sector is reflected in the extremely high level of indebtedness of producers, estimated at US$600 million and equivalent to twice the size of agricultural GDP of Chaco Province, the country's largest cotton producing region, which accounts for between 60 and 65 per cent of domestic cotton production.[16]

34. As regards the effects of the US subsidies on the international price of cotton, Argentina considers that the number and quality of the empirical and econometric analyses presented by Brazil, which were carried out by both international organizations and various prestigious US economic research institutions such as the USDA, provide irrefutable evidence of the *collective* and *individual* effects of each subsidy programme on the price of cotton.

[15] *Características del Mercado Mundial de Algodón* (Features of the World Cotton Market), ANEA, 15 February 2002.

[16] Third-Party Submission by Argentina, 15 July 2003, para. 28.

35. Argentina agrees with the conclusions reached by various studies presented by Brazil in its *Further Submission*[17] and repeats that an increase in the world price of cotton would enable countries such as Brazil and Argentina to recover their competitive position in the world cotton market.

36. Over and above any endorsement that may be given to the conclusions of any one of those studies (and each study's estimate of the price effect of the subsidies), Argentina emphasizes Brazil's point[18] that the suppressing and depressing effect on international cotton prices is significant, even if international prices were to decrease by only 1 cent per pound, for even such a level of decline implies highly prejudicial consequences for the cotton economies of many countries, including Argentina.

III.3 ARTICLE 6.3(D) OF THE SCM AGREEMENT

37. The existence and threat of serious prejudice to the interests of other Members, including Argentina, is also based on the following provision of the SCM Agreement:

> Article 6.3 "*Serious prejudice in the sense of paragraph (c) of Article 5 may arise in any case where one or several of the following apply:*
>
> ...
>
> *(d) the effect of the subsidy is an increase in the world market share of the subsidizing Member in a particular subsidized primary product or commodity as compared to the average share it had during the previous period of three years and this increase follows a consistent trend over a period when subsidies have been granted.*"

38. As regards the serious prejudice claim, Argentina proposes on the one hand to refer to the U.S. levels of domestic support for cotton, as detailed at paragraph 64 of Argentina's first Third-Party Submission of 15 July 2003. Thus, the US budgetary outlays for support for the cotton sector in marketing years 1999 to 2002 were US$3.445 million, 2.311 million, 4.093 million and 3.113 million respectively, according to data supplied by the USDA.[19]

39. Such being the US levels of domestic support for cotton, Argentina will now give the US level of cotton exports over that same period, in order to demonstrate that the effect of the subsidies has been to increase the US world export market share for cotton.

40. The US level of cotton exports in recent years – according to data drawn from a USDA report other than the documents on which Brazil based its Article 6.3(d) claim[20] – is as follows:

[17] Brazil's Further Submission, 9 September 2003, Section 3.3.4.8.1.

[18] Brazil's Further Submission, 9 September 2003, Section 3.3.5.

[19] See Exhibits Bra-6, Bra-76, Bra-4, Bra-57, Bra-55, Bra-47, and footnotes 301 and 321. The budgetary outlays for US cotton export credits and credit guarantees have not been taken into account.

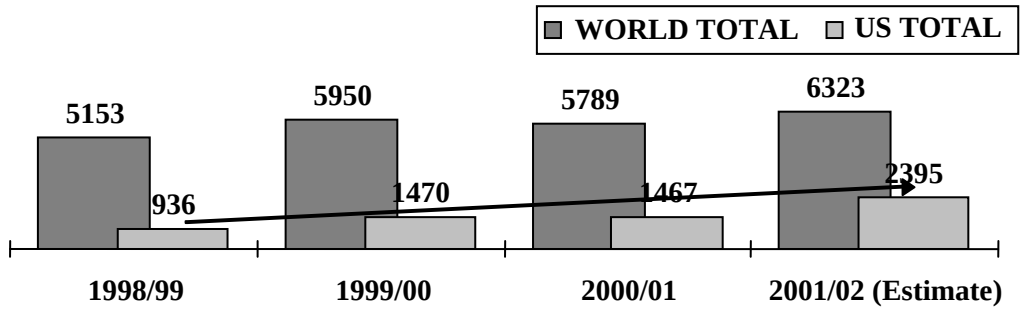
[20] *Cotton: World Markets and Trade*, USDA, March 2003, Table 1 (http://www.fas.usda.gov/export-sales/esrd1.html).

**COTTON EXPORTS**
**(in 1,000 metric tons)**

| | 1998/99 | 1999/00 | 2000/01 | 2001/02 (Estimate) |
|---|---|---|---|---|
| **WORLD TOTAL** | 5,153 | 5,950 | 5,789 | 6,323 |
| **US TOTAL** | 936 | 1,470 | 1,467 | 2,395 |
| **US WORLD SHARE (percentage)** | **18.16** | **24.70** | **25.34** | **37.87** |

41. In chart form, the US share of world cotton exports is as follows:

**WORLD AND US COTTON EXPORTS**
**(in 1,000 metric tons)**



42. Argentina thus contends that there has been an increase in the world market share of the United States as compared to the average share it had during the previous period of three years and that this increase has followed a consistent trend over a period when the subsidies have been granted, since the average world market share of the United States was 22.73 per cent between 1998/99 and 2000/01 and 37.87 per cent in MY 2001/02, recording **a more than 15 percentage point increase** over the average share during the immediately preceding three-year period.

43. In conclusion, Argentina asserts that, in the absence of subsidies, US cotton production would naturally have been lower than that actually recorded and consequently the volume of US exports and ultimately the impact of the US world market share would also have been smaller.

III.4 THREAT OF SERIOUS PREJUDICE: ARTICLE 6.3(C) AND (D)

44. Having established the existing serious prejudice caused by the US cotton subsidies, Argentina agrees with Brazil that the threat of serious prejudice is clearly foreseeable and imminent because of the effects of the even larger subsidies provided under US legislation for the MY 2003 2007 period.

45. As discussed in detail by Brazil,[21] the *marketing loan payments, crop insurance subsidies, CCP, direct payments* and *Step 2 Payments* programmes are mandatory in terms of the US budget for the MY 2003-2007 period, with no limitations on the volume of production and exports or on budgetary expenditure for cotton.

46. By way of example that confirms the above, and subsequently to Brazil's Further Submission, the USDA announced on 17 September 2003 that it would begin issuing counter-cyclical payments for final 2002-crop cotton.[22] The counter-cyclical payment rate for cotton is U$S303.09/ton. This is the amount by which the *target price* (U$S1,596.1/ton[23]) exceeds the *effective price* (the national average market price producers received or the *loan rate* – whichever is higher).

As can be seen from the table below, these payments represent a major portion of the price.

| | **Current price (US$/t)** | **Counter-cyclical payment rate (US$/t)** | **Percentage (counter-cyclical payments)** |
|---|---|---|---|
| **Cotton** | 1,235 | 303.09 | 24.54% |

47. Counter-cyclical payments for 2002-crop cotton are at their maximum levels because of this season's low market prices. In other words, the reason why counter-cyclical payments are so high is because this MY's prices are very low. The fact that the target price is maintained regardless of market price fluctuations confirms Argentina's point that US producers are insulated from such changes in market prices (see paragraph 5 above).

48. Argentina contends that this guaranteed flow of subsidies will undoubtedly lead to a higher level of US cotton production and exports. This will inevitably result in price suppression and depression as well as an increasing and inequitable US world market share for cotton, thus creating a source of permanent uncertainty that confirms the threat of serious prejudice generated by the subsidies.

49. Moreover, Argentina also agrees with Brazil[24] that the link between the US cotton subsidies and the threat of significant price suppression and depression and of an increase in the US world market share for cotton stems from the fact that that the future subsidies will be as necessary as the current ones for U.S. producers to bridge the gap between market prices and their total production costs. This will enable U.S. producers to continue competing with more efficient third-country producers, especially considering that the USDA forecasts an increase in total production costs.[25]

## II. CONCLUSION

50. In view of the foregoing, Argentina considers that the subsidies granted by the United States to the US cotton sector over the MY 1999-2002 period have caused and still cause serious prejudice to the interests of other Members, including Argentina, in that:

---

[21] Brazil's Further Submission, 9 September 2003, Section 4.2.

[22] USDA Release: *USDA ISSUES FINAL 2002-CROP UPLAND COTTON, RICE AND PEANUT COUNTER-CYCLICAL PAYMENTS.*

[23] *Monitoring and Evaluation 2003*, OECD.

[24] Brazil's Further Submission, 9 September 2003, Section 4.5.

[25] See Exhibits Bra-7 (ERS Data: Commodity Costs and Returns); Bra-257 (*Cost of Farm Production Up in 2003*, USDA, 6 May 2003) and Bra-82 (*USDA Agricultural Baseline Projections until 2012*, USDA, February 2003, p.48).

- They have a significant suppressing or depressing effect on international cotton prices, within the meaning of Articles 5(c) and 6.3(c) of the SCM Agreement; and

- they have the effect of increasing the U.S. world market share for cotton, within the meaning of Articles 5(c) and 6.3(d) of the SCM Agreement.

51. Furthermore, Argentina considers that the subsidies provided under US legislation for the MY 2003-2007 period threaten to cause serious prejudice to the interests of other Members, including Argentina, insofar as:

- they will have a significant suppressing or depressing effect on international cotton prices, within the meaning of Article 5(c), its footnote 13, and Article 6.3(c) of the SCM Agreement; and

- they will have the effect of increasing the US world market share for cotton, within the meaning of Article 5(c), its footnote 13 and Article 6.3(d) of the SCM Agreement.

52. Argentina accordingly requests the Panel to find that the aforementioned subsidies granted by the United States to the US cotton sector are inconsistent with Articles 5(c) and 6.3(c) and (d) of the SCM Agreement.

# ANNEX E-4

## FURTHER THIRD PARTY SUBMISSION OF BENIN
## THIRD PARTY SUBMISSION OF CHAD

3 October 2003

TABLE OF CONTENTS

## I. INTRODUCTION

1. This dispute marks the first time that either Benin or Chad – two least-developed, sub-Saharan African countries – have participated in a WTO dispute. Benin and Chad have taken this unprecedented step in response to the serious threat posed to their economic and social stability by massive, WTO-inconsistent US subsidies on upland cotton.

2. As indicated below, subsidies provided by the United States to its relatively small and prosperous group of cotton farmers exceed the gross national income of Benin, Chad, and every other country in the West African region.

3. Cotton plays a critical role in the economic development of West Africa. The cotton farmers of the region are highly vulnerable to changes in the world price of cotton. These small, subsistence farmers have no ability to influence the international cotton market – they are "price takers", not "price makers".

4. When US subsidies cause or contribute to a dramatic fall in world prices, the consequences for Africa are severe: hundreds of thousands of people are pushed from basic subsistence living to stark poverty.

## II. SERIOUS PREJUDICE UNDER THE SCM AGREEMENT

5. US subsidies have caused, and are causing, adverse effects to the interests of Benin and Chad within the meaning of Article 5(c) and 6.3 of the SCM Agreement. The United States has caused, and is causing, serious prejudice to the interests of Benin and Chad through the use of WTO-inconsistent subsidies on upland cotton. The serious prejudice to the interests of Benin and Chad arises because the effect of the US subsidies has been the significant price suppression and/or price depression for cotton in the same market, within the meaning of Article 6.3(c).[1]

6. Benin and Chad agree with Brazil that for the purposes of Article 6.3(c), the term "market" could encompass an individual country, a region, or the world market for cotton.[2] In addition, in the view of Benin and Chad, the Further Submission of Brazil has clearly established the causal link between US subsidies and suppressed prices in the world market.

7. Therefore, for the purposes of this Third Party submission, Benin and Chad accept that the causal link has been established by Brazil, and will focus instead on the impact of such suppressed prices on the economies and cotton sectors of Benin and Chad.

## III. THE COTTON SECTOR IN BENIN

8. Benin's Third Party Submission of 15 July 2003, provided the basic facts about its cotton sector. While Benin does not wish to repeat all of this information, it would recall that:

- cotton is the most important cash crop in the national economy, accounting for about 90 per cent of agricultural exports;

[1] As a threshold matter, upland cotton from Benin and Chad is clearly "like" US upland cotton within the meaning of Article 6.3. Benin and Chad agree with the analysis set out by Brazil in Part 3.3.2 of its Further Submission. Applying the tests set out in previous GATT and WTO cases, the Panel should have little difficulty in concluding that these are "like products".

[2] Further Submission of Brazil, paragraph 98.

- cotton has provided 75 per cent of the country's export earnings over the past four years;

- cotton generates a quarter of the country's revenues;

- a third of all households depend on the cultivation of cotton, and a fifth of wage-earning workers are employed in the cotton sector; and

- overall, about a million people in Benin – out of a population of six million – are dependent on cotton, or cotton-related activities.

## IV. THE COTTON SECTOR IN CHAD

9. Since Chad did not file an earlier submission, it takes this opportunity to provide the Panel with brief essential information about the national economy of Chad, and the cotton sector.

10. Chad, like Benin, is one of the poorest countries in the world. Of the 175 countries listed in the 2003 United Nations *Human Development Index*, Chad is ranked 165th.[3] It is estimated that 80 per cent of the population of Chad lives on less than US $1 per day. Average life expectancy is 48 years. Nearly a third of all children in Chad under the age of five suffer from chronic malnutrition.[4]

11. The cotton-producing region of Chad is located in the southern part of the country, in an area covering about 127,000 square kilometres. Cotton is generally grown on small farms, usually no more than one or two hectares. Farmers have to rely on rain for irrigation and animals for traction when working the cotton fields during the sowing season.

12. Cotton production in Chad affects approximately 1.5 million people, out of a total population of about 8.1 million.[5] Cotton exports account for 5.1 per cent of GDP in Chad, and represents 25 per cent of all exports.[6] Cotton is therefore one of Chad's main sources of income, and sustains the livelihood of a large portion of its population.

13. A recent World Bank report on the cotton sector in Chad stated that:

> "*Revenue from cotton constitutes the only source of community development for villages in the cotton-producing area to meet their needs and improve their quality of life* [original emphasis]....[C]otton payments are received in two ways: as individual lump sums and as rebates/ balances (restourne), *depending on the realized level of prices internationally* [emphasis added]. Rebates constitute the only source farmers have to invest in village-level public goods such as schools, health centres, credit

[3] *Human Development Report 2003*, United Nations Development Programme, http://undp.org/hdr2003.

[4] *Chad at a Glance*, World Bank Group, 20 August 2003.

[5] According to the World Bank, there are roughly 400,000 farm households in the cotton-producing areas of Chad, of which about 60 per cent grow cotton. An average farm household has 5 to 6 people. World Bank, *Chad Cotton Sector Reform: A Case Study on Poverty and Social Impact Analysis*. Document available at http://poverty.worldbank.org/files/13138_chadcottonreform.pdf

[6] P. Fortucci, *The Contributions of Cotton to Economy and Food Security in Developing Countries*. Food and Agriculture Organization of the United Nations. July 2002.

> institutions, storage facilities, clean water pumps and wells, *radiers* to limit village isolation during rainy season, and so forth."[7]

14. Rather more succinctly, the World Bank observed that: "Cotton was introduced in Chad during the colonial period and has dominated the economy since then."[8]

## V. US COTTON SUBSIDIES – SERIOUS PREJUDICE TO BENIN AND CHAD

15. Brazil's Further Submission of 9 September 2003 provides compelling evidence of the serious prejudice Brazil has sustained as a result of massive, WTO-inconsistent cotton subsidies. Yet the serious prejudice to the countries of West Africa, including Benin and Chad, has been far worse.[9]

16. The subsidies paid by the United States to its relatively prosperous 25,000 cotton farmers dwarf the economies of West Africa. As indicated in Benin's Third Party submission of 15 July US cotton subsidies exceed the gross national income of Benin (population 6 million), as well as Chad (population 8 million).

17. US cotton subsidies also exceed the gross national income of Burkina Faso (11 million), Mali (11 million), Togo (5 million) and the Central African Republic (4 million). As the respected international NGO Oxfam noted, "no region is more seriously affected by unfair competition in world cotton markets than sub-Saharan Africa".[10]

18. The Oxfam report notes that:

> "Central and West African countries have suffered far graver injury than any other developing region….The crop…occupies a pivotal position in the macro-economy of many countries….[Cotton] exports are a vital source of foreign exchange, financing essential imports such as food, fuel, and new technologies. They also underpin government revenues, providing the funds needed to invest in health and education….
>
> High levels of poverty and limited government provision of basic services make Central and West Africa acutely vulnerable to adverse trends in world prices. Falling world prices mean that farmers have less to spend on health, education, and investment. Wages for agricultural labour also decline, as does the government's capacity to provide basic social services.
>
> Prospects for economic growth – a key requirement for poverty reduction – have also been damaged."[11]

19. The Oxfam report – using data from the International Cotton Advisory Committee - estimates that in 2001 alone, sub-Saharan exporters lost $302 million as a direct consequence of US cotton subsidies. It notes that Benin's actual cotton export earnings in 2001/02 were $124 million.

---

[8] *Id*.

[9] Benin and Chad also welcome, and endorse, the arguments set out in Part 7 of Brazil's Further Submission, "Serious Prejudice to the Interests of African Countries by Reason of the US Subsidies on Upland Cotton."

[10] *Cultivating Poverty: The Impact of US Cotton Subsidies on Africa*. Oxfam Briefing Paper 30. 27 September 2002. Brazil has filed the full Oxfam report as exhibit Bra-15.

[11] *Id*., pages 8-9.

However, had US subsidies been withdrawn, Benin's export earnings are estimated to have been $157 million. Therefore, the value lost to Benin as a result of US subsidies was $33 million.[12]

20. Chad's cotton export earnings in 2001/02 were $63 million, although in the absence of US subsidies, Chad would have earned $79 million, thus reflecting a loss of $16 million.[13]

21. For the period from 1999/2000 to 2001/2002, Oxfam estimates a total cumulative loss of export earnings of $61 million for Benin and $28 million for Chad.[14] As Oxfam rightly emphasizes, "the small size of several West African economies and their high levels of dependence on cotton inevitably magnify the adverse effects of US subsidies. For several countries, US policy has generated what can only be described as a major economic shock".[15]

22. Indeed, for the subsistence cotton farmers of Benin and Chad, already highly vulnerable to fluctuations in the world price of cotton, the price suppression caused by US subsidies can and does have a highly destabilizing effect. According to the empirical data analyzed by two US economists, Nicholas Minot of the International Food Policy Research Institute and Lisa Daniels of Washington College:

> "*A 40 per cent reduction in farm-level prices of cotton is likely to result in a reduction in rural per capita income of 7 per cent in the short-run and 5-6 per cent in the long-run. Furthermore, poverty rises 8 percentage points in the short-run, equivalent to an increase of 334 thousand in the number of individuals in families below the poverty line*. In the long run, as households adjust to the new prices, the poverty rate settles down somewhat, remaining 6-7 percentage points higher than originally….
>
> Overall, the results in this paper challenge the stereotype of the rural poor in developing countries as consisting of subsistence farmers that are relatively unconnected to, and thus unaffected, by swings in world commodity markets. At least in the case of Benin, *to the extent that fluctuations in world cotton prices are transmitted to farmers, they will have a significant effect on rural incomes and poverty.*"[16] [emphasis added]

23. Thus, as the Minot/Daniels paper indicates, a drop in world cotton prices of 40 per cent pushes an additional 334,000 people below the poverty line in Benin. Moreover, the Minot/Daniels study adopted a *relative* poverty line, equivalent to US$123 per person per year, far below the US$1 per day used by the World Bank. [17]

24. The Minot/Daniels paper describes what this means in human terms. The detailed household surveys carried out in Benin describe the living conditions for cotton farmers:

- 85 per cent of the cotton farmers in Benin have houses with mud or mud-brick walls.
- 62 per cent live in houses with a dirt floor.

[12] *Id*., page 17-18.
[13] *Id*., page 17-18.
[14] *Id*., page 32.
[15] *Id*., pages 17 and 32.
[16] Nicholas Minot and Lisa Daniels, *Effect of Falling Cotton Prices on Rural Poverty in Benin*. Exhibit BEN-CHA 1, paragraphs 36 and 38.
[17] *Id*., paragraph 13.

- 72 per cent have corrugated metal roofs and 28 per cent have straw roofs.
- 53 per cent of the cotton farmer households get drinking water from a public well, while another 18 per cent use water from a river or lake.
- Less than 2 per cent have electric lights, and 98 per cent use oil or kerosene lamps.
- On average, the nearest source of potable water is 430 m away, and the nearest paved road is 36 km away.
- About 34 per cent of the cotton farmers do not own a chair, 38 per cent do not own a table, and 34 per cent do not own a bed.[18]

25. Needless to say, farmers living in such conditions are "price takers", not "price makers" in the global cotton market.

26. While comparable household surveys have not been conducted in Chad, conditions in Chad are, if anything, worse than in Benin. Moreover, as in Benin, the cotton farmers of Chad are highly vulnerable to changes in the international price of cotton.

27. Yet despite this situation of poverty, cotton farmers in both Benin and Chad are, and remain, efficient producers. As noted in Benin's submission of 15 July the cost of producing cotton in West Africa is 50 per cent lower than comparable costs in the United States. Indeed, a recent World Bank Policy Research Working Paper found that West African countries were among the world's lowest cost producers of cotton.[19]

28. Moreover, as Benin noted in its Submission of 15 July the IMF reported that Benin's reform process in the cotton sector is among the most advanced in the region. However, to re-iterate a key point of Benin's earlier submission, these economic efficiencies have been vitiated by the plunge in world cotton prices caused in no small part by US subsidies.

29. Similarly, since 1999, Chad has undertaken major reforms in its cotton production system. The aim of these reforms has been to improve production and productivity with a view to generating supplementary income, which could then be used to reduce widespread poverty in cotton-growing areas, and indeed in the country as a whole. The method for achieving this goal is a progressive liberalization of the cotton industry, similar to methods employed in other African cotton-producing countries.

30. However, as in Benin, the reforms in Chad are being seriously undermined by huge US subsidies. As stated by the World Bank:

> This analysis[20] appears to be all the more urgent today, given the current situation on the international market and the low price of cotton deriving from the recently-introduced US subsidies. These can have the effect of thwarting the reform and of having a considerable social and poverty impact. *Unless the international situation*

[18] *Id*., paragraph 23.

[19] *Cotton Sector Strategies in West and Central Africa*. World Bank Policy Research Paper 2867, July 2002, page 9. Brazil has filed this Working Paper as exhibit Bra-265.

[20] The report's analysis was: "the findings … suggest that privatisation and liberalization will not automatically lead to price competition nor will they automatically solve some of the structural problems that plague the current cotton system in Chad".

> *changes and the US subsidies are removed, any liberalization and privatization of the cotton sector is unlikely to be successful.* [original emphasis].[21]

31. The World Bank Policy Paper adds that:

> "…subsidies to cotton farmers in major cotton producing countries increase artificially the supply in international markets and depress export prices for WCA [West and Central Africa] countries. Downward pressures on export prices have been exacerbated by generous (and in the case of the United States, rapidly increasing) subsidies for cotton production in the United States, China and the European Union."[22]

32. The Policy Paper ultimately concluded that:

> "Removal of these subsidies would benefit WCA countries, and allow them to better exploit their comparative advantage in cotton production for growth and poverty reduction."[23]

## VI. CONCLUSION

33. On 10 June 2003, the President of Burkina Faso, H.E. Blaise Compaoré, presented the joint proposal on cotton to the Trade Negotiations Committee on behalf of Benin, Burkina Faso, Chad and Mali.[24] In presenting the proposal, President Compaoré remarked that:

> "More than ten millions of people in West and Central Africa directly depend on cotton production, and several other millions of people are indirectly affected by the distortion of world market prices due to production and export subsidies to this agricultural product….
>
> While cotton accounts for only a small portion of economic activity in industrialized countries, in all our States, it represents a determining and critical factor for poverty reduction policies as well as for political and social stability. Through induced effects on infrastructure development, education and basic health services, cotton production acts as an essential link within our countries' development strategies….
>
> Arguments in favour of sector-based modalities for cotton are straightforward: *our countries are not asking for charity, neither are we requesting preferential treatment or additional aid. We solely demand that, in conformity with WTO basic principles, the free market rule be applied. Our producers are ready to face competition on the world cotton market – under the condition that it is not distorted by subsidies.*"[25] [emphasis added]

34. Similar remarks were made following the Cancun Ministerial by Dr. Kipkorir Aly Azad Rana, a Deputy Director-General of the WTO. Speaking to the Second East African Business Summit in Kenya (18-21 September 2003), he stated that:

[25] WTO News: Address by President Blaise Compaoré to the Trade Negotiations Committee, 10 June 2003. www.wto.org.

> "A strong call for action in addressing subsidy issues in cotton was made earlier this year by Benin, Burkina Faso, Mali and Chad….West African negotiators put the spotlight, before and at Cancún, on cotton subsidies leading to overproduction by less efficient farmers in rich countries and depressing global market prices….The countries who brought this issue to the table do not have a broad range of export possibilities to choose from, but in cotton, they produce high quality merchandise at competitive prices. In recognition of the benefits of export-led growth for development, they have turned, at the highest level, to the WTO. *They do not ask for aid, which is the World Bank's remit, nor do they make political appeals that belong to the United Nations. They have just asked that WTO rules and disciplines apply also in sectors of interest to the poor - that a fair and market-oriented system be established in agriculture and that rich countries' wasteful export and production subsidies be abolished and cease to undermine their comparative advantage*." [26] [emphasis added]

35. Both President Compaoré and Deputy Director General Rana were speaking about WTO negotiations, not dispute settlement. Yet their messages are equally valid for the purposes of this Panel proceeding. In this dispute, Benin and Chad are not seeking charity or preferential treatment. Similarly, Benin and Chad do not wish to make political appeals.

36. In the context of this proceeding, Benin and Chad ask the Panel simply to find that the United States must adhere to the WTO rules and disciplines on subsidies that it accepted at the conclusion of the Uruguay Round. This includes the clear prohibition in Part III of the SCM Agreement against causing serious prejudice to the interests of other Members. US subsidies on upland cotton have demonstrably caused serious prejudice to the interests of Benin and Chad by suppressing world prices for upland cotton. The results have been devastating for West Africa.

37. Benin and Chad therefore respectfully request the Panel to grant the relief requested by Brazil in Part 9 of its Further Submission.

# Effect of falling cotton prices on rural poverty in Benin

**Summary**

This paper combines farm survey data from Benin with assumptions about the decline in farm-level prices to estimate the direct and indirect effects of cotton price reductions on rural income and poverty in Benin. The results indicate that there is a strong link between cotton prices and rural welfare in Benin. A 40 per cent reduction in farm-level prices of cotton results in an increase in rural poverty of 8 percentage points in the short-run and 6-7 percentage points in the long run. The short-run impact is equivalent to an increase of 334 thousand in the number of individuals in families below the poverty line.

The results in this paper challenge the stereotype of the rural poor in developing countries as consisting of subsistence farmers that are relatively unconnected to, and thus unaffected, by swings in world commodity markets. At least in the case of Benin, to the extent that fluctuations in world cotton prices are transmitted to farmers, they will have a significant effect on rural incomes and poverty.

**Introduction**

1. From January 2001 to May 2002, world cotton prices fell almost 40 per cent, from 64 cents per pound to 39 cents/pound[1]. Since then, prices have rebounded to about 60 cents/pound, but cotton prices still show a long-term downward trend from the mid-1990s when cotton prices were over 80 cents/pound (see Figure 1). One reason for the long-term decline is that world demand for cotton has been stagnant at 20 million tons since the mid-1990s, in part due to competition with synthetic fibers. Short-term fluctuations in cotton prices are often driven by shifts in the net trade of China, the largest cotton producer and consumer in the world.

2. In addition to these two effects, cotton prices are pushed below what they otherwise would be by government support to cotton growers. The International Cotton Advisory Committee (ICAC) estimates that world-wide direct assistance to cotton growers was US$ 4.9 billion in 2001/02. Of this amount, the United States accounted for US$ 2.3 billion, equivalent to 24 cents per pound of cotton produced. Other sources, using a broader definition of assistance, estimate that the government provides US$ 3.9 billion to the cotton sector (Oxfam, 2002). Until 2002, US cotton policy consisted of various programs[2], including two (the marketing loan program and loan deficiency payments) that ensure that farmers receive at least 52 cents/pound. This has the effect of insulating US farmers from the falling world prices. In 2001, in spite of low world prices, the US posted record cotton production and near-record export volumes. Furthermore, US subsidies to cotton have increased since these studies were carried out. The 2002 Farm Bill introduced target prices for the major commodities and programs that effectively pay farmers most of the difference between market prices and the target price. For upland cotton, the target price is 72 cents/pound. In addition, by allowing farmers to update their "base acreage", the new policy provides incentives for farmers to expand production[3].

3. Several recent studies have attempted to assess the impact of subsidies on world prices. The Centre for International Economics in Canberra uses a five-region world model of fibre, textile, and garment markets in 2000-01 to simulate the impact of US and European subsidies on cotton production and export. They find that removing US and European subsidies to cotton growers would raise the world cotton price by 6 cents/pound or 11 per cent. Another study, carried out by ICAC, estimates that removing US production subsidies would have increased the world price by 11 cents/pound in 2001/02 (ICAC, 2002). And most recently, Sumner (2003) estimates that, in the

[1] These prices are based on the A-Index cotton price, calculated as the average of the five lowest prices for US cotton in Northern European markets based on a grade of middling 1-3/32 inch fibre length.

[2] The 1996 Farm Bill introduced production flexibility contract (PFC) payments, which were related to historical (not current) production and would decline over time as part of an effort to phase out farm subsidies. PFC payments to cotton farmers fell steadily from US$ 700 million in 1996 to US$ 474 million in 2002. Loan deficiency payments and marketing loan gains are, on the other hand, tied to current output and market prices. Low commodity prices over the last 3-4 years have sharply increased the cost of these programs. Payments to cotton growers were negligible in 1997, but rose to US$ 1.5 billion in 1999 and almost US$ 2.5 billion in 2002. In addition, Congress has authorized ad hoc market loss assistance (MLA) payments almost annually. MLA payments to cotton farmers were US$ 600 million in 1999 and US$ 650 million in 2002. Cotton exporters and US mills also receive roughly US$ 200 million per year in "Step 2" payments, designed to keep US cotton exports competitive (USDA, 2002b and Oxfam, 2002).

[3] The 2002 Farm Bill introduces two new commodity programs: direct fixed payments and counter-cyclical payments. In the case of upland cotton, the fixed direct payment is set at 6.7 cents/pound and is paid on the basis of 85 per cent of the "base acreage". The counter-cyclical payments involve payments of up to 13 cents/pound on 85 per cent of the base acreage depending on the gap between the market price (or the loan rate, whichever is higher) and the target price. These programs replace the production flexibility contract system and (supposedly) eliminate the need for the market loss assistance. The marketing loan and loan deficiency payments continue under the new Farm Bill with the same loan rate: 52 cents/pound for upland cotton. In addition, farmers are allowed to update their base acreage, providing them incentive to maintain or increase acreage in the event future opportunities to update acreage (USDA, 2002c).

absence of US subsidies, the world cotton price would have been 12.6 percent higher over 1999-2002. This estimate is probably the most authoritative because it takes into account the 2002 Farm Bill, it incorporates a detailed treatment of various US subsidy programs, and it uses a standard modelling framework and parameter estimates.

4. The World Bank estimates that removing US cotton subsidies would generate US$250 million per year in additional revenues for West African cotton farmers (Badiane et al, 2002). An Oxfam report calculates the losses to three West African nations at 1-2 per cent of gross domestic product. It points out that, in Mali and Benin, losses in export revenue associated with US cotton subsidies are greater than US development assistance to those countries (Oxfam, 2002).

5. The adverse impact of lower cotton prices on export revenue and GDP in cotton exporting nations is clear, but does this translate into higher incidence of rural poverty? If cotton is grown mainly by larger farmers with relatively high incomes, then the effect of changes in cotton prices on rural poverty may be modest. Even if cotton is grown primarily by small farmers, the magnitude of the effect on rural poverty will be small if few farmers grow cotton or if it accounts for a small share of rural income. Assessing the direct impact of changes in cotton prices on rural poverty requires detailed household-survey data on incomes and expenditures.

6. This paper examines the impact of changes in cotton prices on rural poverty in Benin. In particular, it has two objectives:

- to describe the living conditions and level of poverty for cotton growers and other farmers in Benin; and

- to estimate the short- and long-run impact of lower cotton prices on the income of cotton growers and on the incidence of poverty in rural Benin.

**Background**

7. The Republic of Benin is a small West African nation of about 6.0 million inhabitants, 59 per cent of whom live in rural areas. Its rural economy is based on maize, sorghum, millet, yams, cotton, and livestock production. The per capita gross national product is US$ 380, placing Benin among the poorest 20 per cent of countries. The per capita income of Benin is lower than the average for sub-Saharan Africa (World Bank, 2000).

8. In 1989, Benin entered a period of economic and political reform. Elections were held in which the military government was voted out of office, and Benin entered into the first of several structural adjustment programs with the International Monetary Fund and the World Bank. In the agricultural sector, state farms and cooperatives were disbanded, food crop prices and marketing were liberalized, and many state-owned enterprises, including agro-processing enterprises, were privatized or closed (République du Benin, 1997). In January 1994, the CFA franc (FCFA) was devalued by 50 per cent, effectively doubling the price of imports and the returns to exports. Although this imposed hardship on manufacturing firms and consumers that had become accustomed to cheap imports, it stimulated the local production of cotton, rice, and other tradable goods.

9. Although the cotton sector benefited from the 1994 devaluation, structural reform in cotton marketing was limited. The cotton sector in Benin remained under the control of the state-owned *Societé Nationale pour la Promotion Agricole* (SONAPRA). In the past two years, Benin has begun to implement reforms to reduce the role of SONAPRA and introduce competition in the distribution of inputs and the marketing of cotton. The fall in world cotton prices has led to political pressure for the government to support the domestic price or even to re-assume control of the sector to protect

farmer interests. According to ICAC (2002), the government provides modest support for the cotton price, equivalent to 5 cents/pound. Currently, cotton represents 90 percent of agricultural exports and 60-70 per cent of its total exports (excluding re-exports[4]).

10. The economic reforms carried out in the 1990s and the growth in cotton production during this period resulted in concrete benefits for rural households. The 1994-95 *Enquête sur les Conditions de Vie en Milieu Rural* (Survey on Living Conditions in Rural Areas) estimated the poverty rate at 33 per cent (UNDP-MDR, 1996: 13). Adopting a similar definition of expenditure and the same poverty line (adjusted for inflation), the poverty rate in the 1998 survey had fallen to 21 per cent. Qualitative questions in the latter survey appear to support the view that rural conditions improved in the 1990s. According to the IFPRI-LARES survey, 52 percent of the households reported that they were better off at the time of the survey (1998) than in 1992 and only 28 per cent reported being worse off . Furthermore, those reporting improvement tended to attribute these gains to economic factors such as crop prices and off-farm income opportunities, while those reporting worsening conditions tended to cite health and weather factors. Cotton farmers, those in the north of the country, and poor households were more likely to report improved conditions than others. (IFPRI, 2001)

11. These results suggest that there is a strong link between market-oriented policies and cotton expansion on the one hand and the living conditions of farmers in Benin on the other hand. The analysis presented in this paper will further examine this link, focusing on the impact of changes in cotton prices on rural income and poverty.

**Methods**

12. The data used in this paper come from the *Enquête des Petits Agriculteurs* (EPP) or Small Farmer Survey, carried out in 1998 by the International Food Policy Research Institute (IFPRI) and the *Laboratoire d'Analyse Régionale et d'Expertise Sociale* (LARES). The survey used a 24-page questionnaire, divided into 16 sections[5]. The households were selected using a two-stage stratified random sample procedure based on the 1997 Pre-Census of Agriculture. In each of the six departments[6], villages were randomly selected, with the number of villages proportional to the volume of agricultural production, subject to a minimum of 10 villages per department. In total, one hundred villages were selected. In each village, nine households were randomly selected using household lists prepared for the pre-Census of Agriculture. The survey was carried out from August to November 1998. In a few villages, the number of interviewed households was eight or ten, resulting in a final sample size of 899 agricultural households. Sampling weights are used in calculating the results presented here (see IFPRI, 2001 for more detail).

13. In this study, we adopt a *relative* poverty line, set at the 40$^{th}$ percentile of per capita consumption expenditure. Per capita expenditure is calculated as cash expenditure on consumption goods, the imputed value of home-produced food, and the rental equivalent of owner-occupied housing. The resulting poverty line is equivalent to US$ 123 per person per year. It is worth noting that this poverty line is far below the US$ 1 per day frequently used by the World Bank.

[4] Re-exports of manufactured goods to Nigeria and other countries accounts for a large share of total exports.

[5] The 16 sections are household characteristics, housing characteristics, land, agricultural production, labour use, input use, changes regarding input use, credit, crop marketing, storage, sources of information, food and non-food consumption, allocation of time, asset ownership, sources of income, and perceptions of farmers.

[6] Since this study was carried out, an administrative reorganization has resulted in an increase in the number of departments from 6 to 12. The analysis in this report retains the old definitions of departments because this was the basis for the sampling design of the survey.

14. We simulate the impact of various percentage reductions in cotton prices on the incomes of rural households. In the short run (before the household responds to lower prices), the change in income of each household is simply the change in the value of cotton production, assuming the farmer grows the same amount of cotton. This can be calculated as follows:

$$y_{1i} - y_{0i} = (Q_{ci}\Delta P_c)/H_i \quad (1)$$

where $y_{1i}$ is per capita income[7] of household i after the shock, $y_{0i}$ is per capita income before the shock, $Q_c$ is the quantity of cotton produced by household i, $\Delta P_c$ is the change in the price of cotton, and $H_i$ is the number of members in household i.

15. In the long run, lower cotton prices will lead farmers to substitute away from cotton and reduce input use, so the long-run direct impact is smaller than the short-run direct impact of the change in cotton prices. In this analysis, we use the concept of producer surplus to measure the welfare impact of the change in cotton price. This is calculated using the following equation:

$$y_{1i} - y_{0i} = (Q_{ci}\Delta P_c)/H_i + \left(\frac{1}{2}(\Delta P_c)^2 \varepsilon_c \frac{Q_{ci}}{P_c}\right)/H_i \quad (2)$$

where $\varepsilon_c$ is the general equilibrium supply elasticity of cotton and Pc is the price of cotton[8].

16. In the absence of estimated elasticities of supply for cotton in Benin, we use a range of plausible elasticities to calculate the range of plausible welfare impacts[9]. The elasticities used are 0.5, 1.0, and 1.5. As in the analysis of the short-run effect, we simulate the impact of these changes on the income of each household in the sample (micro-simulation) in order to estimate the impact on different types of households in terms of income and poverty.

17. The simulations are run with farm-level reductions in cotton price ($\Delta P_c$) of 10%, 20%, 30%, and 40%. The other variables ($y_{oi}$ and $Q_{ci}$ ) are all defined at the household level, allowing the changes in per capita income to be calculated for each household in the sample. This "micro-simulation" approach allows us to estimate the change in income for any sub-group in rural areas, defined by income, farm-size, or other variables.

18. The impact of price changes on poverty is measured using the Foster-Greer-Thorbecke measures of poverty[10], the most widely used of which are known as $P_0$, $P_1$, and $P_2$. $P_0$ is just the

[7] As mentioned above, we use per capita expenditure as a proxy for per capita income

[8] This expression is more accurate for small changes in price than large ones. These are third-order effects in that they would be captured by the third term in a Taylor-series expansion. It will be shown later that the results are not very sensitive even to second-order effects (alternative assumptions about supply elasticities).

[9] Two studies have estimated the supply elasticity of cotton in Tanzania. Dercon (1993) estimated an elasticity of 0.63, while Delgado and Minot (2000), using more recent data, obtained an estimate of 1.0.

[10] The Foster-Greer-Thorbecke measures of poverty are calculated as

$$P_\alpha = \frac{1}{N}\sum_i \left[\frac{\mu - y_i}{\mu}\right]^\alpha$$

where $P_a$ is the poverty measure, N is the number of households, $\mu$ is the poverty line, and $y_i$ is the income or expenditure of poor household i (the summation occurs only over poor households). When $\alpha$=0, the poverty measure, $P_0$, is the incidence of poverty, that is, the proportion of households whose income is below the poverty line. When $\alpha$=1, the poverty measure, $P_1$, is the poverty-gap measure. The poverty gap is equal to the incidence of poverty multiplied by the average gap between the poverty line and the income of a poor household, expressed as a percentage of the poverty line. Thus, it takes into account the depth of poverty as

proportion of the population below the poverty line. $P_1$, sometimes called the poverty gap measure, takes into account how far below the poverty line the poor are, on average. And P2, sometimes called the poverty gap squared, takes into account the degree of inequality among poor households, giving greater weight to extreme poverty.

**Characteristics of Cotton Farmers in Benin**

19. Before estimating the impact of changing cotton prices on rural households, it is useful to describe the role of cotton in the rural economy and the characteristics of cotton growers. According to the IFPRI-LARES Small Farmer Survey, cotton is grown by roughly one third of the farm households. Cotton accounts for about 18 per cent of the area planted by farm households and 22 per cent of the gross value of crop production. In value terms, cotton is the second most important crop, after maize. Among cotton farmers, the average area planted with cotton is 2.3 hectares, producing 2.7 tons of seed cotton[11]. The value of this output is US$ 901 per cotton farm[12].

20. Another measure of the importance of cotton in the rural economy is its contribution to cash income. Farmers in Benin are quite market oriented, selling over half the output of cowpeas, groundnuts, manioc, and sweet potatoes, and selling almost half of the output of the "staple" foodcrop, maize. Nonetheless, cotton accounts for about one-third of the value of crop sales carried out by farm households in Benin (IFPRI, 2002).

21. Who are the cotton growers in Benin and how do they differ from other farmers? As mentioned earlier, cotton production is concentrated in the north and center of Benin. About two-thirds of the farmers in the large northern department of Borgou grow cotton, as do 37 per cent of those in nearby Atacora and 64 per cent of those in the central department of Zou. By contrast, in the three departments in the south (Atlantique, Mono, and Ouémé), the percentage ranges from zero to 25 per cent. If we divide the farm households into quintiles, the proportion of farmers growing cotton does not seem to vary consistently across quintiles. If anything, the proportion of cotton growers is lower (28 per cent) in the richest quintile (see Table 1).

22. Cotton growers tend to have farms that are, on average, twice as large as those of non-growers (5.3 hectares compared to 2.3 hectares). Nonetheless, cotton growers are similar to other farmers in terms of various measures of well-being. The incidence of poverty rate is slightly lower among cotton farmers (37 per cent) than among other farmers (42 percent), but the per capita expenditure of cotton growers is about 8 per cent lower than that of others, and the budget share allocated to food is almost identical to that of non-growers (see Table 2). The reason that the larger farms do not translate into a higher standard of living is that cotton growers are concentrated in the more arid north, where the agricultural potential is lower and where there are fewer opportunities for non-farm employment.

23. To give a more concrete idea of the living standards of cotton growers, it is useful to describe some indicators of living conditions, according to the farm surveys:

---

well as the percentage of the households that are poor. If $\alpha=2$, then the poverty measure, $P_2$, takes into account the degree of inequality among poor households, as well as the depth of poverty and the number of poor households. $P_2$, sometimes called the poverty-gap squared, will be referred to as a measure of the severity of poverty (see Foster, Greer, and Thorbecke, 1984).

[11] It is worth noting that the average yield is calculated at the household level and aggregated, so it is not necessarily equal to the average quantity divided by the average area. A similar qualification applies to production, price, and value of output.

[12] When the Small Farmer Survey was carried out, the exchange rate was around 630 FCFA/US$, so that the value of cotton production was US$ 901 per cotton farm.

- 85% of the cotton farmers in Benin have houses with mud or mud-brick walls,
- 62% live in houses with a dirt floor,
- 72% have corrugated metal roofs and 28% have straw roofs,
- 53% of the cotton farmer households get drinking water from a public well, while another 18% use water from a river or lake,
- Less than 2 percent have electric lights,
- On average, the nearest source of potable water is 430 m away, and the nearest paved road is 36 km away,
- About 34% of the cotton farmers do not own a chair, 38% do not own a table, and 34% do not own a bed.

These figures are fairly typical of farmers in Benin. Thus, it is not that cotton farmers are poorer than average, but rather that almost all farmers in Benin, including cotton farmers, are quite poor.

**Effect of lower cotton prices**

24. In this section, we use the data from the IFPRI-LARES Small Farmer Survey to estimate the impact of lower cotton prices in Benin. First, we examine the impact of lower prices on the income and poverty of cotton farmers in the short-run, before they have an opportunity to respond to the lower prices. Next, we estimate the impact on cotton farmers in the longer run, after they have responded to the shock of reduced prices.

**Short-term direct effects of lower cotton prices**

25. As described earlier, we estimate the short-term change in income associated with lower cotton prices using household-level information on per capita expenditures and the volume of cotton production, combined with different assumptions about the reduction in cotton price. A 40 per cent reduction in the farm-gate price of cotton reduces the income of cotton growers 21 per cent. Taking into account the incomes of non-growers, which do not change in this simulation, the average income falls 7 per cent. Smaller reductions in the cotton price cause roughly proportionate changes in income (see Table 3).

26. With a 40 per cent fall in the cotton price, the average incidence of poverty, including both cotton growers and other farmers rises 8 percentage points, from 40 per cent to 48 per cent (see Table **3**). In absolute terms, this implies that about 334 thousand people would fall below the poverty line as a result of a 40 per cent reduction in cotton prices.[13] A 40 per cent decrease in the price of cotton results in a 40% increase in the poverty gap for all farm households in Benin, while the poverty gap squared ($P_2$) or severity of poverty increases 61 per cent.

27. This analysis can be broken down by department to evaluate regional differences in the impact of falling cotton prices[14] (see Table 3). In Atlantique and Ouémé, the reduction in cotton prices has negligible effects on income and poverty because there are virtually no cotton farmers in these departments. On the other hand, the impact on the departments of Borgou and Zou are large. In Zou, a 40 per cent reduction in cotton prices results a 15 percent fall in per capita income and a 17 percentage point increase in the incidence of poverty. In Borgou, the same decrease in cotton

[13] This estimate is obtained by multiplying the percentage point increase in poverty (.08), the number of farm households in Benin based on the sum of the sampling weights (474,964), and the average household size of farms in Benin according to the survey (8.8).

[14] As mentioned earlier, since the survey was carried out, the number of departments has increased from 6 to 12. The sample size of the survey is too small to allow disaggregation of results by the newly defined departments.

prices causes an 18 per cent reduction in per capita income and a 18 percentage point increase in the incidence of poverty. In fact, the department of Borgou moves from having an "average" poverty rate (greater than in two departments and less than in two others) to having the highest incidence of poverty, 62 per cent. Similarly, the poverty-gap ($P_1$) in Borgou increases by a factor of three and the severity of poverty ($P_2$) doubles as a result of the 40 percent reduction in cotton prices.

28. Finally, we look at the effect of falling cotton prices on the cumulative distribution of income per capita (see Figure 2). Among other things, it gives us information about the sensitivity of the results to alternative poverty lines, an important consideration given that our poverty lines is relative (set at the 40$^{th}$ percentile in the base distribution). The point where the cumulative distribution cross the poverty line is the poverty rate (note that the base distribution cross the poverty line at the 40$^{th}$ percentile). It is clear from the graph that similar results would have been obtained for higher and lower poverty lines.

**Long-term direct effect of lower cotton prices**

29. Because of uncertainty regarding the supply elasticity of cotton, we carry out this analysis using three elasticities: 0.5, 1.0, and 1.5. In order to simplify the discussion, we present only the impact of a 40 percent reduction in cotton prices. These results are presented with the base levels and with the short-run impact. Since the assumption behind the short-run impact is that the supply elasticity is zero ($\varepsilon$=0)., they are labelled as such.

30. As described earlier, the short-run impact of the lower cotton price is to reduce average per capita income by 7 per cent. If the general equilibrium supply elasticity of cotton is 0.5, the average income after the price reduction falls 6 percent from the base. At the other extreme, if the supply elasticity is 1.5, then the average income falls 5 per cent from the base (see Table 4 ).

31. In the long run, a reduction of 40 percent in the price of cotton is associated with a 6-7 percentage point increase in the overall rural poverty rate, depending on the assumption regarding the supply elasticity. The poverty gap measure ($P_1$) rises from 0.10 to 0.12 - 0.13, again depending on the elasticity assumption. And the poverty gap squared ($P_2$) increases from 0.036 to 0.047 - 0.058 (see Table 4). As expected, the long-run impact of the 40 per cent reduction in cotton prices is somewhat less adverse than the short-run impact. It is notable, however, that the results are not very sensitive to the elasticity assumption.

32. The long-run effects on each department are given in Table 4. For example, in Borgou, per capita income falls 18 percent in the short-run, but rebounds 4 percentage points if the supply elasticity is 1.0 and 7 percentage points if the elasticity is 1.5. Similarly, the per capita income in Zou falls 15 per cent in the short-run, but rebounds 3 percentage points in the long-run if the elasticity is 1.0.

33. The poverty rates in each department follow the same pattern in reverse. In the short-run, they rise as a result of the 40 percent fall in cotton prices, but in the long-run they fall back down part of the way. In Borgou, the poverty rate rises from 44 per cent to 62 per cent in the short run, falling back to 58-60 per cent in the long run, depending on which elasticity assumption is used. Similarly, the incidence of poverty in Zou increases from 33 per cent to 50 per cent in the short run, then falls to 47-49 per cent in the long run. As described above, there is little or no change in poverty in the three southern departments (Atlantique, Mono, and Ouémé) because there are very few cotton growers in these departments.

34. In Figure 3, we show the cumulative distribution of income in the base scenario, with a 40 per cent reduction in cotton prices in the short run ($\varepsilon$=0), and with a 40 per cent reduction in cotton prices in the long run ($\varepsilon$=1.5). Although the long-run supply elasticity used in this figure is at the upper end

of what we believe is plausible, the difference between the short-run and long-run results is not very large. In other words, the long-term results are not very sensitive to the assumption regarding the supply elasticity of cotton. Even with a relatively elastic supply ($\varepsilon$=1.5), the response of farmers only offsets about one-third of the initial negative short-run impact.

**Conclusions**

35. This paper analyzes the impact of changes in world cotton prices on farmers in Benin. Both quantitative measures of per capita expenditure from household surveys and qualitative responses to a nationally representative survey suggest that rural living conditions improved over the 1990s. Furthermore, farmers tend to attribute this improvement in rural living conditions to economic factors such as crop prices, availability of food, and access to non-farm employment. Although the causal link is difficult to establish with certainty, it appears the economic reforms of the 1990s (including the 1994 devaluation) and the growth of cotton production during this period contributed to a noticeable improvement in rural standards of living.

36. The link between cotton markets and rural living conditions can, however, work against farmers as well. The analysis in this paper is motivated by the 39 percent decline in the world price of cotton between January 2001 and May 2002. We combine farm survey data from 1998 with assumptions about the decline in farm-level prices to estimate the short- and long-term direct effects of cotton price reductions on rural income and various measures of poverty. We also use the survey data to study two types of indirect effects: the impact of lower cotton production on the demand for agricultural labour by cotton growers and the impact of lower cotton prices on other households through the multiplier effect.

37. The results indicate that there is a strong link between cotton prices and rural welfare in Benin. A 40 per cent reduction in farm-level prices of cotton is likely to result in a reduction in rural per capita income of 7 per cent in the short-run and 5-6 per cent in the long-run. Furthermore, poverty rises 8 percentage points in the short-run, equivalent to an increase of 334 thousand in the number of individuals in families below the poverty line. In the long run, as households adjust to the new prices, the poverty rate settles down somewhat, remaining 6-7 percentage points higher than originally.

38. Furthermore, these estimates may well underestimate the actual effect of lower cotton prices on rural poverty in Benin. First, in an economy with unemployed resources and excess capacity, an external shock affecting income (such as a change in cotton prices) has a multiplier effect. Changes in cotton farmer income result in changes in demand for goods and services produced by their non-cotton-growing neighbours, which in turn influences the demand for goods and services these neighbours consume. Estimates for four countries in sub-Saharan Africa suggest that the multiplier is in the range of 1.7 to 2.2, meaning that the total effect on income (positive or negative) is 1.7 to 2.2 times greater than the direct impact. Second, we assume that farm prices change by the same proportion as world prices. In competitive markets with a fixed marketing margin, the percentage change in farm prices will be greater than the percentage change in world prices[15]. Third, our estimates do not take into account other indirect effects associated with declining cotton production. An earlier analysis of the Small Farmer Survey data from Benin indicated that cotton farmers are three times more likely to apply fertilizer to their maize crops compared to non-cotton farmers (see Minot et al, 2001). This is because growing cotton gives farmers access to fertilizer on credit, some of which they "divert" to their maize fields. The implication is that lower cotton prices will indirectly reduce the yields of food crops.

[15] Until recently, the effect of changes in world prices on farm-level prices in Benin was muted by government regulation of the market which stablized prices. Under market reforms being carried out in Benin and elsehwere in West Africa, markets are becoming more competitive and changes in farm prices will closely match changes in world prices.

39. Overall, the results in this paper challenge the stereotype of the rural poor in developing countries as consisting of subsistence farmers that are relatively unconnected to, and thus unaffected, by swings in world commodity markets. At least in the case of Benin, to the extent that fluctuations in world cotton prices are transmitted to farmers, they will have a significant effect on rural incomes and poverty. The broader implication is that policies that subsidize cotton production in the United States and elsewhere, dampening world prices, have an adverse impact on rural poverty in Benin and (by extension) other poor cotton-exporting countries.

## CANADA'S FURTHER THIRD PARTY SUBMISSION

3 October 2003

Canada's systemic interest in this case lies in the interpretation of the provisions of Article 13 and Annex 2 of the *Agreement on Agriculture*, as they related to certain US domestic support measures. It also lies in the interpretation of the export subsidy provisions of both the *Agreement on Agriculture* and the *SCM Agreement*, as they related to US export credit guarantee programmes.

Regarding US domestic support measures, were the Panel to accept the evidence presented by Brazil, it would find that US PFC payments and direct payments do not satisfy the policy-specific criteria in paragraph 6 of Annex 2 of the *Agreement on Agriculture*. The Panel should also count US counter-cyclical payments going to US producers of upland cotton as "support to a specific commodity" under Article 13(b)(ii) of the Agreement.

Regarding US export credit guarantees, were the Panel to find that the programs provide export subsidies within the meaning of Article 1(e) of the *Agreement on Agriculture*, then it would also find that the United States has violated Articles 8 and 10.1 at the very least in respect of exports of upland cotton. In this respect, the Panel should confirm that neither the *Agreement on Agriculture* nor the *SCM Agreement* contain an exemption for any US export credit guarantee subsidy found to exist in this case.

Canada has no further views to provide to the Panel at this point in the proceedings.

# ANNEX E-6

## FURTHER THIRD PARTY SUBMISSION OF THE EUROPEAN COMMUNITIES

3 October 2003

TABLE OF CONTENTS

## 1. Introduction

1. The European Communities (the "EC") makes this submission because of its systemic interest in the correct interpretation of the *Agreement on Subsidies and Countervailing Measures* (the "*SCM Agreement*"), the *Agreement on Agriculture* (the "AA") and the *General Agreement on Tariffs and Trade 1994* (the "GATT").

2. This submission provides the views of the EC with respect to Brazil's further submission of 9 September 2003. Due to the short deadline imparted to third parties, this submission does not address the further submission made by United States on 30 September 2003. The EC intends to provide its comments on the US submission at the meeting with the Panel.

3. Many of the issues raised in Brazil's further submission concern factual matters on which the EC is not in a position to comment. Accordingly, the EC will limit itself to provide its views with respect to a number of issues of legal interpretation to which it attaches particular importance. More specifically, the EC will argue in this submission that:

- in assessing the "significance" of price depression or suppression for the purposes of Article 6.3 (c) of the *SCM Agreement*, only their impact on the producers concerned is relevant;
- Brazil cannot complain about the continuing effects of recurring subsidies while expensing the full amount of such subsidies to the year in which they were granted;
- the phrase "world market share" in Article 6.3(d) of the *SCM Agreement* includes also the market of the subsidising Member;
- the mere fact that a subsidy is not subject to "pre-established limitations" is not sufficient for a finding of "threat of serious prejudice";
- Articles 5 and 6 of the *SCM Agreement* do not prohibit *per se* legislation that mandates subsidies that threaten serious prejudice "in certain circumstances".

4. The EC reserves the right to address other issues raised by Brazil's further submission at the meeting with the Panel.

## 2. The meaning of "significant" in Article 6.3 (c) of the SCM Agreement

5. Brazil argues that, in assessing the "significance" of price depression or suppression for the purposes of Article 6.3 (c), it is relevant to consider not only their impact on the producers concerned, but also on the Government of the complaining Member. Specifically, Brazil contends that

> A developing country Government facing foreign reserve or fiscal problems may find the loss of foreign exchange or tax revenue from its producers to be significant even if the level of price suppression is relatively small. In this regard, the amount of actual and potential revenue losses suffered by a complaining Member as a result of price suppression may be evidence of the significance of the price suppression.[1]

[1] Brazil's submission, para. 96.

6. The EC takes issue with this interpretation. As rightly argued by Brazil elsewhere in its submission[2], the existence of serious prejudice must be presumed whenever it is established that the effect of the subsidy is to cause *inter alia* significant price depression or suppression, without it being necessary to show, as an additional and separate requirement, that such price depression or suppression causes a serious prejudice to the interest of the Member concerned. Brazil's interpretation, however, amounts to reading such a separate requirement into the term "significant".

7. In *Indonesia – Autos*, which is cited with approval by Brazil, the panel held that

> Although the term 'significant' is not defined, the inclusion of this qualifier in Article 6.3(c) presumably was intended to ensure that margins of undercutting so small that they could not meaningfully affect suppliers of the imported product whose price was undercut are not considered to rise to serious prejudice …[3]

8. The above interpretation takes into account only the effects of price undercutting on the performance of the domestic producers of the complaining party, to the exclusion of any indirect effects on Government revenue. By the same token, where serious prejudice takes the form of price suppression or price depression, its significance should be evaluated only with respect to the producers concerned.

9. In any event, the EC rejects Brazil's suggestion that the threshold for establishing the existence of serious prejudice should be lower when the complaining party is a developing country Member. Article 6.3 (c) is not a provision on Special and Differential Treatment. There is no basis for giving different meanings to the term "significant" depending on the identity of the parties to a dispute.

### 3. Continuing effects of recurring subsidies

10. Brazil alleges that the effects of the subsidies paid during Marketing Years ("MY") 1999-2002 continue after they have been provided. More precisely, according to Brazil, by providing farmers with a significant source of income, these payments result in increased investment and production.

11. The EC finds it difficult to understand what point, if any, Brazil is trying to make. Brazil does not seem to be arguing that part of the benefit conferred by the subsidies granted during MY 1999-2002 should be allocated to subsequent years. That position would depart from the usual practice of most countervailing duty authorities, which is to consider that recurring subsidies must, in principle, be deemed "expensed" during the time period in which they are made. Similarly, the report of the Informal Group of Experts concerning Article 6.1(a) of the *SCM Agreement* recommended that subsidies should be expensed rather than allocated unless: (1) the purpose of the subsidy is linked to the purchase of fixed assets; (2) the subsidy is non-recurring or large; (3) the subsidy is oriented towards future production; (4) the subsidy consists of equity; or (5) is carried forward in the recipient's accounting records.[4]

12. Elsewhere in its submission Brazil appears to have expensed the full amount of the subsidies paid during each marketing year to that marketing year, rather than allocate it over a number of marketing years. Brazil cannot have it both ways. If it considers that part of the benefit should be allocated to subsequent marketing years, it should justify that position in light of the criteria outlined

[2] Ibid., paras 437-443.
[3] Panel report, *Indonesia – Automobiles*, WT/DS54/R, para. 14.254.
[4] Report by the Informal Group of Experts to the Committee on Subsidies and Countervailing Measures, 25 July 1997, G/SCM/W/415, paras. 5-12.

above and provide the Panel with a detailed allocation. Moreover, Brazil should deduct the amounts allocated to subsequent years from the yearly amounts for the period 1999-2001, so as to avoid any "double counting" of benefits. Needless to say, this could make more difficult for Brazil to establish that the subsidies paid during MY 1999 – 2001 have caused serious prejudice during that period.

13. In any event, while Brazil claims that the subsidies continue to have effects after MY 1999-2001, the alleged continuing effects (increased investments and production) do not of themselves amount to "serious prejudice" within the meaning of Article 5. Brazil has not explained, let alone proved, how those effects translated into one of the categories of "serious prejudice" described under Article 6.3 after 2001.

**4. World Market Share in Article 6.3(d)**

14. Brazil contends that the phrase "world market share" in Article 6.3(d) of the *SCM Agreement* means the "share of world market for exports".[5] The EC sees no basis for this proposition. The ordinary meaning of "world market" is the sum of all the geographical markets for the product concerned, including also the domestic market of the subsidising Member.

15. This reading is supported by the context. As evidenced by paragraph (a) of Article 6.3, the notion of "serious prejudice" may include also the prejudice suffered in the market of the subsidising Member. There is no reason, therefore, why the effects of a subsidy in that market should be excluded from the analysis under paragraph (d).

16. The phrase "world market share" may be contrasted with the phrase "share of world export trade", which is used in Article XVI:3 of the GATT. Surely, if the drafters of Article 6.3(d) had meant the "share of world market for exports", as argued by Brazil, they would have used the same terms as in Article XVI:3. Moreover, in the context of Article XVI:3, it makes perfect sense to use as a benchmark the "share of the world market for exports" because that provision is concerned exclusively with export subsidies, which have no direct effect on the domestic market of the subsidising Member. In contrast, the disciplines on "serious prejudice" contained in Articles 5 and 6 of the *SCM Agreement* apply equally to both export and domestic subsidies and, in practice, are meant to address primarily the effects of the latter, since export subsides are prohibited by Article 3 (except where provided in conformity with the *Agreement on Agriculture* or Article 27 of the *SCM Agreement*).

**5. Threat of injury**

17. Brazil sets forth two legal standards in order to analyse the existence of threat of serious prejudice. According to the first standard, there is threat of serious prejudice whenever "the legislation and practice of granting subsidies has no effective limits in terms of the volume of exports or domestic subsidies production eligible to receive subsidies".[6] Brazil contends that this standard can be "distilled" from the two GATT panel reports in *EC – Sugar* and from the Appellate Body report in *US – FSC*.[7]

18. For the reasons explained below, the EC considers that, while the fact that a subsidy is not subject to any "pre-established limitations" is certainly a relevant factor in considering the existence of threat of serious prejudice, it is not necessarily dispositive.

[5] Brazil's submission, para. 265.
[6] Brazil's submission, para. 301.
[7] Ibid.

19. The two GATT reports in *EC – Sugar* are of questionable authority on this point. Neither of the panels made any attempt to provide a generally applicable interpretation of the notion of "threat of serious prejudice". The findings cited by Brazil are just bare assertions, without any supporting reasoning. Furthermore, other passages of the reports indicate that both panels took the view that the unlimited availability of subsidies could not be, of itself, a cause of serious prejudice. Thus, the panel in *EC – Sugar (Australia)* noted that

> The Panel felt that since the Community sugar exporters were leading the world market for white sugar, traditionally covering more than half of the world market for refined sugar, the availability of exportable Community surpluses of sugar combined with the possibility of non-limited amounts available to cover export refunds, may well have had a depressing effect on world market prices for both white and raw sugar.[8]

Similarly, the panel in *EC – Sugar (Brazil)* observed that

> The Panel concluded that in view of the Community sugar made available for export with maximum refunds and the non-limited funds available to finance export refunds, the Community system of granting export refunds on sugar had been applied in a manner which in the particular situation prevailing in 1978 and 1979contributed to depress sugar prices in the world market, and that this constitutes a serious prejudice to Brazilian interests, in terms of Article XVI:1.[9]

20. The above passages suggest that both panels considered that the unlimited availability of the EC subsides was a cause of serious prejudice only because, in conjunction with the availability of supplies of sugar in the EC and with the "particular situation" prevailing during the years 1978 and 1979, it had a depressing effect on prices. It follows that, unless the same or similar circumstances were also present or imminent in this case, the mere availability of subsidies could not be considered to pose, as such, a threat of serious prejudice.

21. Brazil's arguments based on *US – FSC* are also without merit. Unlike Articles 5 and 6 of the S*CM Agreement*, Article 10.1 of the *Agreement on Agriculture* is not subject to a "trade effects" test. It prohibits any export subsidies not covered by Article 9, which exceed, or threaten to exceed, a Member's reduction commitments (in terms of budgetary outlays or exported volumes), regardless of the trade effects of the subsidy. In contrast, Articles 5 and 6 do not stipulate any limitations on the volume or value of subsidies. Rather, they prohibit the granting of subsidies in so far as they have certain "adverse effects" for the interests of another Member. Whether or not a subsidy has such effects will depend not only on the amount of the subsidy or the volume of subsided goods but also on other circumstances. For that reason, the mere fact that a subsidy is not subject to "pre-established limitations" is not a sufficient reason to conclude that it threatens to cause serious prejudice.

22. Brazil appears to agree with the view that the elements of a threat of serious prejudice injury are the same as those of a serious prejudice case, the only difference between the two being that "in a serious prejudice case, all the elements already exist, whereas in a threat of serious prejudice case, all of the elements need not have come to pass."[10] Yet that view cannot be reconciled with Brazil's first standard. Article 6 of the *SCM Agreement* makes it clear that the existence of "serious prejudice" cannot be established by looking only at the value of the subsidy (with the exception of the no-longer operational presumption in Article 6.1 (a)) or to the absolute volume of subsidised goods (as opposed

[8] Panel report, *European Communities – Refunds on Exports of Sugar (Australia)*, BISD 26S/290, para. 4.31

[9] Panel report, *European Communities –Refunds on Exports of Sugar (Brazil)*, BISD 27S/69, V(f).

[10] Brazil's submission, para. 304.

to their market share). Therefore, a determination of threat of serious prejudice cannot be based on those factors alone either.

23. The EC considers that Article 15.7 of the *SCM Agreement* provides relevant context for the interpretation of the notion of "threat of serious prejudice". Both "injury to the domestic industry" and "serious prejudice" are "adverse effects" within the meaning of Article 5. There is no good reason why the threshold for establishing the existence of "threat of injury" should be higher than the threshold for establishing the existence of "threat of serious prejudice". The EC is of the view, therefore, that the requirements set out in Article 15.7 of the *SCM Agreement* must be deemed implicit in the notion of "threat of serious prejudice". Accordingly, a determination of threat of serious prejudice, like a determination of injury, must "be based on facts and not merely on allegation, conjecture or remote possibility". Also, the relevant "changes in circumstances" must be "clearly foreseen and imminent".

24. As recalled by Brazil, Article 15.7(i) of the *SCM Agreement* provides that the "nature of the subsidy or subsidies in question and the trade effects likely to arise therefrom" is one of the factors that should be considered for the purposes of a threat of injury determination.[11] The EC agrees that this is also one of the factors that should be considered for the purposes of a determination of threat of serious prejudice. But it is not the only relevant factor. Brazil glosses over the last sentence of Article 15.7, which provides that no one of the factors listed in that provision "can necessarily give guidance". Rather, "the totality of the factors considered must lead to the conclusion that further subsidised exports are imminent and that, unless protective action is taken, material injury would occur". This confirms that, while the absence of "pre-established limitations" is a relevant factor, it is not necessarily dispositive.

25. Brazil further asserts that the other factors listed in Article 15.7 "are not directly relevant to a threat of serious prejudice case because they address the situation of imports that would harm the domestic industry in the country of importation."[12] This is, of course, correct. Nonetheless, Article 15.7 suggests that analogous factors may be relevant for a determination of serious prejudice. For example, the following factors could be relevant for establishing the existence of serious prejudice in an export market:

- a significant rate of increase of subsidised exports to the export market;
- sufficiently freely disposable, or an imminent, substantial increase in, capacity of the exporter indicating the likelihood of substantially increased subsidised exports, taking into account the availability of other export markets to absorb any additional exports;
- whether subsidised exports are entering into the export market at prices that will have a significant depressing or suppressing effect in prices, and would likely increase demand for further imports; and
- inventories of the product investigated.

26. In sum, the EC is of the view that, while the fact that a subsidy is not subject to any "pre-established limitations" as regards the value of the subsidies or the volume of subsidised goods is a relevant factor in order to establish the existence of threat of serious prejudice, it is not necessarily dispositive. Other factors, including in particular factors analogous to those listed in Article 15.7 (ii)-(v) of the *SCM Agreement*, may also be relevant and should be examined as well.

[11] Ibid., para. 302.
[12] Ibid., para. 303.

### *6.* ***Per se* claims**

27. Brazil claims that the US legislation conferring the subsidies at issue in this case is inconsistent *per se* with Article 5(c) of the *SCM Agreement* and Article XVI:3 of the GATT because it *mandates* the payment of subsidies that will necessarily threaten serious prejudice *in certain circumstances*. This claim is based on the assumption that

> It is established under WTO law that a Member can challenge measures of another Member on a per se basis when those measures mandate, in certain circumstances, a violation of its WTO obligations.[13]

28. The above proposition, however, is nowhere stated in the WTO Agreement and, as noted already in its first submission[14], the EC disputes its validity. True, some panels have asserted this position on the basis of an erroneous interpretation of the panel report in *US - Superfund*. Other panels, however, have taken a contrary, or at least more qualified view.[15] In particular, the panel in *US – Section 301* observed that

> we believe that resolving the dispute as to which type of legislation, *in abstract*, is capable of violating WTO obligations is not germane to the resolution of the type of claims before us. In our view the appropriate method in cases such as this is to examine with care the nature of the WTO obligation at issue and to evaluate the Measure in question in the light of such examination. The question is then whether, on the correct interpretation of the specific WTO obligation at issue, only mandatory or also discretionary national laws are prohibited. We do not accept the legal logic that there has to be one fast and hard rule covering all domestic legislation. After all, is it so implausible that the framers of the WTO Agreement, in their wisdom, would have crafted some obligations which would render illegal even discretionary legislation and crafted other obligations prohibiting only mandatory legislation? Whether or not Section 304 violates Article 23 depends, thus, first and foremost on the precise obligations contained in Article 23.[16]

29. The Appellate Body has not pronounced itself yet clearly on this issue. Thus, in *US – 1916 Act*, which is sometimes cited erroneously as an endorsement of the principle invoked by Brazil, the Appellate Body noted that

> … the 1916 Act is clearly not discretionary legislation, as that term has been understood for purposes of distinguishing between mandatory and discretionary legislation. Therefore, we do not find it necessary to consider, in these cases, whether

---

[13] Brazil's submission, para. 417.

[14] EC's First Third Party Submission, paras. 4-7.

[15] See e.g. the Panel report on *United States – Countervailing Measures Concerning Certain products from the European Communities*, WT/DS212/R, para. 7.123:

> While only legislation that mandates a violation of WTO obligations can be WTO-inconsistent, we are of the view that the existence of some form of executive discretion alone is not enough for a law to be prima facie WTO - consistent, what is important is whether the government has an effective discretion to interpret and apply its legislation in a WTO-inconsistent manner.

[16] Panel report, *United States – Sections 301-310 of the Trade Act of 1974*, WT/DS152/R, para. 7.53. [footnotes omitted]

> Article 18.4, or any other provision of the Anti-Dumping Agreement, has supplanted or modified the distinction between mandatory and discretionary legislation.[17]

30. The Appellate Body was even more cautious in a subsequent case, *US – Lead and Bismuth II*, where it noted that

> We are not, by implication, precluding the possibility that a Member could violate its WTO obligations by enacting legislation granting discretion to its authorities to act in violation of its WTO obligation. We make no finding in this respect.[18]

31. The EC agrees with the panel in *US – Section 301* that whether or not *discretionary* legislation may be subject to challenge depends on the specific obligations imposed by each provision of the WTO Agreement. Thus, for example, it is arguable that Article XI:1 of the GATT prohibits not only mandatory legislation, but also legislation which authorises expressly the executive branch to apply an import restriction under well specified circumstances, because such authorisation, of itself, may have a chilling effect on imports.

32. For the same reasons, it would be mistaken to assume, as Brazil does, that legislation which mandates action that would result in a violation of a WTO provision *in certain circumstances* is necessarily inconsistent with that provision. As illustrated by the present case, this notion would have absurd and unacceptable results when applied to WTO provisions which, like Article 5(c) of the *SCM Agreement* and Article XVI:3 of the GATT, incorporate a "trade effects" test. The EC considers that, once again, whether or not legislation that mandates a violation *in certain circumstances* can be challenged *per se* will depend on the specific obligations impose by the WTO provision at issue.

33. It is often overlooked that in *US– Superfund* the panel justified its finding that the tax legislation at issue could be challenged, even though it had not entered into effect, by reasoning that Article III of the GATT is not concerned with trade volumes, but rather with competitive opportunities[19]:

> The Panel noted that the United States objected to an examination of this tax because it did not go into effect before 1 January 1989, and - having no immediate effect on trade and therefore not causing nullification or impairment – fell outside the framework of Article XXIII. […]
>
> […] The general prohibition of quantitative restrictions under Article XI, which the Panel on Japanese Measures on Imports of Leather examined, and the national treatment obligation of Article III … have essentially the same rationale, namely to protect expectations of the contracting parties as to the competitive relationship between their products and those of the other contracting parties. Both articles are not only to protect current trade but also to cerate the predictability needed to plan future trade. That objective could not be attained if contracting parties could not challenge existing legislation mandating actions at variance with the General Agreement until the administrative acts implementing it had actually been applied to their trade. Just as the very existence if a regulation providing for a quota, without it restricting particular imports, has been recognized to constitute a violation of Article XI;1, the

[17] Appellate Body report, *United States – Anti-Dumping Act of 1916*, WT/DS136/AB/R, WT/DS162/AB/R, para. 99.

[18] Appellate Body report, *United States – Countervailing Measures Concerning Certain Products from the European Communities*, WT/DS212/AB/R, footnote 334.

[19] Panel report, *United States – Taxes on Petroleum and Certain Imported Products*, BISD 34/136, 160, paras.5.2.1-5.2.2.

> very existence of mandatory legislation providing for an internal tax, without it being applied to a particular imported product, should be regarded as falling within the scope of Article III:2, first sentence. …

34. It is also a common mistake to assume that, like Articles III or IX of the GATT, all other WTO provisions are concerned also with competitive opportunities. Some WTO provisions, however, are not concerned with competitive opportunities, but instead with trade effects. Article 5(c) of the *SCM Agreement* and Article XVI:3 of the GATT fall within that category. They prohibit the granting of subsidies only to the extent that the subsidies cause "adverse effects" in the form of "serious prejudice". Such effects must be actual or threatened, not just theoretical.

35. The "mandatory" standard invoked upon by Brazil would result in the creation of third category of prohibited adverse effects in addition to actual and threatened serious prejudice, which is nowhere mentioned in Article 5(c): the mere possibility of threat of serious prejudice *in certain circumstances*. Furthermore, as a result, Brazil's interpretation would render redundant the two categories of effects which are mentioned in Article 5(c). As explained above, threat of serious prejudice must be *imminent* and *foreseeable*. Yet, on Brazil's interpretation, it would be sufficient, in order to establish a *per se* violation, to show that the legislation at issue mandates action that threatens serious prejudice *in certain circumstances*, no matter how remote the likelihood that such circumstances will ever materialise. For example, on Brazil's interpretation, it would be enough to show that the legislation mandates the payment of subsidies that will threaten serious prejudice in a purely hypothetical situation where world prices fall to an extremely low level, even if the chances that prices may actually fall to such level are negligible in practice.

36. In sum, Brazil's *per se* claim is an ingenious but misguided attempt to avoid the requirements of Article 5(c) of the *SCM Agreement*, which should be rejected by the Panel.

# ANNEX E-7

## FURTHER THIRD PARTY SUBMISSION OF NEW ZEALAND

3 October 2003

TABLE OF CONTENTS

## I. INTRODUCTION

1.01 Although New Zealand is not a producer or exporter of cotton, New Zealand has a systemic interest in ensuring the continued integrity of important WTO disciplines applicable to agricultural trade and has therefore joined this dispute as a third party. As outlined in New Zealand's First Submission to the Panel[1], New Zealand is concerned to ensure that Members are able to utilise their rights under the *Agreement on Subsidies and Countervailing Measures* (the *SCM Agreement*) and GATT 1994 to take action in respect of domestic support measures and export subsidies where the requirements of the "peace clause" have not been respected.

1.02 New Zealand believes that Brazil has demonstrated that the "peace clause" has not been respected in relation to domestic support and export subsidies provided by the United States to upland cotton in the marketing years ("MY") 1999, 2000, 2001 and 2002, and that accordingly Brazil is entitled to bring actionable and prohibited subsidy claims against the United States under the GATT 1994 and the *SCM Agreement*.

1.03 In its Further Submission to the Panel,[2] Brazil has provided the legal and factual basis upon which the Panel should conclude that the United States subsidies cause or threaten to cause serious prejudice to the interests of Brazil within the meaning of Articles 5(c), 6.3(c) and 6.3(d) of the *SCM Agreement* and violate GATT Article XVI. New Zealand therefore considers that the Panel should make the findings and recommendations requested by Brazil.

1.04 This submission addresses issues raised in the Further Submissions of Brazil and the United States[3] and should be read in conjunction with New Zealand's First Submission. As recognised by the Panel in its communication of 24 September 2003, New Zealand has had only limited time to consider the Further Submission of the United States and therefore reserves the right present arguments in addition to those set out in this written submission in its oral statement to the Panel on 8 October 2003.

## II. PRESENT SERIOUS PREJUDICE

2.01 Brazil has demonstrated that the United States subsidies[4] cause serious prejudice to the interests of Brazil within the meaning of Articles 5(c), 6.3(c) and 6.3(d) of the *SCM Agreement* and violate GATT Article XVI.

2.02 Brazil has demonstrated that the United States subsidies during marketing year (MY) 1999-2002:

- cause present significant price suppression[5] in the world and Brazilian markets, as well as in markets where Brazilian producers export, within the meaning of Article 6.3(c) of the *SCM Agreement*;

---

[1] *United States – Subsidies on Upland Cotton*, Third Party Submission of New Zealand, 15 July 2003 ("New Zealand's First Submission").

[2] *United States – Subsidies on Upland Cotton*, Brazil's Further Submission to the Panel, 9 September 2003 ("Further Submission of Brazil").

[3] *United States – Subsidies on Upland Cotton*, Further Submission of the United States of America, 30 September 2003 ("Further Submission of the US").

[4] New Zealand uses that term as it is used by Brazil in its Further Submission (para 7). Details of these programmes were provided by Brazil in its First Submission to the Panel Regarding the "Peace Clause" and Non-"Peace Clause" Related Claims, 24 June 2003 ("First Written Submission of Brazil"), paras 45 – 106.

[5] New Zealand uses the term as it is used by Brazil in its Further Submission to also encompass circumstances showing price depression characteristics.

- had the effect of increasing the United States share of the world upland cotton market within the meaning of Article 6.3(d) of the *SCM Agreement*, and

- contributed significantly to the United States having more than an equitable share of world export trade within the meaning of GATT Article XVI:3.

New Zealand will focus in particular on Brazil's claim that the United States subsidies cause "significant price suppression".

**1. The effect of the United States subsidies is significant price suppression**

2.03 Brazil has demonstrated that the United States subsidies during marketing year (MY) 1999-2002 cause present significant price suppression in the Brazilian and world markets, including in markets where Brazilian and United States producers export, within the meaning of Article 6.3(c) of the *SCM Agreement* and thus cause serious prejudice. Brazil has demonstrated that the United States subsidies suppressed A-index prices by an average of 12.6% over MY 1999-2002.[6] That translates into a total amount of lost revenue for Brazilian producers of $478 million[7] and suppressed revenue worldwide of $3.587 billion.[8]

2.04 With subsidisation at levels of 95 per cent on average[9], subsidies are the greater part of farmers' incomes and have a major impact on farmers' production decisions. Producers of upland cotton in the United States are thereby largely insulated from the effects of the market. Thus, when prices for upland cotton were falling[10], and the value of the United States dollar[11] and costs of production were rising[12], production of upland cotton and United States exports of upland cotton significantly increased.[13] United States farmers planted 13.5 per cent more acres with upland cotton.[14] United States production hit a record high.[15] United States exports and the United States share of the world market increased.[16]

2.05 Professor Sumner estimates that if all United States government support to upland cotton were eliminated, United States exports would have been 41 per cent less in MY 1999-2002.[17] By contrast, *with* the subsidies the United States world market share in fact more than doubled over that period.[18]

2.06 This subsidy-fuelled production and export growth resulted in significant price suppression within the meaning of Article 6.3(c). Prices were suppressed by the increased world supply of upland cotton and increased competition from United States upland cotton in world markets. Brazil has also outlined the influence that the United States has on world prices for upland cotton[19] - the sheer size of

[18] *Ibid*, para 283.
[19] *Ibid*, para 3.3.4.6.

the United States share of total world production[20] and of world exports magnifies the trade distorting effects of the United States subsidies. Any doubt about the impact that United States subsidies have on the world market for upland cotton should be quickly dispelled by the graphic demonstration of United States dominance of the world market illustrated by Brazil in Figure 26.

2.07 New Zealand agrees with Brazil that the absolute size and average subsidisation level of the United States subsidies creates a strong *de facto* presumption of production, export and price effects.[21] However Brazil has not simply relied on such a presumption. Brazil has produced econometric analysis demonstrating that the United States subsidies caused significant price suppression, as actual market prices throughout MY 1999-2002 would have been higher but for the effects of the United States subsidies.[22]

2.08 At no point in its submission does the United States dispute the accuracy of this econometric analysis. Instead, in response to Brazil's claims, the United States seeks to argue that Brazil's case "suffers from a failure of factual proof"[23] and that Brazil has failed to make a *prima facie* case of serious prejudice or more than equitable market share because Brazil has done no more than assert that causation is established because there were large United States outlays during marketing years with low prevailing upland cotton prices.[24] According to the United States, factors other than United States subsidies "were the causes of the dramatic plunge in cotton prices experienced in recent years,"[25] namely: competition from low price polyester; flat retail consumption of cotton outside of the United States; slow world economic growth; burgeoning United States textile imports leading to more United States cotton exports; a stronger United States dollar leading to weakened commodity prices and China's trade position.

2.09 However Brazil's argument is not that declining cotton prices were due solely to the impact of the United States subsidies. Nor does Article 6.3(c) require that to be the case. It is Brazil's contention, backed up by sound econometric analysis, that the United States subsidies have a significant price-suppressing effect. And that effect exists regardless of whether cotton prices are rising or falling.[26] Nor did Brazil's analysis fail to take into account the impact of other adverse factors affecting upland cotton prices as alleged by the United States.[27] The econometric models used by Brazil, in particular FAPRI, hold other relevant factors affecting the price of cotton constant while cotton subsidies are removed, thereby isolating the effect of those subsidies. Therefore Brazil's analysis did not attribute to cotton subsidies the effects of other factors affecting cotton prices. As noted above, at no point in its submission does the United States question the integrity of the models referred to by Brazil and upon which the estimated impacts of the removal of United States cotton subsidies is based.

*(i) Interpretation of Article 6.3(c)*

2.10 New Zealand disagrees with the United States interpretation of Article 6.3. Essentially the United States reached the wrong conclusion from its comparison of the language of Article 6.1 with that of Article 6.3. The United States concluded that because Article 6.3 used the phrase "*may* arise in

[20] 19.5 per cent in MY 2002 (*Ibid*, para 135).
[21] *Ibid*, paras 106 and 107.
[22] Evidence adduced by Brazil, specifically the Quantitative Simulation Analysis by Professor Daniel Sumner, shows that but for the United States subsidies A-Index prices between MY 1999-2002 would have been, on average, 12.6 per cent higher.
[23] Further Submission of the US, para 16.
[24] *Ibid*, para 17.
[25] *Ibid*.
[26] Further Submission of Brazil, para 231.
[27] Further Submission of the US, para 80.

any case where one or several of the following apply", whereas Article 6.1 states "serious prejudice *shall be deemed to exist* in the case of …", that this means that serious prejudice "need not arise even under Article 6.3 even where one of the listed effects is found".[28] The United States goes on to infer from this difference in language that a complainant, in addition to demonstrating the existence of one of the listed effects, must also meet a separate "serious prejudice" standard – the content of which is undefined by the *SCM Agreement*. The United States states that a complainant must show that the "prejudice" suffered is "serious".[29]

2.11 First, the example given by the United States in footnote 43 seems to be covered by the terms of Article 6.4. Second, and more importantly, there is no basis for drawing from a comparison of language used in Articles 6.1 and 6.3 the conclusion that there is some other standard, independent of Article 6, that must be demonstrated in order to show "serious prejudice". In fact, as New Zealand will show, a comparison of both the language *and substance* of Articles 6.1 and 6.3, in the context of Articles 5 and 6 of the *SCM Agreement*, supports the contrary conclusion – that if a complainant has demonstrated the existence of one or more of the effects enumerated in Article 6.3 there is "serious prejudice" that is an adverse effect of the subsidy within the meaning of Article 5.

2.12 That is because the difference in language simply reflects the different way in which both Article 6.1 and Article 6.3 give meaning to the term "serious prejudice". Both must be seen in the context of concern in this part of the *SCM Agreement* with the effects of subsidies on other Members. In relation to Article 6.1, "serious prejudice" was given meaning by reference to specific types of subsidies or qualities of a subsidy that were "deemed" to have effects that were adverse to the interests of other Members. However, it was open to a subsidising Member under Article 6.2 to overturn that presumption by showing that in fact the subsidy did not cause serious prejudice – i.e. that the subsidy *had not resulted in any of the effects enumerated in Article 6.3*.

2.13 The terms of Article 6.2 make it clear that the effects enumerated in Article 6.3 equate to "serious prejudice" and that nothing more than demonstration that one of those effects exists is necessary to find serious prejudice.

2.14 Further, by contrast with Article 6.1, Article 6.3 looks more broadly at the effects of the subsidy, rather than its specific characteristics. There is thus no need to "deem" certain effects to arise from certain types or characteristics of a subsidy as there was in Article 6.1. Instead Article 6.3 is more broadly cast to take an effects-based approach – in essence it is designed to encompass any kind of subsidy that has the adverse effects enumerated and is therefore "actionable". However there is no basis to draw from this difference in approach, and therefore in language, the conclusion that more is required under Article 6.3 than simply demonstrating that one or more of the prescribed effects exists in order show that there is serious prejudice. Such an interpretation undermines the careful structure of Article 6 and the clear intent of Article 5 and must be rejected.

2.15 Nor does the use of the word "may" in Article 6.3 lead to any other conclusion. In that respect it is important to note that Article 5(c) incorporates, as specified in Footnote 13 to the *Agreement*, GATT Article XVI.1 which includes *inter alia* the threat of serious prejudice. Therefore it was appropriate to state that serious prejudice in the sense of paragraph (c) of Article 5 *may* arise where any of the listed effects exists because there may be other circumstances in which serious prejudice can be demonstrated, including, for example, where there is a threat of serious prejudice. If the word "shall" had been used this would have been taken to mean that Article 6.3 provides the definitive set of circumstances in which serious prejudice can arise. By virtue of Footnote 13 that is not the case.

[28] *Ibid*, para 77.
[29] *Ibid*, para 79.

2.16 Consideration of Article 6.3 in the context of the rest of Article 6 provides further support for the interpretation outlined above. First, it makes little sense to have gone to such detail in Article 6.4 to describe what is required to meet the requirements of Article 6.3(b) if there is another set of undefined requirements that must also be demonstrated in order to find serious prejudice.

2.17 Second, in terms of Article 6.2, if there were other elements outside those in Article 6.3 that had to be demonstrated to show serious prejudice, why would a subsidising Member not also have had to show that those elements were not present in order to avoid the presumption in Article 6.1?

2.18 Third, Article 27.8 (although now defunct because Article 6.1 is no longer in effect), also provides that serious prejudice arising from subsidies by developing country Members "shall be demonstrated by positive evidence, in accordance with the provisions of paragraphs 3 through 8 of Article 6". This makes it clear that serious prejudice need only be determined by reference to Articles 6.3–6.8 of the *SCM Agreement*.

2.19 Finally, Article 6.8 provides that "in the absence of circumstances referred to in paragraph 7, the existence of serious prejudice should be determined on the basis of the information submitted in accordance with the provisions of Annex V". This confirms that paragraph 7 of Article 6 outlines the only set of circumstances in which it is not possible to make a determination as to the existence of serious prejudice when one of the situations in Article 6.3 is demonstrated to exist. The direction in Article 6.8 to determine the "existence" of serious prejudice on the basis of the record would be deprived of meaning if a determination of serious prejudice also had to be made by reference to additional criteria not specified by the *SCM Agreement* that could lead to a materially different outcome as a matter of fact and law.

2.20 Serious prejudice is not the abstract concept the United States attempts to portray it as. Serious prejudice refers to the concrete adverse effects of a subsidy on the interests of another Member that are clearly elaborated in Article 6.3. However, even if the United States is right and a complainant, having demonstrated the existence of significant price suppression within the meaning of Article 6.3(c), must also meet a separate test of "serious prejudice" under Article 5(c), Brazil has demonstrated that serious prejudice exists by providing the Panel with additional information outlining the harm caused to its upland cotton producers as well as to the Brazilian economy.[30]

(a) "Significant"

2.21 Article 6.3(c) of the *SCM Agreement* requires that the level of price suppression caused by the United States subsidies must be "significant", that is, it may not be so small as to have no meaningful effect on other producers or suppliers of the same product.[31] Logically, price suppression that is so small as to have no meaningful effect could not give rise to serious prejudice. However, such an interpretation does not mean that a very small level of price suppression may not have a meaningful effect, for example where large volumes of a product may be traded.[32] As Brazil demonstrates, even a 1 cent per pound price-suppressing effect can reduce worldwide export revenue by $552 million. Average price declines of 12.6 per cent for upland cotton clearly have a meaningful affect on

[30] Further Submission of Brazil, Part 6.

[31] Panel Report, *Indonesia – Certain Measures Affecting the Automobile Industry*, WT/DS54/R, WT/DS55/R, WT/DS59/R, WT/DS64/R, adopted 23 July 1998 ("*Indonesia – Automobiles*"). The Panel considered (at para 254) the meaning of "significant" in the context of Article 6.3(c) and concluded:

> Although the term "significant" is not defined, the inclusion of this qualifier in Article 6.3(c) presumably was intended to ensure that margins of undercutting so small that they could not meaningfully effect suppliers of the imported product whose price was being undercut are not considered to give rise to serious prejudice.

[32] Further Submission of Brazil, para 95and para 256.

Brazilian producers of upland cotton. New Zealand fully agrees with Brazil that such price suppression is thus "far beyond any legitimate threshold of 'significance'".[33]

2.22 The United States argues that Brazil's interpretation of "significant" collapses the concept of "significant price suppression or depression" with the concept of "serious prejudice" because Brazil's assessment of the significance of the price suppression has wrongly focussed on the effect of the subsidy on producers rather than on prices. As outlined in paragraphs 2.10–2.20 above, in New Zealand's view the construction of Articles 5 and 6 makes it clear that "significant price suppression or depression" is simply a form or manifestation of "serious prejudice" and therefore it is artificial to make into two separate inquiries what is clearly meant to be only one.

2.23 In any event the United States argument that the significance of the price suppressive effect of the subsidy can only be determined by reference to the effect on 'price' should be rejected. Articles 5 and 6 are concerned with the *adverse effects* of a subsidy – Article 5 states that "no Member should cause, through the use of any subsidy … *adverse effects* to the interests of other Members." Therefore it is entirely appropriate under Article 6.3(c) to consider whether price suppression is "significant" by reference to the effect of the price suppression on the Member alleging adverse effects to its interests. In other words, what renders price suppression significant or insignificant is whether or not it causes adverse effects to the Member concerned, not whether or not an arbitrary level of numeric significance is achieved as implied by the United States. Under the United States approach, a numerically small suppressive effect on prices could be disregarded, even though it may have significant adverse effects on the complainant Member. Thus, using the example given by Brazil, price suppression by only 1 cent per pound may not be "significant" enough under the United States standard and therefore could not give rise to serious prejudice, even though that level of price suppression would reduce worldwide export revenue by $552 million.[34]

2.24 Nor does the United States explain how 'significance' is to be determined under its proposed approach. That is because such an approach would require Panels to apply some kind of arbitrary standard of significance – would 5 per cent be significant? Would 10 per cent or 20 per cent? Would the level of required significance vary from case to case, and if so how is a Panel to determine what that level should be?

2.25 By contrast, the approach taken by Brazil of interpreting "significant" as requiring the level of price suppression to be "meaningful" in its effect, reflecting the Panel's reasoning in *Indonesia – Automobiles*, provides a more logical and consistent basis upon which to determine whether the price suppression is "significant". It is also consistent with the objective of Articles 5 and 6 which is to address subsidies that have an adverse effect on the interests of other WTO members. Nor is such an approach inconsistent with the United States assertion that the drafters of Article 6.3(c) used the term "significant" to create a threshold to ensure that not just "any theoretical price effect"[35] would suffice. In fact the Panel in *Indonesia – Automobiles* appears to have made the same assessment of the intention of the drafters when it stated that

> the inclusion of this qualifier (ie "significant") in Article 6.3(c) presumably was intended to ensure that margins of undercutting so small that they could not

[33] *Ibid*, para 95.

[34] This example is of course based on the effect of subsidies on "like products", which, as Brazil has demonstrated (Further Submission of Brazil, part 3.3.2), United States upland cotton and Brazilian upland cotton are.

[35] Further Submission of the US, para 84.

> meaningfully affect suppliers of the imported product whose price was being undercut are not considered to give rise to serious prejudice.[36]

2.26 Nor does the United States argument find support in the reference to the price suppression being "in the same market" in Article 6.3(c). The United States argues this means that the price suppression must be significant in "market terms" and therefore the question is the effect of the price suppression on the market and not on the Member concerned.[37] While New Zealand agrees that the effect of the price suppression on the market may be relevant to considering whether that price suppression is "significant", New Zealand notes that the phrase "in the same market" simply serves to locate the price suppressive effects rather than define their substance. In fact the United States acknowledges as much further on it in its submission.[38] Further, the United States has not attempted to claim that its exports are not to the same market as exports from Brazil. And of course it cannot, because, as Brazil has demonstrated, Brazilian upland cotton and United States upland cotton are like products and are treated by upland cotton traders as interchangeable and substitutable.[39]

2.27 Finally, New Zealand notes that the United States arguments do not seek to suggest that the level of price suppression found to exist in the present case - 12.6 per cent - is not "significant" within the meaning of Article 6.3(c). Therefore the Panel should find that "significant price suppression" exists as a result of the United States subsidies and that therefore the United States subsidies cause serious prejudice to the interests of Brazil.

(b) Time Period for Demonstrating Causal Effects

2.28 The United States argues that "a past subsidy no longer exists as of the time a new subsidy payment in respect of current production is made".[40] Therefore, argues the United States, subsidies prior to the most recent period, MY 2002, can have no "effect" within the meaning of Article 6.3 and the "effect of the subsidy must be demonstrated in each year and for each year that Brazil has challenged".[41]

2.29 By the United States reasoning a complainant may only take a serious prejudice case in the year in which the serious prejudice is caused. To say that a "past subsidy no longer exists" once a further payment is made under the same subsidy scheme is entirely artificial. Leaving aside the practical difficulties the United States approach would pose given the nature of the evidence that is required and the timelines for WTO dispute settlement – which would effectively preclude any Members from ever taking serious prejudice cases – this approach ignores that fact that the subsidy programmes are in existence for a period of years and have effects on the decisions of producers beyond simply the year in which they have been paid.[42] Producers expectations of continued subsidies are integral to planting decisions and it is clear that United States producers expect ongoing subsidies as these have been legislatively mandated until MY 2007.

2.30 Similarly the serious prejudice caused to a WTO Member over the lifetime of a subsidy programme is not easily compartmentalised into a particular year and such an artificial constraint on the appropriate time period for consideration by a Panel would seem to undermine the object and

[41] *Ibid*, para 95.
[42] Brazil has demonstrated that the effects of the United States subsidies continue after they have been provided because, for example, they have "wealth" and "investment" effects (Further Submission of Brazil, part 3.3.4.7.7).

purpose of the disciplines on actionable subsidies in the Agreement. New Zealand therefore agrees with Brazil that MY 1999-2002 is a reasonable period for the Panel to use for the present serious prejudice claims.

**2. The effect of the United States subsidies is an increase in the United States world market share**

2.31 Brazil has demonstrated that the United States subsidies resulted in an increase in the United States world market share for upland cotton in MY 2001 within the meaning of Article 6.3(d). The data provided by Brazil shows that the United States world market share in MY 2001 of 38.3 per cent is considerably higher than the previous three-year average,[43] and that this was due to the effect of the United States subsidies.[44]

2.32 The United States argues that the term "world market share" refers to "all consumption" of upland cotton and thus would include "consumption by a country of its own cotton production". The United States appears to suggest that Article 6.3(d) is thus concerned with the effect of the subsidy on world consumption of cotton.

2.33 It is true that GATT Article XVI:3 uses the phrase "world export trade". However it is quite a leap of logic to then conclude that because Article 6.3(d) uses the term "world market share" then it must refer to a Member's share of world consumption. The United States makes this leap on the basis that the relevant context for determining what "world market share" means is GATT Article XVI:3. However the first point of reference should in fact be Article 6.3 itself, and Article 5 to which it is so integrally related. Thus the appropriate context in which to give meaning to "world market share" is the aim of Articles 5 and 6, ie to address the adverse effects of subsidies on the interests of other Members.

2.34 Subsidies are the concern of WTO members to the extent that they distort trade – hence the differentiation in treatment of trade-distorting and non-trade distorting subsidies. Therefore the adverse effects with which Article 6.3 is concerned is the effect of subsidies on trade in the world market. Specifically, it is concerned with adverse effects to other Members caused when one Member uses subsidies in order to increase its share of the world market for a particular product. To construe "world market share" as referring to a Member's share of world consumption of a product would therefore completely subvert the underlying rationale of Article 6.3(d).

**3. The United States has a "more than equitable share" of world export trade in upland cotton**

2.35 Brazil has demonstrated that the United States subsidies have operated to increase United States exports of upland cotton resulting in the United States having a "more than equitable share" of world export trade in upland cotton within the meaning of GATT Article XVI:3 and has thus caused serious prejudice to the interests of Brazil within the meaning of GATT Article XVI:1.[45]

2.36 The United States seeks to dismiss the relevance of GATT Article XVI:3 by reference to pre-Uruguay Round comment by the Panel on Wheat Flour[46], addressing the Tokyo Round Subsidies Code, in an unadopted report, that there are "difficulties inherent in the concept of 'more than equitable share'."[47] The United States also seeks to assert that "Members are generally permitted to

[43] Further Submission of Brazil, para 267 and Figure 24.
[44] *Ibid*, paras 271 – 272.
[45] Further Submission of Brazil, part 3.5.
[46] GATT Panel Report, *EEC – Subsidies on Export of Wheat Flour*, SCM/42, (unadopted).
[47] Further Submission of the US, paras 108 and 109.

provide subsidies."[48] That is true up to the point at which those subsidies cause serious prejudice to the interests of the other Members. And in this context the Panel should consider whether, as the world's largest exporter of upland cotton with average levels of subsidisation of 95 per cent, the United States has a "more than equitable" share of world export trade. New Zealand submits that Brazil has demonstrated that the United States does.

**4. Issues relating to particular United States subsidies**

2.37 Brazil sets out arguments relating to the full complement of United States subsidies and the serious prejudice they cause both individually and collectively. New Zealand will comment only on marketing loan payments, Step 2 payments and market loss assistance/counter-cyclical payments.

*(i) Marketing Loan Payments*

2.38 Brazil has highlighted that these payments are considered by the USDA and by other economists as having the greatest production and export enhancing effects and thus the greatest A-Index price suppressing effects of all the United States subsidies.[49] Brazil has described how the effect of the marketing loan programme is to increase production, increase exports of upland cotton, and suppress upland cotton prices (on average by 5.75% in MY 1999-2002).[50] The marketing loan programme is thus responsible for almost half of the estimated average price suppressing effects of the United States subsidies.

*(ii) Step 2 Payments*

2.39 The availability of Step 2 payments increases production in the United States, displaces imports of lower priced foreign upland cotton and enables additional United States exports of upland cotton. The Step 2 payment programme is specifically designed to stimulate export demand for United States upland cotton. Brazil has shown that the trade distorting effect of the Step 2 payments is widely acknowledged.[51] Professor Sumner estimates that Step 2 payments suppressed world prices between MY 1999-2002 by 3.04 per cent.[52]

2.40 Brazil has demonstrated that Step 2 domestic payments are a prohibited subsidy under Article 3.1(b) of the *SCM Agreement* in that the payments are contingent on the use of domestic over imported upland cotton and thus also violate Article III.4 of GATT 1994.

*(iii) Market loss assistance/Counter-cyclical payments*

2.41 The United States continues to argue that market loss assistance payments and counter-cyclical payments (CCP) are not linked to production and accordingly cannot have "effects" for the purposes of Article 6.3(c) nor operate to increase exports as required by GATT Article XVI:3.[53] The United States implies that their production effects are less than one percent.[54] However Professor Sumner's analysis shows that although their production effects were less than one percent in 1999, since then they have been significantly higher and are projected to increase in the future.[55] He

[48] *Ibid*, para 105.

[50] *Ibid*, para 157.
[51] *Ibid*, para 287.
[52] *Ibid*, Table 12.
[53] Further Submission of the US, para 74.
[54] *Ibid*, paras 73 and 74.
[55] Further Submission of Brazil, Annex 1, Table I.4.

concluded that these payments have a production impact because their effect is to keep land in the production of upland cotton that would not be otherwise because of low prices.[56]

2.42 As outlined by New Zealand in its First Written Submission to the Panel, the CCP payments create incentives for farmers with upland cotton base acreage to maintain upland cotton production.[57] New Zealand pointed out that in fact under the CCP programme the only way a farmer can guarantee a particular income is to continue to grow the same crop, otherwise the farmer runs the risk of missing out. For example, if he or she chooses to produce wheat and cotton prices are high enough that no CCP payment is made but wheat prices fall, the farmer will make a loss they would not have made had they stayed with cotton production. This, combined with other factors set out by Brazil,[58] for example the investment by farmers in cotton-specific machinery, virtually guarantees farmers will continue to produce cotton. The CCP payments are thus far from "de-coupled" in effect.

2.43 In fact Professor Sumner concluded that the CCP payments (as the institutionalised marketing loss assistance payments are now known under the Farm Security and Rural Investment Act 2002[59]) create *more* production incentive than the market loss payments, through base and yield updating and the increased per pound amount of support.[60] Professor Sumner determined that the market loss assistance payments and the CCP payments stimulated production by an average of 1.34% during MY 1999-2002.[61] And, as noted by Brazil, the full effects of the greater production incentives inherent in the CCP programme will only be realised in MY 2003.

## III. THREAT OF SERIOUS PREJUDICE

3.01 Brazil has brought evidence to show that the United States subsidies are not only causing serious prejudice to Brazil's interests today, but also threaten to cause serious prejudice to Brazil's interests in the future. Brazil has demonstrated that the United States subsidies cause a threat of serious prejudice to Brazil's interests within the meaning of Articles 5(c), 6.3(c) and 6.3(d) of the *SCM Agreement*, as well as GATT Article XVI:3 in the period MY 2003-2007 because of the continued operation of the Farm Security and Rural Investment Act 2002 and the Agricultural Risk Protection Act 2000.

3.02 Brazil has demonstrated that the very same factors creating present serious prejudice also create a threat of serious prejudice in the future. The United States subsidies are mandated to continue until MY 2007. They are effectively unlimited. Brazil has demonstrated that they have already caused serious prejudice to Brazil's interests. Their continued operation for a further four years cannot but be considered to threaten further serious prejudice to Brazil's interests.

3.03 The United States argues that the two standards proposed by Brazil are incorrect and that Brazil has, in any event, met neither of them.

3.04 To take Brazil's first proposed legal standard, Brazil argues, drawing on the findings of the GATT Panel in *EC – Sugar Exports I*[62] and *EC – Sugar Exports II*[63] and the Appellate Body in *US* –

[56] *Ibid*, para 169.
[57] New Zealand's First Submission, para 2.20.
[58] Further Submission of Brazil, para 207.
[59] *Ibid*, para 62.
[60] *Ibid*, para 171.
[61] *Ibid*, para 172.
[62] GATT Panel Report, *European Communities – Refunds on Exports of Sugar (Complaint by Australia)*, L4833 – 26S/290, adopted 6 November 1979.
[63] GATT Panel Report, *European Communities – Refunds on Exports of Sugar (Complaint by Brazil)*, L5011 – 27S/69, adopted 10 November 1980.

*FSC*,[64] that where there is effectively no limit on the provision of a subsidy a permanent source of uncertainty exists that threatens serious prejudice to other WTO Members. In such circumstances there is no check on the provision of a subsidy that would prevent it from causing adverse effects to the interests of other Members.

3.05 That is the precise situation in the present case. United States legislation requires the provision of the subsidies irrespective of whether or not those subsidies have adverse effects on other Members. In that respect it is important to bear in mind that the present case involves a level of subsidisation of, on average, 95 per cent, with a dollar value of US$12.9 billion, being provided by a country that currently has a 41.6 per cent share of the world market for upland cotton. The possibility that United States subsidies will continue to cause serious prejudice to the interests of Brazil in the future, is a real one – it is well removed from the realm of "allegations, conjecture or remote possibility" alluded to by the United States.[65]

3.06 In that respect Brazil's second proposed legal standard for determining whether such a threat exists is highly relevant. As Brazil has demonstrated, all of the factors that currently exist that mean that the United States subsidies cause serious prejudice to their interests will continue to exist in the future. Furthermore, United States producers of upland cotton will act in the expectation of future subsidy payments and will make their planting decisions accordingly. Therefore the fact that the legislation creating those subsidies will continue until 2007, and United States producers know that those subsidy programmes will continue until 2007, creates a very strong *prima facie* case that those subsidies will continue to cause serious prejudice to Brazil for the full term of their existence.

3.07 Finally New Zealand supports Brazil's request that if the Panel makes a finding of present serious prejudice, it should not feel constrained in making a further finding that the subsidies also create a threat of serious prejudice in the future.[66] Firstly, even though the present effects of the subsidies are already being felt, their future effects have not yet eventuated and therefore necessarily remain a threat. Secondly, the purpose of dispute settlement is to assist Members in the resolution of disputes – in this case a finding by the Panel on the threat of future serious prejudice is important to resolve this dispute.

## IV. EXPORT CREDIT GUARANTEE PROGRAMMES

4.01 New Zealand notes that the United States raises further arguments in relation to the negotiating history and appropriate interpretation of Article 10.2 of the *Agreement on Agriculture* in order to support its claim that there are currently no export subsidy disciplines on the use of export credit guarantee programmes.

4.02 However the United States does not address the applicability of Article 10.1. As outlined by New Zealand in its First Submission, Article 10.2 does not in any way suggest that it provides an exception from the disciplines of Article 10.1. While Article 10.1 currently provides the only discipline on the use of export credits, it is expected that the work envisaged in Article 10.2 will elaborate further and more specific disciplines that will presumably make identification of the extent to which such export credit programmes constitute export subsidies more straightforward. However it is incorrect to assume that there is a vacuum in the meantime. Item j of the Illustrative List of the *SCM Agreement* clearly already provides guidance on when export credit guarantee or insurance programmes are to be considered to be 'export subsidies' and beyond this the general definition in Articles 1.1 and 3.1(a) of the *SCM Agreement* also applies.

[64] Appellate Body Report, *United States – Tax Treatment for "Foreign Sales Corporation"*, WT/DS108/AB/R, adopted 20 March 2000.

[65] Further Submission of the US, para 115.

[66] Further Submission of Brazil, para 291.

## V. CONCLUSION

5.01 In conclusion, New Zealand considers that Brazil has provided the legal and factual basis upon which the Panel should conclude that the United States subsidies cause or threaten to cause serious prejudice to the interests of Brazil within the meaning of Articles 5(c), 6.3(c) and 6.3(d) of the *SCM Agreement* and violate GATT Article XVI. New Zealand therefore requests the Panel to make the findings and recommendations requested by Brazil.

# ANNEX E-8

## SECOND WRITTEN SUBMISSION OF PARAGUAY (THIRD PARTY)

3 October 2003

1. Paraguay is grateful for the opportunity to express its views in this dispute.

2. As already stated, Paraguay maintains that the subsidies and support granted to cotton production of the type at issue are inconsistent with the Agreement on Subsidies and Countervailing Measures and other WTO rules.

3. The agricultural subsidies cause serious prejudice to the domestic industries of many WTO Members, in violation of Articles 5 and 6 of the Agreement on Subsidies and Countervailing Measures. Indeed, these measures involve a financial contribution which, by conferring a benefit, could adversely affect the determination of the world price of the product.

4. Article 5(c) stipulates that "no Member should cause, through the use of any subsidy [-specific and not exempted under the Agreement –] adverse effects to the interests of other Members, i.e.: … (c) serious prejudice to the interests of another Member."

5. The threat of serious prejudice takes the form of price undercutting and unfairness in international trade, particularly as regards developing countries like Paraguay, which is highly dependent on its cotton production.

6. Article 6, which concerns serious prejudice, states that serious prejudice in the sense of paragraph (c) of Article 5 shall be deemed to exist in the case of subsidies to cover operating losses sustained by an enterprise, other than one-time measures which are non-recurrent and cannot be repeated for that enterprise and which are given merely to provide time for the development of long-term solutions and to avoid acute social problems; and direct forgiveness of debt, i.e. forgiveness of government-held debt, and grants to cover debt repayment.

7. Paraguay submits that the measures adopted by the United States do not fit these descriptions and cause injury to its economy, Paraguay being a predominantly agricultural country.

8. Because of the amounts involved, the subsidies granted to the cotton industry have a significant impact on the world market as reflected in increased production and export and price variations on the global market.

9. In the International Cotton Advisory Committee (ICAC) as in other forums, governments have remarked on the critical situation that the world cotton industry is going through and its link to subsidies, stressing the need to submit complaints before the WTO for violation of the applicable rules. The Committee considers that without the subsidization, the average world cotton price would undergo a reasonable increase.

10. Paraguay's cotton trade is affected by such measures because cotton production has a considerable impact on its economy, and especially on its rural populations which depend on cotton for their livelihood. In the sectors involved, such as transport and related industries, the impact is considerable, with approximately 30 per cent of the population affected.

11. Thus, the impact on trade in countries like Paraguay is devastating and causes the migration of rural populations to the urban areas, further aggravating the economic situation of a country dependent on its agriculture.

12. As shown in the attached table, cotton fibre exports to the United States was 518 tons, for a value of US$898,000.

13. The effect is clear: in 2001, the volume of exports to the same market practically doubled, reaching 924 tons, and yet the price decreased in equal proportions, with exports generating US$830,000. The world cotton trade figures reflect the same trend.

**CONCLUSION**

14. There is sufficient evidence to prove that the subsidies are causing problems to the international marketing of cotton and that the American subsidies are further aggravating the situation of cotton exports from Paraguay.

15. We respectfully request the Panel to find that the measure applied by the United States is inconsistent with the obligations laid down by the WTO in various provisions of the GATT 1994 and the Agreement on Subsidies on Countervailing Measures, and to take account of the arguments put forward by Brazil.

## ORAL STATEMENTS OF PARTIES AND THIRD PARTIES AT THE RESUMED SESSION OF THE FIRST SUBSTANTIVE MEETING

# ANNEX F-1

## EXECUTIVE SUMMARY
## STATEMENT OF BRAZIL AT THE
## RESUMED FIRST SUBSTANTIVE MEETING
## OF THE PANEL WITH THE PARTIES

### 1. Brazil's Claims of Present Serious Prejudice Relating to Subsidies Provided in MY 1999-2002

1. Brazil's *present* serious prejudice claims relate to US subsidies provided for the production, export and use of US upland cotton during the period MY 1999-2002. This period covers the measures challenged by Brazil and represents the relevant period of investigation to examine *present* serious prejudice caused by the US subsidies under Articles 5(c) and 6.3 of the SCM Agreement. This four-year period is long enough to allow the Panel to make a determination (in the words of the Appellate Body in the recent *EC – Pipe Fittings* decision) "that is less likely to be subject to market fluctuations or other vagaries that may distort a proper evaluation."

### 2. Brazil Has Established That the US Subsidies between MY 1999-2002 Caused Significant Price Suppression within the Meaning of Article 6.3(c) of the SCM Agreement

2. Brazil has shown in its Further Submission the amount and the subsidization rate of the US subsidies which cause serious prejudice to Brazil as well as demonstrated that all of the US subsidies are specific within the meaning of Article 2 of the SCM Agreement. The United States asserts that crop insurance subsidies provided to upland cotton producers by the 2000 Agricultural Risk Protection ("ARP") Act are not specific. In seeking to rebut Brazil's evidence that more than 50 per cent of the value of US agricultural commodities did not benefit from crop insurance benefits, the United States now argues that livestock is covered in "pilot programmes". Yet, a close examination of the "pilot" programmes indicates that the great majority of livestock production was *not* covered by the crop insurance programmes during the period of investigation. Therefore, the crop insurance programme is specific.

3. Contrary to the US arguments, the Panel is required by Article 5 of the SCM Agreement to examine the collective and interactive effects of *all* US subsidies. While different economists have estimated varying degrees of acreage, production, export and price effects of the US subsidies, no economist has ever found or suggested that removing all of the US subsidies would have only minimal effects.

4. The conditions of competition in the upland cotton market that existed during MY 1999-2002 (and that exist today) explain why: **First**, upland cotton is a basic fungible commodity that is widely traded throughout the world; **Second**, demand for upland cotton is relatively price-inelastic and consumption increased steadily during MY 1999-2002**,** whether upland cotton prices rose or fell; **Third**, world market prices for upland cotton as reflected in the New York futures price and the A-Index are sensitive to changes in supply – prices tend to rise when world supply decreases and fall when world supply increases; **Fourth**, US producers in MY 2002 supplied 41.6 per cent of world export market demand – the next largest exporter (Uzbekistan) had only 13 per cent of the world market share. **Fifth**, US producers of upland cotton are among the world's highest cost producers and total average costs between MY 1999-2002 were 77 per cent higher than market revenue received for

upland cotton lint; and **Sixth,** US upland cotton subsidies covered the cost-revenue gap with subsidies averaging 95 per cent which are 19 times greater than the five per cent subsidization rate formerly deemed to create a presumption of serious prejudice under Article 6.1(a) of the SCM Agreement.

5. US subsidies are a key element of the conditions of competition in the world market for upland cotton. The US subsidies create a situation in which USDA's Chief Economist has acknowledged that many US upland cotton producers are immune from market forces. This is readily illustrated by the extensive record provided by Brazil.

6. The United States now argues that US upland cotton farmers are sensitive to changes in market prices. Yet, US planted acreage *increased* as prices *declined* between MY 1999-2001. There can be little doubt that without the US subsidies, many US upland cotton producers would have to switch to crops providing a higher market return or take marginal land out of production. This means that without subsidies, US acreage and production would fall considerably. In addition to falling US production, the removal of US subsidies would also result in significant reductions in US exports contributing to increased world prices. Professor Sumner found that, *but for* the US subsidies between MY 1999-2002, US exports would fall from the annual *actual* average exports of 8.62 million bales by 41.2 per cent to 5.07 million bales. This reduction of 3.55 million bales represents 13.4 per cent of the total average world export market between MY 1999-2002. Given the relatively inelastic demand for upland cotton, it would be remarkable if world prices did not increase with a 13.4 per cent decrease in the supply of upland cotton to the world export market.

7. Brazil has examined some of the non-subsidy market factors that the United States apparently now claims account for *all* of the fall in prices in MY 1998-2002. Even though some of these factors may have contributed to lower and suppressed prices during MY 1999-2002, the US arguments and evidence do not refute Brazil's evidence that the impact of $12.9 billion in US subsidies on US acreage, production, exports and prices was significant. Moreover, Brazil does not dispute that there were other factors causing world prices to fluctuate throughout MY 1999-2002. And these same types of factors are causing prices to fluctuate today – and they will do so tomorrow. Changes in weather, exchange rates, economic growth, and financial conditions, among other factors, will always play a role in price discovery in world commodity markets. But it is simply not credible for the United States to argue now that $12.9 billion in subsidies to US producers faced with an average 24.3 cents per pound cost-revenue gap, who nevertheless increased their world market share to 41.6 per cent at times of record low prices, had no impact on production or world prices.

8. Having established that US production and exports would fall significantly if US upland cotton subsidies were eliminated, Brazil also demonstrated that the effects of lower US exports would result in world upland cotton prices being higher by an amount that is "significant". Brazil presents additional evidence on the price-suppressing effect of the US subsidies from the Report of the Commission on the Application of Payment Limitations for Agriculture. At the request of the Commission, USDA economists Westcott and Price examined the effects of eliminating marketing loan benefits for MY 2000 and MY 2001 finding significant acreage and price effects representing 33.6 per cent of the average prices received by US farmers in MY 2001. The record contains the results of a number of different simulations of price suppression effects caused by all or some of the US subsidies. All of these results reveal "significant" price suppression within the meaning of Article 6.3(c). They are "significant" because these results of price suppression are far from *de minimis*.

9. Finally, Brazil has demonstrated the close link between world A-Index prices, Brazilian internal prices and prices received by Brazilian producers in the export markets.

10. Andrew Macdonald has provided his expert testimony and described the importance of US market factors in influencing the perception of traders in the New York futures market and in shaping the perceptions of price movements by traders in international transactions as reflected in the A-Index price development. Mr. Macdonald has also provided evidence of the close relationship between these two sets of prices and the determination of prices in the Brazilian market. This evidence fully supports the pricing data reflecting the close connection between US domestic prices, US export prices, A-Index prices, Brazilian prices, and the prices received by Brazilian and third country exporters.

11. The United States has asserted that the term world market share in Article 6.3(d) "would appear to encompass all consumption of upland cotton, including consumption by a country of its own production". This is incorrect. The ordinary meaning of the term "world market share" in Article 6.3(d) of the SCM Agreement is not "world production share" or "world consumption share". Rather, it is the share of the world market for exports. This interpretation is consistent with USDA's and the EC's use of the term "world market share". In addition, footnote 17 to Article 6.3(d) states: "Unless other multilaterally agreed specific rules apply to the *trade* in the product or commodity in question." This provision refers explicitly to "trade" referring to international commercial sales and purchases in export markets, not global consumption or production.

**3. Threat of Serious Prejudice**

12. By guaranteeing a level of support of approximately 75 cents per pound, the US Subsidies create a continuing threat of excess US acreage, production, and exports, and continued suppressed world prices. This threat is a seamless continuation of the *present* serious prejudice that Brazil has already demonstrated. The threat exists today and will exist throughout the lifetime of the 2002 US Farm Act – until the end of MY 2007. A key initial issue for the Panel to decide is the time period for assessing data regarding the existence of a threat of serious prejudice. The Appellate Body has noted that a threat analysis requires examination of "facts" not "conjecture" and requires the "use of facts from the present and the past to justify the conclusion about the future". The Appellate Body also has held it is important to examine data for the entire period of investigation "to allow the investigating authority to make a . . . determination that is less likely to be subject to market fluctuations or other vagaries that may distort a proper evaluation".

13. A threat of serious prejudice exists for the following reasons: The mandatory US subsidies in the 2002 US Farm Act create a guaranteed revenue stream for US producers of 75 cents per pound. This revenue cannot be stopped between MY 2003-2007 regardless of how *low* US and world prices may fall, regardless of how much US production of upland cotton *increases*¸ and regardless of the amount of US exports. As found by the *EC – Sugar Exports* panels, and the Appellate Body in *US – FSC,* the absence of any legal mechanism to limit the quantity of subsidies is a critical factor to assess in determining the existence of threat.

14. Brazil has demonstrated the existence of *present* price suppression, increases in world market share and an inequitable share of world export trade based on actual data and market conditions for MY 1999-2002. This four-year period of serious prejudice is the best guide for the Panel to assess whether during the remaining five years of the 2002 US Farm Act there is a significant threat that serious prejudice will occur *again.* In making this assessment, the Panel should also consider the fact that the US National Cotton Council estimated that the 2002 US Farm Act *increased* the revenue stream to US producers by 10 cents a pound over that provided in MY 1999-2001.

15. US planted acreage during MY 2003-2007 will remain at significant levels – around 14 million acres (slightly less than the average for MY 1999-2002). USDA and FAPRI both estimate that there will be *no* significant reduction in US acreage or production between MY 2003-2007. The

guaranteed high US acreage between MY 2003-2007 means high levels of production and exports. It also means suppressed world prices.

16. USDA estimates that US producers' cost of production will increase during MY 2003-2007 and remain high relative to market revenue. The most recent data shows that US producers' cost of production in MY 2002 was 83.59 cents per pound. At these cost levels, many US upland cotton producers will not be able to meet total costs of production without receiving all of the US subsidies. This fact demonstrates the clear causal connection between US subsidies and continuously high acreage, production, and exports along with significantly suppressed prices throughout MY 2003-2007.

17. With respect to Brazils threat claim under Article 6.3(d), Brazil notes that the threat of an increased US world market share in MY 2002 has already materialized, as the US world market share continued to increase in MY 2002 to 41.6 per cent, well above the MY 1999-2001 three-year average of 29.1 per cent. Brazil also notes that there is a real and clear threat of an Article 6.3(d) violation for MY 2003 as recent USDA projections for MY 2003 US exports indicate that the likely US share will be 38.8 per cent in MY 2003 – an increase over the three-year (MY 2000-2002) average of 34.9 per cent. This evidence further supports the finding of a threat that the US share of world export trade will continue to be inequitable for MY 2003-2007.

18. Finally, Brazil has established that GATT Articles XVI:1 and 3 allow for threat claims to be based on this provision. Brazil has also demonstrated that a threat of the United States to have a more than equitable share of world export trade exists.

**5. Export Credit Guarantees**

19. Contrary to the US allegation, Brazil has demonstrated that the CCC export credit guarantee programmes are "mandatory" programmes. Moreover, the CCC export credit guarantee programmes are expressly exempt from the requirement that a programme receive new Congressional budget authority before it undertakes new loan guarantee commitments. The Appellate Body considered that the unlimited nature of the FSC regime posed a significant threat, under Article 10.1 of the Agriculture Agreement, that the United States would surpass its agricultural export subsidy reduction commitments. In addition, Brazil again notes that for guarantees, the United States, through the Federal Credit Reform Act, has concluded that costs and losses are best measured and recorded on a net present value basis, rather than on a cash basis, at the time the guarantees are issued.

**6. New US Requests for Preliminary Rulings**

20. The United States' "new" request for a preliminary ruling addresses Brazil's failure to provide a statement of available evidence with respect to export credit guarantees for commodities other than upland cotton. This request is in fact not "new".

21. The US request for a preliminary ruling that Brazil should have included more information in its statement of available evidence has no merit. Brazil has already addressed this issue. Brazil was required to file a statement of the evidence available to it at the time.

22. Second, the United States claims that cottonseed payments for 1999 and 2000, and 2002 are not within the terms of reference of the Panel because the measures allegedly were not identified within Brazil's consultation or panel request, and because Brazil and the United States allegedly did not consult regarding these measures. Both of these claims are false. Brazil and the United States did consult about "any programme providing support to the US upland cotton industry for the production, processing, use, sale, promotion or export of cottonseed or products derived from cottonseed."

Similarly, Brazil's Panel request specifically identified in four different places "measures" that would encompass all forms of cottonseed payments from MY 1999-2007.

23. Finally, the United States argues that the "other payments" such as "storage payments" and "interest subsidies" allegedly were not included in Brazil's consultation or panel request, that Brazil and the United States did not consult about such payments, and that these payments are not properly within the Panel's terms of reference. These assertions are also false. Both the consultation and panel requests identify in four different paragraphs as "measures" payments which encompass "other payments" and "storage" and "interest subsidy" payments. Further, Brazil understands that "storage payment" and "interest subsidy" are part of the operation of the marketing loan programme, which Brazil specifically identified in both the consultation and panel requests, as well as in its questions to the United States during the consultations. The record demonstrates that Brazil and the United States consulted about all marketing loan and loan deficiency payments, as well as "any other support to or government funding for the US upland cotton industry". Therefore, it is properly before the Panel.

# ANNEX F-2

## EXECUTIVE SUMMARY
## CLOSING STATEMENT OF BRAZIL AT THE RESUMED FIRST SUBSTANTIVE MEETING OF THE PANEL WITH THE PARTIES

### 1. Introduction

1. In its Closing Statement, Brazil reiterates that at the core of this case are $12.9 billion of US subsidies for upland cotton for MY 1999-2002. These subsidies increase and maintain the production of high-cost US upland cotton, increase US upland cotton exports, suppress US, world and Brazilian prices and lead to the United States having a more than equitable share of world export trade. In short, these US subsidies cause and will continue to cause serious prejudice to the interests of Brazil.

### 2. Direct, CCP, PFC, and Market Loss Assistance payments were received by producers of upland cotton

2. In its Oral Statement of 7 October, the United States alleged that Brazil has not substantiated the amount of PFC, market loss assistance, direct and counter-cyclical payments to US upland cotton producers. Brazil requested this information from the United States more than a year ago in the consultation phase of this dispute but never received any information. Yesterday, the United States indicated to the Panel that it did not collect or have this information. In similar circumstances, WTO panels have held that "[i]n situations where direct evidence is not available, relying on inferences drawn from relevant facts . . . to determine whether applicable and unrebutted inferences are sufficient for satisfying the burden of proof". In lieu of this non-existent *direct* proof, Brazil presented extensive *circumstantial* evidence that all or nearly all of these producers of upland cotton in MY 1999-2002 received PFC, market loss assistance, direct and counter-cyclical payments.

3. Brazil previously set forth this circumstantial evidence in a number of different Submissions between 24 June and 9 September 2003. To assist the Panel, Brazil has collected this evidence in Annex I to its Closing Statement.

4. A summary of the evidence set out in the Annex is the following: It demonstrates very high production levels of cotton relative to total upland cotton base acreage throughout MY 1999-2002. It shows near universal participation of eligible upland cotton producers in the 1996 PFC programme and 95.7 per cent participation of upland cotton base acreage planted to programme crops in MY 2001. By June 2003, nearly all eligible farms producing, upland cotton in MY 1993-95 or MY 1998-2001 signed up for the direct and counter-cyclical payments. USDA recognized that cotton farmers benefited from PFC and market loss assistance payments and even treated such payments as part of "Government Payments by Crop Year" to upland cotton. Additional evidence shows relatively small fluctuation of cotton planted acreage between MY 1999-2002 and the strong cotton equipment and geographic forces maintaining historic cotton producers in current cotton production. Numerous statements by the National Cotton Council establish that their members received PFC and market loss assistance payments, and would (and do) receive direct and counter-cyclical payments.

5. In addition, the 2002 FSRI Act provides much higher per acre payments for upland cotton than other programme crops (except rice and peanuts). The 1996 FAIR Act similarly provided higher per acre payments for upland cotton (except rice). The only possible rationale for the much higher

upland cotton per acre payments for PFC, market loss assistance, direct and counter-cyclical payment base acreage than other programme crops was the expectation that historical producers of upland cotton needed the higher per-acre income to continue to produce high-cost upland cotton on base acreage. This conclusion is further supported by the fact that given their high costs of production, US upland cotton producers would have lost 10 cents per pound in MY 2002 if they had planted on corn (or six other programme crops) direct and counter-cyclical payment base acreage in MY 2002. Similar losses would also have been experienced in MY 1999-2001 if upland cotton were grown on most other programme crop base acreage.

6. The evidence in Annex I supports Brazil's methodology to calculate the amount of PFC, market loss assistance, direct and counter-cyclical payments by using the ratio of actual US upland cotton production and the amount of upland cotton base acres for programme payments. For example, total planted upland cotton acreage in MY 2002 was 14.1 million acres. The total amount of upland cotton base acreage in MY 2002 was 16.2 million acres. The ratio of these two amounts is 0.87. Brazil used this ratio to adjust the amount of total upland cotton direct and counter-cyclical payments for the marketing year to obtain the amount of subsidies received by upland cotton producers. Out of the 16.2 million upland cotton base acres, 2.1 million acres were not planted to upland cotton in MY 2002. Thus, holders of these 2.1 million cotton base acres either did not plant any crops or planted other crops. Consequently, Brazil has not included direct and counter-cyclical payments on these 2.1 million acres in its calculation of payments to upland cotton producers.

7. The total amount of upland cotton base acreage for direct payments in MY 2002 (which include the portion of PFC payments that were deemed to be direct payments) was $558 million. USDA paid out the maximum amount of upland cotton CCP payments in MY 2002 – $1.148 billion. Multiplying those figures by 0.87 results in $485 million in direct payments and $998 million in counter-cyclical payments to US upland cotton producers.

8. The United States refuses to offer a methodology for calculating the amount of direct and counter-cyclical (or PFC and market loss assistance) payments made to upland cotton farmers. Brazil's suggested methodology is based on the conclusion that all upland cotton producers received these payments. In particular, the evidence suggests that the amount of payments can be best calculated by finding that US upland cotton producers received those payments using upland cotton base acreage. This follows from the evidence listed in Annex I to Brazil's Closing Statement.

9. The United States asserts that "Brazil has presented no evidence that the recipients of these decoupled payments on upland cotton base acres are, in fact, upland cotton producers". Apparently what the United States had in mind in making this statement is that Brazil must produce data detailing the amount of each direct payment received by every single upland cotton farmer between MY 1999-2002. This is data the United States admits does not exist. But such a burden would require the Panel to disregard all the circumstantial evidence provided by Brazil. DSU Article 11 requires the Panel to "make an objective assessment of the facts of the case". In the absence of any alternative methodology proposed by the United States, the "facts of the case" are those presented by Brazil.

10. Therefore, what the United States suggests is that the Panel ignores $1.7 billion in PFC and direct payments simply because the United States does not collect data that could ascertain the precise figure – which will be very small – of upland cotton farmers that did not receive those payments. Such an approach would permit WTO Members to write off large amounts of subsidies by simply refusing to collect data. The Panel must not allow this position to prevail.

### 3. Brazil's Article 6.3(c) Price Suppression Claims and the Econometric Studies

11. Brazil has offered considerable evidence in the form of documents and witness statements demonstrating the existence and payment of subsidies, as well as the causal link between the subsidies

and significant price suppression. In addition, Brazil presented the Panel with evidence of a number of different studies that show significant price suppressing effects. Notably among these are the two Westcott/Meyer USDA studies (referred to and commissioned by the Payment Limitation Commission) showing 10 per cent price suppression for MY 2000 and an estimated 33.6 per cent price suppression in MY 2001 from *only* the effects of removing the marketing loan subsidies. By contrast, Professor Sumner found that US prices were suppressed by 32.7 per cent by the effects of *all* US subsidies that applied during MY 2001. In light of the lower level of price effects found by Professor Sumner, the United States claim that Professor Sumner's analysis is not "conservative" is curious. Other studies by the ICAC – of which the United States and Brazil are both Members – show increases in world prices from the removal of some US subsidies of 10.5 per cent for MY 2000 and 26.3 per cent for MY 2001. Professor Sumner found that the effects of a removal of *all* US subsidies that applied during MY 2000 and MY 2001 would have resulted in world price increases of 7.74 per cent and 17.7 per cent respectively. Brazil has presented many other studies as evidence. They all show significant price suppression.

12. What has been the US reaction to every one of these studies? As they indicated over the past two days, they have found many initial problems with all of them. But they reserved the broad scale attack for Professor Sumner's FAPRI model that has been repeatedly relied on by the US Congress and USDA. The United States even identified flaws in the results of the Westcott/Meyer 2000 and 2001 marketing loan studies. And the United States promises they will be busy for the next six weeks in critiquing all the studies cited by Brazil.

13. But the Panel must ask whether *all* these economists, including some of USDA's own leading economists, could be wrong although their results support USDA's own Chief Economist's views that US producers are insulated from market forces by these subsidies? Could these economists be wrong because they made the mistake of applying the fundamental notion that large production subsidies create larger supplies, and larger supplies result in significantly lower prices?

14. In the final analysis, these econometric studies are useful tools to confirm what common sense already tells us. That $12.9 billion in subsidies provided between MY 1999-2002 have production effects. That the National Cotton Council was correct when it argued that US upland cotton farmers could not exist without all of the cotton-specific subsidies. That many US producers needed subsidies to bridge the huge gap between their total costs and market revenue. That US acreage did not decrease as prices plummeted to record lows between MY 1999-2001 – rather planted US acreage increased. That US producers planted 14.1 million acres of upland cotton when prices were at record lows in the spring of 2002. That US exports did not decrease as prices plunged and the US dollar appreciated, rather they increased. And that the effects of US subsidies on suppressed prices are transmitted to the world and individual country markets, including Brazil.

**4. Brazil has established a claim under Article 6.3(d)**

15. With respect to Brazil's claim under Article 6.3(d), Brazil demonstrated that the ordinary meaning of the term "world market share" is the world market share of exports. USDA, the EC and Canada all use this term to refer to export market share, not share of world consumption. This interpretation is consistent with the use of the term "trade" in footnote 17 of the SCM Agreement which means the "sale and distribution of goods and services across international borders". It is also consistent with the object and purpose of Article 6.3(d) which is to prevent a Member from using its subsidies to *increase* its share of the world market for a particular product.

16. Undisputed facts show that the US share of world trade increased considerably from MY 1998 to MY 2002, and is projected to remain at very high levels in MY 2003. This increase follows a consistent trend from MY 1996. The "consistent trend" need not be an unbroken line of increases during the trend period examined, as the United States appears to argue. Because of severe

weather problems, such as occurred in the United States in MY 1998, export market share in agricultural problems will always susceptible to some annual variations not caused by subsidies. Rather the trend must reflect an overall increase and not reflect a number of wide swings within the period examined. The trend for US world market share of upland cotton from MY 1996, and particularly the period from MY 1998 onward, shows a sustained and significant increase in the US world market share. And the undisputed facts show that the record US world market share reached in MY 2001 and 2002 occurred at the same time as record high levels of US subsidies.

**5. Brazil has established that the US share of world export trade is not equitable**

17. The notion of "equitable share of world export trade" necessarily depends on the facts of each case. The fact-intensive nature of each case is reflected in the text of Article XVI:3, which requires the Panel to examine "special factors". Brazil suggests that examining whether there were any subsidy-induced *increases* in market share is one factor to consider. Another factor is the relative cost of production of the Members competing for world market share. The undisputed facts show (based on September 2003 ICAC data) that the US share of world exports of cotton more than *doubled* between MY 1998-2002 – from 18.7 to 39.3 per cent. At the same time, the African producers' collective share of world exports *decreased* from 10.2 to 8.1 per cent of world trade. Figure 26 shows these trends. If a picture is worth a thousand words, it is this one.

18. Brazil submits it is not equitable for a heavily subsidized WTO Member to more than double its share of competitive world markets for upland cotton in only five years reflecting a significant contribution of subsidies. And it is not equitable for that Member to do so when its costs of production were double those of the poorest and neediest producers in the world. Yet, when faced with these facts, the United States' only response is that the definition of "inequitable" is hopelessly vague. Brazil does not believe the inequity in this case is so difficult to determine.

# ANNEX F-3

## EXECUTIVE SUMMARY OF THE OPENING STATEMENT OF THE UNITED STATES AT THE SECOND SESSION OF THE FIRST MEETING OF THE PANEL WITH THE PARTIES

1. **Brazil's Analysis Fails to Establish to Whom Certain Payments Go and Whether Certain Payments May Properly Be Attributed to Exported Upland Cotton**. One of the fundamental elements of Brazil's claims is that Brazil needs to identify the "subsidized product" that is causing the serious prejudice that Brazil claims its interests are suffering.[1] Brazil has not even explained, however, what is the "subsidized product" for each of the types of subsidies from which it claims serious prejudice. Brazil appears to assume that the "subsidized product" is upland cotton in the form traded on the world market. Yet many of the subsidies at issue are paid to producers of cotton. Cotton is processed and sold before being traded. Brazil has made no showing of how the subsidy to the producer can be assumed to pass through to the exporter.

2. Brazil's panel request identifies the challenged measures as "subsidies provided to US producers, users, and/or exporters of upland cotton". However, it is for Brazil as the complaining party to establish who are the recipients of the subsidies and that the subsidies are properly attributed to upland cotton. Brazil's failure to do so means that it has not carried its burden in demonstrating that cotton is subsidized for purposes of considering adverse effects.

3. In the Peace Clause portion of this dispute, the United States has discussed at length certain decoupled payments that are not linked to production of upland cotton. With respect to these decoupled payments, Brazil has failed to demonstrate who the recipients of these payments are in connection with any exported upland cotton. Brazil simply presumes that every upland cotton producer is an upland cotton base acreage holder and receives a decoupled payment. Brazil has brought forward no facts to demonstrate that this is the case.

4. Even if Brazil had brought forward evidence that the recipients of these payments were upland cotton producers, that would not be enough. Brazil would still need to allocate these payments, which Brazil concedes are not linked to current production of upland cotton, over total production on a recipient's farm.[2]

[1] For example, for purposes of a claim under Article 6.3(c) of the Subsidies Agreement, the "effect of the subsidy" must be "significant price undercutting" or "significant price suppression, price depression, or lost sales" caused by "the subsidized product." Similarly, under Article 6.3(d) "the effect of the subsidy" must be an increase in world market share "in a particular *subsidized primary product or commodity*."

[2] Subsidies Agreement, Annex IV, paras. 1-3 (We note the context provided by Annex IV of the Subsidies Agreement, which explained the calculation of the ad valorem subsidization of a product under the now-defunct Article 6.1(a) of the Subsidies Agreement. This Annex provided that (among other conditions), unless "the subsidy is tied to the production or sale of a given product," the overall rate of subsidization of a "product" is found by taking the amount of the subsidy over the "total value of the recipient firm's sales in the most recent 12-month period".).

5. Thus, Brazil assumes that the subsidies[3] at issue are received by someone currently producing cotton, based simply on the fact that the subsidy is based on past production of cotton. Brazil has not explained how this makes upland cotton currently for sale on the export market the "subsidized product" with respect to these payments. Brazil has failed to demonstrate that the recipients of the subsidies are involved in current cotton production, nor has it demonstrated how much of the subsidy, even under Brazil's approach, should be allocated to other products produced by the recipient, such as corn or soybeans.

6. **Brazil Has Not Established that US Subsidies Have Suppressed or Depressed Prices in the Same Market**. As noted above, Brazil has in fact not even demonstrated the subsidized product for each of the subsidies it challenges or the size of the subsidies to exported upland cotton. However, without relieving Brazil of its burden on these issues, we note that even Brazil's overly simplified approach does not suffice to demonstrate causation. US subsidies largely resulted from low market prices, not the other way around.

7. This is nowhere more evident than in marketing year 2001, a year with historically low market prices. Brazil has failed to explain that market signals (futures prices) at the time when planting decisions were taken by US producers suggested prices would remain high. Thus, the large marketing loan payments ultimately made in marketing year 2001 do not demonstrate that marketing year 2001 payments had the effect of increasing US production. Brazil's expert acknowledges this very point, but Brazil has not presented in its further submission *any* information on "the expectations about production incentives that growers hold at the time they make their planting decisions", information on which its own expert has stated "cotton plantings depend". Thus, Brazil's simple explanation of the conditions in marketing years 1999 through 2002 ignores "the basic economic principles" its own expert says are relevant in this case.

8. **The Sumner Model Presented by Brazil Is Inadequately Explained, Inappropriately Applied for a Retrospective Analysis, and Apparently Uses Faulty Assumptions and Estimations.** In presenting this reaction to Brazil's expert's analysis, the United States notes that the use of a simulation model to explore the counter-factual of removal of US subsidies cannot be made without answers to previous questions on the subsidized product and size of the subsidies. That is, the use of a simulation model cannot relieve Brazil of its burden of arguing the elements necessary to establish its claims. This critique of Dr. Sumner's analysis is made to show that Brazil's approach is fundamentally flawed in all aspects.

9. Since Brazil has not provided access to the model itself, one cannot say with certainty how the modelling affects the results.[4] Nonetheless, based on what has been presented in Annex I, Brazil's analysis appears flawed in several respects and as a result, the conclusions drawn are biased and misleading. While the modelling approach used is well accepted for forward-looking projections, using a baseline model to simulate counterfactual outcomes over the historical period 1999-2002 is

[3] Brazil purports to include export credit guarantees under the GSM-102 programme within its actionable subsidy claims. However, Brazil has merely alleged the quantities of export credit guarantees benefitting cotton and the value of exports. Brazil has nowhere presented evidence on any alleged subsidy rate resulting from this programme nor the amount of the subsidy. Therefore, Brazil again has not provided any evidence with respect to the amount of the subsidy alleged to be provided by US export credit guarantees.

[4] The report provided by Brazil as Annex I to its further submission does not provide the model itself, including detailed specifications of the equations used therein. As a result, Brazil is essentially asking the Panel and the United States to accept Dr. Sumner's results on faith alone. The United States points out why Brazil's expert's approach is inappropriate for a retrospective analysis of the effect of US subsidies. Even were Brazil's expert's approach appropriate, however, Brazil has failed to provide sufficient evidence to allow the Panel to fully understand and evaluate that model. Thus, quite apart from flaws identified by the United States, Brazil's reliance on Dr. Sumner's inadequately explained results, evident throughout Brazil's latest submission, further demonstrates that Brazil has not established a *prima facie* case that US subsidies have the effects complained of.

problematic because of the implicit assumption of perfect foresight by producers of actual conditions in the historical year. This potentially overstates the effects of the programme because the model assumes outcomes that were unanticipated by producers when they made their planting decisions. Also, it is not clear to what extent actual observed data enter into the solution process. The difference is not merely conceptual: the choice of values can potentially affect the reported results.

10. Brazil's use of lagged prices as a proxy for expected prices is also problematic. Recent studies have criticized the use of lagged variables as substitutes for expectations, and numerous papers use the futures price for next year's crop as the best proxy for expected price. The use of futures prices in a multi-commodity modelling framework for extended time projection is cumbersome. Nonetheless, the use of lagged prices as a modelling convenience does not preclude the possibility of bias. In those years where there are large shocks, lagged prices are poor predictors of expected price. Futures prices, by contrast, are more efficient because they are based on more current information.[5]

11. Brazil's expert's estimates of US programme impacts after marketing year 2001 are further inflated by his choice of a low-price baseline for the counter-factual comparison.[6] The low-price baseline exaggerates the 2003-07 results and ensures projections of significant marketing loan payments throughout 2003-07.

12. The economic literature on decoupled payments acknowledges the programmes may have some impact on production, and that those impacts depend in part on farmer' s expectations. However, the research concludes that the impact appears negligible. Brazil's expert, on the other hand, uses a stylized logic to come up with the estimates for the impact of production flexibility contract (PFC) payments that have neither empirical nor theoretical grounding. It is widely accepted that these programmes have whole farm impacts rather than crop specific impacts. Furthermore, the impact is much smaller than Brazil has estimated; the whole farm impact is, at its upper estimate, perhaps one-quarter to one-fifth the impact Brazil's expert cites for cotton alone.

13. Brazil argues that market loss assistance (MLA) payments have a larger effect on area than do PFC payments, despite the fact that MLA payments were paid on the identical payment base as the PFC payments. Supplemental legislation authorizing each of these MLA payments was passed several months after planting for the crop year in question had occurred. Brazil asserts that producers had expectations about MLA payments at the time of planting. However, if producers had expectations of payment, then they also knew that they would be eligible to receive such a payment whether or not they planted cotton. Indeed, they could choose not to plant any crop at all and still be eligible for the payment.

14. Brazil argues that counter-cyclical payments "clearly provide more production incentive than the market loss or the direct payments," yet offers no empirical evidence to justify such a claim. The claim, as well as Brazil's expert's treatment of decoupled payments in general, is particularly puzzling

[5] Consider as an example the 2002 crop year. In Brazil's analysis, area response to the removal of the cotton loan programme results in a 36-per cent reduction in US planted area–the largest single effect for any of the years considered in his analysis. Based on lagged prices, price expectations for 2002 were 29.8 cents per pound, a 40 per cent reduction from 2001 levels. Yet, the futures market data suggests a far smaller reduction in expected price. December futures prices taken as an average in February 2002 averaged 42.18 cents per pound, a 28 per cent drop from year earlier levels. Based on Brazil's range of supply response elasticities of 0.36 to 0.47, a decline of this magnitude would suggest a drop in acreage of 10 to 13 per cent from the preceding year. In fact, actual US cotton acreage dropped 12 per cent (from 15.5 million acres in 2001 to 13.7 million acres in 2002) suggesting acreage levels entirely consistent with world market conditions and price expectations.

[6] Brazil's expert's estimate for the 2002 A-Index is 51 cents, compared with 54 cents in FAPRI' s March 2003 baseline, and an actual price of 56 cents. For 2003, Brazil's expert's A-Index is estimated again at 51 cents, whereas FAPRI's baseline has a 58.4 cent forecast; as of 15 September 2003, the A-Index is at 65.5 cents.

given a recent paper by Brazil's expert in which he concludes that the 2002 farm bill would have a minimal effect on cotton area and world prices. Brazil's expert also remarked that: "The impacts of the FSRIA will be hard to isolate amid the normal flux of world markets".[7] We agree with Dr. Sumner's previously *published* conclusions on these points.

15. Crop insurance subsidies are generally available for most crop producers and hence do not give a specific advantage to one crop over another. Thus, their effects are not commodity specific, and have no or minimal impacts on cotton markets. Moreover, crop insurance purchases by cotton growers have generally been at lower coverage levels than for other row crops. Over 2002-03, roughly 90 per cent of cotton acreage insured was at coverage levels at 70 per cent or less, consistent with the criterion under paragraph 8(a) of Annex 2 of the Agreement on Agriculture. This suggests that even if one were to consider cotton crop insurance subsidies as crop specific, over 90 per cent of insured cotton area would be exempt as having no or minimal trade-distorting effects.

16. Lastly, while some studies like the ones cited by Brazil have suggested crop insurance subsidies may have a slight effect on acreage, the effects on production are less clear. Recent studies suggest that farms with more insurance tend to use less inputs like fertilizer and pesticides and vice versa. This demonstrates a potential moral hazard problem with crop insurance: a negative effect on yields, which may well offset any marginal effects on crop area.

17. The size of Step 2 payments under Brazil's baseline appears to be biased upwards, in part, due to the low-price baseline discussed earlier. Brazil's results are inconsistent with other analyses of Step 2.[8] Thus, contrary to the results of Brazil's expert's model, the benefits of Step 2 payments would appear to largely accrue to the producer, with only negligible effects on world markets. While Brazil's model documentation is lacking, one explanation for the difference may be a more price responsive acreage equation by Brazil.

18. While Brazil has presented a modelling framework that is conventional, much of how Brazil's expert has modelled US farm payments can be considered "unconventional". Thus, the analysis presented by Brazil in Annex I is not "conservative", but rather produces results that are inconsistent with a wider body of academic research.

19. **Additional Legal Arguments**. With respect to price suppression or depression under Article 6.3(c) of the Subsidies Agreement, Brazil believes that it is the effect on the producers of the complaining Member that must be "significant". We find it implausible that the Subsidies Agreement was intended to create multiple standards for panels to apply: that is, what may be "significant" to one Member's producers may be "insignificant" to another's. Context for rejecting Brazil's approach can be found in Article 15.2 of the Subsidies Agreement, which sets out for countervailing duty purposes the same effects found in Article 6.3. This text makes it even more clear that the analysis is whether the level of price suppression or depression itself is "significant".[9] Brazil has not suggested that the analysis under Articles 15.2 and 6.3(c) should be different.

---

[7] Sumner, D.A. "Implications of the US Farm Bill of 2002 for Agricultural Trade Negotiations." Australian Journal of Agricultural and Resource Economics. 47(2003): 99-123, at 114. (See Exhibit US-56)

[8] In Brazil's baseline, Step 2 payments average 5.6 cents per pound over the 2003-07 period, elimination of Step 2 payments raises world prices by an average of 1.6 cents, while farm prices fall by 2.5 cents per pound. These alleged effects are higher than those found by others. For example, in 1999, when Congress was debating whether to reauthorize Step 2 subsidies, the FAPRI analyzed the effects of reauthorization for the Senate Committee on Agriculture, Nutrition and Forestry. Their analysis estimated an average Step 2 payment of 5.3 cents per pound, resulting in an increase of the US spot price by 4 cents and a fall in the world cotton price of less than 0.5 cents.

[9] Subsidies Agreement, Article 15.2 ("With regard to the effect of subsidized imports on prices, the investigating authorities shall consider whether . . . the effect of such imports is otherwise to depress prices *to a*

20. With respect to GATT 1994 Article XVI:3, Brazil appears to assume that it may advance a claim under this provision on all challenged US subsidies. However, Article XVI:3 only applies to export subsidies. Therefore, as Brazil has predicated its claim under Article XVI:3 on evidence relating to all challenged US subsidies and not only those subsidies it alleges are export subsidies, Brazil has failed to establish a *prima facie* case on its claims.

21. Finally, with respect to Brazil's claims of a threat of serious prejudice, the United States notes Brazil's failure to present recent market and futures price data, which belie the notion that there is a clearly demonstrated and imminent likelihood of future serious prejudice. In fact, prices are currently above the level at which the marketing loan programme confers any benefit on US upland cotton producers and are expected to remain so. If there is not a "clearly demonstrated and imminent likelihood" of serious prejudice in marketing year 2003, it follows that there cannot be a threat of serious prejudice for marketing years 2004-07, either.

---

*significant degree* or to prevent price increases, which otherwise would have occurred, *to a significant degree*.").

# ANNEX F-4

## EXECUTIVE SUMMARY OF THE CLOSING STATEMENT OF THE UNITED STATES AT THE SECOND SESSION OF THE FIRST MEETING OF THE PANEL WITH THE PARTIES

1. The US comments speak briefly to Brazil's allegations regarding "the effect" of US subsidies. Brazil has not shown causation between the US subsidies and the effects Brazil attributes to those subsidies. The United States has pointed out the failure of Brazil to separate and distinguish evidence on the effect of other factors from the alleged effect of the challenged US subsidies. Ultimately, this issue goes to the quality of the evidence before the Panel and whether Brazil has established a *prima facie* case on its claims.

2. There are three main elements of Brazil's argument. First is the "temporal proximity" argument – that is, that low world prices correspond in time with high US subsidies.[1] Mr. Chairman, there are subsidies and there are subsidies. For example, there is a difference if I give you a $10 subsidy to produce versus $10 whether you produce or not. Depending on the nature of the payment, one would estimate different effects. Therefore, one cannot merely aggregate the value of all US payments and claim that those subsidies have had "an effect" on production and prices.

3. In this part of its argument, Brazil misuses the data on production by making comparisons using marketing years 1998 and 2001. In 1998, production was driven downward by drought and record crop abandonment. In 2001, production was driven upward by record yields. To use 1998 and 2001 as the beginning and end of a comparison therefore distorts a proper analysis.

4. Brazil stated yesterday that the increase in US production in marketing year 2001 was not solely due to record yields but also to an increase in acreage. That is true – there was some increase in acreage in 2001, but Brazil has failed to make the proper comparison to put that information in context. Brazil should have compared the US acreage increase between marketing years 2000 and 2001 with that in the rest of the world. The United States invites the Panel's attention to Exhibit US-63 circulated today. This exhibit reflects, for marketing years 1996-2002, the percentage change in harvested acreage over the previous marketing year in the United States and the rest of the world.

5. In marketing year 1996, when the programmes challenged by Brazil were introduced, you see a large decrease in US acreage compared to the rest of the world. The United States draws your attention to marketing year 1998, in which there is a large decline in US harvested acreage due to drought, followed by a large increase in marketing year 1999, which largely cancel each other out. In marketing year 2001, we see that the increase in acreage in the United States corresponds to the increase in acreage for the rest of the world. In marketing year 2002, the percent decline in harvested acreage in the United States is *greater* than that observed in the rest of the world. Thus, the data do not support Brazil's contention that US producers are insulated from market forces. In fact, US harvested acreage largely increases and decreases in line with the rest of the world.

6. (Yesterday Mr. Moulis asked about the data in the upland cotton fact sheet. The data in Exhibit US-63 does not come from that fact sheet but from the most recent US Department of Agriculture data base – the specific source is indicated on the second page of the exhibit. Brazil has used this same source for numerous exhibits in its submissions.)

[1] The United States has addressed the disconnect between low world prices and the level of subsidy in Exhibit US-44.

7. The second element of Brazil's arguments that the United States would like to address is its reliance on Mr. Sumner's model. We first would like to comment on something Mr. Sumner said today in his statement to the effect that the United States does not object to the use of the FAPRI baseline model. In fact, as reflected in the portion of the US opening statement delivered by Dr. Glauber, we do criticize as inappropriate the use of a baseline simulation model for retrospective analysis, a type of analysis for which it is not designed and is poorly suited.

8. Mr. Sumner's analysis also uses an inappropriately low baseline for his prospective analysis of future years. I noted with interest Mr. Sumner's statement that he used the November 2002 preliminary FAPRI baseline because this was available when he ran his model and that the results would have been even more extreme had he used FAPRI's published 2002 baseline "released the previous winter". The United States realizes it would have been inconvenient for Mr. Sumner to re-run his model, but FAPRI released a more recent baseline in January 2003 (published in March 2003[2]), many months before Brazil submitted the results of its model to the Panel and the United States. We believe this more recent FAPRI baseline would have been a more appropriate baseline with which to do calculations, but Brazil has chosen not to do so, instead presenting to the Panel results based on more out-of-date and inaccurate data. We wonder what would arise from a prospective analysis using such more recent data.

9. The third issue concerns the allegations of high US costs, an issue we have touched on only briefly in this hearing and will return to in more detail in our submissions. Brazil asks: without subsidies how could high-cost US producers have stayed in business? It is important first to point out that all of the cost projections by the US Department of Agriculture cited by Brazil are merely updates of a 1997 cost survey. In every year subsequent to 1997, the Department simply takes the results of the 1997 cost survey and updates it to reflect the general increase in prices according to the producer price index.

10. This approach assumes that the mix of inputs remains the same in 1997 as in subsequent years. However, this causes a presentation of inaccurate data on what costs are now. Brazil has several times in this hearing stated that it is not denying that factors reducing costs have occurred – for example, pest eradication bringing new, low-cost areas of the United States into production or the adoption of biotech cotton which requires fewer pesticide applications. Brazil, however, has not updated the cost information it presents to the Panel to account for such new developments and information.

11. The United States also notes Brazil's repeated references to a so-called cost/revenue gap. In fact, Brazil presents another such comparison for marketing year 2002 at page 5 to the annex to its Closing Statement. However, Brazil's so-called "gap" is the difference between an inaccurate average total cost per pound and the average marketing year farm price. Mr. Chairman, this is a faulty comparison. Total costs are relevant over the long-term, but Brazil uses this (inaccurate) number to compare to revenue in the short term – that is, the market price for one year. Such a comparison tells you nothing and does not establish that it is only the effect of US subsidies to keep US cotton farmers in business.

12. In fact, Brazil has apparently not listened to the testimony of its own farmer witness, Mr. Christopher Ward. In his statement during the first day of this hearing, he said the following (and I quote from paragraph 6 of his statement):

> But even with these high yields and the excellent quality of our land, *we were not able to fully recover all of our variable costs of production during the 2000/01* ***and***

[2] Exhibit US-52.

> *2001/02 seasons*. These variable costs included depreciation and maintenance of equipment, seed and fertilizer, labor, insurance, and fuel. ***Nor were we able to meet our total costs*** *which include the additional fixed costs*.[3]

That is, Mr. Ward says he has not been able to cover *either* his variable costs *or* his total costs for a period of two marketing years, and yet he continues producing. Under Brazil's analysis, he should be out of the business of producing cotton. He is not, and Brazil claims he is not subsidized, so how can Brazil claim that it is "the effect of the subsidy" to keep US farmers in business when they allegedly were not able to cover their total costs in marketing year 2002? What's true for Brazil should also be true for the United States.

13. Mr. Chairman, members of the Panel, on the basis of these arguments and the evidence presented to date, the United States does not believe that Brazil has established a *prima facie* case that the challenged US subsidies have caused the effects complained of. We will continue to develop and provide our response to the voluminous submissions of Brazil in our answers to your questions and in our rebuttal submission. Thank you.

[3] Statement of Mr. Christopher Ward at the Second Session of the First Panel Meeting, para. 6 (emphasis added). Mr. Ward goes on to state: "Based on my discussions with many producers relating to Mato Grosso cotton production and revenue, *I know that most other producers in State of Mato Grosso were in the same situation as we were during the 1999-2002 period*." *Id.* (emphasis added).

# ANNEX F-5

## ORAL STATEMENT OF ARGENTINA

Table of Contents

### I. INTRODUCTION

1. Argentina would like thank the Panel for this renewed opportunity to submit its views as a third party in these proceedings, and as stated in its submission of 3 October[1], it will be commenting on some of the claims made by the United States in its written submission of 30 September.[2]

### II. CLAIMS OF THE UNITED STATES

#### II.1 Causal relationship and other factors which affected and still affect the world cotton economy

2. In paragraph 5 of its submission, the United States asserts with respect to marketing loan payments and step 2 payments that Brazil seeks to ascribe extraordinarily low cotton market prices in recent years to US subsidy payments without presenting or explaining to the Panel the factors that led to this low market price level that in turn resulted in larger US subsidies.

3. Similarly, in paragraph 80 of its submission, the United States claims that Brazil's argument rests largely on the assertion that large US outlays under the challenged measures necessarily demonstrate that US measures caused those price declines.[3]

[1] Second Written Third-Party Submission of Argentina, 3 October 2003, paragraph 4.
[2] Further Submission of United States, 30 September 2003.
[3] Further Submission of the United States, paragraph 80.

4. The United States claims that Brazil has not been able to demonstrate the causal connection between the US measures and their effects, nor has it considered other factors which affected and still affect the world cotton economy.

5. Argentina believes that Brazil, in its First Written Submission, provided a precise and comprehensive description of the world cotton market situation, backing the facts with considerable evidence and documentation.[4] Similarly, in its Further Submission, Brazil took account of other factors which also contributed to demonstrating the suppressing or depressing effect on prices of the US subsidies.[5]

6. Argentina would further like to point out that despite the existence of factors other than the US subsidies that could also have had a depressing effect on international prices (such as the development of synthetic fibres, Chinese trade polices and other factors raised by the United States in its further submission[6], some of which will be considered by Argentina further on), Article 6.3 of the SCM Agreement[7] clearly states that "*serious prejudice … may arise in **any case** where … the effect of the subsidy...*".

7. In other words, Argentina considers that Brazil has demonstrated the causal relationship between the subsidies that the United States has granted and continues to grant to its cotton sector and the fall in international cotton prices.

8. That is, Argentina considers that under the SCM Agreement **it is not necessary for a subsidy to be the only factor** in the decline in international prices in order to be able to establish a causal relationship between that subsidy and the serious prejudice.[8] Rather, the subsidy must be a determining factor or, according to the text of Article 6.3(c), its effect must be a "**significant**" price suppression or price depression, and this was demonstrated by Brazil.

9. Argentina recalls that the United States, given the size and global impact of its cotton market – with a 41.6 per cent share of the world market – is the international market "price-setter" *par excellence.*

10. Thus, without the US subsidies which generate a world market surplus, international cotton prices would have been higher or would not have fallen as much. Similarly, if the US share in the world market had not increased as a result of the subsidies, the international price of cotton would have been higher or would have not fallen as much, and as a result, third-country producers, including Argentina, would not have suffered as much prejudice as a result of artificially depressed prices.[9]

11. Argentina does not agree with the US statement that Brazil has not established a *prima facie* case because it has failed to provide sufficient evidence of the causal relationship between the enormous budgetary outlays and the low international cotton prices.[10]

[4] Brazil's First Submission to the Panel, 24 June 2003.
[5] Brazil's Further Submission to the Panel, 9 September 2003, Section 3.3.4.4.
[6] Further Submission of the United States, Section IV.B and C.
[7] Agreement on Subsidies and Countervailing Measures.
[8] "*Further Third Party Submission of New Zealand"* (3 October 2003), *para. 2.09: "Brazil's argument is not that declining cotton prices were due solely to the impact of the United States subsidies. Nor does Article 6.3(c) require that to be the case … ".*
[9] Second Written Third-Party Submission of Argentina, 3 October 2003, paragraphs 21, 26 and 27.
[10] Further Submission of the United States, paragraphs 17 and 80.

12. Brazil has not based its claims on a mere assertion, but rather, as we have already stated[11], the number and quality of the empirical and econometric analyses presented by Brazil in its Further Submission[12], which were carried out both by international organizations and by various prestigious US institutions, not to mention the USDA itself, provide irrefutable evidence of the *collective* and *individual* effects of each subsidy programme on the price of cotton.

13. It is therefore difficult for Argentina to understand how the United States can claim that other factors, and not its subsidies, were the cause of the dramatic fall in cotton prices over the past few years. Nor does Argentina understand how the United States can disregard the evidence provided by Brazil[13] to the effect that during the marketing years 1999 to 2002, the total value of US cotton subsidies amounted to almost US$13 billion while the average cotton subsidization rate was 95 per cent.[14]

14. In the paragraphs that follow, Argentina will refute some of the arguments put forward by the United States concerning other factors that may have influenced the fall in international cotton prices:

15. FIRST: the United States claims that the explosion in the production of synthetic fibres played a considerable part in causing cotton prices to fall. Argentina submits that the contrary appears to be true.

16. Indeed, the "Fibre Prices" Table in paragraph 23 of the US Further Submission shows that polyester prices have always been lower than cotton prices (see: "US mill" as compared to "US spot" and "Asia poly") and, moreover, they appear to follow cotton prices (see 1995, when cotton prices reached their record level for the series and polyester happened to follow the same trend).

17. The fact that polyester had to adapt to cotton prices, and not the reverse as the United States claims, is confirmed by the very close correlation between cotton and polyester prices. On the other hand, the last few years do not show any correlation between the price per barrel of oil and the price of polyester fibres.

18. SECOND: Argentina does not understand how the United States can claim that without the increase in US retail consumption, international cotton prices would currently be lower[15] (which is not being questioned), while disregarding the role that its enormous subsidies have played and still play in the fall of international cotton prices.

19. As we have already pointed out[16], price movements of the US Cotlook "A" Index and third country (e.g. Brazilian and Argentine) market prices are directly interconnected, and this is an unquestioned and irrefutable fact. This being the case, the amount of the US subsidies granted to the cotton sector added to the scale of US production and exports are decisive when it comes to determining the extent to which the subsidies affect the fixing of both international and third market prices.[17]

20. THIRD: The United States correctly points out that since the world's cotton trade is managed in US dollars, an appreciation of the dollar will lead to a fall in the price of cotton both in the

[11] Second Written Third-Party Submission by Argentina, paragraphs 34-36.
[12] Further Submission of Brazil, Section 3.3.4.8.1.
[13] USDA's "Fact Sheet: Upland Cotton" (January 2003). (See Annex BRA-4).
[14] Written Third-Party Submission by Argentina, 15 July 2003, paragraph 20.
[15] Further Submission of the United States, paragraph 26.
[16] Second Written Third-Party Submission by Argentina, paragraph 22.
[17] *Idem*, paragraph 28.

United States and in third markets.[18] What the United States does not explain in connection with this fact is why this appreciation of the dollar by some 37 per cent between 1995 and 2002[19] did not also result in a fall in production, and consequently, in US cotton exports. The National Cotton Council (NCC) gives us the answer, pointing out that without its subsidies, the United States' share in the world cotton market would have declined.

21. FOURTH: Regarding the United States argument that China is the giant of the world cotton industry, and hence the impact of its trade policies and stocks, we note that neither Brazil nor third parties, such as Argentina, overlooked this fact. We repeat, Argentina has already pointed out[20] that while there were a great many cotton producing countries, four of them (China, the United States, India and Pakistan, in descending order) alone account for two thirds of world cotton production.

22. However, Argentina also pointed out that most of the cotton was used in the producing country itself, and that the great exception to that rule was the United States, which exported over a half of the cotton it produced and was the world's leading exporter. This was why the level of subsidization in the United States was the main factor in determining the world cotton market price. In other words, while China may be the giant in the world cotton **industry**, the United States is the giant in world cotton **trade**.

23. FIFTH: The United States claims that the decisions of farmers are based on expected cotton prices for the upcoming crop year and not prices from the previous crop year as cited by Brazil, and that US cotton producers are not insulated from international price movements.[21] We can only repeat some of the questions that we addressed to the United States during the consultations[22], namely:

24. If this is so, how does the United States explain the fact that in 2001 – the fifth year of falling prices – US cotton producers achieved a record harvest of 20.3 million tons, an increase of 42 per cent compared to 1998, and that the cotton planted area increased by 6 per cent during the same period? Why does the USDA estimate a 10 per cent drop in the world production for 2002 – reflecting the impact of world prices on investment – and at the same time estimate for this year another record harvest in the US – the fourth biggest ever recorded? How does the US explain the reasons for the increase in the volume of its cotton exports from 946,000 tons in 1998 to 1.8 million tons in 2001, while there was a drop in international prices?

25. Besides, the United States is not a low-cost producer[23] (despite its claim that pest eradication programmes and the adoption of genetically modified varieties of cotton have lowered its production costs[24]), and its productivity levels are lower than those of other exporting countries. Nevertheless, while international prices have fallen by some 54 per cent since the middle of the 1990s, the United States has expanded the area under cotton and increased its production. How does the United States explain the lack of correlation between the world cotton price and US cotton production?

26. Brazil has given answers to all of these questions. Argentina has also pointed out that if the United States did not grant subsidies to its cotton sector, the US cultivated acreage and production

[18] Further Submission of the United States, paragraph 35.
[19] *Idem*, paragraph 32.
[20] Written Third-Party Submission by Argentina, 15 July 2003, paragraph 21.
[21] Further Submission of the United States, paragraph 45.
[22] Second Written Third-Party Submission by Argentina, 3 October 2003, paragraph 7.
[23] International Cotton Advisory Committee, "Survey of the Cost of Production of Raw Cotton", 2001.
[24] Further submission of the United States, paragraph 46.

would diminish. US exports would also diminish and, the US being the world's leading supplier of cotton, international prices would be higher or would not have decreased as much.[25]

27. Argentina considers that the evidence submitted with respect to the increase in US production and exports which took place entirely independently or in isolation from the fall in the international price clearly demonstrates that US cotton producers are immune to changes in the market prices for cotton.[26]

28. SIXTH: The United States claims that the eradication of pests and the adoption of genetically modified varieties of cotton have lowered production costs.[27] We stress that even so, there continues to be a widening gap between those costs and market prices.

29. We repeat what has already been stated by Brazil and Argentina[28], namely that while US cotton production costs are among the highest in the world, US producers' market prices have fallen from US$0.60 to US$0.30 per pound.[29] The only possible explanation of how the United States has been and continues to be able to bridge the widening gap between production costs and market prices is subsidies, since without them many US producers would have been or would be compelled to cease cotton production.

30. SEVENTH: Argentina does not understand how the United States can claim that US cotton producers are highly sensitive to price changes when in spite of a 54 per cent fall in international prices since the middle of 1990s, the area under cotton and the production of cotton in the United States expanded considerably. In other words, contrary to what the United States has claimed, the area under cotton has responded to the fall in international prices by increasing steadily. The only way to achieve such a result is to grant enormous subsidies, since without them the cultivated area, and hence production, would have decreased.

31. EIGHTH: Argentina does not understand how the United States can state that its cotton producers show greater sensitivity to price changes than is demonstrated by third markets when, for example in Argentina – which is basically a "price-taker" in the international cotton market – the cultivated area shrank by 76 per cent during the marketing year 2001/2002, while production fell by 63 per cent compared to 1998.[30]

### II.2 Exclusion of measures

32. Regarding the US argument that some of its domestic support measures should not be included in the analysis[31], Argentina considers that the Panel should examine the collective effects of all of the support measures that are not green box measures. Argentina does not agree with the US statement that direct payments and counter-cyclical payments should be excluded from the analysis simply because their individual effects may not be that significant.

---

[25] Second Written Third-Party Submission by Argentina, 3 October 2003, paragraphs 11 and 12.

[26] *Idem*, paragraph 5.

[27] Further Submission of the United States, 30 September 2003, paragraph 46.

[28] Written Third-Party Submission by Argentina, 15 July 2003, paragraphs 17 and 18.

[29] According to a recent ICAC study, the cost of production in the United States was US$0.81 per pound of cotton in the marketing year 1999. In contrast, as pointed out by Brazil in paragraph 32 of its submission, Argentina's production costs averaged 59 cents per pound of cotton. "Cotton: World Statistics", Bulletin of the International Cotton Advisory Committee, September 2002 (Annex BRA-9).

[30] "Argentina: Economic Injury to the Cotton Sector as a Result of Low Prices", Working Group on government Measures of the International Cotton Advisory Committee, 2002. Written Third-Party Submission by Argentina, 15 July 2003, paragraph 22.

[31] Further submission of the United States, 30 September 2003, paragraphs 71 to 75.

33. It is the collective impact of all of the US subsidies that has effects on the cultivated area, production, exports and prices.

## II.3. Interpretation of Article 6.3(c)

### II.3.1 Effect of the subsidy

34. Argentina considers that Brazil has made a proper *prima facie* case with respect to its claim of inconsistency with Article 6.3(c) of the SCM Agreement, conclusively demonstrating the significant price suppression or depression effect.

35. Firstly, Argentina does not understand how the United States can simply brush aside the Panel's findings in *Indonesia-Automobiles*[32], since this was the only dispute under the GATT-WTO which dealt with the interpretation of the term "significant".

36. Secondly, Argentina fails to understand how the United States can claim that Brazil argued that it is the effect on producers that must be significant, and not on prices, when Brazil has submitted copious evidence, based on numerous empirical and econometric analyses, of the effects of the subsidies on prices.

37. It is remarkable that the United States should completely disregard these analyses, especially considering they were conducted by international organizations and by different prestigious US institutions, not to mention the USDA itself[33], in an attempt to distort Brazil's evidence.

38. Argentina repeats that over and above any endorsement that may be given to the conclusions of any one of these studies (and each study's estimate of the price effect of the subsidies), an increase in the world price of cotton would be significant, even if international price suppression or depression were to amount to only one per cent per pound, since such an increase would enable countries such as Brazil and Argentina to recover their competitive positions in the world cotton market.[34]

39. Finally, at no time does the United States seem to suggest that a suppression or depression effect of 12.6 per cent on international cotton prices is not "significant" within the meaning of Article 6.3(c). The Panel should therefore find that the subsidies in question have caused and still cause significant depression of cotton prices in the world market resulting in serious prejudice to Brazil's interests.

### II.3.2 "In the same market"

40. Contrary to what the United States has claimed[35], Argentina considers that Brazil has presented sufficient evidence with respect to the significant effect of subsidies on prices for each relevant geographical market, including the United States, Brazil, the African Countries, other producer countries and Brazilian export markets.

41. The United States provides no legitimate reason why the Panel should not consider the world market. As stated earlier[36], price movements of the United States, of the Cotlook "A" Index and third

---

[32] *Idem*,paragraph 82.

[33] Further Submission of Brazil, 9 September 2002, Section 3.3.4.8.1.

[34] Second Written Third-Party Submission by Argentina, 3 October 2003, paragraph 34 to 36. See also Further Third-Party Submission of New Zealand (3 October 2003), paragraph 2.21: "*...As Brazil demonstrates even a 1 cent per pound price-suppressing effect can reduce world wide export revenue by 552 million dollars"*.

[35] Further Submission of the United States, paragraphs 90 to 92.

[36] See paragraph 17 above.

country (e.g. Brazilian and Argentine) market prices are directly interconnected, and this is an unquestioned and irrefutable fact.

42. Moreover, US cotton forms part of Cotlook's "A" Index basket, so that the Panel cannot ignore the fact that the US subsidies have a decisive impact on the price of cotton in the world market.

43. Indeed, this being the case, the amount of US subsidies granted to the cotton sector added to the scale of US production and exports is decisive when it comes to determining the extent to which the subsidies affect the fixing of both third market and world market prices.

II.3.3 Time period to be considered

44. Regarding the US argument that subsidies that have ceased to exist can have no "effect"[37], Argentina would like to recall the Panel's remarks in the *Indonesia-Automobiles* concerning the irrelevance of serious prejudice having been caused by programmes that are no longer in force. Upon examining whether the subsidies caused serious prejudice to the interests of the complainants, the Panel in the said case rejected the argument that the effects of an expired subsidy programme could not be considered.[38]

45. Moreover, Argentina considers that it is necessary to consider a sufficiently extensive period to reflect market trends, and a period of one year as suggested by the United States is not sufficient.[39]

**II.4 Interpretation of article 6.3(d)**

II.4.1 World market share

46. The United States errs in its interpretation of the expression "world market share" by trying to identify it with "share in world consumption".[40] If, as the United States contends, the expression "world market share" in Article 6.3(d) refers to the increase in consumption of the country granting the subsidy, it would be contrary to the object and purpose of Articles 5 and 6 of the SCM Agreement, namely to avoid adverse effects of subsidies to the interests of other Members.

47. Indeed, if there were an increase in the share in world consumption of the product subsidized by the Member granting the subsidy, this would very probably lead to an increase in the international price of the product in question, and hence, there would be no adverse effects for other Members. In other words, to identify "world market share" with "share of world consumption" would completely subvert the underlying rationale of Article 6.3(d).[41]

[37] Further Submission of the United States, paragraph 94.

[38] The Panel stated that: *"[W]e must assess the 'effect of the subsidies' on the interests of another Member to determine whether serious prejudice exists, not the effect of 'subsidy programmes'. We note that at any given moment in time some payments of subsidies have occurred in the past while others have yet to occur in the future. If we were to consider that past subsidies were not relevant to our serious prejudice analysis as they were 'expired measures' while future measures could not yet have caused actual serious prejudice, it is hard to imagine any situation where a panel would be able to determine the existence of actual serious prejudice.*" Panel Report on *Indonesia – Automobiles*, paragraph 14.206.

[39] See WT/DS219/AB/R, paragraph 80: *" … we understand a POI to provide data collected over a sustained period of time, which period can allow the investigating authority to make a dumping determination that is less likely to be subject to market fluctuations or other vagaries that may distort a proper evaluation"*.

[40] Further Submission of the United States, paragraph 97.

[41] See also Further Third-Party Submission of New Zealand, paragraph 2.34.

48. Moreover, if we take account of the immediate context of Article 6.3(d), i.e. footnote 17, which states *"unless other … rules apply* ***to trade*** *… "*, we have a clear indication that the expression "world market share" can only refer to the share in world exports.

II.4.2 Time period to be considered

49. Contrary to the US claim that the trend in the period considered is not consistent because it includes years in which the United States world market share decreased rather than increasing[42], the fact is that there will always be peaks and troughs in agricultural production and export for climatic and other reasons. This does not mean that a trend over the years cannot be "consistent".

50. In other words, the word "consistent" cannot be interpreted in such a way as to allow a decrease in world market share during a given year to invalidate a trend over several years. On the contrary, the word "consistent" should be interpreted in the context of the investigation period, disregarding the market variations.

### II.5 Threat of serious injury

51. Argentina considers that since Brazil has established the existence of serious prejudice caused by the US subsidies, the threat of serious prejudice is clearly foreseeable and imminent as a result of the even higher subsidies planned under mandatory US legislation for the marketing years 2003-2007. Consequently, Argentina maintains that Brazil has established a prima facie case that these subsidies threaten to cause serious prejudice to Brazil.

52. Argentina contends that this guaranteed flow of subsidies will unquestionably lead to a higher level of US cotton production and exports. This will inevitably result in price suppression and depression as well as an increasing and inequitable US market share for cotton, thus creating a source of permanent uncertainty that confirms the threat of serious prejudice generated by the subsidies.

53. Argentina further considers that the link between US cotton subsidies and the threat of significant price suppression and depression and of an increase in the US world market share for cotton stems from the fact that the future subsidies will be as necessary as the current ones for US producers to bridge the gap between market prices and their total production costs. This will enable US producers to continue competing with more efficient third country producers, especially considering that the USDA itself forecasts an increase in total production costs.[43]

## III. EXPORT CREDIT GUARANTEES

54. In its Further Submission, the United States reverts to its argument in connection with the negotiating history for the interpretation of Article 10.2 of the Agreement on Agriculture, maintaining that there are no disciplines regulating the use of export credit guarantees.

55. Argentina repeats what it stated in its oral submission of 24 July 2003, namely that Article 10.2 in no way provides an exception to the general disciplines on export subsidies, and in particular, to the applicability to Article 10.1. As Argentina has pointed out, *"if that had been the intention, then the negotiators would have expressly said so."*[44]

---

[42] *Idem*, paragraph 101.

[44] See Oral Third-Party Submission by Argentina, paragraphs 35 to 43.

## IV. CONCLUSION

56. For the reasons set forth both in this statement and in previous submissions, Argentina requests the Panel to issue the findings and recommendations requested by Brazil throughout these proceedings.

# ANNEX F-6

## ORAL STATEMENT OF BENIN

8 October 2003

Mr. Chairman, members of the Panel,

1. My name is Eloi Laourou from the Mission of Benin. I am joined by Mr. Nicholas Minot of the International Food Policy Research Institute in Washington, D.C., the co-author of the study that has been annexed to our Third Party submission, "Effect of Falling Cotton Prices on Rural Poverty in Benin". I will ask Mr. Minot to speak to you in a moment. The other members of our delegation are our legal advisers, Mr. Brendan McGivern and Mr. Stefan Ramel, both from White & Case.

2. As noted in our Third Party submission, this is the first time that Benin has participated in a WTO dispute. We have not taken the decision to participate lightly. Indeed, it was only the serious threat posed to the economic and social stability of our country by massive, WTO-inconsistent US subsidies on cotton that has led us to take this unprecedented step.

3. The cotton farmers of Benin are efficient producers. The World Bank has estimated that the cost of producing cotton in West Africa is about 50 per cent of the cost of production in the United States. Moreover, the cotton sectors of both countries have undergone considerable structural reforms.

4. Yet the economic efficiencies of our producers, and the painful reforms they have accepted, have in the end proved to be almost completely irrelevant. US subsidies have had a ruinous effect on the world price of cotton, which in turn has had devastating effects on the economies of West Africa.

5. US cotton subsidies do not just dwarf the cotton sectors of West Africa. They dwarf all economic activity in the region. As noted in our submission, the subsidies paid by the United States to its prosperous 25,000 cotton farmers exceed the gross national income of Benin, Chad, Burkina Faso, Mali, Togo and the Central African Republic.

6. Oxfam estimates that for the period from 1999/2000 to 2001/2002, Benin suffered a total cumulative loss of $61 million in export earnings. Mr. Chairman, this is not an abstract, anodyne statistic. This translates into genuine suffering on the ground, as hundreds of thousands of people, deprived of export earnings, are pushed from bare subsistence to absolute poverty. Indeed, Dr. Minot estimates that a 40 per cent reduction in farm-level prices of cotton has the effect of pushing an additional 334,000 thousand people below the poverty line in Benin.

7. This is an important point, one that should be considered carefully by the panel as it assesses the meaning of "serious prejudice" to one of the poorest countries in the world.

8. With your permission, I would now ask Mr. Minot to summarize briefly the results of his study on how depressed world prices for cotton translate into poverty in Benin.

Dr Minot:

9. Thank you for the opportunity to present the results of a study that I hope will be relevant to the dispute. Before I begin, I would like to provide some background. I am a Research Fellow at the International Food Policy Research Institute, a Washington-based international organization whose mandate is to generate information to address problems of hunger and poverty in developing countries. I received my Ph.D. in agricultural economics from Michigan State University and have worked on issues of agriculture in developing countries for more than 15 years, including four years living in sub-Saharan Africa.

10. From 1998 to 2000, I led a German-funded study of the impact of agricultural reforms on farmers in Benin. In collaboration with a local research firm, we carried out four surveys in Benin: surveys of farmers, traders, market managers, and village cooperatives. In 2002, I was contracted by the World Bank to use these survey data to examine the impact of falling world cotton prices on poverty in Benin. My co-author, Lisa Daniels, and I finished the report later that year and a version of it was distributed as an IFPRI working paper in November.

11. Cotton prices are affected by competition with synthetic fibres, weather-related supply shocks, the rate of growth in the global economy, and government policies, among other factors. Cotton prices are pushed below what they otherwise would be by government support to cotton growers. The International Cotton Advisory Committee estimates that worldwide direct assistance to cotton growers was US$ 4.9 billion in 2001/02. Of this amount, the United States accounted for US$2.3 billion, equivalent to 24 cents per pound of cotton produced. Other sources, using a broader definition of assistance, estimate that the government provides US$ 3.9 billion to the cotton sector.

12. Until 2002, US cotton policy consisted of various programs, including two (the marketing loan program and loan deficiency payments) that ensured that farmers receive at least 52 cents/pound. This has the effect of insulating US farmers from falling world prices. In 2001, in spite of low world prices, the US posted record cotton production and near-record export volumes. Furthermore, US subsidies to cotton have increased since these studies were carried out. The 2002 Farm Bill introduced target prices for the major commodities and programs that effectively pay US farmers most of the difference between market prices and the target price. For upland cotton, the target price is 72 cents/pound. In addition, by allowing farmers to update their "base acreage", the new policy provides incentives for farmers to expand production.

13. Several recent studies have attempted to assess the impact of subsidies on world prices. The Centre for International Economics in Canberra uses a five-region world model of fibre, textile, and garment markets in 2000-01 to simulate the impact of US and European subsidies on cotton production and export. They find that removing US and European subsidies to cotton growers would raise the world cotton price by 6 cents/pound or 11 per cent. Another study, carried out by ICAC, estimates that removing US production subsidies would have increased the world price by 11 cents/pound in 2001/02. And most recently, Sumner estimates that, in the absence of US subsidies, the world cotton price would have been 12.6 per cent higher over 1999-2002.

14. The adverse impact of lower cotton prices on export revenue and GDP in cotton exporting ations is clear, but does this translate into higher incidence of rural poverty? If cotton is grown mainly by larger farmers with relatively high incomes, then the effect of changes in cotton prices on rural poverty may be modest. Even if cotton is grown primarily by small farmers, the magnitude of the effect on rural poverty will be small if few farmers grow cotton or if it accounts for a small share of rural income. Assessing the direct impact of changes in cotton prices on rural poverty requires detailed household-survey data on incomes and expenditures.

15. The paper examined the impact of changes in cotton prices on rural poverty in Benin. In particular, it had two objectives:

- to describe the living conditions and level of poverty for cotton growers and other farmers in Benin; and

- to estimate the short and long-run impact of lower cotton prices on the income of cotton growers and on the incidence of poverty in rural Benin.

16. The Republic of Benin has a population of about six million, 59 per cent of whom live in rural areas. Its rural economy is based on maize, sorghum, millet, yams, cotton, and livestock production. The per capita gross national product is US$380, placing Benin among the poorest countries in the world. Indeed, the per capita income of Benin is lower than the average for sub-Saharan Africa.

17. In 1989, Benin entered a period of economic and political reform. It made a peaceful transition from a military government to a constitutional multi-party democracy. It also began to move from a quasi-socialist economy to a free-market economy. In the agricultural sector, state farms and cooperatives were disbanded, food crop prices and marketing were liberalized, and many state-owned enterprises were privatized or closed. In January 1994, the CFA franc was devalued by 50 per cent, effectively doubling the price of imports and the returns to exports. Although this imposed hardship on manufacturing firms and urban consumers, it stimulated the local production of cotton, rice, and other tradable goods.

18. In the past two years, Benin has greatly reduced the role of the state cotton marketing board, introducing competition in the distribution of inputs and the marketing of cotton. The fall in world cotton prices has led to political pressure for the government to support the domestic price or even to re-assume control of the sector to protect farmer interests. Cotton represents 90 per cent of agricultural exports and around 70 per cent of its total exports (excluding re-exports).

19. Because the reliability of the results depends heavily on the quality of the survey data, it is worth briefly describing the survey methods. The survey, called the *Enquête des Petits Agriculteurs* (EPP) or Small Farmer Survey, was carried out in 1998 by the IFPRI and a local research firm, the *Laboratoire d'Analyse Régionale et d'Expertise Sociale* (LARES). The survey used a 24-page questionnaire covering 16 topics. The households were selected using a two-stage stratified random sample procedure based on the 1997 Pre-Census of Agriculture. In total, one hundred villages were selected. In each village, nine households were randomly selected using household lists prepared for the pre-Census of Agriculture. Due to some variation in the number of households interviewed in each village, the final sample was 899 rural households. The interviews were carried out in local languages by two teams of Benin interviewers, supervised by staff from LARES and IFPRI.

20. In order to study poverty, we need to define it. In this analysis, the poor are defined as those living in households whose per capita expenditure is below the $40^{th}$ percentile in rural areas. Expenditure is used instead of income because it is more reliably measured and is a better measure of household well-being. It includes cash spending on consumption goods, the value of home-produced food, and the rental equivalent of owner-occupied housing. The resulting poverty line is equivalent to US$123 per person per year. It is worth noting that this is a low poverty line, far below the US$1 per day frequently used by the World Bank.

21. We simulated the impact of various percentage reductions in cotton prices on the incomes of rural households using the concept of producer surplus. The details of the calculation are shown in the paper, but these are standard formulas used in economic analysis. In the short run (before households respond to lower prices), the change in income of each household is simply the percentage

change in the value of cotton production multiplied by the quantity produced. In the long run, lower cotton prices will cause farmers to substitute away from cotton, so the impact is smaller. We simulated the impact of these cotton price changes in the short and long run on each of the 899 household in the sample to generate estimates of the impact on rural income and poverty.

22. Before turning to the simulation results, I will describe the role of cotton in the rural economy and the characteristics of cotton growers. According to the IFPRI-LARES survey, cotton is grown by roughly one-third of the farm households. Cotton accounts for about 18 per cent of the area planted by farm households and 22 per cent of the gross value of crop production. In value terms, cotton is the second most important crop, after maize. Among cotton farmers, the average area planted with cotton is 2.3 hectares, producing 2.7 tons of seed cotton. The value of this output is US$ 901 per cotton farm. Cotton accounts for about one-third of the value of crop sales (these figures are shown in Table 2 of our paper).

23. Cotton growers tend to have farms that are larger than other farmers, but they are similar to other farmers in terms of the poverty rate and average per capita expenditure. The larger farms do not translate into a higher standard of living because cotton production is concentrated in the north, which is more arid and has fewer opportunities for non-farm employment. It is not that cotton farmers are poorer than average, but rather that almost all farmers in Benin, including cotton farmers, are quite poor.

24. Turning to the simulations, the short-term impact of a 40 per cent reduction in the farm-gate price of cotton reduces the income of cotton growers 21 per cent. Taking into account the incomes of non-growers, which do not change in this simulation, the average income of rural households falls 7 per cent. Smaller reductions in the cotton price cause roughly proportional changes in income, as shown in Table 3 of our paper.

25. With a 40 per cent fall in the cotton price, the average incidence of poverty, including both cotton growers and other farmers rises 8 percentage points, from 40 per cent to 48 per cent. In absolute terms, this implies that about 334 thousand people would fall below the poverty line. A 40 per cent decrease in the price of cotton results in a 40 per cent increase in the depth of poverty ($P_1$) and a 61 per cent increase in the severity of poverty ($P_2$).

26. Does it matter what poverty line we use? By looking at the cumulative distribution of income with and without the price change, we can evaluate the sensitivity of the results to alternative poverty lines. As shown in Figure 2 in our paper, similar results would have been obtained for higher and lower poverty lines. The results are not very sensitive to the elasticity assumption.

27. In summary, our paper analyzed the impact of changes in world cotton prices on farmers in Benin. Both quantitative measures of per capita expenditure from household surveys and qualitative responses to our 1998 survey suggest that rural living conditions improved over the 1990s. Furthermore, farmers tended to attribute this improvement in rural living conditions to economic factors such as crop prices, availability of food, and access to non-farm employment. Although the causal link is difficult to establish with certainty, it appears the economic reforms of the 1990s (including the 1994 devaluation) and the growth of cotton production during this period contributed to a noticeable improvement in rural standards of living.

28. The link between world cotton markets and rural living conditions can, however, work gainst farmers as well. The analysis in this paper is based on the 39 per cent decline in the world price of cotton between January 2001 and May 2002. We combined farm survey data from 1998 with assumptions about the decline in farm-level prices to estimate the short- and long-term direct effects of cotton price reductions on rural income and various measures of poverty.

29. The results indicated that there is a strong link between cotton prices and rural welfare in Benin. A 40 per cent reduction in farm-level prices of cotton is likely to result in a reduction in rural per capita income of 7 per cent in the short-run and 5-6 per cent in the long-run. Furthermore, poverty rises 8 percentage points in the short-run, equivalent to an increase of 334 thousand in the number of people below the poverty line. In the long run, as household adjust to the new prices, the poverty rate settles down somewhat, remaining 6-7 percentage points higher than it was originally.

30. Furthermore, these estimates may well underestimate the actual effect of lower cotton prices on rural poverty in Benin. First, in an economy with unemployed resources and excess capacity, an external shock affecting income (such as a change in cotton prices) has a multiplier effect. Changes in cotton farmer income result in changes in demand for goods and services produced by their non-cotton-growing neighbours, which in turn influences their income and their demand for goods and services. Estimates for four countries in sub-Saharan Africa suggest that the multiplier is in the range of 1.7 to 2.2, meaning that the total effect on income (positive or negative) is 1.7 to 2.2 times greater than the direct impact.

31. Second, we assume that farm prices change by the same proportion as world prices. In competitive markets with a fixed marketing margin, the percentage change in farm prices will be greater than the percentage change in world prices. Until recently, the effect of changes in world prices on farm-level prices in Benin was muted by government regulation of the market which stabilized prices. Under market reforms being carried out in Benin and elsewhere in West Africa, markets are becoming more competitive and changes in farm prices will closely match changes in world prices.

32. Third, our estimates do not take into account other indirect effects associated with declining cotton production. An earlier analysis of the Small Farmer Survey data from Benin indicated that cotton farmers are three times more likely to apply fertilizer to their maize crops compared to non-cotton farmers. This is because growing cotton gives farmers access to fertilizer on credit, some of which they "divert" to their maize fields. The implication is that lower cotton prices will indirectly reduce the yields of food crops.

33. Overall, the results in this paper challenge the stereotype of the rural poor in developing countries as consisting of subsistence farmers that are relatively unconnected to, and thus unaffected, by swings in world commodity markets. At least in the case of Benin, to the extent that fluctuations in world cotton prices are transmitted to farmers, they will have a significant effect on rural incomes and poverty. The broader implication is that policies that subsidize cotton production in the United States and elsewhere, dampening world prices, have an adverse impact on rural poverty in Benin and (by extension) other poor cotton-exporting countries. Thank you, Mr. Chairman and members of the Panel.

Mr. Laourou:

34. Thank you for allowing Dr. Minot to present his paper, and for allow Benin to present its views.

35. This concludes our oral statement. We respectfully ask this Panel to find that the United States is in breach of its WTO obligations, including by causing serious prejudice to the interests of Benin and other Members. We would be pleased to answer any questions that you may have.

# ANNEX F-7

## ORAL STATEMENT OF CHAD

8 October 2003

Mr. Chairman, members of the Panel,

I am Abderahim Yacoub N'Diaye, the Ambassador of Chad to the WTO. The other members of my delegation are Mr. Mouata Nanrabaye, as well as our legal advisers, Mr. Brendan McGivern and Mr. Stefan Ramel, both from White & Case.

Chad stands by its written Third Party submission of 3 October 2003. In addition, I wanted to supplement this by reading to the Panel a recent statement by Mr. Ibrahim Malloum, who is both the President of the Société Cotonnière du Tchad, as well as the President of the African Cotton Association. Given his unique qualifications, I asked him to prepare a statement for this third party session. Unfortunately, however, he could not attend the hearing, since he had to be in Chad this week. However, his statement is of direct relevance to the issues facing the Panel, and so with your permission, Mr. Chairman, I would like to read it to you.

"Statement by Mr Ibrahim Malloum

**Introduction**

1. My name is Ibrahim Malloum. I am the President of the Société Cotonnière du Tchad, commonly known as Cotontchad. Cotontchad is a public/private organization that controls the production and marketing of cotton in Chad. Cotontchad is responsible for supplying farmers with inputs on credit, purchasing and collecting the harvested seed-cotton, ginning the crop into upland cotton lint, as traded internationally, and finally selling the finished product. Cotontchad is required to purchase all cotton produced by Chad cotton farmers. In addition, Cotontchad is responsible for selling and marketing the cotton produced by more than 2.5 million people in Chad involved in the production of cotton.

2. I am also currently President of the African Cotton Association (ACA). The ACA was formally created during a summit meeting of African cotton producers in Cotonou, Benin, in September 2002. It includes all the West, Central and East African producers, ginners and merchants. Many international merchants, shipping companies, and banks are also members of this Association. The ACA's goals are to defend and promote African cotton in the world market and to encourage knowledge sharing among African cotton producers.

3. I have been involved with selling and marketing cotton for more than 18 years for Cotontchad, during which time I have been involved in all the cotton activities:

- I was in Memphis Cotton School in 1985.
- From the end of 1997 to 1999 I was the General Manager of Cotontchad.
- When I was General Manager I was in charge of supplying the farmers with fertilizers, and pesticides; we buy all the production from farmers, we gin the cotton, we classify and export the cotton.

- Today I am in charge of marketing all Chad cotton production around the world. I am thus selling in more than 30 countries (Europe, Far East, Africa and South America.).

- Our selling prices are based on the international prices driven by the New York Cotton Futures Market and the Liverpool "A" Index.

**Cotton in Chad**

4. Cotton is essential to the livelihood of more than 2.5 million people in Chad. It has been the major cash crop and driver of Chad's economy dating back to the 1920s and continues to be today. Cotton represents 25 per cent of Chad's export earnings and 5.1 per cent of its GDP.

5. Chad has about 8.1 million inhabitants of which over 2.5 million are in one way or the other involved in the production of cotton. Cotton is typically produced on small family farms that lack mechanization and modern equipment, and electricity. Irrigation is completely reliant on rain and all harvesting is done by hand. Many farms are not even accessible by road. Despite these handicaps, production costs are approximately between 54 and 58 cents per pound. This is approximately one-half of the costs of producing cotton in the United States.

6. In order to streamline the production of cotton, farmers are organized into roughly 5,000 Village Associations (Associations Villageoises), each comprising about 100 households of both cotton and non-cotton producers. These Associations Villageoises also provide some basic social structure for about 80 per cent of Chad's eight million people who live in rural areas and that depend on subsistence farming. Normally cotton production in each Association Villageoise is a group effort with everyone in the community contributing to the production process. The cotton harvest and the amount produced is a source of both pride and prestige in each Association Villageoise.

**The Role of Prices for Chadian Cotton**

7. As already mentioned, Cotontchad plays a central role in the production of cotton in Chad. The production cycle of cotton in Chad starts when each Association Villageoise requests input supplies from Cotontchad's field agents or "interface", based on their planned land cultivation. Cotontchad then allocates inputs to each Association Villageoise on credit using future cotton harvests as collateral. The amount of inputs acquired and distributed is influenced directly by the prices that are able to be obtained by Cotontchad in its international sales. When prices are low, as they were during 2001-2002, Cotontchad cannot afford to provide all of the imports demanded by the Associations Villageoises. This in turn reduces the amount of cotton produced by each Association Villageoise and in Chad in general. When prices increase, more inputs are purchased which are then provided to each of the Association Villageoise and causes cotton production – and incomes generated by those Associations – to increase. Thus, higher prices obtained in international markets directly impacts the amount of present and future income received by cotton producers in Chad.

8. Cotontchad purchases upland cotton from each Association Villageoise at its 2,500 nation-wide weigh stations. The price received by the producers is a countrywide uniform price that is set each year by a committee representing both farmers and Cotontchad. The price determined by the committee is a function of the price received by Cotontchad in its physical sales of cotton. Cotontchad can only offer a price to the farmers that is consistent with the international market price.

9. Cotontchad then transports the upland cotton to its nine ginning stations to be sorted, ginned and commercialized. Finally Cotontchad sells the finished cotton in physical markets on the spot and forward market. Cotontchad markets its cotton on both an immediate (spot) and on a forward contract

basis. I am the principal negotiator for sales of Chad cotton. In marketing cotton, I provide information to a number of purchasers concerning the availability of Chad cotton. In some countries (Europe, Japan, and partially India) Cotontchad uses the agent channels to sell directly to the spinning mills. In other countries, we sell directly to the international merchants. We fix prices in relation with New York Future prices, Liverpool "A" index and also in relation to the competition prices offered in the market. Everyday we inform our agents and merchants of the available quantities and the prices of the different qualities we are offering.

10. In negotiations for the spot market or immediate shipment of cotton, the price negotiation involves reference to the current N.Y. futures contract price as well as the A and B-index prices. I will always make reference to the N.Y. futures price if prices are increasing and the N.Y. futures price is higher than the A-index price.

11. The New York Cotton futures market is the main cotton market place in the world. It goes without saying that the cotton price is dictated by New York. All the business men can forecast the index "A" by looking to what New York did the night before.

12. The vast majority of cotton produced in Chad is exported (about 95 per cent). Cotton produced in Chad is in direct competition with other regional and foreign exporters of cotton. The extremely small world market share of Chadian cotton exports (about 1 per cent) invariably makes Chad a price taker.

**The United States and Its Influence on World Cotton Prices**

13. The United States' production of upland cotton has a large influence on the world market price for cotton. All traders of upland cotton keep a close watch on developments in the United States. As the largest exporter of cotton, the United States supplies more than 40 per cent of cotton sold in international sales. The United States is by far the largest exporter of upland cotton. Because of the large size of the US production and exports, when stocks of US cotton for sale decrease because of weather problems in the United States, then the world price of upland cotton invariably increases. This is normally first reflected in increased N.Y. futures prices and then later by increases in prices in the A-Index. On the other hand, when US production of upland cotton increases because of increased land planted to cotton or because of favourable weather conditions, then the increased stocks of US upland cotton in the world markets press world prices lower. I have seen this process repeatedly over the years that I have been trading upland cotton on world markets. In my view, it is obvious that if the US producers did not have access to very large subsidies, they would plant less cotton and world upland cotton prices would increase. There is no doubt in my mind that the large US subsidies keep world prices lower. This includes prices received by Chad cotton.

14. To give the Panel some idea of the impact of the large US exports, I frequently encounter during negotiations purchasers who indicate that they can purchase US cotton at a price lower than what I am seeking to obtain in negotiations. These purchasers frequently tell me that US upland cotton is available to them at a lower price because of the US Step 2 payments. These payments are well known in the industry and are reported in trade publications. The Step 2 payments for US cotton allows exporters selling US cotton to underbid my bids when I am in direct competition for sales. This has happened to me on a number of occasions. Again, the result is lower prices for cotton that I am able to negotiate for Cotontchad.

**Suppressed Cotton Prices and Their Effect on Chad**

15. I would tell you that the low prices received by Chad producers contributes to poverty in Chad. The description of what happened in Benin is the same as what has been happening in Chad. Cotton for most Associations Villageoises in Chad is the only source of outside income. Therefore Chadian schools, hospitals and local governments rely directly on money received from cotton sales. The cotton industry in Chad is still trying to recover from record low prices from 2001-2002. While prices are now increasing, prices will have to increase considerably more to make up for the unprecedented crisis caused by extremely low prices last year. In my view, the continuing high levels of US production are still depressing world prices. I look forward to the day when I do not have to compete with US upland cotton for every sale. Increased prices will allow Chad producers and Chad communities to obtain additional income and improve the life of our very poor people".

Thank you for your attention. I would be happy to answer any questions you may have.

# ANNEX F-8

## ORAL STATEMENT OF THE EUROPEAN COMMUNITIES

8 October 2003

### 1. Introduction

1. The European Communities (the "EC") welcomes this opportunity to submit orally its views to the Panel.

2. The EC has already submitted in writing its views with respect to Brazil's further submission of 9 September 2003. Today, the EC will provide its comments on the further submission of the United States of 30 September 2003. Many of the issues raised in the US submission concern factual matters. The EC will limit itself to address three of questions of legal interpretation. Specifically, the EC will argue in this Statement that:

III. the crop insurance payments made by the United States would be "specific" in so far as it can be established that different insurance policies result in different benefits being conferred with respect to different products;

IV. the issue of whether green box payments can cause "serious prejudice" within the meaning of Article 5(c) of the *Agreement on Subsidies and Countervailing Measures* (the "SCM Agreement") does not arise in this dispute;

V. the term *same market* in Article 6.3 (c) may refer to any geographical market, including also the world market, provided that there is such a world market for the product under consideration.

3. Before addressing these issues, the EC would like to put on record its agreement with the United States with respect to a number of questions on which it does not consider it necessary to submit additional arguments:

VI. the EC agrees with the US interpretation of the term "world market share" in Article 6.3(d) of the *SCM Agreement*;

VII. the EC endorses the U.S. interpretation of the term "more than equitable share" in Article XVI:3 of the GATT;

VIII. the EC also agrees with the US position that Brazil's first standard to establish the existence of "threat of serious prejudice" for the purposes of Article 5(c) of the *SCM Agreement* is incorrect;

IX. finally, the EC agrees with the United States that the *Agreement on Agriculture* (the "AA") excludes the application of Article III:4 of the GATT and of Article 3.1 (b) of the *SCM Agreement* to subsidies "in favour of agricultural producers" which are paid to the processors.

4. On the other hand, the EC would like to restate its disagreement with the US position that Article 10.1 of the AA does not apply to export credits and guarantees.

**2. Specificity of crop insurance payments**

5. The United States contests Brazil's claim that the subsidies allegedly provided in the form of crop insurance payments are specific. The United States argues that crop insurance is not "specific" because it is available, in one way or another, with respect to all agricultural products.[1]

6. The EC understands, however, that different crop insurance policies apply to different agricultural products.[2] If such differences had the consequence that some agricultural products will receive a benefit in circumstances where other products will receive no benefit, or only a smaller benefit, the difference would be clearly "specific".

**3. Green Box subsidies**

7. The United States argues that Brazil has failed to make a prima facie case that the payments for which it claims green box status cause serious prejudice. The United States recalls that paragraph 1 of Annex 2 of the AA makes clear that green box payments have no, or at most minimal, trade-distorting effects and that, under Article 21.1 of the AA, the *SCM Agreement* applies "subject to" the AA.[3]

8. This is correct. But this argument does not appear to be relevant in the context of this dispute. If the payments at issue meet all the criteria of Annex 2, they would be exempted from action under the *SCM Agreement* in accordance with Article 13 (a)(i) AA. If not, the United States could not invoke their conformity with Annex 2 and Article 21.1 in order to argue that they have no or minimal trade-distorting effects. Logically, the issue raised by the United States could arise only in the absence of the peace clause, or if the peace clause had expired at the initiation of this dispute.

**4. The meaning of "same market" in Article 6.3 (c)**

9. The United States contends that the term "same market" in Article 6.3 (c) cannot be interpreted to include the world market, because that would render redundant the word "same".[4] The EC disagrees. In accordance with its ordinary meaning, the term "market" may refer to any geographical market, including not only national or regional markets but also the world market, provided that there is such a world market for the product under consideration.

10. The US argument is based on the assumption that there will always be a world market for any given product. That assumption is incorrect. In order to characterise a certain geographical area, whether it is the territory of one or more Members or the entire world, as a "market" it must be shown that the conditions of competition prevailing within that geographical area are sufficiently homogenous. If there are significant trade barriers between Members, or between groups of Members, with the consequence that conditions of competition are significantly different within each Member or group of Members, it will not be possible to consider that there is a world market for the purposes of Article 6.3(c), but only national or regional markets.

# ANNEX F-9

## ORAL STATEMENT OF INDIA

8 October 2003

1. We thank you for giving us the opportunity to present India's views in this third party session. India is the third largest producer of cotton in the world and has the highest area under cotton cultivation in the world. India has a substantial trade interest as well as systemic interest in this dispute. In the first part of this session on 24 July 2003, we had presented some views on the three US subsidy programmes that we consider as violative of the Agreement on Subsidies and Countervailing Measures (SCM Agreement). Today we wish to present our views on the term 'serious prejudice' used in Article 6.3 of the Agreement.

2. The measures challenged by Brazil in its claims of *present* serious prejudice include the payment of subsidies through various programmes which include marketing loan payments, counter-cyclical payments, direct payments, production flexibility contract payments, market loss assistance payments, crop insurance subsidies, Step 2 payments, and GSM 102 export credit guarantees. The legal instruments providing these subsidies include the 1996 FAIR Act, the 2002 FSRI Act and the 2000 ARP Act as well as various appropriations bills for Marketing Years (MY) 1999-2002.

3. The subsidies given by US at issue are explicitly limited to certain enterprises or industries. None of the subsidies at issue are widely available throughout the US economy across industries. Eligibility for the domestic support and export subsidies at issue in this dispute is either "explicitly" limited to the subset of the US industry producing *agricultural crops*, to subgroups of industries producing *certain* agricultural crops, or to *only* upland cotton. None of the subsidies are available for any non-agricultural product. Thus the subsidies given by US to cotton are "specific" as understood under the SCM Agreement.

Mr. Chairman, Members of the Panel,

4. For establishing serious prejudice caused by the subsidies given by the US to cotton, Brazil has provided numerous facts that independently as well as collectively demonstrate the causal link between these subsidies and significant price suppression in upland cotton markets in MY 1999-2002.

5. It has been demonstrated, *inter-alia* through the analysis of Professor Daniel Sumner, details of which are available in Section 3.3.4.8.2 of Brazil's Further Submission to the Panel, that in terms of significant price suppression, removal of the subsidies given by the US would increase the A-index prices by an average of 12.6 per cetn or 6.5 cents per pound between MY 1999 and 2002. Brazil has demonstrated that the subsidies given by the US during MY 1999-2002 cause *present* significant price suppression within the meaning of Article 6.3(c) of the SCM Agreement in the Brazilian and world markets, including in markets where both Brazilian and United States producers export, and thus cause serious prejudice.

6. The average rate of subsidisation of cotton in the US during MY 1999-2002 as revealed in the Table at page 4 of Brazil's Further Submission was as high as 95 per cent. These subsidies, therefore, almost entirely constitute the farmers' incomes and have a major impact on farmers' production decisions. Producers of upland cotton in the United States are thereby largely insulated from the effects of the market. Thus, even when prices for upland cotton were falling, and the value of the United States dollar and costs of production were rising, production and exports of upland cotton by

the United States increased significantly. Similarly, the acreage under upland cotton in the US increased by 13.5 per cent between MY 1998 and MY 2001. Thus, in our view, Brazil has made a prima facie case of having suffered "serious prejudice" on account of the subsidies given by the US to cotton.

7. In its Further Submission, the United States has argued that after Brazil demonstrates that one or more of the effects of the subsidy mentioned in Article 6.3 is applicable, Brazil must then further demonstrate that the "prejudice" caused by the effects of the subsidy were "serious" enough to constitute "serious prejudice" within the meaning of the term in that Article. The argument of the United States appears to be based on the use of the words "may arise" in Article 6.3 as against the use of the words "shall be deemed to exist" in Article 6.1. The US seems to conclude that serious prejudice need not arise even if one or more of the effects of the subsidy listed in Article 6.3 is found. The United States goes on to infer from this difference in language that a complainant, in addition to demonstrating the existence of one of the listed effects, must also meet a separate "serious prejudice" standard – the content of which is undefined by the SCM Agreement.

8. In India's view nothing more than the demonstration that one of the effects enumerated in Article 6.3 exists is necessary to arrive at a finding of "serious prejudice". Subsidies listed under Article 6.1 are *deemed* to cause serious prejudice, hence such a presumption is rebuttable under Article 6.2 if the subsidy does not result in any of the effects enumerated in Article 6.3. No such rebuttal is envisaged under Article 6.3. There is, thus, no obligation under the SCM Agreement to demonstrate serious prejudice separately after establishing that one of the effects of a subsidy listed under Article 6.3 applies, as the effects listed in Article 6.3 themselves equate to serious prejudice. This interpretation is also confirmed by a reading of Article 6.2, which equates serious prejudice to effects listed under Article 6.3. India disagrees with the US interpretation of Article 6.3.

9. In conclusion, Mr. Chairman and Members of the Panel, India holds the view that the subsidies given by the US on upland cotton are specific, causal link exists between these subsidies and the significant price depression, and these subsidies given by the US have caused serious prejudice within the meaning of the term in Article 6.3 of the SCM Agreement.

# ANNEX F-10

## NEW ZEALAND'S ORAL STATEMENT

8 October 2003

1. Mr Chairman, Members of the Panel, New Zealand's Further Submission to the Panel of 3 October outlines New Zealand's support for the claims made by Brazil and its views on the issues raised in the Further Submission of the United States. The evidence brought by Brazil in support of its claims is overwhelming and conclusive.

2. New Zealand's submission, and our statement today, focuses in particular on Brazil's demonstration that the United States subsidies cause significant price suppression within the meaning of Article 6.3(c) of the *Agreement on Subsidies and Countervailing Measures* (or the *SCM Agreement*). Evidence brought by Brazil shows that the United States subsidies suppressed A-index prices by an average of 12.6 per cent over MY 1999-2002. That means a total amount of lost revenue for Brazilian producers of $478 million and suppressed revenue worldwide of $3.587 billion.

3. The United States has produced no evidence or argument to rebut this claim. Instead the United States points to a number of factors that it says caused prices for upland cotton to fall. However, those factors are entirely irrelevant to the issue of whether the United States subsidies cause significant price suppression. Nothing in the *SCM Agreement* requires a complainant to show that the subsidies at issue are the sole or major cause of prices falling in order to demonstrate serious prejudice.

4. In fact, the *SCM Agreement* does not even require prices to fall for there to be price suppression. As demonstrated by Brazil, price suppression can occur even when prices are rising. All a complainant is required to show to satisfy Article 6.3(c) is that significant price suppression is caused by the subsidies at issue. Brazil has done that, and the econometric models Brazil has used have not been challenged by the United States. Furthermore, those models isolate the effects of the subsidy from other factors, and thereby ensure that the effects of other factors affecting cotton prices are not attributed to cotton subsidies.

5. By contrast, the United States advocates an interpretation of Articles 5 and 6 that would completely undermine their objective, which is of course to allow WTO Members to act when adversely affected by other Members' use of subsidies.

6. In particular the United States draws the wrong conclusion from a comparison of Article 6.1 and Article 6.3, namely that it is not sufficient for a complainant to show that one of the effects set out in Article 6.3 exists for there to be serious prejudice. A closer look at the substance and nature of those provisions in the broader context of Articles 5 and 6 makes it clear that once a Member has demonstrated the existence of significant price suppression within the meaning of Article 6.3, there is serious prejudice. We note that the EC agrees with this interpretation in its Further Third Party Submission. New Zealand has described in detail in its Further Submission why the United States interpretation of Article 6 should be rejected.

7. The United States takes a similar approach to interpretation of the phrase "significant" in Article 6.3(c). The United States approach would require "significant price suppression" to be demonstrable solely by reference to some arbitrary level of numeric significance. Yet the United States does not suggest what level of significance would be appropriate in the present case, nor

does the United States go so far as to suggest that 12.6 per cent is not "significant". The United States offers no explanation at all of how "significance" is to be determined under its proposed approach. This is perhaps because such an approach is unworkable in practice.

8. Whether or not price suppression is significant within the meaning of Article 6.3(c) will depend on the circumstances of the case. And such a determination must be anchored in the overall context of consideration of the adverse effects of the subsidy if the *Agreement* is to operate as Members intended it to. Thus Brazil's approach of considering whether the level of price suppression is "meaningful" in its effect is entirely appropriate and workable, and offers the best means of ensuring that Article 6.3(c) is effectively and consistently applied.

9. These are but two examples of attempts by the United States to read into the *SCM Agreement* additional requirements that are simply not there and distort the requirements that are there. If accepted, such interpretations would make it virtually impossible for Members to show the existence of serious prejudice. Such an erosion of the rights negotiated by Members under the *SCM Agreement* cannot be permitted.

**Threat of Serious Prejudice**

10. New Zealand's Further Third Party Submission also outlines why the Panel should find that the United States subsidies create a threat of serious prejudice to the interests of Brazil in the future. The fact that Brazil's interests are already suffering serious prejudice as a result of the United States subsidies leads to a strong presumption that they will continue to do so. United States legislation requires the continued provision of the subsidies irrespective of whether or not they have adverse effects on other Members. The present case involves a level of subsidisation of, on average, 95 per cent, with a dollar value of US$12.9 billion, being provided by a country that currently has a 41.6 per cent share of the world market for upland cotton The threat of future serious prejudice is therefore a real one.

11. In addition to the points addressed in New Zealand's Further Submission, New Zealand takes this opportunity to record its views on two further issues raised by the United States.

**Crop Insurance**

12. The first is the United States argument that crop insurance payments fail to meet the requirement for specificity in Article 2 of the *SCM Agreement*. As demonstrated by Brazil, the crop insurance subsidies to upland cotton producers enhanced United States upland cotton production. The payments act as a direct production stimulant by keeping marginal upland cotton land in production. Professor Sumner's analysis concludes that in the period MY 1999-2002 United States crop insurance subsidies resulted in suppression of world prices by 1.2 per cent.

13. Brazil has demonstrated that the crop insurance programme is limited to certain enterprises and thus is not generally available but is effectively available only in respect of crops. The crop insurance programme is therefore specific within the meaning of Article 2 of the *SCM Agreement*.

**Step 2 domestic payments**

14. Second, New Zealand wishes to elaborate its view in support of Brazil's claim that the Step 2 domestic payments are prohibited subsidies under Article 3.1(b) of the *SCM Agreement* and GATT Article III.4. There is no basis upon which to claim that the *Agreement on Agriculture* gives Members a right to use whatever domestic support they wish with complete impunity from action under other WTO Agreements. The *Agreement on Agriculture* is silent on the issue of local content subsidies. Such silence cannot be taken as creating an "entitlement".

15. Nor does New Zealand accept that Members could have so encroached on the fundamental GATT principle of national treatment any way other than explicitly and expressly. The United States has been unable to demonstrate that Members intended, through the *Agreement on Agriculture*, to effectively waive their rights under GATT Article III in respect of agricultural products. Nor is there any evidence that Members traded those rights in return for reduction commitments on domestic support. Where there was a trade-off was between the application of Articles 5 and 6 of the *SCM Agreement* (for a limited period of time) and reduction commitments, as set out explicitly in the peace clause. There is no such trade-off in the peace clause for Article 3.1(b) of the *SCM Agreement*.

16. Paragraph 7 of Annex 3 of the *Agreement on Agriculture*, relied upon by the United States and EC as evidence that the *Agreement* authorises the use of local content subsidies, provides no basis for such a conclusion. All paragraph 7 does is recognise that it is possible for measures directed at agricultural processors to benefit the producers of basic agricultural products. For example, a government may pay a subsidy to a processor which it is required to pass on to the domestic producers. This can occur without affecting the competitive relationship between imports and domestic production. The measure would be consistent with Article 3.1(b) of the *SCM Agreement* and GATT Article III, and the support rightly counted against the Member's AMS. Nothing in paragraph 7 suggests that it should be interpreted as referring to domestic content subsidies, let alone that it authorises them in contravention of Article 3.1(b) of the *SCM Agreement* or GATT Article III.

**Conclusion**

17. In conclusion, New Zealand considers that Brazil has presented the factual evidence necessary to substantiate its claims under the *SCM Agreement*. Brazil has also demonstrated that the United States cannot avail itself of protection under the peace clause. The interpretation advanced by the United States of the provisions of the *SCM Agreement* would render actionable subsidies inactionable, thereby undermining the carefully negotiated balance of rights and obligations in the *SCM Agreement* and the *Agreement on Agriculture*. New Zealand therefore requests the Panel to make the findings and recommendations requested by Brazil.

# ANNEX G

## FURTHER REBUTTAL SUBMISSIONS OF PARTIES

# ANNEX G-1

## EXECUTIVE SUMMARY OF BRAZIL'S FURTHER REBUTTAL SUBMISSION

1. Brazil responds in its Further Rebuttal Submission to various arguments raised and evidence presented by the United States in earlier stages of this proceeding.

2. Brazil presents new evidence in rebuttal of US assertions that it has failed to demonstrate that contact payments were paid to current producers of upland cotton in MY 1999-2002. This evidence is in the form of USDA payment data obtained and analyzed by the Environmental Working Group (EWG) concerning, *inter alia*, upland cotton and other crop base contract payments between MY 2000-2002, as well as upland cotton marketing loan payments. The EWG database matches the upland cotton recipients and farms receiving each type of payment. It shows that the great majority of upland cotton producers grew upland cotton on upland cotton base acreage. It also shows that upland cotton producers received approximately three-quarters of all upland cotton contract payments between MY 2000-2002. Additional contract payments supporting upland cotton are found by attributing contract payments on non-cotton base acreage. While the EWG data underestimates the amount of contract payments in support of upland cotton, it nevertheless corroborates and supports Brazil's "14/16" methodology. Moreover, this data is also consistent with the large body of evidence demonstrating that upland cotton producers receive, rely on, and need upland cotton contract payments to make "ends meet."

3. Better evidence of the amount of contract payments in support of upland cotton would come from an examination of the amount of upland cotton currently planted on upland cotton (or other) contract acreage. This evidence is collected and exclusively in the control of the United States. Brazil rebuts the US assertions that it does not collect or maintain information permitting it to respond to the Panel's Question 67bis or to Brazil's repeated requests for information regarding the amount of contract payments received by current producers of upland cotton. In fact, the United States has access to all of the farm-specific and commodity specific commodity acreage and payment data from both current upland cotton producers as well as holders of crop base under contract payment programmes that would permit it to (1) provide a close approximation of the PFC and market loss assistance payments to current upland cotton producers in MY 1999-2001, and (2) provide the precise amount of direct and counter-cyclical payments to current upland cotton producers in MY 2002. Brazil requests the Panel to ask the United States, for the third time, to produce this information.

4. In the absence of information within the exclusive control of the United States, the information on marketing loan and contract payments in the EWG database, together with the considerable other evidence presented by Brazil, is the best information available to assist the Panel in making the determination concerning the amount of "support to upland cotton" for the purposes of the peace clause.

5. Regarding Brazil's price suppression and increase in world market share claims under Articles 6.3(c) and 6.3(d) of the SCM Agreement, Brazil first responds to US arguments that only variable costs are relevant to any cost of production analysis. This is the wrong legal as well as economic benchmark. Brazil notes the Appellate Body's decisions in the *Canada – Dairy (21.5)* disputes held that a cost of production analysis should focus on *total*, not *variable*, costs. That is, only an analysis of the total cost of production takes account of the economic resources the producer

invests in the product. The Appellate Body's jurisprudence on this issue reflects the economic reality that, over the long term, producers have to recover *all* their costs and make profits to stay in business. To the extent that the producer charges prices that do not recoup the total cost of production, over time, it sustains a loss which must be financed from some other source.

6. USDA cost data shows that US producers would have lost $871 per acre if they had grown upland cotton without subsidies between MY 1997-2002. With subsidies, these upland cotton producers made a per-acre "profit" of $120 over the six-year period. Further, most of the fixed costs of US producers must be covered over a long-term six-year period, or upland cotton producers would be forced to halt production. This evidence supports the close causal link between US subsidies and continued high levels of US upland cotton production and exports, as well as suppressed prices. These facts demonstrate the veracity of the National Cotton Council's Chairman's statement that US upland cotton producers "can't exist without subsidies".

7. The United States' argument that a cost of production analysis may be limited to variable costs defies all economic logic. This is particularly true in light of the items that the United States counts towards fixed costs, including hired labour, opportunity cost of unpaid labour, capital recovery of machinery and equipment, opportunity cost of land, taxes and insurance, and general farm overhead. These facts confirm the common sense notion that without the US subsidies, a significant portion of the US upland cotton production would not be economically viable and would not be produced.

8. Brazil rebuts US arguments that US subsidies had no price-suppressing effects by demonstrating the close relationship between increases or decreases in world cotton stocks and A-Index prices. USDA's own economists estimate that US subsidies increased US upland cotton world supply by 1.9 million bales in MY 2000 and 4.3 million bales in MY 2001. Because the United States has admitted that the injection of 11.6 million bales of Chinese government stocks into world supply between MY 1999-2001 depressed prices, it is not surprising that USDA economists, as well as Professor Sumner, found that the addition of similar quantities of US subsidy-generated upland cotton had similar price-suppressing effects. Moreover, if Chinese Government sales of stocks significantly depressed prices, as the US claims, then withdrawing a similar amount of US upland cotton during the same period certainly would significantly increase prices.

9. In addition, market experts predict that a 14 million bale US crop in MY 2004 (resulting from a potential crop failure) would have a significant impact in MY 2004 on increasing the New York futures price – and the world (and Brazilian) price of cotton. Brazil demonstrated the interconnected nature of world upland cotton market and the direct relationship between large US subsidies in sustaining US production and in lowering world and Brazilian prices.

10. Brazil rebuts US arguments that the appreciation of the US dollar does not demonstrate any causal link between US subsidies and increased US world market share and suppressed prices. Using data from Exhibit US-69, Brazil demonstrates that there has been a dramatic increase in the appreciation of the US dollar against a cotton-trade weighted basket of currencies of other world cotton producers by 154 per cent between the period 1996-2003. US exports – instead of falling as predicted by USDA economists – almost doubled.

11. The impact of the subsidies on international cotton trade is best assessed by analyzing the cotton trade-weighted exchange rate for cotton-exporting countries in general. This where the competition exists and where the impact of exchange rate movements on the competitiveness of countries should be found. With their currencies depreciating dramatically against the US dollar, US competitors should have been able to increase their market share and their exports compared to high-priced and high-cost US exports of the same commodity product. But since these competitors do not

have access to subsidies averaging 95 per cent of the value of their production, as a result, these competitors saw their exports and world market share reduced.

12. Brazil responds to US arguments that US producers are responsive to changes in futures prices at the time of planting. Brazil demonstrates that average January-March futures prices *declined* between MY 1998-2002, while US planted acreage *increased.* This is exactly opposite of what would be expected without the effect of US subsidies (that *increased* significantly during the same period). All of the analysis presented by Brazil is consistent with Congressional testimony by USDA's Chief Economist Keith Collins that there is little supply (i.e., planted acreage) response from US upland cotton farmers because of the subsidies they receive.

13. Further, the 72.4 cents target price support level available to US upland cotton producers in MY 2002 meant that US producers could not expect to receive higher revenue even if prices increased throughout MY 2002. In fact, US planted acreage declined in MY 2002 because some US upland cotton producers had suffered significant losses even with US subsidies, as they could not recover their cost of production.

14. Brazil responds to US legal arguments seeking to impose countervailing duty concepts in adverse effects claims by demonstrating that there is no textual basis in either Article 1 or Part III (adverse effects) of the SCM Agreement for the imposition of "pass-through," "value of subsidy**",** "subsidized product" or "tied-untied" methodologies. Unlike a countervailing duty investigation, it is the cumulative effects of the US subsidies that are the focus of price suppression and increase in world market share claims under Articles 6.3(c ) and (d) of the SCM Agreement. The current US position is directly contrary to its arguments in Indonesia – Automobiles, where the United States rejected Indonesian efforts to have the Panel examine each subsidy of the National Car Programme" individually.

15. The focus of Articles 5 and 6 of the SCM Agreement is on the effect of the subsidies in suppressing prices or increasing world market share. These cumulative effects of a variety of US subsidies caused price suppression and an increase in the US world market share between MY 1999-2002, and will continue to do so through the end of MY 2007.

16. Contrary to the US argument to sustain its serious prejudice claims, Brazil does not have to prove "that the 'prejudice' caused by the effects of the subsidies were 'serious'". Brazil's interpretation of the chapeau of Article 6.3 of the SCM Agreement does not read "may" to mean "shall". Rather, the term "may" refers to various situations in which the four enumerated types of serious prejudice exist but are not actionable.

17. Brazil highlights the collective effects of the US subsidies by noting that numerous econometric studies that Brazil has presented to the Panel, all conclude that US subsidies significantly increase US production and suppress US and world prices. Moreover, no study has ever found that the US subsidies to upland cotton would not have a significant production and export-enhancing as well as a price-suppressing effect.

18. Furthermore, Brazil rebuts US arguments that Professor Sumner's results, using the November 2002 FAPRI baseline misrepresent the real effects. Brazil demonstrates that using the most recent January 2003 FAPRI baseline, Professor Sumner's results also show significant production and export-enhancing and price-suppressing effects. Brazil further argues that a USDA study and an IMF study that the United States claims show that Professor Sumner's analysis was inflated are, in fact, consistent with Professor Sumner's findings.

19. Therefore, the US assertion that Professor Sumner's results are grossly overstated due to the use of a baseline projecting artificially low upland cotton prices is false. Whether the results of the modified or the original model and whether the November 2002 or the January 2003 baseline are used, continue to fully support that the US subsidies cause significant price suppression and an increase in the US world market share, as well as that those subsidies caused the United States to have more than an equitable share of world export trade.

20. Brazil further demonstrates the causal link between US subsidies and price suppression and increased exports by showing that the individual effects of the various US subsidies increase US production and exports, and result in suppressed prices. USDA and other economists are unanimous in finding that marketing loan payments to upland cotton created significant production- and export-enhancing and price-suppressing effects during the period of investigation. The effect of this subsidy alone caused serious prejudice to the interests of Brazil in MY 1999-2002.

21. Furthermore, USDA economists also found that crop insurance subsidies for upland cotton have far more production-enhancing effects than for other crops.

22. The National Cotton Council and cotton market experts have repeatedly emphasized the importance of the Step 2 subsidy in stimulating US production and exports. Brazil has provided compelling evidence that the Step 2 subsidies are trade- distorting and have caused increased US upland cotton exports and suppressed world prices.

23. Lastly, Brazil rebuts the United States so-called "literature review" for contract payment subsidies by pointing out that none of the studies addresses the specific situation of upland cotton during the period of investigation, none focuses on the impact of the restrictions on planting fruits and vegetables, none examine the impact of the updating of the base acreage and yield in 2002, and none focuses on the production effects caused when CCP payments are triggered by lower prices, or the production effects of more than $1 billion paid to producers of upland cotton in MY 2002. Finally, the studies do not explain the much higher per acre cotton payments than other base acres or the fact that US average upland cotton producers could not have covered their total costs without contract payments during MY 2000-2002.

24. Therefore, the evidence submitted to the Panel demonstrates that the decoupled payments have production-enhancing effects. While these effects are smaller than the effects of the marketing loan payments, they are an important part of the collective effects of the US subsidies in creating price suppression and increased and inequitable world market share.

25. Brazil demonstrates that crop insurance subsidies are specific within the meaning of Article 2 of the SCM Agreement. There are different crop insurance policies that are available for only limited products, as well as groups of policies available for certain crops. Therefore, the US crop insurance system is simply not the "one size fits all" programme as argued by the United States. Furthermore, Brazil rebuts US arguments concerning the specificity of crop insurance subsidies by showing that there are no crop insurance policies available for livestock, with the exception of four pilot programmes. Even these pilot programmes are very limited in terms of recipients, and have only a total budget of $20 million, a tiny fraction of the crop insurance subsidies paid for crops.

26. Additionally, the *US – Softwood Lumber CVD* panel report endorsed a finding by USDOC that subsidies paid to only a handful of industries in an economically diverse economy are "limited" (and therefore "specific") within the meaning of Article 2.1 of the SCM Agreement. The record continues to demonstrate that agricultural products representing approximately 50 per cent of the value of US agricultural commodities are not covered by crop insurance subsidies. This, together with the evidence submitted of specific policies and groups of coverage that are provided to only

selected crops such as upland cotton, highlight the fact that only certain enterprises receive the benefits of these subsidies.

27. Regarding Brazil's Article 6.3(d) claim, the United States is incorrect in claiming that Brazil's claims relate only to MY 2001. As discussed in Section 3.9, those claims also include claims for MY 2002, 2003 and the period from 2004-2007.

28. Furthermore, the United States argues that the term "world market share" in Article 6.3(d) of the SCM Agreement means "world consumption share". Contrary to the US arguments, the "world market share" does not refer to "all the markets in the entire 'world', including the market of the subsidizing Member. Brazil has demonstrated that the ordinary meaning of "world market share" refers to the share of a Member in the world export trade.

29. This interpretation is further supported by the context of Article 6.3(d), which includes the reference to the word "trade" in footnote 17. Additional context can also be found in the close similarity between the concepts used in Article 6.3(d) and Article XVI:3, second sentence (both involve primary products, increase in exports, representative periods, effects of any subsidy). Given the similarities between these provisions, the use of the terms "world market share" and "share of world export trade" does not state that both provisions deal with separate situations, as the United States argues. Instead, both terms refer to a share of export transactions in the world market. Therefore, the phrase "world market share" means the world market share of exports, not consumption.

30. In sum, Brazil has demonstrated that the US subsidies caused serious prejudice and threat thereof to the interests of Brazil, because for each marketing year between 2001-2003 the US world market share in upland cotton increased over its previous three-year average. These increases followed a consistent trend, within the meaning of Article 6.3(d) of the SCM Agreement.

31. Brazil rebuts US arguments that GATT Article XVI:3 only applies to export subsidies and, thus, has been superseded by Article 3.1(a) of the SCM Agreement. GATT Article XVI:3 is an actionable subsidy provision that applies to all subsidies having the effect of increasing exports. The phrase "which operates to increase the export" is quite different from the phrase "subsidy on the export". Furthermore, the phrase "operates to increase the export" does not contain any export contingency requirement. Therefore, read in the context of the SCM Agreement and GATT 1994, Article XVI:3, second sentence refers to export-related subsidies, which is a far broader notion than subsidies that are "contingent upon export performance".

32. In sum, GATT Article XVI:3 is not superseded by the export subsidy provisions of the Agreement of Agriculture and the SCM Agreement. Instead, it provides obligations concerning any form of subsidy, independent of the obligations set forth in Article 3 of the SCM Agreement.

33. Brazil also conclusively demonstrates that US upland cotton subsidies violate GATT Article XVI:3 by causing the United States to have a more than equitable share of world export trade in upland cotton.

34. With respect to Brazil's threat serious prejudice claims, Brazil argues that the appropriate standard for serious prejudice claims is not the "imminent threat" standard argued by the United States, but rather whether the unlimited and mandatory US subsidies create a structural and permanent source of uncertainty in suppressing prices, increasing world market share, and securing an inequitable share of world trade.

35. Brazil has demonstrated that it is appropriate for the Panel to rely on the standard proposed by the GATT *EC-Sugar Exports* panels to determine whether the mandatory and unlimited US subsidies on upland cotton create a permanent source of uncertainty in the world upland cotton market. The facts of this dispute meet that standard. The United States has admitted that the US subsidies are both mandatory and unlimited. Given the large US world market share and share of total world production, the US subsidies will have the effect of locking in large amounts of US production, of creating an ongoing significant threat of suppressed prices, and of securing an increasing and inequitable US world market share throughout MY 2003-2007.

36. The "imminent threat" standard is not found in the text of Part III of the SCM Agreement, and is only applicable to investigations by investigating authorities in countervailing duty, anti-dumping, or safeguard contexts. It is inconsistent with the remedies provided for in Article 7.8 of the SCM Agreement, which are imposed well after the period of investigation examined by a Panel.

37. Therefore, the collective effects of the mandated and unlimited US subsidies in MY 2003-2007 threaten to maintain a large US upland cotton production, to increase and maintain US exports, and to significantly suppress world upland cotton prices during MY 2003-2007, in violation of Articles 5(c), 6.3(c), and (d), and GATT Articles XVI:1 and 3.

38. In sum, the mandatory and unlimited US upland cotton subsidies cause threat of serious prejudice to the interests of Brazil. They constitute a structural and permanent source of uncertainty in the world upland cotton market, in which the United States enjoys a dominant position. This conclusion is further supported by the trade-distorting nature of the US subsidies, their effects in causing present serious prejudice in MY 1999-2002.

39. Finally, with respect to export credit guarantees, Brazil offers the Panel a recounting of its evidence and argument in support of its claims against the CCC export credit guarantee programmes, along with footnote citations to all of the places in its various submissions in which it makes those arguments and offers that evidence. Brazil also responds to particular points raised by the United States that Brazil has not yet addressed. The GSM 102, GSM 103 and SCGP export credit guarantee programmes constitute export subsidies that circumvent, or threaten to circumvent, the US export subsidy reduction commitment, within the meaning of Articles 10.1 and 8 of the Agreement on Agriculture. They also constitute prohibited export subsidies within the meaning of Articles 3.1(a) and 3.2 of the SCM Agreement and item (j) of the Illustrative List of Export Subsidies.

# ANNEX G-2

## EXECUTIVE SUMMARY OF THE UNITED STATES FURTHER REBUTTAL SUBMISSION

### 1. Brazil has failed to establish all of the elements necessary to establish its subsidies claims

1. For the Panel to make the findings Brazil requests, Brazil must adduce evidence and arguments sufficient for the Panel to identify the product(s) that a particular subsidy benefits. This requirement of identification can come up in a variety of ways, but the two most frequently encountered questions are: Which product(s) benefits from the subsidy? and Should the benefits of a subsidy be allocated to future production and sales of the product in question, or should such benefits be "expensed" – that is, allocated only to current production and sales during the time period in which the subsidy is received? Brazil has not provided a basis for a clear and unambiguous explanation on its conclusions for each of these points in order for the Panel to fulfil
its obligations under Article 12.7 of the DSU.

2. With respect to the first question – which product(s) benefits from the subsidy? – Annex IV to the Subsidies Agreement provides guidance. Annex IV provides guidelines for calculating total *ad valorem* subsidization for purposes of the now-expired Article 6.1(a). A subsidy not "tied to the production or sale of" cotton ("a given product") cannot be regarded as subsidizing merely "that product"; rather, the subsidy benefits all of the "recipient firm's sales". In the Negotiating Group on Rules, Brazil has proposed that Members adopt a "guideline" on calculating the amount of the subsidy precisely along these lines.

3. Implicit in both paragraphs 2 and 3 of Annex IV is the principle that a subsidy provides a benefit with respect to products that the recipient produces. A corollary of this principle is that a subsidy does not provide a benefit with respect to products that the recipient does *not* produce. Thus, a subsidy provided to a recipient who does not produce upland cotton cannot be said to provide a benefit to upland cotton. Such a subsidy cannot be regarded as having one of the effects described in Article 6.3 insofar as upland cotton is concerned.

4. The foregoing analysis suggests that, for each challenged subsidy, Brazil must identify (as would the Panel in its report) the product that benefits. In the case of product-specific support – that is, a payment that is linked to production of a specific product – such as the marketing loan payments and Step 2 payments, the issue is not difficult. In the case of a payment in which the subsidy is not "tied to the production or sale of a given product", the product subsidized by that payment is all the products produced by the recipient. To determine the portion of a payment not tied to the production or sale of a given product that benefits upland cotton, the value of the payment must be allocated over the "total value of the recipient firm' s sales".

5. With respect to the second question – how should subsidies be allocated over time? – Annex IV also provides guidance. Paragraph 7 provides that: "Subsidies granted prior to the date of entry into force of the WTO Agreement, *the benefits of which are allocated to future production*, shall be included in the overall rate of subsidization" (emphasis added). A corollary of this principle – that the benefits of certain subsidies should be allocated to future production – is that if subsidy benefits are *not* allocated to future production, they must be expensed – that is, allocated to production in the time period during which the subsidy is received. Thus, in the context of this dispute, a subsidy the benefits of which are expensed to production/sales in 2001 cannot be said to be causing serious prejudice in 2002 because the subsidy has ceased to exist. The "benefit" – one of the constituent

elements of a "subsidy" under Article 1 – was used up in 2001. Once the benefit was exhausted, the subsidy ceased to exist.

6. The Subsidies Agreement does not expressly identify those subsidies "the benefits of which are allocated to future production". However, guidance is available on this question, and it suggests that subsidies that are "non-recurring" should be allocated over time, while subsidies that are "recurring" should be expensed to the year of receipt.[1] For example, the Informal Group of Experts recommended to the Subsidies Committee that, as a general proposition, recurring subsidies be expensed and non-recurring subsidies be allocated. The Group also specifically recommended that price support payments generally be expensed. In making these recommendations, the Group follows the logic noted above: where there are *not* reasons to allocate subsidy benefits to future production, the subsidy must be expensed, and once the benefit was exhausted in the time period during which the subsidy is received, the subsidy ceased to exist. The analysis presented above and the conclusions and recommendations of the Group are not controversial. The domestic countervailing duty regulations of various Members, including those of Brazil and the European Communities, reflect this very approach.

7. Thus, it is appropriate for the Panel to expense the value of these payments – that is, allocate them to production in the time period during which the subsidy is received. No payment at issue is made for the acquisition of fixed assets. Rather, the challenged payments are recurring. Brazil's own arguments endorse the notion of expensing these payments. That is, for purposes of its Peace Clause arguments, *Brazil expenses these payments* by allocating the total value of each of these payments to the marketing year for which the payment is received. For purposes of Brazil's actionable subsidies claims, *Brazil adopts the identical approach and expenses these payments to the marketing year for which the payment is received*. Thus, despite Brazil's silence on the issue of expensing recurring subsidies, its actions and arguments reveal that it accepts and applies the concept to the challenged US subsidies.

8. The United States has explained, and Brazil tacitly accepts, that the payments challenged in this dispute are recurring subsidies that 0are expensed – that is, allocated to production in the time period during which the subsidy is received. It follows that a recurring subsidy provided in marketing years 1999, 2000, or 2001, respectively, cannot be said to be causing serious prejudice in marketing year 2002. Because the payments in each of those prior years was allocated to production in those years, no "benefit" exists after each of those years – a benefit could only exist in a subsequent year if the payment had been allocated to future production and not expensed.

9. Because the recurring subsidies provided in each of marketing years 1999, 2000, and 2001 ceased to exist when the benefit was used up for production in those years, the effect of those subsidies cannot be the subject of subsidies claims in marketing year 2002. Under Article 5(c) and 6.3, Brazil must demonstrate what "the effect of the subsidy *is*". Similarly, under GATT 1994 Article XVI:3, Brazil must demonstrate that the United States grants or maintains export subsidies "which operate[] to increase the export of any primary product," resulting in a more than equitable

[1] First, Article 2.2.1.1 of the *Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994* ("Anti-Dumping Agreement"), which deals with the calculation of cost of production, singles out "*non-recurring* items of cost which benefit *future and/or current* production" (emphasis added). Second, the Appellate Body has acknowledged that non-recurring subsidies may be allocated over time. In *US - Lead Bar II*, the Appellate Body found that it was permissible for an investigating authority in a countervailing duty proceeding to rely on a rebuttable presumption "that a 'benefit' continues to flow from an untied, *non-recurring* 'financial contribution'" (emphasis added). Third, the *Report by the Informal Group of Experts to the Committee on Subsidies and Countervailing Measures*, G/SCM/W/415/Rev.2 (15 May 1998), recommends that certain subsidies be expensed to the year of receipt and that the benefits from other subsidies be allocated over time.

share of world export trade. Subsidies that were expensed and benefited historical production in marketing years 1999, 2000, and 2001cannot also benefit current production. Thus, these past payments would not form part of Brazil's subsidies claims nor the Panel's analysis. Serious prejudice has to be based on findings for the 2002 marketing year.

## 2. Brazil's legal interpretive errors also demonstrate that it has failed to make a *prima facie case on its subsidies claims*

10. As complainant Brazil must identify properly the measures within the Panel's terms of reference – that is, "subsidies provided to US producers, users and/or exporters of upland cotton" in respect of upland cotton, the subsidized product. The challenged measures are subsidies, or payments, and in order to assess their effect, one needs to know, *inter alia*, how large the subsidy is. Brazil has not properly identified the size of each challenged subsidy.[2]

11. **Brazil Misinterprets Article 6.3(c) on Price Suppression or Depression**. Brazil has not alleged any facts to establish that US and Brazilian cotton are found "in the same market" pursuant to Article 6.3(c) – that is, in each of the markets identified by Brazil (at various times, the United States, Brazil, Argentina, Bolivia, India, Indonesia, Italy, Paraguay, Philippines, and Portugal). Brazil has not identified the extent of subsidization of the US cotton in each market (the subsidized volume) – that is, which exports benefit from which challenged subsidy. Brazil has also not shown a price-suppressing effect by those US imports in each market. Brazil simply asserts that prices in those markets are correlated to the NY futures and A-index prices. This allegation of a generalized price effect cannot satisfy Brazil's burden of showing a price effect by the subsidized product of a like product of another Member "in the same market".

12. Brazilian price quotes in fact consistently undercut US price quotes for delivery CIF Northern Europe. It is also the case that in most of the markets identified by Brazil (Argentina, Bolivia, India, Indonesia, Italy, Paraguay, Philippines, and Portugal), Brazilian prices have been consistently lower than US prices. Thus, rather than US upland cotton suppressing Brazilian prices, the data suggests that it is Brazilian cotton that is undercutting US prices.

13. Article 6.3(c) does *not* establish that serious prejudice may arise if the effect of the subsidy is *any* price suppression or depression. Indeed, were the term "significant" omitted from Article 6.3(c), it would be the case that any production subsidy that was granted on a per-unit basis could be deemed to result in serious prejudice: any increase in production resulting from the subsidy would theoretically lead to some price effect. The use of the term "significant" prevents such theoretical or minor effects from rising to the level of serious prejudice.

14. Because "significant" modifies "price suppression" or "depression", it is the level of price suppression or depression itself that must be significant. One way of examining whether any alleged price suppression is significant would be to examine that degree or level in light of the price of the product itself. Another analytical tool that suggests itself is to look at the nature of the product's price. Strong or frequent fluctuations in price would themselves tend to cut against a finding that any alleged suppression or depression is "significant", especially if the variability frequently brings the

[2] For example, Brazil includes payments made to recipients that do not produce upland cotton and fails to allocate non-product-specific payments across the total value of the recipient firm's sales. Brazil has not reduced the value of decoupled income support payments to account for the capture by landowners of those payments made to farms on which cotton cropland is rented (65 per cent of total cotton cropland). Further, Brazil has Brazil has not identified the value of the cotton export credit guarantees under the GSM-102 programme, conceding that it "is not in a position to quantify the benefit to the recipients that has arisen from the application of the GSM 102 export credit guarantee programme to exports of US upland cotton between MY 1999-2002".

price of the product to a level at which the alleged suppression or depression (judged in light of that price) would not be significant. The United States notes that the price of upland cotton is highly variable, with frequent swings of substantial degree. Thus, this evidence relating to the price variability of upland cotton must be taken into account in any analysis of whether alleged price suppression or depression is "significant".

15. **Brazil Misinterprets Article 6.3(d) on an Increase in World Market Share**. Brazil misinterprets the phrase "world market share" in Article 6.3(d) as the share of world export trade. The plain meaning of the phrase "world market share" is not limited to export trade in products but includes all worldwide consumption – that is, the aggregate of all markets that make up the world. The United States is a "market" for upland cotton and part of the "world"; therefore, its domestic consumption forms part of the "world market" for upland cotton.

16. Context supports this reading of "world market share". For example, Article 6.3(a) identifies the "market of the subsidizing Member" as a relevant market from which a complaining Member's exports can be displaced or impeded. Logically, then, the market of the subsidizing Member should also be relevant for determining the "world market share". Various provisions also provide context for *not* reading "world market share" as relating to "world export trade".[3] Given repeated examples of the use of the terms "trade," "world trade," and "world export trade" in the covered agreements, the choice of the phrase "world market share" must be given meaning in accordance with the plain meaning of those terms.

17. The challenged US payments were only introduced in marketing year 2002; therefore, there can be no "trend" in US world market share with respect to those payments. Nonetheless, were the Panel to examine US world market share using data under the 1996 Act (consumption data, not the export data presented by Brazil), the criteria of Article 6.3(d) are not met.[4]

18. **Brazil Has Not Demonstrated a Clear and Imminent Likelihood of Future Serious Prejudice**. Although Brazil has presented evidence after the date of panel establishment (indeed, after conclusion of its three-year period of investigation), it advises the Panel to consider more probative, for purposes of explaining price developments in marketing year 2003, the conditions *in marketing year 1999* than the actual price developments *in marketing year 2003*. Brazil's approach carries with it a high potential for erroneous findings by the Panel. Given current high market prices and the expectations embodied in futures prices that such high prices will remain through the course of the 2003 marketing year, it would appear that US price-related payments (marketing loan payments and counter-cyclical payments) will decline dramatically, contrary to Brazil's assertions. In such a circumstance, it is difficult to see how challenged US payments would pose a clearly foreseen and imminent likelihood of future serious prejudice.

[3] First, footnote 17 to Article 6.3(d) provides an exception to the provision where "[o]ther multilaterally agreed specific rules apply to the trade in the product or commodity in question". This exception applies only to "trade" because "multilaterally agreed specific rules" would be unlikely to apply exclusively to domestic consumption; however, the use of the world "trade" in the *footnote* to Article 6.3(d) but *not* in the text of the Article itself suggests that "world market share" does not merely encompass shares in world "trade". Second, Article 27.6 speaks of a developing country Member reaching export competitiveness when its "share . . . in world trade of that product" reaches a certain level. This use of "world trade" stands in contrast to the phrase "world market share" in Article 6.3(d). Third, GATT 1994 Article XVI:3 uses the phrase "world export trade", which also stands in contrast to the phrase "world market share".

[4] While US share of world consumption in MY2002 was projected to be higher than the preceding three-year average, that increase has not followed "a consistent trend over a period when subsidies have been granted" – in this case, for purposes of argument, since the 1996 Act came into effect. Reversing direction every year since marketing year 1996 cannot constitute "a consistent trend".

19. **Brazil Has Misinterpreted GATT 1994 Article XVI:3**. Contrary to Brazil's arguments in this dispute, Brazil has previously agreed in a GATT plurilateral setting that GATT 1994 Article XVI:3 is limited in scope to export subsidies. Both the United States and Brazil were signatories to the Tokyo Round *Agreement on Interpretation and Application of Articles VI, XVI, and XXIII of the General Agreement on Tariffs and Trade*, commonly known as the Subsidies Code. Article 10 of the Subsidies Code is entitled "Export subsidies on certain primary products" and states (in paragraph 1): "*In accordance with the provisions of Article XVI:3* of the General Agreement, signatories agree not to grant directly or indirectly *any export subsidy on certain primary products* in a manner which results in the signatory granting such subsidy having more than an equitable share of world export trade in such product . . . ." Thus, Article 10.1 of the Subsidies Code makes clear the understanding of both the United States and Brazil that GATT 1994 Article XVI:3 applies only to "export subsid[ies] on certain primary products". Therefore, Brazil has not made a *prima facie* case under Article XVI:3 on the basis of its arguments relating to *all* challenged US payments.

20. **Brazil Errs in Asserting that Threat of Serious Prejudice Includes "More than an Equitable Share" under GATT 1994 Article XVI:3**. There is no textual basis to assert that a claim of "threat of serious prejudice" under GATT 1994 Article XVI:1 may be founded on the "more than equitable share" language of GATT 1994 Article XVI:3. Neither Brazil nor the *EC – Sugar Exports* GATT panel report on which it relies cites any and that panel report does not appear to explain the basis for its decision to read the standard of Article XVI:3 into Article XVI:1. By way of contrast, footnote 13 to Article 5(c) of the Subsidies Agreement states that "[t]he term serious prejudice to the interests of another Member" is used in this Agreement in the same sense as it is used in paragraph 1 of Article XVI:1 of GATT 1994, and includes threat of serious prejudice". This footnote does not reference Article XVI:3, and as there is no "more than equitable share" prong to Article 6.3, there would not appear to be any basis to advance a threat of serious prejudice claim using that standard under Article 5(c) of the Subsidies Agreement. Footnote 13 states that "serious prejudice" in the Subsidies Agreement and GATT 1994 Article XVI:1 should be read "in the same sense". Therefore, footnote 13 provides a further textual basis for finding that a threat of serious prejudice claim under GATT 1994 Article XVI:1 may not be based on the "more than equitable share" language of Article XVI:3.

### 3. Brazil has failed to demonstrate the challenged US subsidies caused the effects complained of

21. **The "Temporal Proximity" of US Payments and Low Cotton Prices Fails to Demonstrate that US Subsidies Caused Low Prices**. Brazil has failed to make a *prima facie* case based on the assertion that large US outlays during marketing years with low prevailing upland cotton prices necessarily establishes causation. Brazil makes selective use of data to present a number of erroneous claims about US production or exports during a period of low and declining cotton prices. Brazil repeatedly begins the period of comparison with marketing year 1998 or ends it with marketing year 2001. Such comparisons are inappropriate for several reasons and can produce misleading results.[5] The fact that high US payments were made when cotton prices were low does not establish causation.

[5] First, to use either marketing years 1998 or 2001 as one end of a period for comparison contradicts Brazil's own argument that the "period of investigation" should be marketing years 1999-2002. Second, marketing year 1998 was a year in which US harvested acreage and production were severely impacted by weather conditions, in particular, drought. The record shows record abandonment during that year (that is, the difference between planted acres and harvested acres). Thus, to begin a comparison of harvested acreage or production with marketing year 1998 will overstate any resulting increase. Third, marketing year 2001 was a year in which US production increased, primarily because of record yields (as Brazil has acknowledged). That is, while planted acreage increased over marketing year 2000 in large part due to the decline in expected returns from competing crops, production increased by a much greater percentage because of uncommonly favourable

22. **Brazil Erroneously Alleges Production Effects from Decoupled Payments, Contrary to the Economic Literature**. A fundamental error made by Brazil throughout its submissions and statements is to assert that decoupled payments are production-distorting. Brazil's conclusion that decoupled payments have had a large effect on cotton prices appears to be a direct consequence of Dr. Sumner's faulty analysis – one that is inconsistent with the empirical and theoretical literature on such payments. Economic theory suggests that, if producers are seeking to maximize profits, the decision of which crop to plant is based on expected returns offered by the market or government payments above operating (variable) costs. Decoupled income support payments do not figure in this decision because such payments will be paid to the producer regardless of the programme crop that is planted or whether any crop is planted at all.[6]

23. The main impact of decoupled payments is likely on land values. In well-functioning markets, asset prices reflect expectations about the future returns from their ownership. The direct link between base acres for decoupled payments and the known programme benefits allowed the future stream of payments to be efficiently capitalized into land values. Thus, much of the increase in wealth from farm payments accrues to non-operator landlords (Burfisher and Hopkins, 2003). Thus, the effects of increased wealth largely accrue to non-operators, and any theoretical production effects are further minimized. In fact, land values set by sales and rental markets have diverged from commodity prices, suggesting that land markets have additionally capitalized the present and expected future value of government payments.

24. Data also indicate that decoupled payments, by increasing income and wealth, have allowed households to increase their leisure and reduce their work hours. If the downturn in labour comes from agricultural activities, the effect of such payments could be to *decrease* the household's agricultural production, which would support world commodity prices. Data indicate that farm households that received decoupled payments in 2001 consumed more than farm households with similar incomes not participating in the programme. Thus, these data suggest that decoupled payments allow recipients to consume more out of income and may allow them to draw down savings that they typically carry as a precaution against income shortfalls.

25. Empirical studies have generally concluded that the effects of decoupled payments are minimal. For example, using an intertemporal Computable General Equilibrium model, Burfisher et al. (2003) estimate that production flexibility contract payments had "no effects on agricultural production in either the short run or the long run". These and other results are fully consistent with the fundamental requirement of Annex 2 of the Agreement on Agriculture that green box decoupled income support have no or at most minimal trade or production effects.

26. The available data also show large shifts in cotton acreage. Based on a preliminary review of a sampling of marketing year 2002 acreage reports, the United States estimates that nearly half (47 per cent) of farms receiving direct and counter-cyclical payments in 2002 for upland cotton base acreage in fact planted no cotton at all. Preliminary estimates from the Farm Services Agency indicates that cotton producers enrolled upwards of 2 million acres for the 2002 Direct and Counter-Cyclical Programme that had not been enrolled under the 2002 Production Flexibility Contract programme. Marketing year 1999 planted acreage deviated substantially from base acreage, both by region and by

---

weather conditions. Thus, to end any comparison of production with marketing year 2001 will overstate any resulting increase.

[6] Brazil has alleged that increased income can induce producers to take riskier choices, thus potentially increasing production and distorting markets. The economic literature suggests any such effects are empirically trivial. Recipients of decoupled payments use many market mechanisms to reduce their risk exposure in their farm operation. These strategies to manage risk reduce the extent to which changes in risk attitude due to decoupled payments, if any, will be evidenced in their production levels or demand for inputs.

State.[7] Thus, the data indicate that recipients of "upland cotton base acreage" decoupled payments plant alternative crops or no crops at all, and other farmers who do not hold upland cotton base acres choose to produce upland cotton.

27. **Third-Party Economic Studies Have Not Properly Modeled Cotton Production Decisions and Therefore Cannot Assist in Determining the Effect of US Subsidies on Cotton Production**. Brazil has pointed to various third-party economic studies which find price effects from US payments. Upon review, the United States concludes that they do not present relevant results because they generally suffer from two conceptual flaws. These fundamental flaws establish that these papers do not provide a basis to find a causal link between US payments and the effects of which Brazil complains.

28. First, several of these studies do not model the marketing loan programme appropriately.[8] Simply put, if Dr. Sumner and FAPRI's understanding of producer decisions is correct, then Brazil would have to agree that these papers do not properly model farmers' production decisions and any potential impact of marketing loans on those decisions. As a result, these models do not provide insight into the question this Panel has been asked to examine.

29. Second, most of these studies do not distinguish between payments linked to production and payments decoupled from any requirement to produce, instead treating them as having equal impacts on production. Again, Brazil's own expert recognizes that decoupled payments do *not* have the same impact as, for example, product-specific marketing loan payments. Thus, Dr. Sumner's own modelling of the impact of decoupled payments (with which the United States disagrees as contrary to the economic literature in ascribing *any* impact on production to these payments) indicates that these papers treat decoupled payments inappropriately.

30. **Brazil's "Total Costs of Production / Revenue Gap" is Meaningless and Cannot Establish Causation**. Brazil's so-called "gap" between the average total cost of production per pound of cotton for US cotton producers and the revenue such producers received from the market is an economically meaningless measure and is based on a simplistic calculation that misstates both the revenue and cost sides of the calculation. Brazil's revenue calculation is based on an erroneous representation of government support, especially crop insurance, decoupled payments, and Step 2 payments, and of market revenue.[9] More fundamentally, the existence of a "gap" does not establish

[7] Comparing marketing year 1999 planted acreage to base acreage, the ratio of planted to enrolled acreage, by region, in 1999 ranged from only 51% in the West to 141.25% in the Southeast. In the Southeastern United States (Alabama, Florida, Georgia, North Carolina, South Carolina and Virginia), for example, upland cotton planted acreage *exceeded* base acreage *by over 1 million acres*. In each of the other three regions, planted acreage was between 879,000 and 1 million acres *less than* base acreage. The variations by State are even more extreme.

[8] (a) Specifically, several of these papers simply remove the full outlay of the marketing loan program. This implies that farmers at the time of planting knew what actual prices would be at harvest time. Brazil's own expert recognizes that it is producers' expectations of harvest season prices that drive planting decisions. Thus, using the full outlays will overstate the influence of the marketing loan programme on the planting/production decision when actual prices turn out to be below the expected prices at the time of the planting/production decision.

[9] In three different submissions, Brazil presents three different per pound revenue figures derived from market revenue and US support programmes, and purports to represent this figure as average revenue received by upland cotton farmers in that year for every pound of cotton produced. This combined per pound figure in no way represents what a cotton farmer would have received – or even could have expected to receive – in the specific year in the way of government support. In addition, Brazil's measure of revenue for upland cotton producers – revenue from sales of cotton lint and cottonseed – is incomplete. Revenue from all sources – commodity sales, contracts in futures markets, off-farm employment, investment income – are needed to put the costs into perspective.

that US production would necessarily decline without the US payments Brazil has decided to challenge. For example, Brazil concedes that a substantial amount of US upland cotton in recent years was grown on non-upland cotton base acreage, at the same time that government payments were allegedly "necessary" for US producers to remain in business. Brazil fails to explain how it accounts for these inconvenient facts that do not support its cost-revenue gap theory.

31. On the cost side, Brazil's use of average total cost of production for US cotton to make its revenue gap argument is the wrong figure to measure costs – it is operating costs, not total costs, that figure in production decisions. Brazil also has made no effort to update cost data that is based on a 1997 survey and so does not take into account any technological or structural changes that have occurred in the interim. Since 1997, significant technological changes have occurred in US cotton production, changes which are not reflected in the estimated costs of production, such as increased production in low-cost regions and the introduction and adoption of genetically modified varieties of cotton with significantly increased yields while reducing pest control costs.

32. Finally, Brazil has used data from the International Cotton Advisory Committee (ICAC) to compare costs of production across countries arguing that the United States is a higher-cost producer than many other countries. Even when good survey data are available for one country, using cost of production data to draw valid economic conclusions is fraught with difficulties. The comparison of costs across countries poses greater difficulties, rendering such comparisons invalid. The ICAC itself notes that the cost data it presents is not appropriate for making these kinds of cross-country comparisons.

33. **Brazil Has Failed to Make A Proper Analysis of Conditions Actually Faced by Producers in Making Production Decisions Using Futures Prices, Which Reveals No Expected Impact from Marketing Loans Except for MY2002**. An analysis of the effect of marketing loan payments must begin with an understanding of farmers' planting decisions. The United States agrees with Mr. MacDonald, Brazil's expert on cotton markets, that the New York futures price provides the principal indicator of how market participants expect cotton prices to develop in the future. Unfortunately, Brazil's other expert, Dr. Sumner, has ignored Mr. MacDonald's testimony in modelling producers' expectations of harvest season market prices by using "lagged prices" instead of futures prices. Had Dr. Sumner conferred with Mr. MacDonald, Dr. Sumner would have learned that "[t]he ' New York futures price' is a key mechanism *used by cotton growers . . . in determining the current market values as well as the contract prices for forward deliveries*."

34. Comparing the planting-time (February) New York futures price for the following harvest season (December delivery) to the marketing loan rate for upland cotton for each marketing year reveals that in every year but marketing year 2002, *the planting time futures price was above the marketing loan rate*. That is, New York futures prices indicated to producers that in every year but marketing year 2002 the return from the market would *exceed* the marketing loan rate. Thus, the marketing loan programme in marketing years 1999-2001 would not be expected to have had an effect on the decision to plant.

35. Only in marketing year 1999 does Dr. Sumner's "lagged price" approach result in a value for producers' expectations that equals or exceeds the futures price. In every other marketing year, *the "lagged price" method significantly understates the harvest season price expected by producers* and thus would distort an analysis of the effect of US subsidies. In fact, the use of "lagged prices" would lead to the erroneous conclusion that expected prices in every year but marketing year 1999 were *below* the applicable marketing loan rate. However, market price expectations actually were *above* the loan rate in every year but marketing year 2002. Thus, the use of "lagged prices" instead of futures prices to gauge producers' price expectations at the time of planting in the specific years in which Brazil has alleged effects from US subsidies would seriously overstate the expected impact of

US marketing loans. To the extent Brazil relies on Dr. Sumner's analysis, which uses lagged prices rather than futures prices, Brazil's analysis is fundamentally flawed.

36. The futures price data and "lagged price" data above also reveal that, despite declining market prices over the course of marketing years 1999-2002, *market participants persisted in expecting prices to recover.*[10] Thus, Brazil's reliance on actual market year prices to claim that US cotton plantings should have been declining ignores the fact that harvest season cotton futures prices at the time of planting were fairly stable from marketing year 1999 through marketing year 2001, even as futures for other competing crops fell in value.

37. In marketing year 2002, harvest season futures prices at the time of planting had fallen below the loan rate. In this marketing year, there is a least the possibility that producers were planting for the loan rate and not for the harvest season expected price. However, the decline in US planted cotton acreage was within the range of expected values given the decline in the harvest season futures price from the previous year. Had US producers been planting for the 52 cents per pound marketing loan rate, one would have expected to see only one-tenth of the decline in planted acreage that actually occurred from marketing year 2001 to 2002.

38. Moreover, the per cent decline from marketing year 2001 to 2002 in US harvested acreage was very similar to (but larger than) the change in harvested acreage in the rest of the world. Despite the *theoretical* possibility that the marketing loan rate could have had some impact on planting decisions in marketing year 2002, the *actual* decline in US planted and harvested acreage suggests that US acreage levels were entirely consistent with price expectations and world market conditions. Thus, even in marketing year 2002, there is no evidence on this record that the marketing loan rate serves to insulate US producers' planting decisions from market price movements. To the contrary, the evidence suggests that US producers do respond to changes in expected prices (for cotton and for other competing crops) and are as responsive if not more so than producers in other countries.

[10] The marketing year 2000 harvest season futures price at planting time was 61.31 cents per pound, suggesting that the market expected prices in marketing year 2000 to recover from the previous year's levels. For marketing year 2001, the harvest season futures price at planting time was 58.63 cents per pound (nearly the same as futures in marketing years 1999 and 2000), once again indicting that market participants expected prices in marketing year 2001 to recover from their marketing year 2000 levels. It is only in marketing year 2002 that persistent lower-than-expected farm prices translated into a lower harvest season futures price at planting. For marketing year 2002, the February average futures price for December delivery fell to 42.18 cents per pound. However, even in marketing year 2002, market participants expected prices to recover and run higher than the "lagged price" of 29.80 cents per pound suggested.

# ANNEX H

## ORAL STATEMENTS OF PARTIES AT THE SECOND SUBSTANTIVE MEETING

# ANNEX H-1

## EXECUTIVE SUMMARY
## STATEMENT OF BRAZIL AT THE SECOND SUBSTANTIVE MEETING OF THE PANEL WITH THE PARTIES

**The United States Has Invented Threshold Burdens for Serious Prejudice Challenges that Do Not Exist in the Text of Articles 5 and 6.3 of the SCM Agreement**

1. The United States' has raised a number of threshold burdens that an Article 6.3 complainant allegedly must meet to establish a claim which are not based in the text of the serious prejudice provisions of the SCM Agreement.

2. First, the United States incorrectly asserts that under Article 6.3, Brazil must show an *ad valorem* subsidy rate and the amount for each of the challenged US subsidies. The only textual basis the United States provides is Annex IV of the SCM Agreement, which has expired with the text of Article 6.1(a) that contained the now-expired presumption of serious prejudice from a 5 per cent *ad valorem* subsidization. The United States further relies on *countervailing duty* measure procedures and interpretations of Brazil and the EC. But these allocation methodologies are irrelevant to Article 6.3 claims because unlike the expired Article 6.1(a) or Part V of the SCM Agreement, the focus of Articles 5(c) and 6.3 is on an examination of the *effects* of subsidies that are provided either directly or indirectly to producers of a product, such as cotton. In any event, Brazil has demonstrated a collective subsidization rate averaging 95 per cent and subsidies in the amount of $12.9 billion.

3. Second, the United States makes the sweeping argument that there is a legal prohibition on bringing adverse effects claims against subsidies that it alleges cannot be "expensed" or allocated to future years. The United States argues that all subsidies to cotton are "recurring" and therefore, as a matter of law, "cannot be said to be causing serious prejudice" except in the year in which they are provided. In fact, there is *no* textual basis in Part III or Article 6.3 of the SCM Agreement (or Article XVI:3 of GATT 1994) for distinguishing between the adverse effects of "recurring or non-recurring" subsidies. Nor is there any basis for "expensing" subsidies in one year or another year, as is often done in a countervailing duty investigation. Because Article 5 requires Members to *prevent effects*, a breach of Article 5 does not necessarily arise when a subsidy is granted, but only when actionable adverse effects occur.

4. The US argument is also inconsistent with the object and purpose of the SCM Agreement which is to protect Members from *any* subsidy causing serious prejudice. Under the US interpretation, a Member can permanently avoid any liability under Article 6.3 simply by carefully constructing the form of the payment as a recurring annual subsidy. Brazil has also presented evidence of continuing effects from subsidies provided in MY 1999-2002.

**Brazil Has Established the Existence of Price Suppression in the US, World, Brazilian, and Other Markets Where Brazilian Producers Export**

5. The United States now asserts that even though there may be evidence that New York futures market and A-Index prices as well as prices in other countries are suppressed by a "generalized effect," the "in the same market" language in Article 6.3(c) requires that US exports be present in the same geographical markets in which Brazilian cotton is present.

6. Brazil has established, consistent with the requirements of Article 6.3(c), that the effects of the US subsidies were to suppress prices in the "same market" in which Brazilian producers marketed their "like" cotton – i.e., in the world's, Brazil and in third countries. First, Brazil demonstrated the impact of US overproduction on the US and the "world market" prices (A-Index and New York futures market prices). Brazil then demonstrated that prices in Brazil and the countries to which Brazilian exporters shipped their cotton between MY 1999-2002 were suppressed and heavily influenced by US subsidies. The effects of those subsidies are communicated world-wide via a global price discovery mechanism. The parties agree that US, Brazilian and other countries' cotton are "like products". Throughout the world, prices for this fungible, price-sensitive commodity are determined by reference to the New York futures market and A-Index prices. Thus, Brazil established that the effect of the US subsidies is significant price suppression in the United States and Brazil, and in countries to which Brazilian producers exported their cotton. Further, the evidence shows that US subsidized cotton was present and contributed to the suppression of prices in 37 of the countries in which Brazilian producers marketed their cotton.

**Brazil Has Established the Causal Link between the US Subsidies and Significant Price Suppression, Increased US World Market Shares, and the Inequitable US Share of World Trade**

7. Brazil has properly analyzed both US revenues and costs using USDA's own data and conclusively demonstrated that the US industry producing cotton is heavily dependent on all US subsidies to cover total costs over the short and long run. This finding provides a key economic rationale for the large production-enhancing effects from the US cotton subsidies found by USDA, as well as by US and international economists.

8. Over the long term, even the United States agrees that producers must recover all of their costs and make a profit to stay in business. USDA's own cost and planted acreage data shows that US producers' long-term costs from MY 1997-2002 were $12.5 billion greater than their market revenue received. The United States argues that off-farm income should have been included in Brazil's revenue calculations. This US approach is conceptually as well as legally wrong. The relevant question is whether the "US cotton industry" is profitable from market revenue, not whether this industry is kept alive by cross-financing from other (non-subsidy) sources, such as social security payments.

9. US cotton producers would have suffered a cumulative loss of $332.79 per acre of cotton during MY 1997-2002 if they did not receive contract payments. But USDA's own data in the Environmental Working Group database demonstrates that almost all US producers of cotton did receive contract payments. And as a result, they made cumulative 6-year "profit" of $106 per acre by MY 2002, allowing them to plant significant acreage to cotton in MY 2002 and 2003.

10. Finally, the United States criticizes Brazil's comparison of costs of production among various countries. While Brazil agrees that the ICAC "data must be used carefully", the problems with ICAC's data do not render them unusable. Comparing ICAC "Variable Cash Costs" – which the United States does not challenge – demonstrates that it is much cheaper to produce a kilogram of cotton in Brazil than the United States.

11. The United States has argued that "in no year from marketing year 1999-2001 would the marketing loan rate be expected to have much of an impact, if any, on producer planting decisions," and that it did not affect producer decisions in MY 2002. This new US argument contradicts numerous USDA studies. In assessing the credibility of the new US argument that marketing loans provided no production incentives, the Panel should consider that USDA's own economists Westcott and Price found considerable effects of the marketing loan programme on US cotton production. The results of the Westcott and Price study are neither unique nor unexpected. Numerous other

economists have found similar results. Looking at futures prices also reveals that US producers are unresponsive to price changes at planting time.

12. Moreover, the basic US assumption is that if the *futures* price (minus five cents) is above the marketing loan rate of 52 cents per pound, then "economic logic" demands that the marketing loan can have no impact on planting decisions.

13. The United States' analysis of the marketing loan programme is based on a completely irrelevant comparison between the "expected cash price" and the marketing loan rate. Cotton marketing loan payments are based on the difference between the loan rate (52 cents) and the adjusted world price ("AWP") not the price received by US farmers. The AWP is typically far lower than the price received by U.S. farmers. The average spread between the December contract futures price during the period January-March and the adjusted world price of the following marketing year was 18.5 cents per pound. Thus, even using the US "futures price" methodology at planting time, for every year between MY 1999-2002, there was the expectation at planting time that significant marketing loan payments would be made.

14. Even if the expected AWP is above the loan rate, this does not mean that farmers expect a zero marketing loan payment. If the expected AWP lies above the loan rate, farmers would still expect, with a certain likelihood, that the actual AWP could be below the loan rate because the expectations about the AWP is a probability distribution. Thus, they would still expect a positive marketing loan payment.

15. Brazil emphasizes that the US futures price approach suffers from several significant shortcomings. Both farmers' decisions about planting and marketing of cotton are more complex. Planting decisions take place between January-March and the marketing of cotton takes place during the whole marketing year. Thus, just the February quote of the December futures contract does not properly address the complexity of farmers decisions.

16. The evidence is that the US cotton industry is sceptical of relying too heavily on present futures market prices as an accurate guide to future prices. Farmers have seen such volatility in the past as well as today. Therefore, any cotton farmer planting in the MY 1996-2002 period who actually relied on futures prices would know that the futures market is far from constituting a perfect predictor of future prices. Thus, as Professor Sumner correctly stated, "it is impossible to know what precisely individual farmers expect;" price expectations are "fundamentally unobservable".

17. The record supports a finding by the Panel that more than $4 billion in contract payments were provided to *current* producers of cotton in MY 1999-2002. Brazil has demonstrated that the publications listed in the US review literature were largely irrelevant because they are not cotton-specific, as they do not address the re-coupling of production due to the base acreage updating for direct and CCP payments, or the huge target price CCP payments provided to cotton producers. Brazil has also shown that the US subsidies do not meet the criteria of paragraph 6 of Annex 2 of the Agreement on Agriculture, and are therefore not "decoupled".

18. The record supports a finding by the Panel that the "other effects" apart from increased rental costs include significant production effects tied to upland cotton. First, the large majority of current cotton producers receive much higher per-acre payments for cotton than for other programme crops. The Panel must ask why much higher per acre direct and CCP payments are made to cotton base acreage *if* these payments are totally de-connected from current production? If that were the intention, as the United States argues and USDA presumes, then all contract payments in the same state or county would provide the same per acre benefit. The reason for the higher payments, of course, is that cotton is a high-cost crop and that cotton farmers insisted they were not receiving enough payments during MY 1999-2001 "to make ends meet".

19. Second, the United States has now admitted that two million additional cotton base acres were added to the total contract "base" acreage. This means that in MY 2002, an additional $227 million in payments were made to farmers producing cotton during MY 1998-2001. This is not "decoupling" payments from production, but re-coupling to reward farmers for increasing their recent production. And the prospect of future updates will keep many farmers planting cotton in order to protect and even increase future bases. Even USDA economists agree that this creates a link to current production.

20. Third, the 72.4 cent target price triggers CCP payments when *cotton* prices are lower – not corn, or soybeans prices – but *cotton*. Why is that? Because the NCC argued and Congress agreed that given the high costs of producing cotton in the United States, *current* and *future* cotton farmers will need high payments when prices decline. There would be no reason to set a "target price" to protect against low cotton prices if Congress expected that most farmers with upland cotton base acreage would start planting apple trees.

21. Fourth, Brazil presented the Panel with information from USDA's own electronic payment data showing that during MY 2000-2002 at least 71.3 to 76.9 per cent of total so-called "de-coupled" cotton base acreage payments were paid to producers of cotton. The data further shows that, in MY 2002, these producers of cotton received 85 per cent of their contract payments from cotton base acreage.

**The US Subsidies Increase Exports, in Violation of Article 6.3(d) of the SCM Agreement**

22. Brazil has demonstrated that, in violation of Article 6.3(d) of the SCM Agreement, the effect of the US subsidies played a significant role in the increase of the US world market share in MY 2001-2003 over its previous three-year average, following a consistent trend since MY 1996.

23. The US argues that "[u]nder Brazil's reading, a Member would be free to provide subsidies that increased the share of its own domestic consumption that its producers supplied without any disciplines under Article 6.3(d)". But this argument ignores the fact that Article 6.3(a) disciplines subsidies that increase domestic production in the market of the subsidizing Member. Further, Article 6.3(b) addresses any export displacement or impedance effects of subsidies in third country markets.

24. Second, the United States now argues explicitly that Article 6.3 has superseded Article XVI:3, second sentence. Assuming *arguendo* that the United States is correct, the effect of the US interpretation of "world market share" as meaning "world market share of consumption" would be to eliminate any WTO disciplines on production-enhancing subsidies that increase a Member's world market share of exports. As Brazil has pointed out, this would be contrary to the fact that the language and scope of both Article XVI:3, second sentence and the text of Article 6.3(d) are very closely related.

25. Finally, the entire concept of a "world market share of consumption" is flawed for the purposes of Article 6.3(d) as it results in double counting. The United States argues that "the US share of the world market for upland cotton should be defined as US consumption plus US exports over world consumption". However, the ordinary meaning in a trade remedy context of "domestic consumption" is total domestic "shipments" (i.e., net use from production or stocks) plus imports *minus* exports. Total "world consumption" is the sum of each country's domestic shipments plus imports minus exports. But the US methodology addresses as "consumption" both imports and exports and thus, double counts.

**CCC Export Credit Guarantee Programmes**

26. The United States considers that Article 10.2 exempts export credit guarantees from the disciplines included in Article 10.1. In Article 10.2, the negotiators reached a good faith agreement to work toward specific disciplines on export credits. That need for a good faith commitment to negotiate explains the difference between the Draft Final Act and the final version of Article 10.2. Given the "magnitude" of those programmes, the United States argues that no Member could possibly have intended for its agricultural export credit programmes to be subject to Article 10.1. But, among others, the EC and Canada, both massive users of export credits, have told the Panel that they consider export credits to be subject to Article 10.1 if they meet the definition of an "export subsidy". The United States did not think it needed to account for the CCC programmes in its reduction commitments, since it did not consider them to be export subsidies.

27. The United States says that it has offered "uncontroverted evidence" that for 12 of 13 scheduled products, US exports under the CCC export credit guarantee programmes did not exceed the United States' reduction commitment levels. The correct question, however, is whether *total* US exports of a scheduled product exceed the quantitative reduction commitments, which Brazil has demonstrated. It is for the United States, under Article 10.3, to prove that those excess quantities did not receive export subsidies.

28. Whomever bears the burden, Brazil has demonstrated that the CCC export credit guarantee programmes confer "benefits" *per se*, and also constitute export subsidies within the meaning of item (j). The United States argues that even if the CCC programmes constitute export subsidies, because "the quantities were within the applicable US export subsidy reduction commitments[,] they would conform fully to the provisions of Part V of the Agreement on Agriculture". The United States is in error.

29. With respect to *unscheduled* products, Brazil has established both actual circumvention and the threat of circumvention. Brazil's Exhibits 73 and 299 and Exhibit US-41list the billions of dollars of CCC guarantee support that have been provided for exports of unscheduled products during fiscal years 1992-2003, thereby circumventing the US commitment not to provide export subsidies. The mere availability of CCC guarantees for unscheduled products threatens circumvention, since Article 10.1 prohibits *any* export subsidy for such products.

30. With respect to s*cheduled* products, Brazil has demonstrated actual circumvention for US rice exports benefiting from CCC guarantees that have exceeded the US quantitative export subsidy reduction commitment. In its 18 November submission, the United States argues that because CCC has not disbursed the minimum amounts (at least $5.5 billion in guarantees each year, plus an additional annual amount of at least $1 billion in direct credits or guarantees for exports to "emerging markets") there is no threat of circumvention. The United States misunderstands the test set out by the Appellate Body in US – FSC. The lack of a legal mechanism that stems, or otherwise controls, the flow of CCC guarantees threatens circumvention. There is no limit on the amount of CCC guarantees and CCC's is exempt from the standard requirement of new Congressional budget authority for new guarantees.

# ANNEX H-2

## EXECUTIVE SUMMARY
## CLOSING STATEMENT OF BRAZIL AT THE SECOND SUBSTANTIVE MEETING OF THE PANEL WITH THE PARTIES

### 1. The United States enjoys No Peace Clause Protection

1. The record demonstrates that the United States enjoys no peace clause immunity for its upland cotton subsidies. Under any of three methodologies – a "budgetary outlay/expenditure", an "aggregate measure of support", or a "rate of support" methodology – the level of support provided in MY 1999-2002 exceeds the level of support decided in MY 1992. The United States has acknowledged that all challenged US subsidies, except PFC and direct payments, are non-green box (trade and production-distorting) subsidies. Brazil and all third parties agree that direct payments under the 2002 FSRI Act are non-green box because of the updating of a fixed base period contrary to Annex 2, paragraphs 6(a) and (b) of the Agreement on Agriculture. Further, PFC and direct payments are non-green box support because of the prohibition on fruits and vegetables contrary to Annex 2, paragraph 6(b). Moreover, payments for cotton base acreage are higher than those for other crop base acreage. The weight of evidence shows that all the challenged US subsidies are "support to" upland cotton within the meaning of Article 13(b)(ii) because they were received by current producers or by users and exporters of US upland cotton. Brazil's "14/16ths" methodology for estimating the amount of the four contract payments is reasonable and supported by the EWG database and considerable circumstantial evidence.

### 2. Brazil has established the Elements to Support its Significant Price Suppression Claims under Article 6.3(c)

2. Upland cotton is a basic, widely-traded commodity. Both Brazil and the United States agree that Brazilian upland cotton and other upland cottons are "like" subsidized US upland cotton. Because of this widespread interchangeability among world cottons, increases in world cotton supply by major cotton-producing countries have a major impact on discovery or establishment of world prices reflected in the A-Index and the New York cotton futures exchange.

3. The United States has made a great deal about what it terms some "fundamental" issues about the nature and amount of subsidies. Brazil has demonstrated the absence of any textual basis for incorporating various countervailing duty principles from Part V of the SCM Agreement into Part III and resurrecting Annex IV from the dead. However, Brazil used USDA's own data to show both the amount and rate of subsidization for each of the subsidies. To make up for US acreage and yield information the US has hidden from Brazil and the Panel for 16 months, Brazil has demonstrated through the EWG database and other circumstantial evidence that its "14/16th" methodology is reasonable. This methodology allocates payments only to current producers of upland cotton and does not "double count" payments provided to other producers of crops. And since the peace clause phase of this proceeding, Brazil has demonstrated that all the US subsidies are "tied" to the production of upland cotton and are "support to" upland cotton.

4. The US government has poured $12.9 billion over the past four years into a number of subsidy programmes specifically targeted at US upland cotton. No other US commodity has a Step 2 programme and no other US commodity received subsidies as high as 136 per cent *ad valorem*. Even

the so-called decoupled contract payments for "historical" cotton base acreage are much higher than for any other crop except rice. The subsidies provide a specific "target price support" of 72.4 cents per pound for upland cotton – not for other crops. And Congress insisted that USDA has no discretion to limit any of the required payments, all of which are mandatory and place no limit on the amount of upland cotton that could be produced with the support of these subsidy programmes.

5. The United States has agreed that all of the challenged US subsidies are "specific" except crop insurance. But USDA's own evidence showed that this programme is also specific since it is targeted at the industry growing crops, not livestock and thus covers only half of the value of US agricultural commodities and 38 per cent of farmland.

6. While Brazil continues to wait for farm-specific acreage and yield information from the United States, the incomplete Environmental Working Group data based on USDA farm-specific data show almost $3 billion in contract payments paid to upland cotton producers in MY 2000-2002 alone. And the great bulk of the other evidence shows that US upland cotton farmers are dependent upon, need and, in fact, receive such payments to "make ends meet" and "to survive".

7. Having established the fungible nature of the product and the existence and specificity of the subsidies, Brazil must link the effects of the subsidies to significant price suppression. The first important fact is that the United States is by far the world's largest exporter, with a world market share of 41.6 per cent, and the second largest producer of upland cotton in the world, with a 20 per cent share. The US subsidization rate of 95 per cent provided by the second largest producer and largest exporter creates the potential of causing serious prejudice to the interests of other Members, including Brazil. It is useful to recall the size of these subsidies compared to the 5 per cent *ad valorem* rate establishing a presumption of serious prejudice under Article 6.1(a) and compared to the amount, if any, of subsidies received by US competitors.

8. But what was the impact of the large US subsidies on production and world supplies of cotton? One answer to this question is found in the difference between market revenue and the US producers' total costs. While claiming that only variable costs are important in the short term, the United States admits that in the long-term, US producers have to make a profit to stay in business. Using only USDA's data for the period MY 1997-2002, the *average* US upland cotton producer received market revenue that was $872 dollars *per acre less* than its total costs. This means the cost/revenue gap for all upland cotton farmers between MY 1997-2002 was $12.5 billion.

9. The United States has attempted to leave you with the impression that its upland cotton producers do not rely or need any subsidies between MY 1997-2002 to make up this $12.5 billion gap. In assessing the credibility of these claims, consider that during this same 6-year period, US cotton producers received $16 billion in US subsidies and ended up with a 6-year "profit" of $127 per acre. The US claims that the PFC, market loss assistance, direct payment and CCP payments were not support to cotton. But without those 4 payments, US cotton producers would have lost $333 per acre between MY 1997-2002. The US further claims that the marketing loan payments in MY 1999-2002 made no difference to producers' planting decisions. But this argument ignores the impact of the subsidies in those producers' costs. By MY 2002, the average US producer would have been faced with a 3-year loss of $372 per acre if they had *not* received marketing loan payments during MY 1999-2001. This evidence confirms the conclusion of the Chief USDA economist that by making marketing loan payments "*you don't get cutbacks in production*". Clearly, the marketing loan programme kept many producers from reducing their planted acreage between MY 1999-2002.

10. Indeed, US producers planted between 14.2 – 15.5 million acres of upland cotton between MY 1999-2002 as prices fell to record lows. The combined revenue from *all* the US subsidies and market prices allowed producers to earn a long-term "profit" of $17.67 per year over the 6-year period. What is most amazing is that after having received record low prices for their cotton in MY

2001 and with futures prices at the time of planting suggesting market prices would remain at record low levels, US producers still planted 14.2 million acres of upland cotton – a similar amount of acreage that was planted when prices were much higher in MY 1996-1998. However, even 135 per cent *ad valorem* subsidies in MY 2001 were not sufficient to provide a profit to the highest-cost and lowest-yield US producers. This explains why US planted acreage declined to 1996-98 levels in MY 2002.

11. Having established that the US subsidies prevented production cutbacks, the Panel has to estimate how much of a cutback would have been made without US subsidies. USDA economists Westcott and Price estimate a 20 per cent cutback in MY 2001 from only the marketing loan programme. Professor Sumner estimates an average production cutback of 28.7 per cent or a total of 19.8 million bales between MY 1999-2002 from eliminating all subsidies.

12. The Panel then must estimate the effect of these estimated US production cutbacks on world prices. First, Brazil demonstrated the impact of US overproduction on the US and the "world market" prices (A-Index and New York futures market prices). Brazil then demonstrated that prices in Brazil and the countries to which Brazilian exporters shipped their cotton between MY 1999-2002 were also suppressed and heavily influenced by US subsidies. The effects of those subsidies are communicated world-wide *via* a global price discovery mechanism. Throughout the world, prices for this fungible, price-sensitive commodity are determined by reference to the New York futures market and A-Index prices. There is a world market for upland cotton. Subsidized US cotton and Brazilian cotton compete in this world market, i.e., "in the same market", as used in Article 6.3(c) of the SCM Agreement. Brazil established that the effect of the US subsidies is significant price suppression in that world market.

13. There are numerous studies from a number of economists finding clear and identifiable amounts of price suppression ranging from 10-33 per cent for the US price and 10-26 per cent of the world A-Index price. Professor Sumner responded to the US critiques of these studies by showing that they are not biased and correcting for some shortcomings are consistent with his results. The United States also claims these studies are useless for this dispute because they did not use "futures prices", but then admits that USDA and FAPRI models also use "lagged prices" because it is not possible to use futures prices in models to judge farmers' revenue expectations. Brazil also demonstrated that, using the US futures methodology, farmers expected significant revenue from marketing loan programmes in MY 1999-2002.

14. Finally, the Panel should judge the "significance" of the price suppression by the extent of the impact on Brazilian producers. But even judged in relation to objective levels, any of the price suppression estimated in the various econometric studies is sufficient to establish "significance".

### 3. Claims under Article 6.3(d) of the SCM Agreement

15. The facts strongly support Brazil's claims that US subsidies contributed to an increased US world market share of exports. USDA's data show that US exports increased in MY 2001, MY 2002, and are projected to increase in MY 2003 to levels well above the previous 3-year averages as required by Article 6.3(d).

16. The US domestic subsidies played a major role in the increased US exports by maintaining high-cost US production. Similarly, the Step 2 subsidy was paid in 188 out of 208 weeks and more than $1.6 billion worth of US upland cotton exports received GSM 102 export credit guarantee financing. The NCC confirmed that both subsidies played a major role in the significant expansion of US exports, in particular against the background of a rapidly appreciating US dollar. Professor Sumner's analysis estimates that on average, US exports would be 41.2 per cent lower without any of the US subsidies between MY 1999-2002. US world export market share expanded

rapidly from MY 1999 even as prices plunged to record lows. After reaching 41.6 per cent in MY 2002, the US market share is projected to remain very high at 39 per cent in MY 2003.

17. The United States response to this evidence is to argue that the term "world market share" means "world market share of consumption". But USDA, Canada, and the EC agricultural experts, among others, use and interpret the phrase as "world market share of exports". This is the correct meaning as confirmed by the use of the word "trade" in the footnote qualifying Article 6.3(d), and by the close similarity between the scope and text of Article 6.3(d) and Article XVI:3, second sentence, which also deals with world market share of exports. Further, as we demonstrated yesterday, the US "consumption" interpretation is unworkable and illogical because US consumption is total domestic "shipments" (i.e. net use from production or stocks) plus imports *minus* exports. To count US exports as consumption means double counting other countries' imports as consumption.

**4. Claims under GATT Article XVI:1 and 3**

18. The facts strongly support a finding that the US share of world export trade is inequitable. While world market prices plunged and the US dollar appreciated rapidly, the huge US subsidies allowed US exporters to purchase a record high share of 41.6 per cent. At the same time, the share of much lower cost and non-subsidized producers declined between MY 1999-2002. The text of Article XVI:3, second sentence, covers any type of subsidy that "operates to increase the export" of a primary product such as upland cotton. Contrary to the US arguments, nothing in the text of the WTO or GATT 1994 suggests that Article XVI:3, second sentence, has been superseded by Article 6.3.

**5. Claims of Threat of Serious Prejudice**

19. Brazil has also established that there is a present threat of serious prejudice during the lifespan of the 2002 FSRI Act. This threat covers the threat of significant price suppression, threat of a further increased US world market share and the threat that the United States continues to have a more than equitable share of world export trade. The mandatory and unlimited nature of the production and trade-distorting US upland cotton subsidies and the absence of a legal mechanism that stems, or otherwise controls, the flow of these subsidies constitutes the actionable threat of serious prejudice to the interests of Brazil. The timing and nature of actionable subsidy cases, as well as the remedies available under the SCM Agreement compel that such a threat need not be "imminent", but instead "present" to be actionable.

20. Brazil has demonstrated that there is a present threat of serious prejudice from the existence of the US subsidies. There is no dispute between the United States and Brazil that the US marketing loan, Step 2, crop insurance and contract payments are mandatory subsidies. There is no limit on the amount of upland cotton that can be produced, used and exported from farmers receiving these payments. Brazil has also demonstrated that all of these subsidies are production and trade-distorting and have caused present serious prejudice between MY 1999-2002.

21. The most recent USDA and FAPRI baselines project continued high levels of US planting and continued high costs that will not be covered by market revenue. Therefore, the US subsidies will continue to have large production and export-enhancing and price-suppressing effects. In particular, until MY 2007, the US subsidies threaten to cause significant price suppression in the US, world, Brazilian and in third-country markets to which Brazil exports its upland cotton.

22. Finally, the US subsidies mandated until the end of MY 2007 will cause serious prejudice under any market conditions. Thus, the provisions mandating marketing loan, Step 2, crop insurance and direct and counter-cyclical payments constitute per se violations of Articles 5 and 6.3(c) and (d) of the SCM Agreement.

## 6. Brazil's Claims regarding Step 2 Export and Domestic Payments under Article 3.1(a) and (b) of the SCM Agreement

23. The Step 2 export and Step 2 domestic subsidies are prohibited subsidies under Article 3.1(a) and (b) of the SCM Agreement. The Step 2 export subsidies violate Article 3.1(b) because they are subsidies expressly contingent upon proof of export of US upland cotton and are paid only to eligible exporters. The NCC describes the Step 2 programme as "export assistance" and the USDA acknowledges it makes U.S. exports of upland cotton more "competitive".

24. The United States acknowledges that Step 2 domestic subsidies are local content subsidies within the meaning of Article 3.1(b) of the SCM Agreement. Local content subsidies to processors of agricultural commodities are not expressly exempted from the disciplines in the SCM Agreement by either Agreement on Agriculture or by the chapeau of Article 3.1. In particular, Annex 3, paragraph 7 and Article 6.3 of the Agreement on Agriculture do not create rights and obligations that by necessity conflict with Article 3.1(b). Brazil has demonstrated the absence of any inherent conflict because it is possible to provide domestic support to processors of agricultural products without violating Article 3.1(b). Further, Article 13(b)(ii) is properly read as meaning that even if a local content domestic support measure may conform to Article 6.3 of the Agreement on Agriculture, it is not exempted from claims under Article 3 of the SCM Agreement. If the drafters had intended to exempt agricultural local content subsidies from Article 3 claims, they would have included Article 3 in Article 13(b)(ii), the same way that they included Article 3 of the SCM Agreement in Article 13(c)(ii) for purposes of exempted export subsidies for scheduled products.

## 7. Brazil's Claims regarding the CCC Export Credit Guarantees

25. Brazil has demonstrated that the GSM 102, GSM 103 and SCGP export credit guarantee programmes administered by the CCC constitute export subsidies within the meaning of Articles 10.1, 1(e) and 8 of the Agreement on Agriculture, Articles 1.1 and 3.1(a) of the SCM Agreement, and item (j) of the Illustrative List of Export Subsidies. Brazil has also demonstrated that those export subsidies circumvent, or threaten to circumvent, the United States' export subsidy reduction commitments, in violation of Articles 10.1 and 8 of the Agreement on Agriculture. Additionally, because they violate the Agreement on Agriculture, these programmes are not exempt from actions by Article 13(c)(ii) of the Agreement on Agriculture, and constitute prohibited export subsidies within the meaning of item (j) and Articles 1.1, 3.1(a) and 3.2 of the SCM Agreement.

## 8. Brazil's Claims regarding the ETI Act Subsidies

26. With respect to the ETI Act, Brazil and the United States agree that the Panel should follow the precedent of the panel in *India – Patents (EC)*. Indeed, the United States has effectively admitted the inconsistency of the ETI Act by repeatedly stressing to the Panel that it intends to implement the rulings and recommendations of the Dispute Settlement Body to bring the ETI Act into conformity with the Articles 10.1 and 8 of the Agreement on Agriculture and Articles 3.1(a) and 3.2 of the SCM Agreement.

# ANNEX H-3

## EXECUTIVE SUMMARY
## OPENING STATEMENT OF THE UNITED STATES AT THE SECOND MEETING OF THE PANEL WITH THE PARTIES

### I. THE EFFECT OF US SUBSIDIES IS NOT SIGNIFICANT PRICE SUPPRESSION

1. Brazil's theory of its case is that subsidies result in greater production, increased exports, and suppressed world prices for upland cotton. Brazil does not, because it cannot, refute the fact that US producers have increased and decreased acreage commensurately with producers in the rest of the world. Thus, there is no evidence that US producers are insulated from market forces in making production decisions.

2. In every year but one in which Brazil has alleged price suppression, and in marketing year 2003 in which it alleges a threat of price suppression, expected harvest season prices at the time of planting have been *above* the US marketing loan rate. In marketing year 2002, the only year in which expected harvest season price was below that rate, US harvested acres fell by a slightly *larger* percentage than the rest of the world. In fact, US planted acres fell by the amount expected from the decline in expected harvest season prices from marketing year 2001 to 2002 and by *far more* than would have been expected had producers been planting for the marketing loan rate. Therefore, rather than supporting Brazil's argument – that the effect of US payments is to make US producers unresponsive to market price changes – the evidence contradicts it.[1]

3. Brazil's allegation that the effect of US subsidies is price suppression is dispelled by the fact that Brazilian cotton undercuts the US price in various third-country markets.[2] Aggregated data on average US and Brazilian upland cotton prices to various markets identified by Brazil unambiguously show that Brazilian cotton undercuts the US price in these third-country markets. Thus, these data demonstrate that it is not US upland cotton that has suppressed Brazilian upland cotton prices, but Brazilian cotton prices that have undercut US prices.

### II. THE EFFECT OF US SUBSIDIES IS NOT AN INCREASE IN WORLD MARKET SHARE

4. The facts do not demonstrate any increase in US world market share. While US world market share in marketing year 2002 was projected to be higher than the average of the preceding three-year period, the 2002 subsidies are different from the subsidies for prior marketing years, and 2002 payments were only introduced with the 2002 Act. It is the effect of the 2002 subsidies that Brazil must demonstrate under Article 6.3(d) of the SCM Agreement establishes an increase that follows a

[1] We also recall that Brazil failed to properly analyze marketing loan payments through its use of "lagged prices" instead of futures prices. During marketing years 2000-2003, lagged prices significantly understate the harvest season prices expected by producers, thereby inflating the expected effect of the marketing loan rate.

[2] Brazil's evidence under Article 6.3(c) must establish the volume of subsidized US upland cotton that is "in the same market" as Brazilian upland cotton, the extent of subsidization, and the prices of those respective products sufficient to establish its claim of "significant price suppression". Brazil has not even shown that for each foreign market, there have been *any* US exports of upland cotton.

"consistent trend." One year does not make a "consistent trend". Thus, there can be no "consistent trend over a period when subsidies have been granted".[3]

## III. THE EFFECT OF US SUBSIDIES IS NOT A THREAT OF SERIOUS PREJUDICE

5. The facts do not support a finding of threat of serious prejudice. We submit that Brazil seeks to have the Panel reject the "imminent threat" standard, even though it was Brazil itself that previously suggested this standard to the Panel, because market prices have recovered to the point that *no marketing loan payments have been made since 18 September 2003*, and counter-cyclical payments are expected to be well below their statutory maximum for marketing year 2003.[4]

6. Brazil concedes that "market prices [may] increase to the point where the present effects of the subsidies are minimal". Given current and expected prices for marketing year 2003, even Brazil might have to concede that the present effects of US subsidies could be "minimal". However, Brazil seeks to prevent the Panel from basing its threat of serious prejudice analysis on that same marketing year 2003 data. If Brazil cannot demonstrate an imminent threat of serious prejudice in marketing year 2003, logically, neither can it demonstrate a threat of serious prejudice in farther off years, given that (in Brazil's words) "market[] prices move up and down," and "[n]o Member . . . can predict the course of future prices".

## IV. BRAZIL HAS FAILED TO SHOW THE ELEMENTS NECESSARY TO ESTABLISH ITS SUBSIDIES CLAIMS

7. Brazil has argued that no concepts or analysis drawn from other parts of the SCM Agreement or provisions from other agreements may be applied to claims under Part III of the Subsidies Agreement. This position is untenable. The United States is not suggesting some radical methodology dreamt up for purposes of this dispute but instead is proposing methods based on principles set forth in the SCM Agreement and accepted and applied by other WTO Members, including Brazil, for purposes of their countervailing duty practice.

8. Brazil says there is no need for it to quantify the subsidy benefit attributable to the product at issue nor the rate of subsidization but does not explain how to evaluate the effect of the subsidy without identifying the amount or rate of support. Further, Brazil has repeatedly alleged a subsidy amount and subsidization rate for the marketing year 1999-2002 period. Presumably, then, the value of the subsidy and the subsidization rate of exported US upland cotton would be highly relevant to the Panel's analysis of the effect of the challenged subsidies; Brazil's position would deprive the Panel of that crucial element.

---

[3] Even if one were to look to the period since the 1996 Act when different subsidies were in place, there is no consistent trend over a period when those subsidies have been granted. The facts demonstrate that since marketing year 1996, US world market share has increased and decreased in alternating years, and US world market share in marketing year 2002 is lower than in marketing years 1996-1997. These data cannot support a finding of a consistent trend. Brazil seeks to evade these facts by ignoring the change in subsidies over the years and by interpreting "world market share" contrary to the ordinary meaning of those terms.

[4] The effect of such higher market prices is vividly suggested by Brazil's use of the January 2003 FAPRI baseline versus the November 2002 preliminary FAPRI baseline in Dr. Sumner's new model. We, of course, strongly disagree with what we understand to have been the way in which Dr. Sumner has most recently modeled all of the US payments at issue, but we note that a mere change in baselines that increased the baseline A-index price by an average of *4.24 cents per pound* per year over MY 2003-2007 *reduced* the estimated impact of removal of all US subsidies on A-index prices by *nearly one-third*. Price movements since January 2003 would suggest that Dr. Sumner's estimated impacts using more current data would be smaller still. For example, the January 2003 FAPRI baseline projected a 2003 marketing year A-index price of 58.40 cents per pound while the year-to-date A-index price has been *68.73 cents per pound*, an increase of more than 10 cents per pound over the January baseline.

9. Brazil errs in asserting that it need not identify the "subsidized product", ignoring or selectively quoting various provisions – Subsidies Agreement Articles 6.1(a), 6.3(c), 6.3(d), 6.4, and 6.5 – that expressly mention the "subsidized product". Subsidies to products other than upland cotton would not be within the Panel's terms of reference nor relevant to the Panel's analysis of the effect of the challenged subsidies. Again, Brazil's position would deprive the Panel of a crucial element in determining, for example, whether and to what extent the US product in the same market as the Brazilian product was a subsidized product.

10. Brazil also errs in arguing that it need not attribute payments not tied to production across the recipient's total value of production. The methodology of attributing subsidies not tied to production across the value of a recipient 's production is spelled out in Annex IV to Part III of the Subsidies Agreement. Attributing such non-tied payments across the total value of the recipient's production is necessary to avoid double-counting of the subsidy.

11. The United States does not see how decoupled payments made with respect to non-upland cotton base acres would be within the scope of this dispute. Given Brazil's own explanation of the measures it has challenged[5], it cannot be possible that one set of measures was within the scope of the dispute at one point but that Brazil has the sole discretion to change the scope of that dispute by changing its legal position as to what it is challenging as support to upland cotton.

12. Finally, Brazil says effects of subsidies can linger, even if allocated to a particular year for countervailing duty purposes. It is clear in Annex IV, paragraph 7, that Members took it for granted that some subsidies are allocated to future production and others are not. Brazil, however, does violence to this principle by essentially asserting that all subsidies – including so-called "recurring" subsidies that most experts and national authorities (including its own) would expense to current production – should be allocated to future production. Brazil has now conceded that the subsidies at issue in this dispute are "recurring".[6] Brazil cannot have it both ways: it cannot expense the entire value of a payment to a particular crop year but also claim that the subsidy continues to exist in a later year in which new recurring subsidies are made.

## III. BRAZIL'S HAS FAILED TO SHOW THE EFFECT OF THE CHALLENGED SUBSIDIES

13. **Decoupled Payments**. Brazil has fundamentally erred in its explanation and modelling of decoupled payments by ascribing a production effect to them that is based on little more than conjecture. This assertion contradicts basic economic theory, the economic literature on such payments, and the available data showing large shifts in cotton acreage as recipients of decoupled payments plant alternative crops or no crops at all and other farmers who do not hold upland cotton base acres choose to produce upland cotton.[7] Thus, there is no basis to ascribe production-distorting

[5] For example, Brazil has repeatedly argued that the challenged US subsidies provided $12.9 billion in support over marketing years 1999-2002; this figure was based on payments made under specific programmes, including decoupled income support with respect to upland cotton base acres only. Brazil also has argued that decoupled payments for upland cotton base acres (net of base acres not "planted to cotton") are all support to upland cotton irrespective of what is planted on the land now.

[6] *See* Brazil's Further Rebuttal Submission, para. 208 n. 344 ("Brazil agrees that the recurring subsidies at issue would be allocated to the year in which they are paid for purposes of a CVD analysis . . . .").

[7] For example, the marketing year 2002 base acreage increase means that, on average over marketing years 1998-2001, 2.6 million acres of upland cotton were planted on farms without upland cotton base acreage or in excess of those farms' upland cotton base acreage, suggesting that Brazil's theory that upland cotton must be planted on upland cotton base acreage is not supported by the facts.

effects to decoupled payments. In fact, most empirical studies have concluded that the effects of decoupled payments are minimal.[8]

14. **Third-Party Papers**. Brazil cannot cite to results from papers that employ an approach fundamentally at odds with its own. These third-party economic studies do not provide insight into the question this Panel has been asked to examine because they generally suffer from two crucial conceptual flaws. First, most of the cited studies do not distinguish between payments linked to production of upland cotton and payments decoupled from any requirement to produce, instead treating them as having equal production impacts. Second, most of the third party studies do not model the marketing loan programme appropriately, simply removing revenue from the producer without focusing on the producer's expected harvest season price at the time of planting. Thus, Brazil would have to agree that these third party papers do not properly model farmers' production decisions.

## IV. BRAZIL HAS ADVANCED ERRONEOUS LEGAL STANDARDS UNDER ITS CLAIM IN THIS DISPUTE

15. **Threat of Serious Prejudice/Article XVI:3**. Brazil may not advance a claim of threat of serious prejudice using the "more than equitable share of world export trade" standard from GATT 1994 Article XVI:3. Nothing in the text of GATT 1994 Article XVI indicates that a threat claim under paragraph 1 may utilize the more than equitable share standard under paragraph 3. Neither is there any analysis in the *EC – Sugar Exports* GATT panel report that provides a textual basis to import that standard. Further, Brazil's interpretation would also introduce a contradiction between GATT 1994 Article XVI:1 and SCM Agreement Articles 5 and 6 even though the term "serious prejudice" is used "in the same sense" in these provisions.[9]

16. **Threat of Serious Prejudice and *Per Se* Serious Prejudice Standard**. Brazil's argument is that "[c]onsistent with prior precedent [the GATT *EC – Sugar Export Subsidies* panel report], the threat of serious prejudice is caused by the absence of any legal mechanism that stems or otherwise controls the flow of mandatory and unlimited US subsidies". The GATT *Sugar Export Subsidies* panel report, however, provided no basis for selecting that standard, and neither we nor Brazil find any basis for that standard in the text of the Subsidies Agreement or GATT 1994 Article XVI:1.

17. Brazil is simply wrong that US payments are "mandatory" and "unlimited".[10] More fundamentally, however, Brazil's argument that "the availability of a mandatory subsidy for an unlimited amount of production and exports will inevitably create a threat and support a finding of a per se violation" proves too much. Brazil's standard means that only way a Member could act consistently with its WTO obligations would be to have a cap on expenditures with respect to a

[8] A recent study concluded that production flexibility payments had "no effects on agricultural production in either the short run or the long run". USDA, ERS, Decoupled Payments: Household Income Transfers in Contemporary US Agriculture, M.E. Burfisher and J. Hopkins, Eds. (February 2003), at 23. (See Exhibit US-53). Other studies cited in Exhibit US-23 and discussed in the US rebuttal and further rebuttal submissions suggest that the effects of decoupled payments on planted area are less than 0.5 per cent.

[9] Under Articles 5 and 6 a Member cannot claim threat of serious prejudice using the "more than equitable share" standard because that standard is not enumerated in SCM Agreement Article 6.3(c). Therefore, under Brazil's interpretation, a Member could show a threat of "serious prejudice" (under GATT 1994 Article XVI:1) by showing a threat of something that is not "serious prejudice" within the meaning of Articles 5 and 6.

[10] The payments Brazil identifies as "mandatory" are "mandatory" only if price conditions are fulfilled. Thus, the *likelihood* that price conditions will be satisfied must be taken into account. The payments Brazil identifies are also not "unlimited". For decoupled payments, the payments are set by multiplying fixed base acres times fixed base yields times the fixed or statutory maximum payment rate. The challenged payments are also not unlimited because a "circuit breaker" in the 2002 Act could result in these "mandatory" payments not being made.

particular product. It is not at all clear at what level such a cap would have to be set. But Members rejected product-specific expenditure caps in the Uruguay Round, instead agreeing on a commitment across *all* commodities (the Total and Final Aggregate Measurement of Support).

## V. BRAZIL'S SUBSIDIES AND PEACE CLAUSE ARGUMENTS MUST BE CONSISTENT

18. Brazil's arguments in this dispute must be consistent. First, it is evident that Brazil has conceded that various payments it previously claimed were product-specific – namely, decoupled income support and crop insurance – are, in fact, non-product-specific support. That is, these subsidies are provided to "agricultural producers in general", either because they do not specify any production that must occur for receipt of payment or because they are provided to producers of a wide range of products.[11] As non-product-specific support, they should not be included in the comparison under Article 13(b)(ii) of the Agreement on Agriculture. This contradicts the Brazilian approach, and is consistent with the US approach, to the Peace Clause.

19. Second, Brazil not only recognizes that support to upland cotton *may* be measured in terms of a rate but also that this is the only way to gauge the support decided by the United States for future years; therefore, Brazil relies on the rate of support concept for its threat and *per se* claims.[12] By advancing such arguments, Brazil has effectively conceded the basis for the US Peace Clause analysis – that is, that the only way for Members to know whether US measures for any given year will comply with Peace Clause requirements is to examine the way in which they "decide" support: that is, the rate of support. If Brazil makes arguments under its subsidy claims based on the rate of support, it cannot credibly assert that the rate of support is inapt in the context of the Peace Clause. As demonstrated during the Peace Clause phase, the United States disciplined itself to remain within those limits by deliberately moving away from production-linked deficiency payments with a high target price to decoupled income support.

[11] For example, if a recipient of decoupled income support can choose to produce cotton, something else, or nothing at all, the payment is not tied to production of a particular product. There is nothing in the Agreement on Agriculture to suggest that support may be at one and the same time "product-specific support" and "non-product-specific support". Thus, in attributing part of the decoupled payments on upland cotton base acres to producers and part to non-producers, Brazil concedes that such payments are non-product-specific support.

[12] Brazil's Further Submission, para. 432 ("When US upland cotton farmers plant their crop in spring, farmers expect a certain price level. But, by no means is it ensured that this price level will be accomplished. However, given the US subsidies, that is irrelevant. . . . . *The single fact that these programmes exist ensures a guaranteed revenue amount from the production of upland cotton.*") (italics added).

# ANNEX H-4

## EXECUTIVE SUMMARY
## CLOSING STATEMENT OF THE UNITED STATES AT THE SECOND MEETING OF THE PANEL WITH THE PARTIES

### I. CCC EXPORT CREDIT GUARANTEE PROGRAMMES ISSUES

#### A. BRAZIL WRONGLY MINIMIZES THE SIGNIFICANCE OF ARTICLE 10.2 OF THE AGREEMENT ON AGRICULTURE

1. Brazil's assertions in its opening oral statement regarding the CCC export credit guarantee programmes invite a brief response.

2. First, as discussed with the Panel during this meeting, Brazil asserts that Article 10.2 of the Agreement on Agriculture reflects merely a banal compromise to accommodate potential "additional obligations regarding notification, consultation, and information exchange". Brazil implausibly asserts that the obvious transition between the language of the Draft Final Act that would have imposed significant substantive disciplines on export credit guarantees and the absence of such language in the Article 10.2 ultimately adopted can be fully explained as reflecting merely an agreement to work on such pedestrian disciplines as information exchange.

3. Brazil asserts that the Members had agreed on the applicability of export subsidy disciplines to export credit guarantees and that Article 10.2 was an apparently insignificant "good faith agreement". However, Article 10.2 did not arise only because "other participants were not willing to offer more than general disciplines included in Article 10.1". It arose because part of the grand compromise of the Agreement on Agriculture was that export credit guarantees were excluded from the export subsidy disciplines.

4. Ironically, however, Brazil's statement further serves to illustrate that export credit guarantees were *not* considered export subsidies under the Agreement on Agriculture. In December 1994, the Preparatory Committee for the World Trade Organization issued *Notification Requirements and Formats Under the WTO Agreement on Agriculture*.[1] These notification requirements remain in effect. Elaborate reporting requirements are set forth for Members with respect to numerous aspects of the disciplines of the agreement, including with respect to export subsidies.[2] However, no reporting requirement is indicated for export credit guarantees. This is consistent with treatment of such programmes as outside export subsidy disciplines. Had the parties agreed that all were "willing to offer" at least "the general disciplines included in Article 10.1", as Brazil asserts, then it would have been logical to include reporting requirements for such purposes. It is hard to imagine parties willing to make such an offer in the absence of the United States, among the largest providers of export credit guarantees. In fact, the United States never offered to include export credit guarantees in Article 10.1, and the Members never so agreed. Indeed, the agreement reflected in Article 10.2 is expressly to the contrary.

5. Article 10.2, furthermore, would be unnecessary for mere "notification, consultation, and information exchange". Had export credit guarantees been subject to export subsidy disciplines,

[1] PC/IPL/12, circulated 2 December 1994 (exhibit US-99).
[2] See, e.g., Exhibit US-99, paras. 1(c), 1(e), 1(i), 2; Table ES:1 and Supporting Tables ES:1 and ES:2.

Article 18 of the Agreement on Agriculture, to review the progress in the implementation of commitments negotiated under the Uruguay Round reform programme, and the Notification Requirements, which are still in effect, could amply accommodate any "notification, consultation, and information exchange".[3]

B. BRAZIL INVENTS A STANDARD NOT REQUIRED UNDER ARTICLE 10.3 OF THE AGREEMENT ON AGRICULTURE

6. Second, with respect to Article 10.3 of the Agreement on Agriculture, Brazil asserts that the only way for the United States to satisfy any burden applicable under that provision is "to demonstrate the absence of subsidization on a transaction-by-transaction basis". Such a standard would obviously be impossible to satisfy. Perhaps more importantly, Article 10.3 requires no such demonstration. Brazil simply invents this. The only authority it offers for this novel proposition is a Third Party Submission of Canada, which itself offers no authority for the assertion.

7. Article 10.3 applies only to export subsidy *reduction* commitments. We believe that Brazil agrees at least with that. Brazil has alleged that the United States has exceeded only its quantitative export subsidy reduction commitments and only during the period July 2001-June 2002. The United States has demonstrated that with respect to 12 of the 13 commodities for which the United States has reduction commitments the respective exports during that period under the export credit guarantee programme did not exceed applicable quantitative reduction commitments. Other than the Dairy Export Incentive Programme applicable to cheese and skim milk powder, with respect to which the United States previously noted in a prior submission the issuance of export subsidies, the United States provided no export subsidies for the other scheduled commodities. To avoid any further ambiguity the United States submits a copy of its notification concerning export subsidy commitments for fiscal year 2001, which reflects no export subsidies provided by the United States other than for cheese and skim milk powder.[4]

C. BRAZIL'S RECENT STATEMENTS CONCERNING THE CORRECT ANALYSIS UNDER ITEM(J) ARE INCONSISTENT AND INCORRECT

8. Third, with respect to item (j) Brazil directly acknowledges its view that the relevant period of time for examination is 10 years.[5] Yet Brazil disingenuously urges the Panel to examine allegedly "uncollectible amounts" on pre-1992 guarantees, and defaults of Iraq and Poland, which commenced in 1990 and the 1980's, respectively.[6]

9. Brazil also mysteriously alleges that "according to CCC's 2002 financial statements, CCC has been relieved of what the United States argues are onerous government-wide accounting rules that 'compel' projection of enormous losses". CCC, however, has never been so "relieved". It remains compelled to adhere to the requirements of the federal Credit Reform Act of 1990, and relevant provisions of the Office of Management and Budget Circular A-11, implementing that legislation. CCC remains subject to government-wide requirements for subsidy estimates and the risk categories mandated by OMB with respect to exposure to debt from different countries. The government-wide rules continue to dictate the methodology for calculation of estimates, and reestimates, and as the United States has previously noted, a principal reason for overly high initial estimates is continuously overly optimistic projections of programme use. Also, as the United States has previously noted, the result of the estimate (and reestimate) process is simply carried forward to the CCC financial statements; Brazil continues to misrepresent the $411 million figure in the 2002 financial statement

[3] See, e.g., Article 18.5, 18.6, and 18.7.
[4] *Notification*, G/AG/N/USA/47, circulated 6 June 2003 (exhibit US-100).
[5] Statement of Brazil - Second Panel Meeting (2 December 2003), para. 81.
[6] Statement of Brazil - Second Panel Meeting (2 December 2003), para. 84.

as well as to mistakenly assert the inclusion of "enormous uncollectible amounts . . . on post-1991 guarantees".

D. BRAZIL CONTINUES TO WRONGLY ASSERT THAT THE ISSUANCE OF CCC EXPORT CREDIT GUARANTEES IS UNBOUNDED

10. Fourth, with respect to Brazil's circumvention arguments, Brazil continues to insist that notwithstanding the myriad programmatic impediments to issuance of guarantees the export credit guarantee programmes are a runaway train, beyond the ability of CCC to "stem or otherwise control the flow of" CCC export credit guarantees. With respect, this is simply not so.

11. Similarly, in its oral statement, Brazil has increased the supposed annual mandatory minimum dollar amount of guarantees to $6.5 billion from $5.5 billion.[7] As the United States has previously observed, CCC has never remotely approached issuing any such fancifully large amount of export credit guarantees.[8]

## II. ACTIONABLE SUBSIDY ISSUES

12. The United States has reviewed Brazil's evidence and arguments underlying Brazil's actionable subsidy claims and found them lacking. We will not repeat our criticisms of fundamental errors in Brazil's legal interpretations. We do note that the evidence on the record does not demonstrate that US producers are unresponsive to market price signals, does not demonstrate significant price suppression in any "same market", does not demonstrate an increase in world market share, and does not demonstrate a threat of serious prejudice. Our comments today go principally to the consistency, or lack thereof, in Brazil's arguments.

A. BRAZIL HAS FAILED TO ESTABLISH ALL OF THE ELEMENTS NECESSARY TO ESTABLISH ITS SUBSIDIES CLAIMS

13. Consider the fundamental issue of identifying the subsidized product and the subsidy.

### 1. Brazil has not identified which products benefit from the subsidy

14. If Brazil cannot distinguish the benefit to cotton provided by a subsidy from the benefit to other products – that is, attribute the subsidy to the recipient's production – then it will lead to double-counting of the subsidy benefit. Recall the example the United States provided in the opening statement with respect to soybeans and cotton. If a producer grows both soybeans and cotton and receives a $1 payment not tied to the production of any crop, according to Brazil's approach, the *entire* $1 payment is attributed to and support for upland cotton. However, were Brazil to bring a dispute settlement proceeding against US support for soybeans (as was reported almost occurred roughly two years ago), under Brazil's approach, the entire $1 payment would *also* be support for soybeans. The same $1 payment cannot provide both $1 in benefit to cotton and $1 in benefit to soybeans – that's double-counting. Therefore, the payment must be attributed across the value of the recipient's production. As noted in the US further rebuttal submission, Brazil *would* attribute the value of the payment across all of a recipient's production for countervailing duty purposes.

[7] *Compare* Statement of Brazil - Second Panel Meeting (2 December 2003), para. 91, *with* Answer of Brazil to Panel Question 142 (October 27, 1993) paras. 95, 100.

[8] US Further Rebuttal Submission (18 November 2003), para. 201.

**2. Brazil has not quantified the subsidy benefit attributable to upland cotton**

15. If Brazil cannot properly quantify the amount of subsidy benefit to upland cotton producers, how can the Panel analyze the effect of the subsidy? Brazil cannot both claim that it need not quantify the benefit and at the same time argue that the subsidies provide $12.9 billion in aggregate support.

16. Similarly, if Brazil cannot properly identify the level of subsidization of the exported product, the Panel's analysis will be impacted. Again, Brazil cannot claim that it need not identify the subsidization rate and at the same time claim a 95 per cent subsidization rate over the 1999-2002 marketing year period.

**3. Brazil has not expensed the recurring payments at issue, contrary to its countervailing duty practice and inconsistent with its arguments in this dispute**

17. Finally, Brazil cannot both expense the *entire* amount of these subsidies it admits are "recurring" to the year for which the payment was received (for example, marketing year 1999) and *also* claim that the subsidy continues to exist in a later year in which new recurring subsidies are made (for example, marketing year 2002). That is, if the subsidy continues to exist in a later year, it *must* have been allocated to future production. Indeed, Brazil would expense these recurring payments for purposes of countervailing duties.

18. The Panel must demand consistency from Brazil. It is not enough for Brazil to say that those concepts are for countervailing duty purposes, not for serious prejudice purposes. We were not aware that the concept and definition of "subsidy" as used in Part III and Part V of the Subsidies Agreement were intended to have different meanings. In fact, there is nothing in the Subsidies Agreement to suggest that they should mean different things.

19. Brazil not only rejects the Subsidies Agreement Annex IV methodology with respect to these issues, and not only rejects its own countervailing duty methodology, but does not provide any rational method of approaching these issues. Brazil's approach results in dramatically inflated quantities of support and dramatically inflated levels of subsidization. The Panel should reject Brazil's unprincipled approach to subsidy identification issues.

B. BRAZIL'S APPROACH TO ITS SERIOUS PREJUDICE CLAIMS AND THE PEACE CLAUSE MUST BE CONSISTENT

20. Similarly, as indicated in the US opening statement, the Panel must demand consistency from Brazil between its arguments for purposes of serious prejudice and the Peace Clause. First, Brazil cannot rely on the *rate* of support in US. law and regulations for purposes of its threat and *per se* claims and *deny* their relevancy to the Panel's Peace Clause analysis.

21. Second, with respect to decoupled payments (such as direct payments), Brazil cannot attribute part of a decoupled payment to upland cotton producers and part to non-producers, and *simultaneously* claim that such decoupled payments are not non-product-specific support. They are non-product-specific support because they are (in the language of Article 1(a) of the Agreement on Agriculture) "support provided to agricultural producers in general" and because they are not (in the language of Article 1(a)) "support provided *for an agricultural product* in favour of the producers of an agricultural product". That is, Brazil has acknowledged that some recipients of, for example, direct payments are not producers of upland cotton; they are, rather, "producers in general". Under the Agreement on Agriculture, support (such as direct payments) cannot at the same time be both product-specific support and non-product-specific support. Thus, these payments would not form part of the Peace Clause (Article 13(b)(ii)) analysis.

22. Finally, it is clear that, under Brazil's approach, there can be *no* non-product-specific support for purposes of the Peace Clause. This results because a subsidy payment can always be traced to a final recipient and then can always be attributed to whatever products he or she produces. One problem with this result is that a Member can then have no certainty that it will be in compliance with the Peace Clause in any given year.

23. Consider a hypothetical: under Brazil's outlay approach to the Peace Clause, if a Member gave only decoupled support to producers, but in a given year all the recipients of the payment decided *only* to produce one commodity, the support (outlays) attributed to that commodity in that year could exceed the 1992 support level. But that would purely be a function of the recipients' decisions, not the decision of the United States. Brazil's approach therefore would rob Members of the ability to decide their support in a way to ensure conformity with Peace Clause requirements, and it must be rejected.

A. UPLAND COTTON

**1. Please confirm that all information and data that you have provided to the Panel relating to "cotton" in fact relates to upland cotton only. BRA, USA**

Brazil's answer:

1. Brazil can confirm that, except as explicitly stated otherwise, all the data and references made by Brazil to "cotton" relate and will relate to "upland cotton" only.

B. PRELIMINARY ISSUES

*Note to parties: As indicated in the cover note, the Panel has expressed its views in respect of the three United States requests for preliminary rulings. The Panel's questions reflected in this compilation relating to the requested preliminary rulings on which the Panel has expressed its views are those that were posed in the course of the first session of the first Panel meeting. This is to give an opportunity for the parties to transpose into writing their oral responses.*

**1. Product scope of Panel's terms of reference relating to Brazil's export credit guarantee claims**

**2. Is Brazil's claim in relation to export credit guarantees against the measures said to constitute the GSM-102, GSM-103 and SCGP programmes in their entire application, or against the measures said to constitute the GSM-102, GSM-103 and SCGP programmes in their application to upland cotton, or both? BRA**

Brazil's answer:

2. Brazil confirms that its claims against GSM 102, GSM 103 and SCGP concern the programmes in their entirety and are *not* limited to their application to upland cotton.

**3. If the request for consultations in this dispute omitted certain products in relation to export credit guarantees, on what basis is it argued that it failed to identify the measures at issue in accordance with Article 4.4 of the DSU? USA**

**4. Is it argued that the export credit guarantee programmes concerning upland cotton are each a separate or independent measure, in that they operate independently? USA**

**5. Is there a specification in any legislation or regulation (or any other official government document) which limit or restrict the export credit guarantee programmes at issue exclusively to upland cotton? USA**

**6. For the purposes of the Panel's examination of Brazil's claims relating to GSM-102, GSM-103 and SCGP under the Agreement on Agriculture and the SCM Agreement, is accurate data and information available with respect to these export credit guarantee programmes concerning upland cotton alone (e.g. with respect to "long-term operating costs and losses")? In this respect, the Panel also directs the parties' attention to the specific questions below relating to the programmes. USA**

**7. Are commitments with respect to export subsidies under the Agreement on Agriculture commodity-specific? How, if at all, is this relevant? BRA, USA**

Brazil's answer:

3. Under Articles 3.3 and 8 of the Agreement on Agriculture, a Member can only grant export subsidies for agricultural products if that Member has an export subsidy reduction commitment for the agricultural product in question. The commodity specific aspect becomes relevant in Step 2 and ETI export subsidies because the United States scheduled no reduction commitments for upland cotton. In the case of the export credit guarantee programs challenged by Brazil, the commodity specific aspect becomes relevant only after the Panel has found that export credit guarantees are export subsidies within the meaning of the Agreement on Agriculture. At that stage, the Panel needs to examine whether (a) for the group of *unscheduled* commodities, which includes upland cotton, and (b) for each of *scheduled* commodities, there is a threat of circumvention of the US export subsidy reduction commitments. Brazil has set forth its arguments that GSM 102, GSM 103 and SCGP violate Article 10.1 of the Agreement on Agriculture for both scheduled and unscheduled commodities in paragraphs 295-305 of its First Submission.

4. The commodity-specific nature of export subsidy reduction commitments is, however, irrelevant for determining whether GSM 102, GSM 103 and SCGP in their application to all eligible products are within the Panel's terms of reference.

**8. Does the United States confirm that the questions referred to by Brazil in paragraph 92 of Brazil's oral statement were posed to the United States in the consultations? USA**

**9. How does the United States respond to paragraph 94 of Brazil's oral statement? USA**

**10. What actual prejudice, if any, has the United States suffered as a result of the alleged omission of products other than upland cotton from the request for consultations? USA**

**11. Does the United States agree that Brazil's request for establishment of the Panel can be understood to indicate that Brazil's export credit guarantee claims relatesto products other than upland cotton? How, if at all, is this relevant? USA**

**12. Please address issues and submit evidence regarding the three export credit guarantee programmes concerned relating to upland cotton and other eligible agricultural commodities in your answers to questions and rebuttal submissions. BRA, USA**

Brazil's answer:

5. Brazil has presented its arguments and evidence concerning the three export credit guarantee programmes always with respect to all eligible agricultural commodities[1] and will continue to do so in its answers to these questions and in future submissions to the Panel.

**13. Please include any argumentation and evidence to support your statement during the Panel meeting that the inclusion of such other eligible agricultural commodities would create additional "work" for the Panel with respect to each of these commodities under Article 13 of the Agreement on Agriculture. USA**

[1] *See* paragraphs 252-314 of the First Submission of Brazil and paragraphs 116-133 of the Oral Statement of Brazil.

**2. Expired measures**

**14. Please submit evidence regarding the programmes under the 1996 FAIR Act, in particular, production flexibility contract payments and market loss assistance payments, to the extent that they would be relevant to the Panel's determination under Article 13 of the Agreement on Agriculture in your answers to questions and rebuttal submission. USA**

**15. Do the parties agree that it is beyond a Panel's power to recommend a remedy for an expired measure? Could the Panel could be required to examine "expired measures" in order to conduct its assessment of the matter before it? How, if at all, is Article 7.8 of the SCM Agreement relevant to these matters? BRA, USA**

Brazil's answer:

6. The Panel must examine any continuing effects of subsidies provided by expired measures, and it can recommend a remedy for any such continuing effects. Brazil has set forth its arguments in that respect in paragraphs 4-7 of its Closing Statement at the First Substantive Meeting of the Panel with the Parties, as well as in paragraphs 141-144 of its Oral Statement at the same meeting. Subsidies provided under expired subsidy measures can be the source of present adverse effects. Preventing a panel from examining expired measures in its assessment of the matter before it would render the adverse effects provisions of the SCM Agreement a nullity, as a Member would be freed from any responsibility for the effects of its subsidies by, for example, simply letting the legislation expire and renewing it every year (or in even shorter periods). The Panel is, thus, required to analyze the effects of subsidies provided by production flexibility contract ("PFC") payments and market loss assistance payments in its assessment of Brazil's adverse effects claims. Disregarding those payments would not enable the Panel to conduct "an objective assessment of the matter before it", as it would disregard a source of present adverse effects.[2]

7. Article 7.8 of the SCM Agreement offers the Panel the possibility to recommend a remedy for the adverse effects from subsidies provided by expired measures. Under Article 7.8, a Panel can recommend that a Member withdraw the adverse effects of the expired measures. By virtue of DSU Appendix 2, Article 7.8, not DSU Article 19, provides the basis for remedies involving claims under Articles 5 and 6 of the SCM Agreement. In making recommendations under such claims, the Panel is not limited to a recommendation that a Member bring its measures into conformity with a covered agreement. Rather, a Panel finding adverse effects caused by a Member's actionable subsidies must recommend that the Member withdraw the subsidy or remove the adverse effects.

8. In sum, the Panel is required to objectively assess the present effects of PFC and market loss assistance payments on US production, US exports and prices of upland cotton. If it finds that these subsidies cause adverse effects within the meaning of Articles 5 and 6 of the SCM Agreement – as Brazil believes the Panel will find based on the arguments and evidence to be presented by Brazil on 9 September 2003 – the Panel should recommend that the United States remove the adverse effects pursuant to ASCM Article 7.8.

**3. Agricultural Assistance Act of 2003**

**16. What, if any, prejudice in terms of the presentation of its case does the United States allege, should the Panel proceed to consider the measures constituting the cottonseed payments under the Agricultural Assistance Act of 2003? USA**

[2] The analysis in this paragraph is relevant to the first paragraph of Brazil's Answer to Panel Question 19.

**17. (a) What is the relationship of the Agricultural Assistance Act of 2003 to other legislation in the request for establishment of the Panel? BRA, USA**

**(b) Do the legal instruments follow directly one after another, or are there temporal gaps? Are payments authorized under a broad legislative authority or are they specific to each legal instrument? BRA, USA**

**(c) Please provide any implementing regulations. Do these implementing regulations resemble those relating to previous programmes or payments? Are payments made retrospectively? How if at all is this relevant? BRA, USA**

Brazil's answer:

9. Cottonseed payments for MY 2002, as with the previous cottonseed payments in MY 1999 and 2000, were authorized by annual appropriations acts involving a variety of other legislative provisions that do not relate to cottonseed payments.[3] Public Law 106-113, inter alia, appropriated funds otherwise unused for assistance to producers or first-handlers of the MY 1999 crop of cottonseed.[4] The United States indicated in consultations that $79 million had in fact been used for that purpose. Public Law 106-224, inter alia, appropriates $100 million for assistance to producers and first-handlers of the MY 2000 crop of cottonseed.[5] Public Law 107-25, inter alia, added an appropriation of $84.7 million for assistance to producers and first-handlers of the same MY 2000 crop of cottonseed.[6] No cottonseed payments were authorized for MY 2001. The Agricultural Assistance Act of 2003, inter alia, appropriated cottonseed payments for the 2002 crop in the amount of $50 million.[7]

10. None of these statutory provisions contains any guidance on how USDA was to implement the cottonseed payments. Eligibility, administration, application and payment rates and details are all provided for in regulations. Brazil has provided in Exhibit Bra-32 the regulations applicable to the MY 2000 crop of cottonseed. Regulations governing payments for the MY 2002 crop of cottonseed were issued on 25 April 2003 and are set forth in Exhibit Bra-139. Comparing these regulations with the regulations that implement 2002 cottonseed payments[8] demonstrates that both regulations are almost identical. In fact, the preamble to the 2002-crop regulations provides that "[p]revious 1999-crop and 2000-crop cottonseed programs were codified in 7 CFR part 1427. This rule follows the model set by those preceding programs."[9] Additionally the preamble to the regulations states:

> Presumably, Congress expected the old programme to serve as the model for the new programme provided for in the new legislation as no dissatisfaction was expressed.[10]

11. This evidence demonstrates that the Cottonseed Payment Programme in MY 2002 was a continuation of the Cottonseed Payment Programme with respect to MY 1999 and 2000. The Agricultural Assistance Act of 2003 appropriated new funds for the MY 2002 crop to the existing programme (after no such appropriations took place for MY 2001). The 2002 cottonseed payments provided for in the Agricultural Assistance Act of 2003 are "future measures implementing"[11] the

[11] Brazil's Request For the Establishment of a Panel, WT/DS267/7, p. 2. *See* Appellate Body Report, *Chile – Agricultural Products (Price Band)*, WT/DS207/AB/R, paras. 135-136 and 144.

existing (but unfunded) Cottonseed Payment Program, which formed part of the request for consultations and which has been consulted upon. The MY 2002 cottonseed payments are therefore within the terms of reference of this Panel and Brazil is entitled to challenge the adverse effects caused by these payments.

12. Finally, the Agricultural Assistance Act of 2003 appropriated $50 million in cottonseed payments expressly for the MY 2002 crop. Payments will be made after the United States has received all applications and has calculated the payment rate.[12] Since, payments are made after the 2002 crop has been harvested, payments can be considered to be made retrospectively. Yet, irrespectively of when the payments are made and irrespective of the Panel's decision whether they form part of the Panel's terms of reference, they are made in respect of MY 2002[13] and, therefore, these payments should be included in the calculation of the MY 2002 support to upland cotton for purposes of the test under Article 13(b)(ii) of the Agreement on Agriculture.

**18. If the Panel is correct in understanding that cottonseed payments are divided between processors and producers, how is this reflected in Brazil's calculations? BRA**

Brazil's answer:

13. Brazil has included the full amount of cottonseed payments in its peace clause calculations for MY 1999, 2000 and 2002 because cottonseed payments constitute support to upland cotton. This approach is consistent with the United States' notifications of these payments as product-specific support to upland cotton in its notification of domestic support for MY 1999.[14]

14. Brazil furthermore notes that the full amount of cottonseed payments is available to stimulate production and distort trade. Including the full amount of cottonseed payments is also consistent with basic principles of microeconomics that the incidence of a tax or subsidy does not depend on where in the processing chain the tax or subsidy is applied. The production or consumption effects of a tax or subsidy depends on supply and demand elasticities and market conditions, but these market impacts do not depend on whether government checks are written in the name of farmers or initial processors.[15]

C. MEASURES AT ISSUE

**19. The Panel notes that Brazil's panel request refers, inter alia, to alleged "subsidies" and "domestic support" "provided" in various contexts. Please specify the measures, in particular, the legislative and regulatory provisions, by number and letter, in respect of which Brazil seeks relief and indicate where each is referred to in the panel request. BRA**

Brazil's answer:

15. Brazil's Request for Establishment of a Panel ("Panel Request") challenges two types of domestic support "measures" provided to upland cotton and various different types of export subsidy measures. The first type of domestic support "measure" is the payment of subsidies for the production and use of upland cotton. These payments were and continue to be made between MY 1999 to the present (and will be made through MY 2007) through the various statutory and regulatory instruments listed on pages 2-3 of Brazil's Panel Request. Brazil referred to these payments at pages 2-3 of the Panel Request as "subsidies and domestic support provided under" or "mandated to

[12] Exhibit Bra-139 (7 CFR 1427.1107-1110 as provided in 68 Federal Register 20331, p. 20333).
[13] *See* Brazil's answer to Question 34.
[14] *See* Exhibit Bra-47 (G/AG/N/USA/43, p. 20).
[15] Exhibit Bra-140 (Pindyck, Robert S. and Rubinfeld, Daniel L. , *Microeconomics*, 5th edition (2002), Prentice Hall, New Jersey, p. 313-317).

be provided" under the various listed statutory and regulatory instruments. Brazil has tabulated the different types of payments (i.e., the measures) made under these legal instruments in paragraphs 146-149 of its First Submission. Brazil's "Further Submission" on 9 September 2003 will provide considerable detail concerning the effects of the subsidies provided and mandated to be provided by the United States. It is these effects in respect of which Brazil seeks relief with respect to the first type of domestic support measures.

16. A second type of domestic support "measure" challenged by Brazil are legal instruments as such. The "legislative and regulatory provisions, by number and letter, in respect of which Brazil seeks relief" are those involving the 2002 FSRI Act and the 2000 Agricultural Risk Protection Act and in particular the following:[16]

- **Marketing loan/loan deficiency payments:** Sections 1201(a)-(b), 1202(a)(6), 1202(b)(6), 1204(b), 1205(a)(1), 1205(b), 1205(c)(1), 1608 of the 2002 FSRI Act and 7 U.S.C. 7286 (Section 166 of the 1996 FAIR Act as amended) and 7 CFR 1427.22 to the extent that these provisions require the provision of marketing loan and loan deficiency payments for all production of upland cotton.

- **Counter-cyclical payments:** Section 1104(a)-(f)(1) of the 2002 FSRI Act and 7 CFR 1412.503.

- **Direct payments:** Section 1103(a)-(d)(1) of the 2002 FSRI Act and 7 CFR 1412.502.

- **Step 2 Domestic Payments:** Section 1207(a) of the 2002 FRSI Act and 7 CFR 1427.103, 7 CFR 1427.104(a)(1), 7 CFR 1427.105(a), 7 CFR 1427.108(d) requiring cotton user marketing certificate ("Step 2") payments to be made to domestic users of US upland cotton.

- **Crop Insurance payments:** Section 508(a)(8), 508(b)(1), 508(b)(2)(A)(ii), 508(b)(3), 508(e) and 508(k) of the 2000 ARP Act[17] mandating the provision or crop insurance policies to farmers, premium subsidies to farmers and reinsurance to insurance providers to the extent that these provisions apply to upland cotton. Section 516 providing for unlimited funding of the crop insurance programme to the extent that these funds are available to upland cotton producers

17. Finally, Brazil challenges three types of export subsidies provided by the United States. Regarding Step 2 export subsidies, the measure Brazil challenges is Section 1207(a) of the FSRI Act, and 7 CFR 1427.103, 7 CFR 1427.104(a)(2), 7 CFR 1427.105(a), and 7 CFR 1427.108(d) requiring cotton user marketing certificate ("Step 2") payments to be made to exporters of US upland cotton.[18] Brazil also challenges as a "measure" subsidies provided by Step 2 export programme as actionable subsidies.

18. Regarding Brazil's ETI Act claim, the measure challenged by Brazil is the FSC Repeal and Extraterritorial Exclusion Act of 2000, Public Law 106-519, 114 Stat. 2423 (2000), and in particular, Section 3 (entitled "Treatment of Extraterritorial Income"), which amends the US Internal Revenue

[16] These Acts are referenced on page 2 of Brazil's Panel Request (WT/DS267/7), and Brazil's *per se* claim regarding these Acts and the regulations is referenced at page 4 of Brazil's Panel Request.

[17] Page 2 of Brazil's Panel Request (WT/DS267/7) identifies the Agricultural Risk Protection Act of 2000.

[18] Page 2 of Brazil's Panel Request (WT/DS267/7) identifies the 2002 FSRI and the regulations in relation to Step 2 payments.

Code (IRC) by inserting into it a new Section 114, as well as a new Subpart E, which is in turn composed of new IRC Sections 941, 942 and 943.[19]

19. With respect to Brazil's export credit guarantee claims, the measures challenged by Brazil are the GSM 102, GSM 103 and SCGP programs as established and maintained by 7 U.S.C. 5622[20] and 7 CFR 1493.[21] Brazil challenges 7 U.S.C. 5622(a)(1) and (b),[22] which provide for the extension of export credit guarantees on terms better than those available on the marketplace. Furthermore, Brazil challenges the maintenance of the GSM 102, GSM 103 and SCGP programs at premium rates that are inadequate to cover the long-term operating costs and losses of the programs. Additionally, Brazil challenges the failure of 7 U.S.C. 5622 and 7 CFR 1493 to prevent circumvention (or the threat of circumvention) of the US export subsidy commitments under the Agreement on Agriculture. Brazil also challenges as a "measure" GSM 102, GSM 103 and SCGP export credit guarantees facilitating the production and export of US upland cotton as actionable subsidies and thereby causing adverse effects to the interests of Brazil.

D. ARTICLE 13(B): DOMESTIC SUPPORT MEASURES

**1. "exempt from actions"**

**20. In paragraph 8 of its initial brief (dated 5 June, 2003), the United States argued that the word "actions" as used in the phrase "exempt from actions" in Article 13 of the Agreement on Agriculture includes the "bringing of a case" and consultations. In paragraph 36 of its first written submission (dated 11 July, 2003), the United States stated as follows:**

> **"[P]rior to this point in the process, the DSU rules did not afford the United States any opportunity to prevent the dispute from proceeding through consultations and panel establishment automatically, regardless of the US insistence that its measures conform to the Peace Clause."**

**Is it the United States' understanding that the drafters used the phrase "exempt from actions" knowing that under the DSU it would not be possible fully to exempt "actions", as the United States interprets that term? USA**

**21. In US - FSC and US - FSC (21.5) the Appellate Body made findings under the SCM Agreement relating to export subsidies in respect of agricultural products without making a finding in respect of Article 13 of the Agreement on Agriculture. How is this relevant to the United States' interpretation of the phrase "exempt from actions" as used in Article 13? USA**

**2. "such measures" and Annex 2 of the Agreement on Agriculture**

**22. Please explain the difference, if any, between the meaning of "defined" and the meaning of "fixed" in the phrase "a defined and fixed base period" in paragraph 6(a) of Annex 2 of the Agreement on Agriculture. BRA, USA**

[19] Page 2 of Brazil's Panel Request (WT/DS267/7) identifies the ETI Act.

[20] Exhibit Bra-141 (7 U.S.C. 5622) codifies the relevant provisions of the 1978 Agricultural Trade Act as amended, identified on page 2 of Brazil's Panel Request (WT/DS267/7).

[21] *See* Exhibit Bra-38 (7 CFR 1493). Pages 2 and 5 of Brazil's Panel Request (WT/DS267/7) identifies GSM 102, GSM 103, and SCGP programs.

[22] Exhibit Bra-141 (7 U.S.C. 5622) codifies the relevant provisions of the 1978 Agricultural Trade Act as amended, identified on page 2 of Brazil's Panel Request (WT/DS267/7).

Brazil's answer:

20. The meaning of the term "defined" in relation to "base period" is the period of time used to define the parameters ("indicate the extent"[23]) of the base period. The word "period" is defined as "a course or extent of time".[24] For example, the "defined" "base period" to determine the amount of upland cotton base acreage for the PFC (and market loss assistance) payments was the average planted and considered planted acreage during MY 1993-95.[25] The term "fixed" in relation to "base period" means that the "defined" base period cannot change or be updated. This is confirmed by the dictionary meaning of the term "fixed," which is "definitely and permanently placed or assigned; stationary or unchanging in relative position; definite, permanent, lasting."[26] In sum, a base period is first "defined" in terms of a period of time, and then that period remains definitely and permanently assigned.

**23. Please explain the meaning of "a" in "a defined and fixed base period" in paragraph 6(a) of Annex 2 of the Agreement on Agriculture, the meaning of "the" in "the base period" in paragraphs 6(b), (c) and (d), and the difference between these and the phrase "based on the years 1986-88" in Annex 3. BRA, USA**

Brazil's answer:

21. Paragraph 6(a) requires Members to establish clearly defined eligibility criteria for a de-coupled direct payment measure. These eligibility criteria must be taken from "a" defined and fixed base period of time. Paragraph 5 of Annex 2 makes it clear that all of the subparagraphs of paragraph 6 apply to the same type of de-coupled income support. Thus, a de-coupled income support measure with "a" "fixed base period" must also comply with Annex 2, paragraphs 6(b), (c) and (d). These sub-paragraphs use the phrase "after the base period." Because Article 6(a) establishes that there can only be "a" (single) "fixed" base period for a particular de-coupled domestic support measure, the use of the term "the" in 6(b)-(d) refers back to "a" "fixed" base period established in Article 6(a). Thus, a de-coupled income support measure can have only one "fixed" base period.

22. The Panel is faced with the question whether a Member can make minor adjustments to a decoupled support measure, label it a new decoupled support measure and then update the base period. Guidance for this question is provided by the first part of Annex 2, paragraph 6(a), which sets out a transparency requirement that eligibility criteria for decoupled support measures be determined by "clearly-defined criteria". In assessing whether one decoupled income support measure is essentially the same as a replacement decoupled income support measure, the Panel could examine the eligibility criteria for each set of measures. If the structure, design, and eligibility criteria have not significantly changed between the original measure (containing the "fixed base period") and its replacement, then there is no basis for any updating of the "fixed base period".

23. The factual question the Panel must address in this case is whether the "direct payment" programme in the 2002 FSRI Act contains similar design, structure, and eligibility criteria as the "production-flexibility contract payments" for upland cotton in the 1996 FAIR Act. The clearest evidence that the direct payment programme is the direct successor to production flexibility contracts is found in Section 1107(b) of the 2002 FSRI Act. It provides as follows:

> If a producer receives all or any portion of the payment authorized for fiscal year 2002 under a production flexibility contract, the Secretary shall reduce the amount of

[23] The New Shorter Oxford English Dictionary, 1993 edition, p. 618 (definition of "define").
[24] The New Shorter Oxford English Dictionary, 1993 edition, p. 2163.
[25] *See* First Submission of Brazil, para. 46. *See* also Exhibit Bra-31 (7 CFR 1412.103) in connection with Exhibit US-3 (7 CFR 1413.7(c)).
[26] The New Shorter Oxford English Dictionary, 1993 edition, p. 962.

> the direct payment otherwise due the producer for the 2002 crop year under section 1103 by the amount of fiscal year 2002 payment received by the producer under the production flexibility contract.[27]

24. Trading PFC dollars for direct payment dollars makes perfect sense given the very close similarities in the eligibility criteria between PFC and direct payments reflected in the statutes and regulations governing each. This is best illustrated in the following table:

**Similarities of Production Flexibility Contract and Direct Payments**

| Eligibility Criteria | **Production Flexibility Contracts** | Direct Payments |
|---|---|---|
| **Payment contract** | Annual fiscal payment based on 7 year contract[28] | Annual payment based on annual contract[29] |
| **Eligible Recipients** | "Producers" who assume all or part of the risk of producing a crop[30] | Same[31] |
| **Contract Acreage (Base Acreage)** | MY 1993-95[32] | MY 1993-95 or MY 1998-2001[33] |
| **Programme crops** | 7 Crops[34] | Same plus soybeans, other oilseeds, and peanuts[35] |
| **Planting Flexibility and Restrictions** | Limitations on fruits and vegetables (wild rice added in 2000).[36] | Same.[37] |
| **Payment Yield** | Base yield same as deficiency payment base average MY 1981-85[38] | Same.[39] |
| **Cotton Payment** | Payment on 85% of base acres times base yield times 7.07 cents per pound[40] on average between 1999-2001 for upland cotton[41] | Payment on 85% of base acres times base yield times 6.67 cents per pound for upland cotton[42] |
| **Compliance conditions** | Abide by conservation compliance requirements[43] | Same. [44] |

[40] Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50). Brazil notes that these payment rates were not statutory rates but resulted from the allocation of a fixed amount of budgetary outlays to holders of upland cotton base under the PFC programme in MY 1999-2001.
[41] Exhibit Bra-31 (7 CFR 1412.103)
[42] Exhibit Bra-35 (7 CFR 1412.502(e))
[43] Exhibit Bra-31 (7 CFR 1410.20)

25. For an upland cotton producer with upland cotton base in MY 2001 and MY 2002, the direct payments available in MY 2002 were based on the following four elements: (1) yield (the average of the farm for MY 1981-85), (2) base acreage for the farm (resulting from either MY 1993-95 or MY 1998-2001 production), (3) only 85 percent of base acres could receive payment, and (4) the payment rate of $0.0677 cents per pound (applied to base acreage x yield x .85). The production flexibility contract payment for that same upland cotton farmer in MY 2001 would have been based on (1) yield (the average for MY 1981-85), (2) base acreage resulting from MY 1993-95 production, (3) only 85 percent of base acres could receive payment, and (4) 5.99 cents per pound.[45] Thus, with the exception of the per pound payment rate – which increased under the 2002 FSRI Act – and the ability in 2002 to update base acreage, the payment formula was the same under both programmes.

26. In addition to these payment formula similarities, the eligibility criteria for an upland cotton producer in MY 2001 and MY 2002 are either identical or very similar under both programmes. For example, eligible recipients under both programmes are "producers," defined in each programme as "an owner, operator, landlord, tenant, or sharecropper that shares in the risk of producing a crop".[46] The "producer" under each programme could not plant fruits, vegetables, tree nuts or wild rice without either a forfeiture of all payments or a reduction of payments.[47] And each "producer" under both programmes had to maintain the land in agricultural use and adhere to conservation requirements.[48]

27. In addition to the possibility to update the base acreage, another difference between the PFC and direct payment is the addition of three additional programme crops for purposes of the direct payment programme – soybeans, other oilseeds, and peanuts.[49] Further, instead of a single seven-year contract, annual contacts are entered into between USDA and "producers" who must demonstrate that they are eligible for payments based, *inter alia,* on demonstrating that they "share in the risk of producing a crop and are entitled to share in the crop available for marketing from the farm".[50] The final difference was to set fixed amounts of payments per pound that did not decrease over the six-year term of the 2002 FSRI Act. The 1996 FAIR Act based the payment rate on annual budgeted amounts and as the budgeted amounts declined, the payment rate declined.

28. None of these changes to the direct payment programme in any way changed the eligibility criteria, the design, or the structure of the production flexibility programme as it applied to upland cotton producers. For the typical upland cotton producer farming on upland cotton base acreage, the only thing that changed was that the producer received the option to *increase* payments by updating base acreage and obtained an *increased* payment rate. Given the identical nature of most aspects of the production flexibility contract payments and direct payments, there was no basis to change the "fixed base period" of marketing years 1993-1995 for the calculation of these direct payments.

29. In light of this evidence, the Panel is not faced in this case with the situation where a Member significantly changes the structure, design, and eligibility criteria of an older measure. For example, if a Member replaces an amber box domestic support measure with a green box measure, the structure

---

[44] Exhibit Bra-35 (7 CFR 1412.203)

[45] Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50). Brazil notes that this payment rate was not a statutory rate but resulted from the allocation of a fixed amount of budgetary outlays to holders of upland cotton base under the PFC programme in MY 2001.

[50] Exhibit Bra-29 (Section 1001(1) of the 2002 FSRI Act).

and eligibility criteria is likely to be sufficiently different to permit the establishment of a new "fixed" base period for the new measure. But replacing an older green box measure with a new alleged green box measure, which basically only updates the base period and thereby results in increased payments, violates the requirement of "a" "fixed" base period in Article 6(a).[51]

30. Finally, Brazil believes that Annex 3, paragraphs 9 and 11 provide contextual support for the requirement that "a" "fixed" base period for essentially the same measure should not be changed. For the purposes of calculating total AMS, Annex 3 establishes "a" "fixed" base period – 1986-1988 – for determining the reference price that serves as a basis for the formula approach to calculating AMS for price support measures. This base period could not be changed without eliminating the basis for calculating the total AMS and the required reductions in domestic support. Similarly, paragraphs 6(a) and 6(b) of Annex 2 require a fixed base period and prevent an updating of a base period for "green box" domestic support measures that remain essentially the same programme.

**24. How often can a Member define and fix a base period in accordance with paragraph 6 of Annex 2 of the Agreement on Agriculture? BRA, USA**

Brazil's answer:

31. As set out in Brazil's Answer to Panel Question 23, the answer is *never* if the replacement de-coupled direct payment measure has a comparable structure, design and eligibility criteria as the older de-coupled direct payment measure.

**25. Does the United States consider that there is any ambiguity in the term "type of production" as used in paragraph 6(b) of Annex 2 of the Agreement on Agriculture? USA**

**26. Can the United States confirm Brazil's assertions in paragraph 174 of its first written submission that the implementing regulations for direct payments prohibit or limit payments if base acreage is used for the production of certain crops? If so, can the United States clarify the statement in paragraph 56 of its first written submission that direct payments are made regardless of what is currently produced on those acres? Can the United States confirm the same point in relation to production flexibility contracts? USA**

**27. Does Brazil argue that any United States measure that does not comply with the fundamental requirement of paragraph 1 of Annex 2 of the Agreement on Agriculture is actionable independently of any failure of that measure to comply with the basic or policy-specific criteria in Annex 2? BRA**

Brazil's Answer:

32. Yes. A domestic support measure that does not meet the "fundamental requirement" of the first sentence of Annex 2, paragraph 1, cannot be considered to be properly in the "green box". In addition to the arguments at paragraphs 163-172 of Brazil's First Submission, Brazil provides additional rationale for this argument below.

33. The use of the words "fundamental requirement" in the first sentence of paragraph 1, Annex 2, demonstrates that the obligation contained in the sentence is separate and distinct from the obligation to meet the basic and policy-specific requirements set forth in Annex 2. The ordinary meaning of those words, in that context and in light of the object and purpose of the Agreement in Agriculture, support this interpretation.

[51] *See* First Submission of Brazil, paras. 177-181.

34. The ordinary meaning of "requirement" is "a thing required or needed, a want, a need; something called for or demanded; a conditions which must be complied with".[52] Interpreted in the context of paragraph 1, Annex 2, it means that having no, or at most minimal, trade-distorting effects or effects on production is a condition for a domestic support measure, which must be complied with, for exempting this domestic support measure from the reduction commitments.

35. The word "fundamental" qualifies the word "requirement". The ordinary meaning of the term "fundamental" is "going to the root of the matter; serving as the base or foundation; essential or indispensable".[53] The use of this adjective emphasizes and underscores that the requirement that a measure does not have trade-distorting effects or effects on production is *essential and indispensable* for a domestic support measure to be exempted from reduction commitments.

36. In sum, the ordinary meaning of a "fundamental requirement" is an "essential and indispensable condition that must be complied with". It follows that the fundamental requirement in the first sentence of Annex 2, paragraph 1 must be read as a stand-alone obligation and that it is untenable to relegate the obligation in the first sentence of Annex 2, paragraph 1 to a policy objective role that merely informs the rest of the Annex. Instead, it is a condition of central importance that all domestic support measures must meet in order to be exempted from reduction commitments. Its importance is such that it serves as the premise on which the basic and policy-specific criteria are predicated.

37. The principle of effective interpretation (*l'effet utile*), recognized by panels and the Appellate Body, requires that a treaty be interpreted to give meaning and effect to all the terms of the treaty. The first sentence of Annex 2, paragraph 1 of the Agreement on Agriculture, which imposes an obligation in clear and unequivocal terms, has to be accorded full meaning. Nothing suggests that recognizing the fundamental requirement as a stand-alone obligation would undermine or render inutile the obligation to conform to the basic and policy-specific criteria. To interpret the fundamental requirement as a policy objective that merely informs the rest of Annex 2 would detract from the unambiguous obligation that domestic support measures have no, or at most minimal, trade-distorting effects or effects on production.

38. The obligation to meet the fundamental requirement set forth in Annex 2, paragraph 1 is the overriding principle that determines whether a measure can be exempt from reduction commitments. The purpose of the disciplines on domestic support in the Agreement on Agriculture, made effective in part through the reduction commitments, is to eliminate trade and production-distorting effects of domestic support measures or permit these measures to only have at most minimal trade or production-distorting effects. Where a measure does not create trade-distorting effects or effects on production, the rationale for limiting the use of that support measure disappears. Conversely, where a measure *does* have trade-distorting effects or effects on production, it must be subject to reduction commitments, regardless of whether it complies with certain other basic or policy-specific criteria. To exempt a measure because a Member alleges that it is classified as a green box measure, despite having trade-distorting effects or effects on production, would be to accept a circular reasoning and would undoubtedly undermine the disciplines on domestic support measures.

39. Brazil has set forth the evidence demonstrating that production flexibility contracts and direct payments have more than a minimal effect on production and thus are inconsistent with the fundamental requirement of the first sentence of Annex 2, paragraph 1.[54] These production effects are not surprising given the fact that both PFC and direct payments limit payments based on the *type* of

[52] The New Shorter Oxford English Dictionary, 1993 edition, p. 2557.
[53] The New Shorter Oxford English Dictionary, 1993 edition, p. 1042.
[54] First Submission of Brazil, paras. 163-172; 183-191; First Oral Statement of Brazil, paras 50-54, 57-61; Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel 22 July 2003, paras. 20-28).

production. Further, the updating of the base acreage for the direct payment programme (which one third of all eligible US farms took advantage of to increase their base acres eligible to receive direct payments), created further production enhancing effects today (as well as in the future) as detailed by Professor Sumner in paragraphs 20-29 of his Statement at the First Meeting of the Panel on 22 July 2003.[55]

40. Brazil finally notes that if follows from the first sentence of Annex 2, paragraph 1 that any domestic support measures not complying with one of the basic or policy-specific criteria in Annex 2 is to be presumed to violate the fundamental requirement that it have no, or at most minimal, trade-distorting effects or effects on production. This conclusion holds regardless of the finding of the Panel on the character of the first sentence of Annex 2, paragraph 1 as a stand-alone obligation.[56]

**28. Please explain the meaning of the word "criteria" in Articles 6.1 and 7.1. What effect, if any, does the use of the word "Accordingly" in paragraph 1 of Annex 2 of the Agreement on Agriculture have on the meaning of the preceding sentence? BRA**

Brazil's Answer:

41. Articles 6.1 and 7.1 reference "criteria" in general, without a specific mention of "basic criteria", or "policy-specific" criteria. To give meaning to the "fundamental requirement" of Annex 2, paragraph 1, the use of the word "criteria" must encompass all the rules, standards, or requirements established by Annex 2 as conditions for determining whether a domestic support measure can be exempted from reduction commitments. There is no basis, therefore, on which to exclude the fundamental requirement in Annex 2, paragraph 1 from the criteria that a domestic support measure must meet to be exempted from the reduction commitments.

42. Brazil further notes that, while Article 6.1 refers to "criteria set out in this Article", nowhere in the subsequent sub-paragraphs of Article 6 can the word "criteria" be found. This suggests that the term "criteria" as used in the Agreement on Agriculture cannot be interpreted in such a way as to limit its coverage to "basic criteria" or "policy-specific criteria" in Annex 2. The word "criterion" means "a principle, standard or test by which a thing is judged, assessed or identified".[57] It follows that the term "criteria" encompasses all standards and tests set up by the provisions in the Agreement on Agriculture and its Annexes to which Article 6.1 and 7.1 refer. This standards and tests include the fundamental requirement in the first sentence of Annex 2, paragraph 1.

43. The word "accordingly" does not (and cannot be read to) emasculate a "fundamental requirement". It introduces the related but distinct obligation to conform to the basic and policy-specific criteria. "Accordingly" is defined as "in accordance with the logical premise". It is also defined as "harmoniously, agreeably," or "in natural sequence,"[58] or "appropriate, fitting".[59] The word "accordingly" indicates that the "basic criteria" are derivative of the more fundamental obligation in the first sentence of that same paragraph. "Accordingly" simply explains that because it is a fundamental requirement that domestic support measures have no, or at most minimal, trade-distorting effects or effects on production, it is necessary that the measures also meet certain basic criteria. Thus, the "fundamental requirement" is a premise, and the "basic criteria" in the second sentence of Annex 2, paragraph 1 are in accordance – *i.e.*, not contrary – to that fundamental requirement. Because the first is a premise of the second, it is incorrect, indeed illogical, to say that the second sentence takes precedence, subsumes or subordinates the first more fundamental obligation.

[55] *See* Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel).
[56] *See* First Oral Statement of Brazil, para. 21.
[57] The New Shorter Oxford English Dictionary, 1993 edition, p. 551.
[58] The New Shorter Oxford English Dictionary, 1993 edition, p. 15.
[59] The New Shorter Oxford English Dictionary, 1993 edition, p. 15.

**29. Please explain the meaning of the words "the fundamental requirement" as used in paragraph 1 of Annex 2 of the Agreement on Agriculture. USA**

**30. Do the parties consider that direct payments and production flexibility contract payments meet or met the basic criteria referred to in paragraph 1 of Annex 2 of the Agreement on Agriculture? BRA, USA**

Brazil's Answer**:**

44. The direct payments and production flexibility contract payments meet the first basic criteria in paragraph 1(a) of Annex 2. With respect to the second basic criteria, Brazil is not alleging that either of these two types of payments "have the effect of providing price support to producers".

**31. If the first sentence of paragraph 1 of Annex 2 is not a stand-alone obligation, then must new, non- or minimally trade-distorting measures that do not conform to the criteria listed in Annex 2 be classified as non-Green Box? BRA, USA**

Brazil's Answer:

45. Yes. As explained in answer to Question 27 above, any domestic support measures that do not comply with the basic or policy-specific criteria in Annex 2 shall be presumed to violate the fundamental requirement in the first sentence of paragraph 1 of Annex 2 and must, therefore, be considered non green-box domestic support measures. This is true regardless whether the Panel concludes that the first sentence of paragraph 1 of Annex 2 is a stand-alone obligation.

**32. If the first sentence of paragraph 1 of Annex 2 expresses a general principle which informs the interpretation of the criteria in Annex 2, please explain how this affects the assessment of the direct payments programme's compliance with paragraph 6 of Annex 2. USA**

**3. "do not grant support to a specific commodity"**

**33. According to the United States' interpretation of the word "grant", when can a Member claim that a measure is not exempt from action under Article 13(b)? What if the measure is enacted annually? Can the Member obtain a remedy in respect of that measure under the DSU? USA**

**(34) Does Brazil interpret the word "grant" as used in Article 13(b)(ii) of the Agreement on Agriculture to mean payment made in a specific year or payment made in respect of a specific year? BRA**

Brazil's Answer:

46. Brazil interprets the word "grant" to mean "payment made in respect of a specific year".[60]

**35. Does a failure by a Member to comply in a given year with either the chapeau of Article 13(b) or the proviso in subparagraph (ii) of Article 13(b) impact its entitlement to benefit in an earlier or a later year from the exemption from action provided by Article 13(b)? BRA, USA**

[60] *See* First Oral Statement of Brazil, para. 31 ("Thus, the neutral term 'decision' must be read consistently with 'grant.' In sum, a harmonious interpretation of 'decided' exists where the 'decision' is to fund marketing year 1992 non-'green-box' expenditures for a specific commodity.").

Brazil's Answer:

47. Yes. A failure of a Member's measures to meet in any given year the conditions of the peace clause lifts the entitlement to peace clause protection for the whole implementation period for all measures found to fail meeting the conditions of the peace clause. This conclusion applies to domestic support measures as well as export subsidies.

48. At the outset, Brazil would like to recall that the peace clause provides Members only limited protection from actionable and prohibited subsidy claims under the SCM Agreement and GATT Article XVI. Domestic support measures are only exempt from action under Articles 5 and 6 of the SCM Agreement and under GATT Article XVI:1, if the domestic support measures do not violate the Total AMS reduction commitments of a Member and if they do not grant support to a specific commodity in excess of that decided during the 1992 marketing year. Export subsidies are only exempt from actions under Articles 3, 5 and 6 of the SCM Agreement and GATT Article XVI, if they conform fully to the provisions of Part V of the Agreement on Agriculture.

49. The peace clause does not impose any positive obligations and can, thus, not be violated. It constitutes a right and defence of a Member that this Member may or may invoke. The *US – FSC* and *US – FSC (21.5)* dispute are examples of disputes, in which a Member has chosen not to invoke the peace clause defence. Brazil has demonstrated before, that the peace clause is in the nature of an affirmative defence.[61] Accordingly, a complaining party does not bear the burden of proof that the measures at issue do not meet the conditions of the peace clause.

50. Nothing in the text of Article 13 suggests that a Member, which foregoes its peace clause exemption for particular measures in one year during the implementations period, shall be entitled to claim peace clause exemption for those measures for other – earlier or later – years. Article 13 offers peace clause exemption for measures that "fully conform" to Article 6 and that do not "grant support" "in excess of" that decided during the 1992 marketing year, as well as for measures that "fully conform" to Part V of the Agreement on Agriculture. If measures fail to meet one of the relevant conditions in any year – be it the current year or an earlier year during the implementation period – those measures can no longer be considered to "fully conform" or to not "grant support" "in excess of". Consequently, those measures are not exempt from action.

51. Finally, Brazil notes that the Panel need not decide this issue due to the circumstances of the present case. Brazil has demonstrated that the United States' domestic support measures at issue in this dispute do not meet the conditions of the peace clause in any marketing year from MY 1999 to the present and that the US export subsidies also do not conform fully to Part V of the Agreement on Agriculture. Thus, none of the subsidies at issue in this dispute is entitled to exemption from actions pursuant to the peace clause.

**36. Does a failure by a Member to comply with Article 13(b) in respect of a specific commodity impact its entitlement to benefit in respect of other agricultural products from the exemption from action provided by Article 13(b)? BRA, USA**

Brazil's Answer:

52. No. In fact, this is one of the purposes of the word "specific" in Article 13(b)(ii) – to differentiate a specific commodity whose amount of support was greater than the amount of support in marketing year 1992 from other specific commodities whose support may not have exceeded the 1992 marketing year level.

[61] *See* First Submission of Brazil, para. 110-121, and First Oral Statement of Brazil, para. 5-11.

**37. In the United States' view, why did the drafters not use the exact term "product-specific" in Article 13(b)(ii)? USA**

**38. Given the fact that subsidies available for more than one product could have various effects on production, how does the United States demarcate between product-specific support and non-product specific support ? USA**

**39. If "such measures" in Article 13(b)(ii) refers to all those in the chapeau of Article 13(b), why are they not all included in the potential comparisons with 1992? In what circumstances can measures which grant non-product specific support lose exemption from action under Articles 5 and 6 of the SCM Agreement and Article XVI of GATT 1994? USA**

**40. In relation to which other provisions in the Agreement on Agriculture is it relevant to disaggregate non-product specific support in terms of specific commodities? BRA**

Brazil's Answer:

53. The Panel's question uses the phrase "non-product specific support", which is not defined explicitly in the Agreement on Agriculture. Therefore, before responding to this question, Brazil will set forth its understanding of what this term means and which measures at issue in this dispute fall within that definition.

54. "Aggregate Measurement of Support" and "AMS" are defined in Article 1(a) as the "annual level of support, expressed in monetary terms" (a) "in favour of the producers of the basic agricultural product" or (b) "non-product-specific support provided in favour of agricultural producers in general . . ." (emphasis added). Brazil notes that the ordinary meaning of the word "general" is "including, involving, or affecting all or nearly all the parts of a (specified or implied) whole."[62] The "whole" in the case of Article 1(a) of the Agriculture Agreement refers to agricultural producers of all or nearly all basic agricultural products covered by the Agreement on Agriculture. Because the universe of domestic support measures includes either "product-specific" or "non-product-specific" domestic support measures, it follows that any domestic support that is not provided "in favour of agricultural producers in general" is deemed to be "in favour of the producers of the basic agricultural product". Accordingly, the test for determining whether a domestic support measure is "non-product specific" for the purpose of calculating AMS is whether, as a factual matter, the measure provides support to "agricultural producers in general".

55. The United States has argued that Article 1(a) is useful context for interpreting the meaning of "support to a specific commodity".[63] However, the United States latches on to only the first part of Article 1(a), and ignores the "in general" qualification in the second part, which provides the essential meaning as to the scope of what is and is not "product-specific". Brazil notes that none of the measures it used to calculate the levels of support for purposes of Article 13(b)(ii) for MY 1992 or MY 1999-2002 could properly be deemed to be "non-product-specific" support as defined in Article 1(a) of the Agreement on Agriculture. And, as Brazil has previously argued, all of these measures are "support to" upland cotton within the meaning of Article 13(b)(ii).

56. With that introduction, the answer to the Panel's question is that Brazil is not aware of any provision of the Agreement on Agriculture requiring the dis-aggregation of support that is "provided in favour of agricultural producers in general", as discussed above. However, Brazil notes that Article 13(b)(ii) is a sui generis provision of the Agreement on Agriculture that does not use the phrases "AMS", "non-product specific" or "product-specific" support. Contrary to all of the other

[62] The New Shorter Oxford English Dictionary, 1993 edition, p. 1073.

[63] First Submission of the United States, para. 78; *See* also Closing Statement of the United States, para. 18 (ignoring "in general" language).

provisions of the Agreement on Agriculture, Article 13(b)(ii) alone addresses the process for disciplining domestic support provided to a specific commodity under Articles 5 and 6 of the SCM Agreement and Article XVI:1 of GATT 1994.

**41. What is the position of Brazil with regard to certain other domestic support measures not cited by Brazil that were notified by the United States as non-product-specific (e.g. G/AG/N/USA/43), some of which presumably deliver support to upland cotton (e.g. state credit programmes, irrigation subsidies etc). Why have budgetary outlays for such measures related to upland cotton not been included in the comparison of support with 1992? BRA**

Brazil's Answer:

57. Brazil did not include any other types of domestic support measures for MY 1992 or MY 1999-2002 in calculating peace clause amounts because no other measures appeared to meet the test of being non-green box "support to" upland cotton in Article 13(b)(ii). Similarly, these measures appear to meet the test of being provided "in favour of agricultural producers in general". None, of these other measures notified by the United States as non-product specific had any upland cotton specific link in terms of historic, updated, or present upland cotton acreage, present upland cotton production or prices, or upland cotton groups of insurance policies or any other specific upland cotton provisions. Further, the United States has not indicated in any documents that these state credit programmes, irrigation subsidies, etc. were not made available "in favour of agricultural producers in general". If the United States is able to provide such information, then it would be appropriate for the Panel to allocate such support to, inter alia, upland cotton. As detailed in Brazil's answer to Question 40, the United States was obligated to notify to the Committee on Agriculture and to allocate as "product-specific support" to upland cotton any domestic measure that did not provide support "in favour of agricultural producers in general. . .".

58. The only US domestic support measures that Brazil is aware of that would meet the test of being "support to upland cotton" are those that it listed for purposes of calculating the level of peace clause support in its First Written Submission.[64] In the view of Brazil, these non-green box domestic support measures are the measures that constitute "support to" upland cotton for the purpose of Article 13(b).

**42. If the word "specific" were deleted from Article 13(b)(ii), would this change the meaning of the subparagraph? BRA**

Brazil's Answer:

59. Brazil believes that the meaning would change. The deletion of the word "specific" would create some ambiguity. The ordinary meaning of the phrase "a commodity" is "a thing that is an object of trade, esp. a raw material or agricultural crop". Therefore, the meaning of a commodity is rather broad and could for instance refer to "grains".[65] While the term "grains" may refer to "a commodity," it cannot connate "a specific commodity". Specific commodities that make up the commodity "grains" would be wheat, barley, oats, rice etc. Thus, the use of the term "specific commodity" clarifies that the subject of Article 13(b)(ii) is support to specific, i.e., individual, commodities and that this provisions does not deal with groups of individual commodities such as grains.

[64] First Submission of Brazil , paras. 144, 148, 149.

[65] Also Annex 1 of the Agreement on Agriculture refers to some broad commodity categories such as "animal hair" and "essential oils." These would cover several specific commodities such as specific types of animal hair, or specific essential oils like jasmin oil or peppermint oil.

60. Further, the phrase "a specific commodity" also makes it clearer that the "commodity" at issue is equivalent to the "like product" as defined, inter alia, in the SCM Agreement. This parallel construction of the term "specific commodity" and "like product" is consistent with the fact that the peace clause provides a conditional exemption from Articles 5 and 6 of the SCM Agreement and Article XVI:1 of GATT 1994 – which require the examination of effects of subsidies on products "like" those receiving the subsidies.

**43. What are the precise differences between deficiency payments and counter-cyclical payments that lead you to classify the former as product-specific and the latter as non-product specific? How do you classify market loss assistance payments? USA**

**44. Do you allege that counter-cyclical payments could be considered product-specific? BRA**

Brazil's Answer:

61. Brazil notes its discussion of "non-product specific" and "product-specific" support in its Answers to Questions 40-41. For the purpose of calculating AMS, counter-cyclical payments (CCP) are "product-specific" support for two main reasons: (i) they are not "support provided in favour of agricultural producers in general", and (ii) they are directly linked to upland cotton-specific parameters (current prices and historical acreage and yield). Indeed, when the US 2002 FSRI Act was examined by the WTO Committee on Agriculture, the European Communities agreed with Brazil that CCP payments could not be considered "non-product-specific" support.[66] New Zealand has taken a similar view in its Third Party Submission in this dispute.[67]

62. Brazil has provided extensive facts that upland cotton producers receive CCP payments as support to upland cotton and that such payments are support to upland cotton for the purposes of Article 13(b)(ii). These facts also support a finding that CCP payments are "product-specific" support. Further, Brazil notes the following facts demonstrating that counter-cyclical payments (and direct payments) are not provided "in favour of agricultural producers in general", but are instead provided to only a fraction of US agricultural production:

- CCP payments are made to holders of upland cotton base acreage when US upland cotton prices fall below 65.73 cents per pound. Producers/holders of all other farm acreage in the United States do not receive CCP payments when US upland cotton prices received by US producers fall. In MY 2001, (non-updated) upland cotton base acreage represented 1.7 percent of total US farmland.[68]

- CCP payments for upland cotton (and direct payments) are received by holders of upland cotton base acreage, i.e. for land that grew upland cotton between 1998-2001 or between

[66] Exhibit Bra-144 (G/AG/R/31, para. 30) ("Brazil would not accept [CCP] classification as 'non-product-specific payment'."); para 31 ("The EC also shared Brazil's analysis on how the counter-cyclical payments should be classified and pointed to US insurance programmes as not being properly classified at present").

[67] Third Party Submission of New Zealand, para. 2.24 ("Accordingly, New Zealand considers that the United States incorrectly categorizes CCP payments as non-product specific support.").

[68] In MY 2001, total US farmland was 959.163 million acres (*See* Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9.6). Average US upland cotton base acreage for MY 1997-2001 was 16.3 million acres (*See* Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, Table 19). Brazil has requested the United States to provide information on updated base acreage for the CCP and direct payment programme in questions during consultations and in the Annex V proceedings. Brazil has not received that information and, therefore, uses 16.3 million acreage as a proxy for the direct payment base acreage noting that USDA reports that more than 99 percent of eligible acreage signed up for the CCP and direct payment programme (Exhibit Bra-44 ("Direct Payment and CCP Enrollment Report," USDA, 19 June 2003).

1993-1995. USDA reported in 2001 that the 1997 census showed there were 31,500 upland cotton farms. Assuming no increase in the number of US upland cotton farms since 1997, this represents 1.46 percent of all farms in the United States.[69]

- Upland cotton cash receipts as a percentage of total cash receipts from all agricultural commodities was 2.5 percent in MY 1999, 2.35 percent in MY 2000, and 3.05 percent in MY 2001.[70]

- The 10 "programme" crops in the CCP (and direct payment) programme represented only 23.49 per cent of total farm cash receipts from all agricultural commodities on average between MY 1997-2001.[71]

- The base acreage of the 10 "programme" crops in the CCP (and direct payment) programme represented only 30 percent of total US farm acreage in MY 2001.[72]

- In MY 2002, CCP payments to holders of upland cotton base acreage represented approximately 80 percent – or $1.143 billion – of total CCP payments ($1.420 billion) for the ten eligible programme crops.[73]

- In MY 2002, no CCP payments were made to holders of 8 of the 10 eligible crops. In particular, holders of base acreage for barley, corn, grain sorghum, oats, soybeans, other oilseeds, and wheat received no CCP payments.[74]

- CCP base acreage receiving CCP payments in MY 2002 (upland cotton and rice base acreage) represented only 2.2 percent of total US farmland.[75]

- 90 percent of US acreage eligible to receive upland cotton CCP payments for upland cotton is located in only 10 out of 50 US states, with the top 5 US States accounting for 66 percent of US upland cotton production.[76] Thus, upland cotton CCP payments are focused on farms in a limited number of US States (i.e., the "cotton belt").

---

[69] Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9-9). There were 2.155 million farms in the United States in 2001. USDA reported that in 1997, there were 31,500 farms that grew cotton. Exhibit Bra-46 ("Cotton: Background and Issues for Farm Legislation," USDA, July 2001, p. 2).

[70] Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, p. 59). The calculations cited above were derived from comparing upland cotton cash receipts compared to total commodity cash receipts net of government payments.

[71] Exhibit Bra-145 (US and State Farm Income Data (United States and States 1997-2001), USDA, Table 5).

[72] Brazil does not have access to actual CCP base acreage figures. Therefore, Brazil has used MY 2001 figures as a proxy and relies on MY 2001 PFC base acreage for the 7 crops covered by PFC payments (Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, p. 50) and has added MY 2001 soybean, peanut and other oilseed acreage (Exhibit Bra-146 (Acreage, NASS, 28 June 2002, p. 14, 15 and 17) (286.8 million acres). Total US farmland in 2001 was 959,163,331 million acres (Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9.6).

[73] Exhibit Bra-147 ("Estimate of Support Granted by Commodity via Counter-Cyclical Payments").

[74] Exhibit Bra-147 ("Estimate of Support Granted by Commodity via Counter-Cyclical Payments").

[75] Upland cotton and rice PFC base acreage represented 16.2 and 4.1 million acres (Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, p. 50)). Brazil does not have any information on the effects of the base acreage update and, therefore, uses the PFC base acreage as a proxy for CCP base acreage. Total US farmland in 2001 was 959,163,331 million acres (Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9.6).

[76] Exhibit Bra-107 ("US and State Farm Income Data, Farm Cash Receipts," ERS, USDA, June 2003).

63. This evidence demonstrates that CCP (and direct payments) are provided to only a fraction of the producers of agricultural commodities in the United States and that payments are focused to producers of a limited number agricultural products. In view of these facts – particularly that upland cotton has its own "target price" of 72.4 cents per pound and accounted for 80 percent of all CCP payments in MY 2002 – it is appropriate for the Panel to consider only upland cotton statistics to conclude that these payments are "support to cotton" and are also "product-specific".

64. But even if the Panel relies on data regarding all 10 CCP programme crops, the evidence still demonstrates that CCP and direct payments are "support to cotton" and "product-specific" support because they are not provided to producers of US agricultural commodities "in general". Only around 30 percent of the farm acreage in the United States is farmed by producers with the possibility of receiving CCP payments.[77] In MY 2002, only 2.2 percent of total US farmland was eligible to receive CCP payments.[78] In light of these facts, it is not surprising that the EC correctly recognized in June 2002 that the US CCP programme does not represent a domestic support programme "provided in favour of agricultural producers in general".[79]

**45. If the Panel considered that Step 2 payments paid to exporters were an export subsidy, would the United States count them as domestic support measures for the purposes of Article 13(b)? Please verify Brazil's separate data for Step 2 export payments and Step 2 domestic payments in Exhibit BRA-69 or provide separate data. BRA, USA**

Brazil's Answer:

65. Brazil can verify that the Step 2 information its representatives received and that is tabulated in Exhibit Bra-69 was obtained from Wayne Bjorlie (wayne_bjorlie@wdc.usda.gov) in the Kansas City Commodity Office (KCCO) upon request for such data in December 2002.

**46. What is the relevance, if any, of the concept of "specificity" in Article 2 of the SCM Agreement and references to "a product" or "subsidized product" in certain provisions of the SCM Agreement to the meaning of "support to a specific commodity" in Article 13(b)(ii) Agreement on Agriculture? BRA, USA**

Brazil's Answer:

66. The concept of "specificity" in Article 2 of the SCM Agreement is useful context in interpreting the meaning of "support to a specific commodity" in Article 13(b)(ii). As the United States recognized at the First Meeting of the Panel with the parties, the word "support" as used in the Agreement on Agriculture is a synonym for "subsidy".[80] The term "support to a specific commodity" has a similar meaning as "subsidized product," as used in, inter alia, Article 6.3(c) of the

[77] Brazil does not have access to actual CCP base acreage figures. Therefore, Brazil has used MY 2001 figures as a proxy and relies on MY 2001 PFC base acreage for the 7 crops covered by PFC payments (Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, p. 50) and has added MY 2001 soybean, peanut and other oilseed acreage (Exhibit Bra-146 (Acreage, NASS, 28 June 2002, p. 14, 15 and 17) (286.8 million acres). Total US farmland in 2001 was 959,163,331 million acres (Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9.6).

[78] Upland cotton and rice PFC base acreage represented 16.2 and 4.1 million acres (Exhibit Bra-142 (Agricultural Outlook, USDA, May 2002, p. 50)). Brazil does not have any information on the effects of the base acreage update and, therefore, uses the PFC base acreage as a proxy for CCP base acreage. Total US farmland in 2001 was 959,163,331 million acres (Exhibit Bra-143 (Agricultural Statistics 2003, USDA, Table 9.6).

[79] Exhibit Bra-144 (G/AG/R/31, paras. 30-31).

[80] Brazil does not mean to imply that in the second phase of this proceeding it will not have the burden of demonstrating that each of the domestic support programs are "subsidies" within the meaning of the SCM Agreement.

SCM Agreement. Given the textual similarities between "subsidized product" and "support to a specific commodity", assessment of whether "support to a specific product" exists could be examined with at least some reference to the specificity criteria of Article 2 of the SCM Agreement. Article 2 of the SCM Agreement provides, in relevant part:

> 2.1 In order to determine whether a subsidy, as defined in paragraph 1 of Article 1, is specific to an enterprise or industry or group of enterprises or industries (referred to in this Agreement as "certain enterprises") within the jurisdiction of the granting authority, the following principles shall apply:
>
> (a) Where the granting authority, or the legislation pursuant to which the granting authority operates, explicitly limits access to a subsidy to certain enterprises, such subsidy shall be specific.. . .
>
> (c) If, notwithstanding any appearances of non-specificity resulting from the application of the principles laid down in subparagraphs (a) and (b), there are reasons to believe that the subsidy may in fact be specific, other factors may be considered. Such factors are: use of the subsidy programme by a limited number of certain enterprises, predominant use by certain enterprises, the granting of disproportionally large amounts of subsidy to certain enterprises . . .
>
> 2.2 A subsidy which is limited to certain enterprises within a designated geographical region within the jurisdiction of the granting authority shall be specific.

67. The US Statement of Administrative Action ("SAA") describes in some detail how the United States intends to administer the specificity provisions, suggesting that the US Department of Commerce applies a low threshold for finding both "de jure" and "de facto" specificity:

> The Administration intends to apply the specificity test in light of its original purpose, which is to function as an initial screening mechanism to winnow out only those foreign subsidies which truly are broadly available and widely used throughout an economy.[81]

Brazil agrees with this statement that the "original purpose" of the specificity criterion is to make subsidies non-specific only when they are broadly available and widely used throughout an economy.

68. The ordinary meaning of the plural term "certain enterprises," as set out in the chapeau to ASCM Article 2.1, underscores that a subsidy can be specific even if it applies to a "group of . . . industries." The term "industry" is defined as "a particular form or branch of productive labour; a trade, a manufacture".[82] Thus, the text of the chapeau supports the notion that for a subsidy to be specific under the SCM Agreement it must be limited to a certain number of industries that may be involved in different trades or manufacturing processes.

69. The object and purpose of the specificity requirement in Article 2.1(a) of the SCM Agreement is consistent with a broad scope for specificity. One key purpose for the specificity requirement is to avoid the countervailability of those subsidies widely available in an economy, while at the same time ensuring that those subsidies that benefit some groups of industries or enterprises more than others are covered. As the United States noted in the SAA:

> The specificity test was intended to function as a rule of reason and to avoid the imposition of countervailing duties in situations where, because of the widespread

[81] *See* Exhibit Bra-148 ("Statement of Administrative Action," p. 929) (emphasis added).
[82] The New Shorter Oxford English Dictionary, 1993 edition, p. 1356.

> availability and use of a subsidy, the benefit of the subsidy is spread throughout an economy. Conversely, the specificity test was not intended to function as a loophole through which narrowly focused subsidies provided to or used by discrete segments of an economy could escape the purview of the CVD law.[83]

70. Therefore, the ordinary meaning, context and object and purpose of Article 2.1(a) of the SCM Agreement confirm that subsidies that are available to discrete segments of an economy or to only particular industries are specific. Under these standards, each of the subsidies challenged by Brazil in this dispute (and listed as support for the purposes of the peace clause analysis) are provided to "discrete segments" of the US economy. Indeed, they are provided to discrete segments of the sub-section of the US economy known as "agriculture". Thus, if the Panel were to apply the specificity standard set out in Article 2 of the SCM Agreement to Article 13(b)(ii) of the Agreement on Agriculture, the identified domestic support subsidies would be considered "specific".

71. Brazil notes that further support for the use of specificity concepts from the SCM Agreement in interpreting Article 13(b)(ii) of the Agriculture Agreement is found in the definition of "AMS" in Article 1(a) of the Agriculture Agreement. The definition of "non-product specific" support ("support provided in favour of agricultural producers in general") illustrates that the concept of specificity in the context of the SCM Agreement and of AMS in the Agreement on Agriculture are similar. Both would require a finding of specificity unless support is provided to an economy generally, in the case of the SCM Agreement, or to "producers" of agricultural commodities "in general," in the case of AMS under the Agriculture Agreement.

72. In contrast, the United States seeks to apply an extremely restricted concept of specificity to the peace clause that begins and ends with the question whether production of a specific commodity is required to receive the payment. This is one of the "policy-specific" criteria of a "green box" test in Annex 2, paragraph 6, but not the test of "support to a specific commodity" required by Article 13(b)(ii). Further, as demonstrated above, this narrow US interpretation finds no support in the provisions of the SCM Agreement and the Agreement on Agriculture that speak to specificity.

**4. "in excess of that decided during the 1992 marketing year"**

**47. Where does Article 13(b)(ii) require a year-on-year comparison? BRA, USA**

Brazil's Answer:

73. The text of Article 13(b)(ii) sets up a comparison between the "support" "grant[ed]" during the implementation period with support "decided" during the 1992 marketing year. Brazil cannot conceive of a methodology in which all support granted during the entire implementation period could be compared with the support decided during marketing year 1992. In order to generate an "apples to apples" ("support to support") comparison, it is necessary to compare the support granted in any marketing year during the implementation period with the support decided during marketing year 1992. No other reading of Article 13(b)(ii) would permit the required comparison.

74. Additionally, Brazil notes that the second condition for domestic support measures to be exempted from actions under the SCM Agreement is that a Member's domestic support measures conform fully to Article 6, and, thus, grant support within the limits of that Member's Total AMS reduction commitments. These Total AMS reduction commitments are made on a yearly basis. The nature of the reduction commitment and the manner, in which compliance with Article 6 is determined, demonstrates that Article 13(b)(ii) – read in accordance with its chapeau and the reference to Article 6 therein – requires a year-by-year comparison. The context of the chapeau provides support for Brazil's argument made above that the relevant comparison for Article 13(b)(ii)

[83] Exhibit Bra-148 (Statement of Administrative Action, p. 930).

involves a comparison of support granted in any of the marketing years during the implementation period with support decided in MY 1992.

75. Similarly, Article 13(c) provides further context to support the conclusion that Article 13(b)(ii) requires a year-by-year comparison. Brazil notes in its answer to Question 7, that export subsidy reduction commitments under the Agreement on Agriculture are made on a commodity-specific basis. Brazil has also pointed out in its answer to Question 79 that a violation of Part V of the Agreement on Agriculture, and the resulting loss of peace clause exemption, must also be assessed on a yearly basis.

**48. Does Article 13(b)(ii) require a comparison of support granted with support decided? How could such a comparison be made? BRA, USA**

Brazil's Answer:

76. The answer to the first question is yes, the text of Article 13(b)(ii) requires a comparison between the "support granted" for marketing years between 1995-2003 with the "support decided" in marketing year 1992. Brazil has explained in detail in its First Oral Statement the basis for this legal conclusion.[84]

77. The second question asks how the comparison must be made. Brazil is of the view that a harmonious interpretation of "support decided" with "support granted" requires an examination of the expenditures incurred for all of the support related to the 1992 marketing year and each of the marketing years during the implementation period ending 1 January 2004. This expenditure approach permits an objective, easily verifiable approach to compare the support for each of the two time periods. That is particularly important when, as in this case, there are a wide variety of programmes that do not provide support on a "cents per pound" basis to all production. Brazil does not consider that a comparison based on a "rate of support" approach as suggested by the United States allows the same objective and easily verifiable comparison. Professor Sumner explained the difficulty of comparing, on a "cents per pound" basis, deficiency payments, Step 2, marketing loans, and crop insurance provided in marketing year 1992 with the marketing year 1999-2002 measures that replaced or changed the 1992 measures.[85] Nevertheless, Professor Sumner was able, through a relatively complex methodology, to calculate and compare a level of support on a per pound basis between marketing year 1992 and marketing years 1999-2002.

78. Another methodology is the rate of support taking into account expenditures, as detailed in Brazil's answer to Question 60 infra. Brazil would note that a last methodology that would have been possible, had the text of Article 13(b)(ii) included the term "AMS," would be to calculate support based on the criteria set forth in Annex 3 of the Agriculture Agreement. The results of this calculation are set forth in Brazil's answer to Question 67 *infra*.

**49. Brazil claims that the terms "grant" and "decided" in Article 13(b)(ii) have broadly the same meaning. If so, why did the drafters not use the same term? BRA**

[84] First Oral Statement of Brazil, para. 31.
[85] Exhibit Bra-105 (Statement of Professor Sumner at the First Meeting of the Panel).

Brazil's Answer:

79. Brazil set forth its interpretation of the terms "grant" and "decided" in its First Oral Statement.[86] Brazil concluded that the text, context, and object and purpose of Article 13(b)(ii) meant that the MY 1992 "decision" must be related to "support granted" in order to make possible the comparison between MY 1992 and marketing years during the implementation period. Yet, Brazil does not believe that the "decision" in marketing year 1992 means that all of the support had to be "granted" (i.e., paid) during the 12-month period of that single marketing year. Rather, the decision had to authorize payment in respect of a specific marketing year, including MY 1992.[87] However, a Member could have decided during the 1992 marketing year to budget a certain amount of support to specific commodities for the next several marketing years, including MY 1995 et seq. In that case, the relevant peace clause comparison would involve comparing the support granted to a specific commodity in any marketing year during the implementation period to what was decided during the 1992 marketing year to be provided for that later marketing year.

80. Brazil has cited the negotiating history of Article 13(b)(ii), which indicates that the EC insisted on the use of the word "decided" to obtain a safe harbour for the total quantity of its domestic support subsidies that it had already budgeted in marketing year 1992 for marketing year 1995 and thereafter.[88] Brazil will comment further, as required, on the intentions of the "drafters" following receipt of the answers of the European Communities and the United States.

**50. Please provide any written drafting history which could shed light on why the proviso was added to what is now Article 13(b)(ii) and, in particular, why both words "grant" and "decided" were used. USA**

**51. Could the United States please comment on the interpretation advanced by the EC, in paragraphs 16 and 18 of its oral statement, of the words "decided during the 1992 marketing year"? USA**

**52. Please comment on an interpretation of the words "decided during" in Article 13(b)(ii) that would read them as synonymous with the words "authorized during". BRA, USA**

Brazil's Answer:

81. Brazil agrees that in its proper context, the term "decided during" in Article 13(b)(ii) is synonymous with the words "authorized during". Brazil has set forth the reasoning and citations supporting this conclusion in its Answers to Question 49 supra and Question 58 infra, as well as in its First Oral Statement at paragraph 31.

**53. Assume, for arguments sake, that the only "decision" made in the United States in 1992 was the target price. How would Brazil make the comparison vis-à-vis, for example, the year 2001? BRA**

Brazil's Answer:

82. Brazil maintains that the relevant comparison under Article 13(b)(ii) is to compare expenditures incurred relating to MY 1992 with expenditures incurred relating to marketing years during the implementation period. Only this methodology allows for a comparison irrespective of the nature and characteristics of the domestic support measures provided and does not suffer from the

[86] First Oral Statement of Brazil, paras. 27-34

[87] Brazil and the United States appear to agree that MY 1992 is the relevant marketing year for purposes of this dispute.

[88] First Submission of Brazil, para. 140.

shortcomings of other approaches, on which Brazil will comment below. In particular only an expenditure incurred approach allows for an effective comparison in the following situation: Assume, a Member introduces a payment that is made at a fixed rate per pound and is paid for each pound of actual upland cotton production. In this situation, it would be difficult to compare this domestic support measure, which is completely unrelated to market prices to a domestic support measure decided by a Member in MY 1992 and which sets a target price and provides price support.

83. With this qualification in mind, Brazil's understanding of this question is that the assumed single "decision" was the establishment of a target price of 72.9 cents per pound for eligible US upland cotton production during MY 1992. The assumed single "decision" on a target price of 72.9 cents per pound comprised of many other sub-decisions on the mandatory acreage reduction programme, on the operation of the 50/92-programme option, and on optional flex acres, among others.[89] Professor Sumner has analyzed in detail the process through which such a target price of support could be compared to the support provided in MY 1999-2002.[90] For MY 1992, he found that the estimated per unit support rates for all programs was 60.41 cents per pound. For MY 2001, he found the per unit support rates for all programmes was 66.51 cents per pound. Brazil refers to Professor Sumner's detailed description of the methodology he used to make these calculations.[91]

84. The irrationality of the simplistic "72.9 is greater than 51.92" approach by the United States is revealed by comparing it with the results of Professor Sumner taking into account in the calculation of the "rate of support" eligibility criteria and the costs imposed by participation in the US upland cotton support programs. It is also demonstrated by comparing the expenditures in MY 1992 ($1.9 billion) with the expenditures in MY 2001 ($4 billion).

**54. Please identify all United States legal and regulatory and administrative instruments decided during the marketing year 1992, with the respective dates of decision, that decided support for upland cotton. BRA, USA**

Brazil's Answer:

85. Brazil will comment further upon receipt of the answer provided by the United States to this question. The United States obviously has access to records related to all the decisions taken by the United States concerning its support programs for MY 1992. However, Brazil notes that given its understanding of the operation of the US support programmes, the United States took a number of decisions with respect to the upland cotton support programmes for MY 1992.

86. Many of the US support programmes for MY 1992 were decided by Title V of the Food, Agriculture, Conservation and Trade (FACT) Act of 1990 (P.L. 101-624), which established US farm policy for the 5 crop years 1991/92-1995/96, and by the Omnibus Budget Reconciliation Act (OBRA) of 1990 (P.L. 101-508), which established several programme provisions in order to reduce programme costs. Brazil considers that among the decisions taken by the United States in relation to MY 1992 upland cotton support programmes were the following:

- Continuation of the upland cotton target price under the deficiency payment programme at the 1990 level of 72.9 cents per pound set by the 1990 FACT Act. The OBRA limited the maximum payment acreage at 85 percent of the crop acreage minus the acreage reduction programme requirement, which was set annually. Therefore, the United States had to take a decision with respect to the MY 1992 percentage of deficiency programme

[89] For a more thorough discussion of the decisions Brazil understands the United States has taken with respect to MY 1992, *see* Brazil's answer to Question 54.

[90] *See* Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel).

[91] Annex 2 to Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel).

base acreage that would be required to be set aside under the acreage reduction programme.

- In connection with the former, the United States also took a decision allowing producers to plant up to 25 percent of upland cotton acreage base, the so-called "flex acreage," to any commodity except fruits and vegetables and mung beans.

- Furthermore, the United States had to decide on how to implement the 50/92-programme option under the deficiency payment program.

- The United States also needed to determine the upland cotton acreage base for purposes of the deficiency payment programme, which for MY 1992 represents the previous three-year average of planted and considered planted upland cotton acreage.

- Concerning the deficiency payment program, the United States finally had to decide on the payment rate for upland cotton.

- Concerning the marketing loan programme, the United States had to take a decision setting the marketing loan rate for upland cotton.

- Furthermore, the United States had to establish a weekly "adjusted world price" and, thus, the repayment rate for marketing loans determining the rate of marketing loan gains or loan deficiency payments.

- Furthermore, the United States took a weekly decision in MY 1992 with respect to the Step 2 payment rate applicable for that week.

- Regarding crop insurance, the Federal Crop Insurance Act of 1980 was the authorizing legislation, but it was necessary to adopt decisions concerning individual insurance policies that would apply to upland cotton and to set the respective rates of premium subsidies.

87. While Brazil does not consider this list to be exhaustive, it gives the Panel an overview on the variety of decisions the United States had to take to make the support programme to upland cotton operational. Brazil looks forward to the answer provided by the United States and reserves its right to comment as appropriate.

**55. Please provide a copy of the instrument in which the rate of support for upland cotton during the marketing year 1992 was decided, indicating the date of the decision. USA**

**56. Could the United States please explain how support granted under legislation that dates back to 1990 can have been support "decided during the marketing year 1992"? USA**

**57. If the United States decided on a rate of support for MY1992, does that not mean that it decided on whatever budgetary outlay was required to meet that rate of support, even if the exact amount was not known at that time? USA**

**58. Please comment on the argument advanced by the EC, in paragraph 17 of its oral statement that: "Had WTO Members intended a limitation to the support provided or granted in 1992 the word 'for' would have been used in place of 'during'." BRA**

Brazil's Answer:

88. Brazil agrees with the EC that the word "during" does not mean that all of the support need be provided or granted within the 12-month period of marketing year 1992. Rather, the decision must have been related to the amount of support to be granted in respect of marketing year 1992. This interpretation is consistent with an expenditure methodology that compares expenditures for upland cotton in respect of MY 1992 with expenditures for upland cotton in MY 1995-2003, and thereby permits a comparison of 1992 levels of support with levels of support in marketing years 1995-2003.

89. The negotiating history cited by Brazil in its First Submission indicates that the EC is in a special situation vis-à-vis the peace clause.[92] It apparently made the decision in marketing year 1992 to budget an amount of support for commodities for marketing years 1995-2000 in its CAP reform. Brazil agrees with the EC that Article 13(b)(ii) was "intended to set up as a benchmark an amount of support adopted by some form of decision (be it political, legislative or administrative) in which support for a specific product is decided . . ." But the EC qualifies this assertion with the notion that that decision can only be "allocated for future years."[93] This qualification would appear to be compelled by the EC's particular situation. But that situation does not justify the EC's conclusion that its "future years" concept means that Article 13(b)(ii) "clearly is not intended to set up a comparison between domestic support granted in 1992 and domestic support granted in a more recent period."

90. The notion of a "decision" suggests that individual Members each made some sort of a decision with respect to the peace clause. The United States and Brazil agree that the decision made by the United States – whatever it may have been – related to the level of support provided to upland cotton in MY 1992. Brazil's argument with the United States concerns the type of decision and the methodology that can be used to account for the level of support decided during MY 1992.

**59. Should the rate of support as indicated in Article 13(b)(ii) include the market price? If so, why is it appropriate to include it in the comparison under Article 13(b)(ii)? BRA, USA**

Brazil's Answer:

91. The most natural measure of support is budgetary expenditures, and these implicitly include market price in the sense that, for several US upland cotton programs, higher market prices lead to lower budgetary outlays. The US Government payments under the marketing loan, deficiency and counter-cyclical programs all decline with increasing market prices, as they cover the difference between the loan rate or the target price and the market price. Step 2 payments are also related to market prices in that they cover the difference between the A-Index and the lowest-priced US quote for upland cotton and, therefore, vary with market prices.[94] Incorporating the different degrees to which the market price influences the support provided by the US Government to its upland cotton farmers is best achieved by looking at the results in terms of budgetary outlays for the programs. This measure of support is straightforward to apply and allows a ready and accurate comparison between 1992 and subsequent marketing years.

92. Under the US approach and Professor Sumner's adaptation of the US approach, market prices enter the calculation of the "rate of support" in the sense that the expected rate of support from the loan rate and the target price per eligible unit of production includes revenue expected to be received from the market (expected market price) and revenue expected from the US Government (subsidies). The market price enters inversely in the sense that the outlay is inversely related to the market price, as for instance the loan rate benefits make up the difference between the loan rate and the adjusted

[92] First Submission of Brazil, para. 140.
[93] Oral Statement of the European Communities, 24 July, para. 18.
[94] Brazil notes, however, that the relationship between market price and level of Step 2 payments by the US Government is not as straightforward and positively correlated as for the other price-based programmes.

world price for the eligible share of production.[95] The higher the market price, the higher the resulting budgetary outlays.

93. Additionally, there is one further important reason why the notion of support in Article 13(b)(ii) should include the market price. Without reference to the market price, it is impossible to say what the rate of support means to farmers. It may be that the support is completely irrelevant, because market prices are much higher than the loan rate or the target prices set by the US Government. For instance, the loan rate was irrelevant for US upland cotton producers in MY 1994-1996,[96] because market prices were so high that no payments occurred. However, under essentially the same program, market loan benefits amounted to 26.6 cents per pound in MY 2001.[97] Thus, without taking market prices into account, it is impossible to translate a "rate of support" into actual support provided and to give meaning to the term "support."

**60. Can you provide information on support decided in 1992 and the years with which you believe it should be compared, on a per support programme / per unit of production / per annum basis? If possible, please specify how, if at all, budget outlays may be transposed into units of production, and which units of production are best to use. BRA, USA**

Brazil's Answer:

94. Brazil maintains that the appropriate measure of support decided during MY 1992 is total actual expenditures resulting from any decisions regarding support to upland cotton. This must then be compared to total actual expenditures for support to upland cotton for MY 1999, 2000, 2001 and 2002. Presenting expenditures as a "rate of support" per pound of upland cotton disguises the fact that US expenditures for upland cotton have increased considerably since MY 1992. This is due to the fact that the increased US expenditures are now spread over an also increased US production. Therefore, a "rate of support" based on budgetary outlays or expenditure understates the real increase in US support to upland cotton. However, even disregarding the underestimation of the amount spent for upland cotton by presenting the budgetary outlays in the form of support per pound of actual upland cotton production, the data presented below show that also this measurement demonstrates that the US support in MY 1999-2002 is higher in each year than it was in MY 1992.

95. In answering this question, and responding to the Panel's requests, Brazil presents the support provided by the various US support programmes for a given marketing year on a per pound of actual upland cotton production basis. This approach takes into account market prices. Thus, the "support level" from deficiency payments, from the marketing loan programme and from counter-cyclical and Step 2 payments no longer reflects the "target price" approach favoured by the United States, but reflects actual payments made per unit of actual production.

96. Brazil believes that the unit of production that should be used is a pound of upland cotton actually produced in the United States for that marketing year in question. US support programmes provide support based on actual production (marketing loan programme, Step 2 and cottonseed payments), actual acres planted (crop insurance), updated historical production and current prices (deficiency payments and counter-cyclical payments), historical production (PFC, market loss assistance), and finally, updated historical production (direct payments). The most natural comparison on a per unit basis is to use actual production. The US National Cotton Council also calculates the support provided by all of these programmes to its upland cotton producer members in "cents per pound" of actual production.[98] This reflects the reality that an upland cotton farmer

[95] Brazil notes that budgetary outlays have not been part of Professor Sumner's calculation of the rate of support provided by the marketing loan, deficiency payment and CCP payment program.

[96] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5-6).

[97] *See* Brazil's answer to question 60.

[98] Exhibit Bra-109; Exhibit Bra-111; Exhibit Bra-112.

seeking to remain in business must calculate whether the amount of government support plus market revenue compensates for the cost of production incurred by producing a pound of upland cotton.

97. Brazil arrives at the figures presented in the following table by dividing the total annual amount of budgetary outlays to upland cotton from a US support programme by the total amount of production of upland cotton in the relevant marketing year.

**Support Per Pound Of Upland Cotton By Year And Support Programme**

| Year<br>Programme | 1992 | 1999 | 2000 | 2001 | 2002 |
|---|---|---|---|---|---|
| | ----- cents/pound ----- | | | | |
| Deficiency Payments[1] | 13.49 | none | none | none | none |
| PFC Payments[2] | none | 7.00 | 6.71 | 4.81 | none |
| Market Loss Assistance Payments[3] | none | 6.97 | 7.15 | 6.65 | none |
| Direct Payments[4] | none | none | none | none | 6.04 |

| **Total** | **26.44** | **42.29** | **27.8** | **42.97** | **37.31** |

Notes

[1] Deficiency payment per pound of actual production = deficiency payment expenditure / (total production [bales] * 480 [pounds/per bale]). Total deficiency payments in MY 1992 were $1.0174 billion, while total production was 15,71 million bales (Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4-6)). One bale equals 480 pound of upland cotton.

[2] PFC payment per pound of actual production = PFC payment expenditure for upland cotton base * (actual upland cotton acreage / PFC upland cotton base acreage) / (total production [bales] * 480 [pounds/per bale]). Total PFC payments to upland cotton are taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 6). This amount has been adjusted by the ratio of upland cotton acres actually planted (Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4)) to upland cotton base acres in the PFC programme (Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). This adjustment is necessary because only the portion of upland cotton PFC payments that actually benefits acres planted to upland cotton can be considered support to upland cotton. Because the latter figure is higher than the former, this leads to a reduction in the payment rate reflecting actual production in each year. Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

[3] Market loss assistance payment per pound of actual production = Market loss assistance expenditure for upland cotton base * (actual upland cotton acreage / PFC upland cotton base acreage) / (total production [bales] * 480 [pounds/per bale]). Total market loss assistance payments to upland cotton are taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 6). This amount has been adjusted by the ratio of upland cotton acres actually planted (Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4)) to upland cotton base acres in the PFC programme (Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton. Because the latter figure is higher than the former, this leads to a reduction in the payment rate. Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4).

[4] Direct payments per pound actually produced = total direct payment expenditure for upland cotton base * (actual upland cotton acreage/direct payment upland cotton base acreage) / (total production [bales] * 480 [pounds/per bale]). Total direct payments for MY 2002 have been re-estimated from the figure presented by Brazil in its First Submission, para. 59. The new figure is based on the statutory payment rate of 6.67 cents per pound of upland cotton base multiplied by the direct payment upland cotton base acreage of 16.3 million acres (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)) multiplied by the direct payment yield of 604 pounds per acre (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). Payments are made on 85 percent of base acres. This translates into a total of $558.17 million. This amount has been adjusted by the ratio of upland cotton acres actually planted Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4) to upland cotton base acres in the direct payment program. Because the latter figure is higher than the former, this leads to a reduction in the direct payment rate. This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton. Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4).

[5] Counter-cyclical payments per pound actually produced = total counter-cyclical payment expenditure for upland cotton base * (actual upland cotton acreage / counter-cyclical payment upland cotton base acreage) / (total production [bales] * 480 [pounds/per bale]). Total counter-cyclical payments for MY 2002 have been re-estimated from the figure presented by Brazil in its First Submission, para. 69. The new figure is based on the MY 2002 payment rate of 13.73 cents per pound of upland cotton base multiplied by the counter-cyclical payment upland cotton base acreage of 16.3 million acres (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)) multiplied by the counter-cyclical payment yield of 604 pounds per acre (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50) Brazil notes that this underestimates the payments, as it disregards the yield update for purposes of the counter-cyclical payments). Payments are made on 85 percent of base acres. This translates into a total of $1,148.98 million. This amount has been adjusted by the ratio of upland cotton acres actually planted Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4) to upland cotton base acres in the counter-cyclical payment programme. Because the latter figure is higher than the former, this leads to a reduction in the direct payment rate. This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton. Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4).

[6] Marketing loan benefit per pound of actual production = total marketing loan expenditures / (total production [bales] * 480 [pounds/per bale]). Total marketing loan payments (marketing loan gains plus loan deficiency payments) are taken para. 144, 148-149 of the First Submission of Brazil. Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4).

[7] Step 2 payments per pound of actual production = total Step 2 expenditures/(total production [bales] * 480 [pounds/per bale]). Total Step 2 payments are contained in Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 6). Brazil has estimated the MY 2002 amount at note 335 in its First Submission to be $317 million. The amount of production has been taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4). Brazil notes that the difference between 3.95 cents per pound resulting from this calculation and 4 cents per pound – which was the basis for Brazil to calculate the total Step 2 payment for MY 2002 – is due to rounding effects.

[8] Crop insurance payments per pound of actual production = total crop insurance expenditures / (total production [bales] * 480 [pounds/per bale]). Total crop insurance payments are taken from Exhibit Bra-57 ("Crop Year Statistics", Federal Crop Insurance Corporation). Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

[9] Cottonseed payment per pound of actual upland cotton production = total cottonseed expenditures/(total production [bales] * 480 [pounds/per bale]). Total cottonseed payments are listed in Brazil's answer to question 17 (see para. 9). Total production is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 4).

98. Brazil notes that also under this approach, the total US support to upland cotton in MY 1999-2002 surpasses the support decided by the United States in MY 1992. Brazil furthermore notes that even considering the support programs (and their respective replacements)[99] individually, nearly all of them provide higher support in MY 1999-2002 than they (or their predecessors) did in MY 1992 (with the exception of Step 2 and PFC / market loss assistance in MY 2001).

**61. Does the United States consider that Article 13(b)(ii) permits a comparison on any basis other than a per pound basis? USA**

**62. According to Prof. Sumner's calculation, the per pound support increased by approximately 24 % from 1992 to 2002. On the other hand, the Panel understands that the**

[99] The deficiency payments were replaced by PFC and market loss assistance payments in MY 1999-2001 and by direct and counter-cyclical payments in MY 2002.

**total budget outlay, according to Brazil, increased more than that. What, in Brazil's view, is the reason for this difference in the rate of increase? BRA**

Brazil's Answer:

99. US budgetary outlays for upland cotton are a function of the level of price, income and other support provided by the US support programmes. Everything being equal, an increase in the "rate of support" as interpreted by the United States would translate one-to-one into an increase of expenditure. However, the "rate of support" is not the only determinant of budgetary outlays, as two important qualifications apply. First, the most important US subsidy programmes for upland cotton are price-based.[100] For instance the marketing loan payment in MY 2002 guarantees a return of 52 cents per pound. With lower market prices, the gap between the adjusted world price and the loan rate, i.e., the basis for the calculation of the marketing loan benefit, widens and payments per pound increase. During the period MY 1992-2001, prices for upland cotton fell drastically.[101] For example, average upland cotton prices received by farmers in the United States were 53.7 cents per pound in MY 1992 and dropped to a low of 29.8 cents per pound in MY 2001.[102] Therefore, even for an identical set of programs providing an identical "rate of support," budgetary outlays would have vastly increased due to the drop in prices.

100. Second, the United States increased the production of upland cotton between MY 1992 and MY 1999-2002 from 15.7 million bales in MY 1992 to 16.3 million bales in MY 1999, 16.8 million bales in MY 2000, 19.6 million bales in MY 2001 and 16.7 million bales in MY 2002.[103] Thus, the increased "rate of support" was applicable to an increased production of upland cotton.

101. In sum, budgetary outlays for upland cotton increased between MY 1992 and MY 2002 for three main reasons: first, the United States increased its "rate of support", second, lower upland cotton prices led to higher budgetary outlays per pound of upland cotton produced; and third, at times of falling market prices, the United States expanded its upland cotton production so that more upland cotton was eligible to receive the increased rate of support. All of this resulted in an increase of budgetary outlays for upland cotton that is relatively bigger than the increase in the US "rate of support".

102. Lastly, Brazil notes that none of the figures presented by Professor Sumner[104] represent actual payments or actual rates of support. Rather, those figures represent average or expected rates of support in any given marketing year. They are not based on actual production or prices,[105] but solely on expected production and prices. Therefore, they cannot easily be compared to actual payments made by the United States in support of upland cotton. Professor Sumner chose the expected support approach in order to match the approach suggested by the United States as closely as possible, while correcting for its simplistic reliance on the target price that disregarded the eligibility criteria and other features of the programmes.

**63. In relation to Prof. Sumner's presentation at the first session of the first substantive meeting, please elaborate on the reasons behind the increase in the figures (from 1992 to 2002) concerning Loan Support and Step 2 payments. BRA**

[100] These include the marketing loan program, the deficiency payment program, the counter-cyclical payment programme and the Step 2 programs.

[101] *See* First Submission of Brazil, para. 28.

[102] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5).

[103] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

[104] *See* Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel).

[105] Which would only be important for the rate of Step 2 payments, as only this programme depends on actual prices for purposes of a rate of support. The other programs reduce Government payments with increasing prices, so that the total rate of support remains basically the same, or are not price-related.

Brazil's Answer:

103. The support rate from the marketing loan programme calculated by Professor Sumner represents the expected support rate from the marketing loan programme. Concerning the marketing loan programme, Brazil notes that the statutory loan rate, indeed, fell from 52.35 cents per pound in MY 1992 to 51.92 cents per pound in MY 1999-2001[106] before being slightly increased in MY 2002 to 52 cents per pound.[107] However, the somewhat higher loan rate in MY 1992 was accompanied by strict eligibility criteria.[108] In MY 1992, only production on farmland that participated in the upland cotton deficiency payment programme was eligible for marketing loan benefits, which restricted eligibility to 84.7 percent of production.[109] In MY 1999-2001, only upland cotton produced on farmland that participated in the PFC programme was eligible. Professor Sumner has conservatively used 97 percent of upland cotton production in MY 1999-2001 as the participation rate of upland cotton.[110] Finally, in MY 2002, all US production of upland cotton was eligible to receive marketing loan benefits.[111] Thus, taking into account the eligibility criteria for benefiting from the marketing loan programme, the slightly higher loan rate in MY 1992 provided less support to total expected US upland cotton production than the slightly lower loan rates in later years.

104. Concerning the difference between the expected Step 2 rate of support in MY 1992-2001 and MY 2002, this difference stems from the fact that the United States eliminated the 1.25 cents per pound threshold for Step 2 payments in the 2002 FSRI Act. Before MY 2002, Step 2 payments were made in the amount of the difference between the A-Index and the lowest priced US quote for upland cotton minus a 1.25 cents per pound threshold. Section 1207(a)(4) of the 2002 FSRI Act postpones the application of this threshold until 1 August 2006.[112] Thus, expected Step 2 payments for MY 2002 (and through MY 2005) will be 1.25 cents per pound higher than under the 1990 and 1996 Farm Acts, which both applied the threshold.[113]

**64. Do the figures cited in Prof. Sumner's presentation at the first session of the first substantive meeting indicate amount available or amount spent? Can the Panel derive amount spent from these figures? If Article 13(b)(ii) requires a rate of support comparison, is the rate of support the "rate" of support available or the "rate" at which the support was spent? BRA**

Brazil's Answer:

105. The figures in Professor Sumner's calculation do not indicate amounts spent, but were an attempt to approximate the expected rate of support for an expected pound of upland cotton production under the specific rules in place for each support programme in that year. The figures attempt to represent the normal result that would have been expected by policy makers and farmers as a result of the programme decisions taken by the United States. They do not represent actual expenditures per unit for any programme in any year because, in every year, the actual programme payments per pound of actual production deviates from the expected or normal payments, because the actual production will not exactly equal the expected production.

[106] Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 5).
[107] Exhibit Bra-29 (Section 1202(a)(6) and 1202(b)(6) of the 2002 FSRI Act).
[108] *See* Exhibit US-3 (7 CFR 1427.4(a)(3) and 7 CFR 1413 (1992 edition)).
[109] Annex 2 to Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel, p. 3).
[110] Annex 2 to Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel, p. 4).
[111] Exhibit Bra-29 (Section 1201(b) of the 2002 FSRI Act).
[112] Exhibit Bra-29 (Section 1207(a)(4) of the 2002 FSRI Act).
[113] *See* Exhibit Bra-12 ("Cotton: Background for 1995 Farm Legislation", USDA, April 1995, p. 16) and Exhibit Bra-46 ("Cotton: Background and Issues for Farm Legislation," USDA, July 2001, p. 9).

106. For some of the US support programs, the support indicated can be considered – within certain limits – as support available per pound. However, there is not a complete identity between the "expected rate of support" and the "support available to a pound of actual upland cotton production," because – as noted above – expected and actual production will vary from each other.

107. For marketing loan benefits, the loan rate can be considered the maximum support available to eligible production in case the market price would fall to zero. Similarly, for deficiency and counter-cyclical payments, the difference between the loan rate and the target price can be considered the maximum support available, albeit again only for the eligible production. The expected support differs from that, as it takes into account that not all of the expected production will benefit from those subsidies. The actual support differs again, as expected and actual production may not be identical. Finally, actual US Government payments depend on market prices.

108. For PFC, market loss assistance, direct and cottonseed payments and crop insurance subsidies, the "expected rates of support" represent expected expenditures per unit of expected production. This has been calculated by using average budget expenditures over an appropriate period as expected support, and by using average production as the expected production. Thus, these payments are not maximum available "rates of support". For example, under the crop insurance programme the US Government pays premium subsidies. Higher per unit support would have been available had all farms joined the programme at the maximum subsidized rates. However, this was not an expected or normal occurrence. Especially in MY 1992, when subsidy rates were relatively low, many upland cotton farms were expected to forgo participation in the programme. Both maximum available crop insurance subsidies as well as expected or normal crop insurance subsidies increased for MY 1999 through 2002, as premium subsidies rose and more cotton acreage found the programme attractive. For crop insurance, but also for PFC and direct payments as well as market loss assistance, the actual support per pound of upland cotton production will vary with the actual production undertaken and actual yields achieved.

109. The actual "rate of support" from the Step 2 payments depends on the actual price differential between the A-Index and the lowest-prices US quote. While it varies from the expected "rate of support" with the actual realization of the price gap, it is not expected to be systematically correlated to the actual level of prices.

110. In sum, it is not possible to derive the amount spent from the "expected rate of support" calculated by Professor Sumner without adding additional information on the level of market prices and the actual US upland cotton acreage, yield and production, among other variables. Following the US approach, Professor Sumner has calculated an expected rate of support that could be characterized as an expected guaranteed revenue. This approach is distinct from an approach looking into actual expenditures, as favoured and advocated by Brazil. In fact, Professor Sumner applied the US approach to a rate of support that would abstract in as far as possible from actual expenditures.

111. Brazil refers the Panel to its answers to questions 60 and 67 for actual expenditures by year, by programme – both per pounds of upland cotton production and as total expenditures for upland cotton.

112. Should the Panel decide that the required test under Article 13(b)(ii) is a "rate of support", Brazil submits that the relevant rate of support is "expenditures per pound of production", and thus the "'rate' at which support was spent", as discussed in Brazil's answer to Question 60.

**65. Does Brazil consider that adjustment for inflation is relevant in the context of the comparison under Article 13 (b)(ii) ? BRA**

Brazil's Answer:

113. Brazil does not believe that an adjustment for inflation is relevant in the context of the comparison under Article 13(b)(ii). First, there is nothing in the text of Article 13(b)(ii) that provides for such an adjustment. Second, the only provision of the Agreement on Agriculture addressing inflation is Article 18.4, which provides: "In the review process Members should give due consideration to the influence of excessive rates of inflation on the ability of any Member to abide by its domestic support commitments." The "review process" is the review by the Committee on Agriculture of the progress of implementation of commitments as set out in Article 18 of the Agreement on Agriculture. The fact that negotiators explicitly opened the possibility of "giving due consideration to the influence of excessive rates of inflation" in the review process, but not for purposes of Article 13(b)(ii), is evidence that this omission was intentional.

114. Furthermore, at no time during the review process has the United States ever stated or made any notifications that "excessive rates of inflation" in the US economy have negatively impacted "the ability of [the United States] to abide by its domestic support commitments". Even, if it had, Article 18.4 has no relevance for the purposes of the comparison required by Article 13(b)(ii), as it refers to the review process only, and not to the peace clause. Accordingly, there is no basis for the Panel to apply any adjustment to the US level of support to upland cotton in marketing year 1992.

115. Nevertheless, if the Panel should decide to use such an adjustment, Brazil submits that the appropriate index to be used is the applicable US agricultural price index. Three alternative indexes could be used. The first and most direct is the index of prices received for cotton. Other indexes that may be considered are the index of prices received for crops and the index of prices received for all farm products.

| | **2000** | **2001** | **2002** |
|---|---|---|---|
| Index of prices received for cotton | 82 | 65 | 49 |
| Index of prices received for all crops | 96 | 99 | 103 |
| Index of prices received for all farm products | 96 | 102 | 99 |

1990 to 1992 average = 100[114]

116. Thus, under none of the applicable indices is there any significant inflation to be taken into account. To the contrary, the cotton price index fell by 51 percent, while price indices for crops and all farm products have been stable if compared to the 1990-1992 base used by USDA.

**66. Could you please comment on the relative merits of each of the following calculation methods for the purposes of the comparison of support to upland cotton with 1992, irrespective of whether a particular measure should be included or excluded:**

**(a) Total budgetary outlays (Brazil's approach). USA**

**(b) Budgetary outlays per unit of upland cotton: Could you please calculate and provide an estimate for the marketing years 1992 and 1999-2002, respectively, and draw attention to any factors/qualifications that the Panel would need to be aware of. BRA, USA**

[114] Exhibit Bra-149 (Agricultural Outlook, August 2002, p. 38)

Brazil's Answer:

117. Brazil has presented figures for budgetary outlays by unit of actual production in its answer to Question 60. However, Brazil would like to add some further considerations on the shortcomings of this approach.

118. A significant issue in using these per unit figures to represent support rather than total budgetary outlays is that a per-unit approach discounts the fact that some of the change in production is itself caused by changes in the rate of support or subsidy. If support is calculated by dividing budgetary outlays by total production, the result neglects this effect. As support rises in the numerator, production rises in the denominator and the ratio or per unit of an increased support rate rises by less than total support (and may even decline).

119. The perverse effect is that the more production is stimulated by the US domestic support programmes and, thus, the more those programmes distort trade, the smaller the per unit measure effect of the increased subsidy. For this reason, a subsidy rate per unit of actual production should be avoided or used with extreme caution.

**(c) Per unit rate of support (United States approach): How should changes in acreage, eligibility and payment limitations per farm(s) (commodity certificate programmes) be factored into this approach? BRA**

Brazil's Answer:

120. The approach of the United States was simply to assert that the target price represented the rate of support per unit in MY 1992 and the loan rate alone represented the rate of support per unit in MY 2002. This approach rests on several fundamental errors.

121. First, the approach left out major support programs in each year. For 1992, the approach left out the Step 2 programme and crop insurance, both of which provided support to upland cotton in that year. For 2002, the approach of the United States left out support provided by the direct payment programme, the counter-cyclical payment programme and the cottonseed payment programme as well as the Step 2 and crop insurance programmes.

122. Second, the United States did not account for any factors that limited eligibility for support or imposed costs of participation as a mandatory condition of receiving support from the US support programmes. The failure to account for these factors in each year completely ignores the true nature of the US support programmes for upland cotton and seriously distorts the rate of support.

123. Lastly, these two per pound numbers cannot simply be added together because the eligibility criteria differ between them and, in particular, the support from the upland cotton deficiency payment programme was expected to apply to an even smaller share of actual production than the support from the marketing loan programme.

124. Professor Sumner's calculation attempted to correct the US presentation for these serious flaws in the implementation of the US approach. Professor Sumner added back the programmes that provide support to upland cotton, but that have been left out by the United States. He also corrected the rate of support for eligibility restrictions and the cost of participation, and presented the rate of support on the basis of expected production in order to be able to sum up the various "rates of support." At the same time, Professor Sumner has attempted to remain true to the approach of the United States by avoiding the use of actual production or actual payments, and instead relying on expected programme support per unit and expected or normal production to arrive at per unit support. Professor Sumner's approach also deals in detail with the question of how to account for eligibility

restrictions and costs of participation. Brazil refers the Panel to Annex 2 to Exhibit Bra-105 for the details of Professor Sumner's methodology.

125. In addition to eligibility, the Panel's question refers specifically to payment limits. Payment limits are applied on the basis of persons, including corporations, partnerships, producers and other persons actively engaged in agriculture.[115] Typically, for larger farms, there is more than one person actively engaged in agriculture, including spouses, and landlords on a share rental basis. In addition, there is typically more than one legal entity per farm and under the three entity rule, a person may receive programme payments from three entities and up to double the payment limit for that person for one entity.[116]

126. Payment limits for deficiency payments in MY 1992 were $50,000.[117] Payment limits for PFC (in MY 1999-2001)[118] were $40,000,[119] as is the case for direct payments (in MY 2002).[120] Payment limits for counter-cyclical payments are $65,000 (in MY 2002).[121] For the marketing loan programme, a payment limitation of $75,000 per person applied in MY 1992. In the 1996 FAIR Act, the payment limits for the marketing loan programme was also $75,000, but was increased to $150,000 for MY 1999-2001 by supplemental legislation.[122] The 2002 FSRI Act limits the amount of marketing loan gains and loan deficiency payments to a total of $75,000 for each producer.[123] However, the key change between MY 1992 and MY 1999-2002 was the establishment of the certificate programme in MY 1999,[124] which effectively eliminated any payment limit for the marketing loan programme.[125]

127. Brazil has no data that would allow it to factor payment limitations into the calculation of an expected rate of support. However, Brazil notes that with the inception of the commodity certificate programme in MY 1999, the limitations imposed by payment limits have – if anything – been relaxed. Additionally, Brazil notes that its approach to Article 13(b)(ii), by comparing total budgetary outlays, takes the budgetary effects of payment limitations into account. For farmers that have reached their payment limit, the US Government incurs no further expenditures, and consequently, the amount of expenditures is lower than it would be absent the payment limit. In that sense, actual expenditures reflect the effects of payment limits.

128. Finally, Brazil notes that Professor Sumner's calculations also do not account for the increase in production or acreage devoted to upland cotton between MY 1992 and MY 2002. Taking this into account by indexing the "expected rate of support" to the level of MY 1992 production – as one

[115] Exhibit Bra-33 (7 CFR 1400.1 et seq.).
[116] Exhibit Bra-33 (7 CFR 1400.1 et seq.).
[117] Exhibit Bra-12 ("Cotton: Background for 1995 Farm Legislation," USDA, April 1995, p. 14).
[118] Additional market loss assistance payments were made that did not count towards the PFC payment limit.
[119] Professor Sumner has stated in his statement at the first meeting of the Panel that a typical cotton farm with 3000 acres received about $300,000 in PFC payments per year (*see* Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting of the Panel, p. 22). This amount results both from the fact that several persons on a farm may be eligible for payment and from the fact that the three-entity rule doubled the payment limit amount a single person could legally receive (for an explanation on the three-entity rule *see* paragraphs 74-76 of the First Submission of Brazil).
[120] Exhibit Bra-27 (Side by Side Comparison of the 1996 and 2002 Farm Act, USDA, p. 12).

[124] Exhibit Bra-42 (The 2002 Farm Act, Provisions and Implications for Commodity Markets," USDA, November 2002, p. 8); Exhibit Bra-29 (Section 1603 of the 2002 FSRI Act).
[125] The certificate programme is described in detail in paragraphs 75-76 of the First Submission of Brazil.

possible approach to account for the increase in production – would increase the "expected rate of support" for later marketing years, as the amount of US production of upland cotton increased.[126] The result of the comparison of MY 1992 and MY 1999-2002 support will, however, be the same: The United States' support to upland cotton in MY 1999-2002 exceeded the support to upland cotton decided in MY 1992 and the US domestic support measures fail to meet the condition in Article 13(b)(ii) for exemption from actions under Articles 5 and 6 of the SCM Agreement and GATT Article XVI:1.

**(d) Per unit rate of support for upland cotton (Prof. Sumner's approach at the first session of the first substantive meeting ). USA**

**(67) The Panel requests the parties to calculate and submit estimates of the AMS for upland cotton for marketing years 1992, 1999, 2000, 2001 and 2002. For this purpose the parties are each requested to submit AMS calculations for upland cotton (using the budgetary-outlay/non-price gap methodology employed by the United States in respect of cotton in its DS Notifications (e.g., G/AG/N/USA/43) and using the formats and supporting tables in document G/AG/2) on the same basis as would be the case in calculating a product specific AMS for the purposes of the calculation of the "Total Current AMS" in any year in accordance with the relevant provisions, including as appropriate Article 1(a), (b) and (h), Article 6 and Annex 3 to the Agreement. BRA, USA**

Brazil's Answer:

129. Brazil sets forth the following table that summarizes the AMS calculation for upland cotton for marketing years 1992 and 1999-2002. Using the definition of non-product specific support detailed in Brazil's answer to the Panel's Question 40, all of the programmes listed constitute non-exempt direct payments, within the meaning of G/AG/2, providing product-specific support to upland cotton. The table includes all support programs that should have been included in "Supporting Table DS:6", within the meaning of G/AG/2. To the best of Brazil's knowledge, no other "product-specific" support to upland cotton has been provided by the US Government.

130. Brazil notes that the United States has notified the deficiency payments using the price gap methodology provided for in Annex 3.[127] Brazil considers it appropriate to follow the US decision and will, therefore, calculate the amount of support to upland cotton provided by the deficiency payment programme by using the "price gap" approach detailed in Annex 3, paragraph 10 and 11. Brazil notes that US budgetary expenditures for MY 1992 for the deficiency programme were $1,017.4 million.[128]

Notes

[1] This calculation is based on the price gap formula set forth in para. 10 and 11 of AoA Annex 3. In its notification of marketing year 1995 support (Exhibit Bra-150 (G/AG/N/USA/10, p. 18), the United States that the applied administered price for upland cotton under the deficiency payment programme is $1,607.169 per ton. The applied administered price (or target price) has been the same in MY 1992 and MY 1995 (Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 5). Therefore, Brazil uses that figure. The external reference price has been notified by the United States to be $1,275.741 per ton. Paragraph 11 of AoA Annex 3 specifies that the external reference price is based on 1986-1988 averages that have not changed between MY 1992 and MY 1995. Thus, Brazil bases the price-related direct payments from the deficiency payment programme in MY 1992 on the difference between $1,607.169 per ton and $1,275.741 per ton ($331.428 per ton) multiplied by the eligible production, which results from multiplying the eligible upland cotton base acreage and the payment yield. Professor Sumner has calculated the eligible upland cotton base acreage for MY 1992 to be 10.17 million acres, while the payment yield is 531 pounds per acres (Exhibit Bra-105 (Annex 2 to Statement of Professor Daniel Sumner at the First Meeting of the Panel, p. 5-6). Thus, the eligible production is 5,400,270,000 pounds or 2,450,213 metric tons (2204 pounds equal one metric ton). Thus, the amount of deficiency payments in that enters the calculation of total AMS for MY 1992 is 2,450,213 metric tons * $331.428 per ton = $812.069 million.

[2] PFC payment expenditure for upland cotton = total PFC payment expenditure for upland cotton base * (actual upland cotton acreage / PFC upland cotton base acreage). Total PFC payment expenditure for upland cotton is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 6). This amount has been adjusted by the ratio of upland cotton acres actually planted (Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4)) to upland cotton base acres in the PFC programme (Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). This adjustment is necessary because only the portion of upland cotton PFC payments that actually benefits acres planted to upland cotton can be considered support to upland cotton.

[3] Market loss assistance expenditure for upland cotton = total market loss assistance expenditure for upland cotton base * (actual upland cotton acreage / market loss assistance (i.e., PFC) upland cotton base acreage). Total market loss assistance expenditures for upland cotton is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 6). This amount has been adjusted by the ratio of upland cotton acres actually planted (Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4)) to upland cotton base acres in the market loss assistance (i.e., PFC) programme (Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton.

[4] Direct payments = total direct payment expenditure for upland cotton base * (actual upland cotton acreage / direct payment upland cotton base acreage). Total direct payments for MY 2002 have been re-estimated from the figure presented by Brazil in its First Submission, para. 59. The new figure is based on the statutory payment rate of 6.67 cents per pound of upland

cotton base multiplied by the direct payment upland cotton base acreage of 16.3 million acres (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)) multiplied by the direct payment yield of 604 pounds per acre (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)). Payments are made on 85 percent of base acres. This translates into a total of $558.17 million. This amount has been adjusted by the ratio of upland cotton acres actually planted Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4) to upland cotton base acres in the direct payment program. This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton.

[5] Counter-cyclical payments = total counter-cyclical payment expenditure for upland cotton base * (actual upland cotton acreage / counter-cyclical payment upland cotton base acreage). Total counter-cyclical payments for MY 2002 have been re-estimated from the figure presented by Brazil in its First Submission, para. 69. The new figure is based on the MY 2002 payment rate of 13.73 cents per pound of upland cotton base multiplied by the counter-cyclical payment upland cotton base acreage of 16.3 million acres (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50)) multiplied by the counter-cyclical payment yield of 604 pounds per acre (Brazil has assumed it to be the previous 5-year average as reported by USDA in Exhibit Bra-142 (Agricultural Outlook, May 2002, p. 50) Brazil notes that this underestimates the payments, as it disregards the yield update for purposes of the counter-cyclical payments). Payments are made on 85 percent of base acres. This translates into a total of $1148.98 million. This amount has been adjusted by the ratio of upland cotton acres actually planted Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4) to upland cotton base acres in the counter-cyclical payment program. This adjustment is necessary because only the portion of upland cotton market loss assistance payments that actually benefits acres planted to upland cotton can be considered support to upland cotton.

[6] Total marketing loan payments (marketing loan gains plus loan deficiency payments) are taken para. 144, 148-149 of the First Submission of Brazil.

[7] Total Step 2 payments are contained in Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 6). Brazil has estimated the MY 2002 amount at note 335 in its First Submission to be $317 million.

[8] Total crop insurance payments are taken from Exhibit Bra-57 ("Crop Year Statistics," Federal Crop Insurance Corporation).

[9] Total cottonseed payments are listed in Brazil's answer to question 17 (see para. 9).

131. The figures presented above indicate that, using the AMS approach, the US level of support for MY 1992 is lower than in each of the marketing years between 1999 and 2002.

132. Brazil also notes that – as explained in the notes on the sources and methodology for arriving at the reported figures – the AMS figures for MY 1999-2002 reflect revised amounts of budgetary expenditures that should replace those listed in Brazil's First Submission at paragraphs 148-149.[129] These revised (and somewhat smaller) expenditures reflect new information collected by Brazil and more accurately tabulate support to upland cotton in MY 1999-2002. Brazil notes that none of these revisions results in any significant change to the total support to upland cotton, and that expenditures decided in MY 1992 are still well below expenditures related to MY 1999-2002.

**68. Could you please clarify the result of the calculations of, and the meaning of the title, in Appendix Table 1 "Estimated per unit Subsidy Rates by Programme and Year" in Annex 2 to Exhibit BRA-105, page 12. Why are the numbers calculated for marketing loans considered to be subsidies? Could the Panel, for example, read the "total level of support" (bottom line of the table) as the effective support price for upland cotton or the maximum rate of support for upland cotton? BRA, USA**

Brazil's Answer:

133. The Appendix Table 1 in Annex 2 to Exhibit Bra-105 should have been titled, "Estimated per unit Support Rates by Programme and Year". Brazil apologizes for any confusion caused by mis-titling this table.

134. The marketing loan programme support listed in Table 1 of Annex 2 to Exhibit Bra-105 is a "support rate" and not an actual loan deficiency payment or marketing loan gain. It does not represent a subsidy amount. The loan deficiency payment or marketing loan gain is calculated as the difference between the loan rate and the adjusted world price (AWP). When the AWP falls, the loan benefit per

[129] No such revision is necessary for MY 1992.

unit of eligible production rises to offset the fall in the AWP. In the US "rate of support" methodology, because the AWP is expected to be positively related to the price received by individual farmers in the United States, the loan rate of 52.35 cents per pound in MY 1992 can be considered an approximate rate of support per unit of eligible production.

135. The deficiency payment rate of support is similar to the marketing loan rate of support and represents the maximum rate of support per eligible unit, where eligibility is measured by the rules applicable in 1992. By contrast, actual support payments under Brazil's expenditure methodology are calculated as the difference between the higher of the average price received by farmers and the loan rate.

136. The other programmes listed in Table 1 provide support per unit of eligible production to upland cotton in addition to the loan rate and deficiency payment target price. These other programmes are calculated as the estimated expected support rates. These rates are not maximum rates of support but rather normal or expected rates of support. The other domestic support measures are not equivalent in overall effect to a price support, but they are calculated on a per unit basis and are added across programmes to give a total support rate.

137. The production and trade distorting effects of these subsidies are each different and are also different from a support price.[130] Brazil will discuss the adverse effects caused by each of those subsidies in its Further Submission, scheduled for 9 September 2003. The variety of the support programmes employed by the United States precludes interpreting the sum of the various support contributions as a "support price." However, their sum can be read as an expected guaranteed income that results from market revenue and US Government payments. Marketing loan benefits, deficiency payments and counter-cyclical payments will increase with falling market prices. Other support programs are relatively decoupled from market prices, and provide an expected rate of support, that can be added to the loan rate and target price established by the marketing loan, the deficiency and counter-cyclical payments.

**69. Can the United States confirm that the "marketing year" for upland cotton is 1 August to 31 July ? Can the United States confirm the Panel's understanding that USDA data for the "crop year" corresponds to the "marketing year"? USA**

E. EXPORT CREDIT GUARANTEE PROGRAMMES

**70. How does Brazil respond to the United States' assertion that Brazil is trying to realize through litigation what it could not achieve in past negotiations? BRA**

Brazil's Answer:

138. In WTO dispute settlement, there is only one way to determine what was achieved in past negotiations – to interpret those provisions actually concluded according to the customary rules of interpretation included in the Vienna Convention. In paragraphs 100-115 of Brazil's Statement at the First Panel Meeting, Brazil demonstrated that it is not in fact attempting "to realize through litigation what it could not achieve in past negotiations." In those paragraphs, Brazil demonstrated that under the ordinary meaning of Article 10.2 of the Agreement on Agriculture, in its context and according to the object and purpose of Article 10 and the Agreement on Agriculture overall, export credit guarantees are subject to the general export subsidy disciplines in the Agreement on Agriculture. Brazil will not repeat those arguments here, but simply notes that by ignoring an interpretation of Article 10.2 according to the Vienna Convention rules, it is the United States that is trying to escape what was in fact achieved in the Uruguay Round negotiations. Other participants in those

[130] *See* Exhibit Bra-105 (Statement by Professor Daniel Sumner at the First Meeting of the Panel, paras 20-39) for a summary of the economic impacts of these various support programs.

negotiations who are third parties in this dispute and who in fact use export credits – Canada, the European Communities and New Zealand – agree with Brazil.

**71. (a) Is an export credit guarantee a financial contribution in the form of a "potential direct transfer of funds or liabilities (e.g. loan guarantee)" within the meaning of Article 1.1(a)(1)(i) of the SCM Agreement? Why or why not? Does it confer a benefit within the meaning of Article 1.1(b)? Why or why not? If so, to whom? USA**

Brazil's Comment:

139. In paragraphs 287-289 of its First Submission, and again at paragraph 116 of its Statement at the First Panel Meeting, Brazil demonstrated that CCC export credit guarantees are expressly included as "financial contributions" within the meaning of Article 1.1(a)(1)(i) of the SCM Agreement. Although export credit guarantees do not automatically confer benefits, CCC export credit guarantees confer "benefits" within the meaning of Article 1.1(b) because they are extended at premium rates and on repayment terms that are not available and in fact do not exist on the market. In its comments and answers to Questions 75 and 82 below, Brazil discusses passages from the GSM 102, GSM 103 and SCGP regulations and materials from USDA's Foreign Agricultural Service (FAS) concerning the programmes, which demonstrate that GSM 102, GSM 103 and SCGP confer "benefits".

140. Brazil notes that a number of agents benefit from the subsidy provided by the guarantees. The US financial institutions and the foreign bank enter into lucrative contracts they would not otherwise have, the importer also gets financing that would not otherwise have be available in the market, but the US Government ultimately designed the programs to provide a benefit to US farmers and exporters. On the FAS website "What Every Exporter Should Know About The GSM-102 and GSM-103 Programmes" it stated that the "USDA will consider announcing, for a specific country or region, the availability of guarantees for any US commercial commodity, if the market for US exports will be expanded or maintained as a result" (emphasis added).[131] Brazil also notes that it is the US exporter who applies for the guarantee and who triggers the process of obtaining coverage for each particular transaction.

**(b) How, if at all, would these elements be relevant to the claims of Brazil, and the United States response thereto? BRA, USA**

Brazil's Answer:

141. Brazil notes that because CCC export credit guarantees constitute subsidies *per se*, and because they are, further, de jure contingent on export, the GSM 102, GSM 103 and SCGP programmes constitute export subsidies within the meaning of Article 3.1(a) of the SCM Agreement. According to the reasoning of the Appellate Body in US – FSC,[132] this means that those programs are also export subsidies within the meaning of the Agreement on Agriculture. In paragraphs 295-304 of its First Submission, Brazil then demonstrated that those programs threaten to lead to circumvention of the United States' export subsidy commitments (both with respect to scheduled and unscheduled commodities), in violation of Article 10.1 of the Agreement on Agriculture and, as a consequence, of Article 8 of that Agreement. Having established a violation of Part V of the Agriculture Agreement, Brazil's claims under Article 3.1(a) of the SCM Agreement against the CCC export credit guarantee programmes are not exempt from action by Article 13(c)(ii) of the Agreement on Agriculture.

[131] Exhibit Bra-151 ("US Export Credit Guarantee Programs: What Every Exporter Should Know About The GSM-102 and GSM-103 Programmes", USDA, November 1996).

[132] Appellate Body Report, *US – FSC*, WT/DS108/AB/R. para. 139-141.

142. Articles 1.1(a)(1)(i) and 1.1(b) of the SCM Agreement are relevant for a number of reasons, including for the purposes of Article 10.3 of the Agreement on Agriculture. As demonstrated in paragraphs 263-268 of Brazil's First Submission, the United States has surpassed its export quantity commitment levels for commodities eligible for GSM 102, GSM 103 and SCGP support. Under Article 10.3, the burden now lies with the United States to prove that its exports in excess of these commitments did not benefit from export subsidies, including export credit guarantees. United States will, inter alia, have to prove that those programs do not grant "benefits" within the meaning of Article 1.1(b) of the SCM Agreement.[133]

**72. Could Brazil expand on why, as indicated in paragraph 118 of its oral statement, it does "not agree" with the United States arguments relating to the viability of an a contrario interpretation of item (j) of the Illustrative List of Export Subsidies in Annex 1 of the SCM Agreement? BRA**

Brazil's Answer**:**

143. As the Panel is aware, Brazil was earlier involved in a dispute (Brazil – Aircraft) that addressed the question whether certain items in the Illustrative List of Export Subsidies admit of an a contrario defense. Although, as the United States notes, Brazil argued in that dispute that a contrario interpretations of certain items included in the Illustrative List (in particular the first paragraph of item (k)) are enabled by footnote 5 to the SCM Agreement, the panel disagreed.

144. Footnote 5 provides that "Measures referred to in Annex I as not constituting export subsidies shall not be prohibited under this or any other provision of this Agreement." The first Article 21.5 panel in Brazil – Aircraft concluded as follows with respect to footnote 5:[134]

> 6.36 In its ordinary meaning, footnote 5 relates to situations where a measure is referred to as not constituting an export subsidy. Thus, one example of a measure that clearly falls within the scope of footnote 5 involves export credit practices that are in conformity with the interest rate provisions of the Arrangement on Guidelines for Officially Supported Export Credits ("Arrangement"). The second paragraph of item (k) provides that such measures "shall not be considered an export subsidy prohibited by this Agreement". Arguably, footnote 5 in its ordinary meaning could extend more broadly to cover cases where the Illustrative List contains some other form of affirmative statement that a measure is not subject to the Article 3.1(a) prohibition, that it is not prohibited, or that it is allowed, such as, for example, the first and last sentences of footnote 59[34] and the proviso clauses of items (h)[35] and (i)[36] of the Illustrative List.[37]
>
> 6.37 The first paragraph of item (k), however, does not contain any affirmative statement that a measure is not an export subsidy nor that measures not satisfying the conditions of that item are not prohibited. To the contrary, the first paragraph of item (k) on its face simply identifies measures that are prohibited export subsidies. Thus, the first paragraph of item (k) on its face does not in our view fall within the scope of footnote 5 read in conformity with its ordinary meaning.

[34] The first sentence of footnote 59 provides that "Members recognize that deferral need not amount to an export subsidy where, for example, appropriate interest charges are collected." The last sentence states that "[p]aragraph (e) is not intended to limit a Member from taking measures to avoid the double taxation of foreign-source income earned by its enterprises or the enterprises of another Member."

[133] The United States will also have to prove that the programmes are not inconsistent with item (j) of the Illustrative List of export subsidies.

[134] Panel Report, *Brazil – Aircraft (21.5)*, WT/DS46/RW, paras. 6.36-6.37.

[35] ". . . provided, however, that prior-stage cumulative indirect taxes may be exempted, remitted or deferred on exported products even when not exempted, remitted or deferred on like products sold for domestic consumption, if the prior stage cumulative indirect taxes are levied on inputs that are consumed in the production of the exported product . . . ." (emphasis added).

[36] ". . . provided, however, that in particular cases a firm may use a quantity of home market inputs equal to, and having the same quality and characteristics as, the imported inputs as a substitute for them . . . ."

[37] In any event, such measures may well fall within the scope of footnote 1, and thus not represent subsidies at all, whether prohibited or otherwise.

145. Reflecting on footnote 5, the panel recalled and rejected the US argument that "'[t]he Illustrative List does not deal with all possible financial contributions, but for those it does deal with, it establishes, by virtue of footnote 5, a dispositive legal standard insofar as prohibited subsidies are concerned'".[135] While the panel agreed that "an illustrative list could in principle operate in such a manner", it concluded that because of footnote 5, the Illustrative List of Export Subsidies annexed to the SCM Agreement did not operate in that manner.[136] According to the panel, "if the drafters had intended the meaning which the United States attributes to footnote 5, they could certainly have found appropriate language to do so".[137]

146. The panel noted that the first paragraph of item (k) has effect even if it does not admit of an a contrario interpretation. The panel likened the Illustrative List to "a list of per se violations".[138] According to the panel, even if a measure does not fulfill the elements of one of the items in the Illustrative List and therefore does not constitute a per se violation, it could still be deemed prohibited if the complaining party demonstrates that it fulfills the elements of Articles 1 and 3 of the SCM Agreement.[139]

147. In dicta, the Appellate Body suggested that the first paragraph of item (k) may indeed admit of an a contrario interpretation.[140] In Brazil's view, however, this suggestion is limited to the first paragraph of item (k), and at least does not extend to item (j). Although the Appellate Body emphasized in the initial appeal in Brazil – Aircraft that the term "material advantage" in item (k) had to be given meaning independent of the term "benefit" in Article 1.1(b)[141], it found that the difference between the two terms is the qualification in item (k) that the advantage conferred relative to the market must additionally be "material".[142] In other words, proving "material advantage" includes a showing that a "benefit" is conferred, but also requires something more. While disproving the existence of a "material advantage" may mean that, in some narrow circumstances, a benefit may nevertheless still exist, the first paragraph of item (k) at least still relies on an analysis whether a "material advantage" is conferred to the recipient, as compared to some market benchmark. This "to the recipient" standard does not undercut and in fact complements the market benchmark "to the recipient" standard included in Article 1.1(b). An a contrario reading of item (k), therefore, does not read out the market benchmark "to the recipient" standard from the test applicable to export credits, but simply gives it a particular meaning in the context of export credits.

[135] Panel Report, *Brazil – Aircraft (21.5)*, WT/DS46/RW, paras. 6.32, 6.38.
[136] Panel Report, *Brazil – Aircraft (21.5)*, WT/DS46/RW, para. 6.38.
[137] Panel Report, *Brazil – Aircraft (21.5)*, WT/DS46/RW, para. 6.38.

[140] Appellate Body Report, *Brazil – Aircraft (21.5)*, WT/DS46/AB/RW (adopted 4 August 2000), para. 80 ("If Brazil had demonstrated that the payments made under the revised PROEX were not 'used to secure a material advantage in the field of export credit terms', and that such payments were 'payments' by Brazil of 'all or part of the costs incurred by exporters or financial institutions in obtaining credits', then we would have been prepared to find that the payments made under the revised PROEX are justified under item (k) of the Illustrative List.").
[141] Appellate Body Report, *Brazil – Aircraft*, WT/DS46/AB/R, para. 179.
[142] Appellate Body Report, *Brazil – Aircraft*, WT/DS46/AB/R, para. 177.

148. In contrast, the evidence required to meet the elements of item (j) are completely unrelated to the evidence necessary to establish that a guarantee programme confers a benefit "to the recipient" of a loan guarantee. Whether the premia collected under an export credit guarantee programme meet the long-term operating costs and losses of the programme is completely irrelevant to the question whether a benefit "to the recipient" of the export credit guarantee is conferred. Consequently, allowing an a contrario reading of item (j) that provides, as the United States argues, "a dispositive legal standard"[143] for determining whether guarantees are prohibited, would suggest that the "to the recipient" market benchmark standard does not apply to guarantees. This cannot be true, since guarantees are expressly included in Article 1.1 (and Article 14(c)) as "financial contributions" that can confer "benefits" to a recipient relative to a market benchmark.

149. The conclusion that item (j) does not admit of an a contrario defense is relevant for a number of reasons, including for the purposes of Article 10.3 of the Agreement on Agriculture. As demonstrated in paragraphs 263-268 of Brazil's First Submission, the United States has surpassed its export quantity commitment levels for commodities eligible for GSM 102, GSM 103 and SCGP support. Under Article 10.3, the burden now lies with the United States to prove that its exports in excess of these commitments did not benefit from export subsidies, including export credit guarantees. Even if the United States is able to demonstrate that premia for the GSM 102, GSM 103 and SCGP programs meet long-term operating costs and losses, it will also have to prove that those programs do not grant "benefits" within the meaning of Article 1.1(b) of the SCM Agreement. Since item (j) does not admit of an a contrario interpretation, disproving the elements of item (j) will not be sufficient to remove the programs from the definition of "export subsidy."

**73. The Panel could arguably take the view that Articles 1 and 3 of the SCM Agreement were relevant in assessing the WTO-consistency of United States export credit guarantees. The United States has yet to submit any evidence or argumentation on this point, either as potential context for interpretation of the terms in Article 10 of the Agreement on Agriculture or in relation to Brazil's claims under the SCM Agreement. The Panel would therefore appreciate United States views in respect of this situation, and invites the United States to submit relevant argumentation and evidence. USA**

**74. If the Panel decides to refer to provisions of the SCM Agreement for contextual guidance in the interpretation of the terms in Article 10 of the Agreement on Agriculture, should the Panel refer to item (j) or Articles 1 and 3 of the SCM Agreement or both? BRA, USA**

Brazil's Answer:

150. In determining what constitutes an export subsidy within the meaning of Article 10.1 of the Agreement on Agriculture, Brazil considers that the Panel should refer to contextual guidance included in Articles 1 and 3 of the SCM Agreement, and in item (j) of the Illustrative List of Export Subsidies annexed to the SCM Agreement. As discussed in paragraphs 258-261 of Brazil's First Submission, this is consistent with the Appellate Body's decisions in US – FSC[144] and Canada – Dairy.[145] As a factual matter, Brazil has demonstrated that the GSM 102, GSM 103 and SCGP programmes constitute export subsidies under Articles 1.1 and 3.1(a) of the SCM Agreement, and under item (j) of the Illustrative List (as well as under Articles 1(e) and 10.1 of the Agreement on Agriculture.

**75. The Panel's attention has been drawn to Article 14(c) of the SCM Agreement (see e.g. written third party submission of Canada) and to the panel report in DS 222 Canada- Export Credits and Loan Guarantees. How and to what extent are Article 14(c) of the SCM**

[143] Panel Report, *Brazil – Aircraft (21.5)*, WT/DS46/RW, para. 6.32
[144] Appellate Body Report, *US – FSC*, WT/DS108/AB/R, para. 136-140.
[145] Appellate Body Report, *Canada – Dairy*, WT/DS103/AB/R and WT/DS113/AB/R, para. 87-90.

**Agreement, and the cited panel report, relevant to the issue of whether or not the United States export credit guarantee programmes confer a "benefit"? What would be the appropriate market benchmark to use for any comparison? Please cite any other relevant material. BRA, USA**

Brazil's Answer:

151. As one way of demonstrating that the GSM 102, GSM 103 and SCGP programs constitute export subsidies within the meaning of Article 10.1 of the Agreement on Agriculture, Brazil has demonstrated that those programmes constitute financial contributions that confer benefits and that are contingent on export, within the meaning of Articles 1.1 and 3.1(a) of the SCM Agreement. Brazil recalls that as discussed above in response to Question 72, Article 10.3 of the Agreement on Agriculture in fact places the burden on the United States to prove that export quantities in excess of its export commitments have not benefited from export subsidies.

152. In any event, Brazil has demonstrated that the CCC guarantee programs confer "benefits" within the meaning of Article 1.1(b) because they are extended at premium rates and on repayment terms that are not available on the market. In fact, the CCC programmes are unique financing vehicles for agricultural commodity transactions that are not available on the commercial market.

153. Brazil notes that the United States has argued in Canada – Aircraft II that where there is no comparable financial product on the market, a programme confers benefits per se. It stated:

> If the commercial market does not offer a particular borrower the exact terms offered by a government, then the government is providing a benefit to the recipient whenever those terms are more favorable than the terms that are available in the market. A government entity "operating on commercial principles" is still a government entity. It is not the commercial market.[146]

154. Brazil agrees with the United States. This interpretation is, in fact, consistent with the benchmark established by Article 14(c) of the SCM Agreement. In relevant part, Article 14 provides as follows:

> For the purposes of Part V, any method used by the investigating authority to calculate the benefit to the recipient … shall be transparent and adequately explained. Furthermore, any such method shall be consistent with the following guidelines:
>
> …
>
> > (c) a loan guarantee by a government shall not be considered as conferring a benefit, unless there is a difference between the amount that the firm receiving the guarantee pays on a loan guaranteed by the government and the amount that the firm would pay on a comparable commercial loan absent the government guarantee. In this case the benefit shall be the difference between these two amounts adjusted for any differences in fees.

155. Brazil first draws the Panel's attention to the fact that Article 14 was specifically conceived for the purposes of Part V of the SCM Agreement only. It should be referred to exclusively as context to determine whether a benefit exists when a particular transaction is backed by a government export credit guarantee. Secondly, Brazil observes that subparagraph (c) of Article 14 is simply a

[146] Panel Report, *Canada – Aircraft II*, WT/DS222/R, Annex C-2 (para. 7).

"guideline", not the sole method of calculating the benefit to the recipient. Other methods may be applied as long as they are "consistent" with the guideline set out in subparagraph (c).

156. There is no market benchmark in the case of the GSM 102, GSM 103 and SCGP programmes, since there are no financial products available on the market on the terms provided by the programmes. As discussed in response to Question 82, the regulations regarding the GSM 102 and GSM 103 programmes, as well as regarding the SCGP programme note that "[t]he programs operate in cases where credit is necessary to increase or maintain US exports to a foreign market and where US financial institutions would be unwilling to provide financing without CCC's guarantee".[147] Moreover, the regulations state that "[t]he programs are targeted towards those countries where the guarantee is necessary to secure financing of the export but which have sufficient financial strength so that foreign exchange will be available for scheduled payments."[148] These passages prove that without a CCC guarantee, a borrower would not be able to secure financing at all – not just financing on less attractive terms than could be secured with the CCC guarantee (or on terms that would constitute a benefit under Article 14(c) of the SCM Agreement) – but no financing at all. The regulations also emphasize that the CCC guarantee is necessary – a commercial guarantee would not be sufficient.

157. Moreover, as the FAS website explains, "[t]he reduction of risk to financial institutions in the United States … may make possible financing that would otherwise be unavailable".[149] The FAS further clarifies that "a CCC guarantee can encourage extension of credit in cases where financial institutions might otherwise be unwilling to finance export on credit terms".[150] In addition, the FAS points out that such guarantees would "facilitate credit to foreign banks in larger amounts and on more favorable commercial terms than would otherwise be available".[151] Whatever the meaning of Article 14(c), the provision by CCC of guarantees that do not exist on the market entails the provision of a benefit per se. The benefit to the recipient, under the benchmark established by Article 14(c), would be the total amount of the loan backed by the guarantee, since there would be no "comparable commercial loan absent the government guarantee".

**76. How does the United States respond to Brazil's statement that : "...export credit guarantees for exports of agricultural exports [sic] are not available on the marketplace by commercial lenders"? USA**

**77. How does the United States interpretation of "long term operating costs and losses" in item (j) as claims paid give meaning to both "costs" and "losses"? Do claims paid represent "losses" or "costs" or both? If claims paid is represented by "losses", what would go into the "cost" element of item (j)? Could the United States expand on why it disagrees with the items which Brazil identifies for inclusion in the examination to be conducted under item (j)? USA**

Brazil's Comment:

158. Brazil may wish to comment in its rebuttal submission on the response the United States ultimately provides to this question. In the meantime, however, Brazil would like to comment on US criticisms of the initial formula Brazil constructed to determine whether the GSM 102, GSM 103 and SCGP programmes fail to meet their long-term operating costs and losses, within the meaning of

[147] Exhibit Bra-38 (7 CFR 1493.10(a)(2)) and Exhibit Bra-38 (7 CFR 1493.400(a)(2)).
[148] Exhibit Bra-38 (7 CFR 1493.10(a)(2)) and Exhibit Bra-38 (7 CFR 1493.400(a)(2)).
[149] Exhibit Bra-151 ("US Export Credit Guarantee Programs: What Every Exporter Should Know About The GSM-102 and GSM-103 Programs," USDA, November 1996).
[150] Exhibit Bra-151 ("US Export Credit Guarantee Programs: What Every Exporter Should Know About The GSM-102 and GSM-103 Programs," USDA, November 1996).
[151] Exhibit Bra-151 ("US Export Credit Guarantee Programs: What Every Exporter Should Know About The GSM-102 and GSM-103 Programs," USDA, November 1996).

item (j). The Panel will recall that Brazil's initial formula, which was included in paragraph 281 and Figure 20 of its First Submission, can be stated as follows:

Premiums collected – (Administrative expenses + Default claims + Interest expenses)

159. Where this formula yields a negative number over a period constituting the "long term", Brazil argued that loan guarantees are provided "at premium rates which are inadequate to cover the long-term operating costs and losses of the programme", within the meaning of item (j).[152] Applying this formula to data for the period 1994-2003, Brazil demonstrated that premiums collected for the CCC guarantee programmes were indeed inadequate to cover operating costs and losses for the programmes.

160. To correct for alleged errors in Brazil's initial constructed formula, which was included in paragraph 281 and Figure 20 of its First Submission, the United States adopted its own alternative formula, in paragraph 173 of its First Submission, which can be stated as follows:

(Fees + Claims recovered + Claims rescheduled) – Claims paid

161. Where this formula yields a positive number over a period constituting the "long term," the United States asserts that loan guarantees are provided at premium rates that are adequate to cover the long-term operating costs and losses of the program, within the meaning of item (j).

162. Brazil made several criticisms of the US formula. In paragraph 123 of its Statement at the First Panel Meeting, Brazil demonstrated that the failure to account for interest paid by the CCC to the Treasury Department leads to artificially low accounting of operating costs. In paragraph 122, Brazil additionally demonstrated that it is incorrect to treat rescheduled debt as a recovery of a default claim. Brazil notes that rescheduling can in fact have the effect of increasing the costs incurred by the government, rather than reducing those costs. In its budget documents, the US Government treats Paris Club rescheduling of imminent defaults as "work-outs."[153] According to the US Office of Management and Budget ("OMB"), work-outs can either have a negative or a positive effect on cash flow.[154] The U. General Accounting Office ("GAO") has in fact stated that historically, the majority of GSM support that is rescheduled is "in arrears."[155] If anything, this increases CCC's cost.

[152] Revenue for "premiums collected" is recorded in the "Financing Account" section of the CCC budget, in the row titled "Loan origination fee" (line 88.40). *See* the US budget documents included as Exhibits Bra-88 to Bra-95. "Administrative expenses" are recorded in the "Programme Account" section of the CCC budget, in the row titled "Administrative expenses" (line 00.09). *See* the US budget documents included as Exhibits Bra-88 to Bra-95. Expenses for "default claims" are recorded in the "Financing Account" section of the CCC budget, in the row titled "Default claims" (line 00.01). *See* the US budget documents included as Exhibits Bra-88 to Bra-95. "Interest expenses" are recorded in the "Financing Account" section of the CCC budget, in the row titled "Interest on debt to Treasury" (line 00.02). *See* the US budget documents included as Exhibits Bra-88 to Bra-95.

[153] Exhibit Bra-121 (US General Accounting Office ("GAO"), Report to Congressional Committees, *Credit Reform: US Needs Better Method for Estimating Cost of Foreign Loans and Guarantees*, GAO/NSIAD/GGD-95-31, December 1994, p. 63) ("GAO/NSIAD/GGD-95-31").

[154] Exhibit Bra-116 (Executive Office of the President, Office of Management and Budget, Circular No. A-11, Part 5, *Federal Credit Programs* (June 2002), p. 185-13) ("OMB Circular A-11")).

[155] Exhibit Bra-152 (GAO, Statement of Allan I. Mendelowitz, Director, Trade, Energy and Finance Issues, National Security and International Affairs Division, before the Task Force on Urgent Fiscal Issues of the Committee on Budget of the US House of Representatives, *Status Report on GAO's Reviews of the Targeted Export Assistance Program, the Export Enhancement Programme, and the GSM-102/103 Export Credit Guarantee Programmes*, GAO/T-NSIAD-90-53, 28 June 1990, p. 14).

163. The United States' formula did correct for one shortcoming of Brazil's initial constructed formula, however. The United States is correct that Brazil's formula did not include recoveries.[156] Brazil therefore introduces a revised constructed formula that accounts for recoveries and interest on those recoveries, as recorded in the "Principal collections" and "Interest collections" rows[157] of the US budget. It also accounts for the interest accruing to the CCC on balances maintained in its so-called "financing account" for the purposes of potential claims,[158] as recorded in the "Interest on uninvested funds" row of the US budget documents.[159] Brazil's revised constructed formula can be stated as follows (including references to the specific budget lines involved):

(Premiums collected + Recovered principal and interest (Line 88.40) + Interest revenue (Line 88.25)) – (Administrative expenses (Line 00.09) + Default claims (Line 00.01) + Interest expense (Line 00.02))

164. Brazil emphasizes that it does not intend for this revised constructed formula to replace the formula used by the US government itself to track the costs of the CCC guarantee programs, pursuant to the US Federal Credit Reform Act ("FCRA"). In paragraphs 124-133 of its Statement at the First Panel Meeting, Brazil discussed the FCRA cost formula in considerable detail. The chart included at paragraph 132 of Brazil's Statement demonstrates that under the FCRA cost formula, CCC's export credit guarantee programs are offered at premium rates that are inadequate to cover their long-term operating costs and losses. Brazil believes that the FCRA cost formula is one very useful way to determine the performance of the CCC guarantee programs relative to the elements of item (j). However, if the Panel would like to confirm the results of the FCRA cost formula, or refer to an alternative formula, Brazil offers its revised constructed formula for these purposes.

165. Where Brazil's revised constructed formula indicates a net cost over a period constituting the "long term", export credit guarantees are provided "at premium rates which are inadequate to cover the long-term operating costs and losses of the programme", within the meaning of item (j). The following chart demonstrates that during the ten-year period FY 1993-2002, premiums for GSM 102, GSM 103 and SCGP export credit guarantees have been inadequate to cover long-term operating costs and losses. Net costs for the programmes during this period total more than $1 billion as set forth below:

| Fiscal year | Premiums collected (88.40) + Recovered principal and interest (88.40) + Interest revenue (88.25) | Admin. expenses (00.09) + Default claims (00.01) + Interest expense (00.02) |
|---|---|---|
| 1993 | $27,608,000 + $12,793,000 + $15,672,000[160] = $56,073,000 | $3.320,000[161] + $570,000,000[162]+ $0[163] = $573,320,000 |
| 1994 | $20,893,000 + $458,954,000 + $0[164] = $479,847,000 | $3,381,000[165] + $422,363,000[166] + $0[167] = $425,744,000 |

[156] First Submission of the United States, para. 173.

[157] In combination with loan origination fees, these rows are collectively recorded as line 88.40 in the US budget documents.

[158] Exhibit Bra-116 (OMB Circular A-11, p. 185-51). *See* also Exhibit Bra-118 (Federal Accounting Standards Advisory Board, *Statement of Federal Financial Accounting Standards No. 19, Technical Amendments to Accounting Standards for Direct Loans and Loan Guarantees in* STATEMENT OF FEDERAL FINANCIAL ACCOUNTING STANDARDS NO. 2, March 2001, p. 16 (para. 37)).

[159] This row is recorded as line 88.25 in the US budget documents. The payment of interest to an agency for uninvested balances in financing accounts is addressed in Exhibit Bra-117 (2 U.S.C. § 661d(c)).

[166] Exhibit Bra-95 (US budget for FY 1996, p. 162).

| | | |
|---|---|---|
| 1995 | $18,000,000 + $62,000,000 + $0[168] = $80,000,000 | $3,000,000 + $551,000,000 + $10,000,000[169] = $564,000,000 |
| 1996 | $20,000,000 + $68,000,000 + $26,000,000[170] = $114,000,000 | $3,000,000[171] + $202,000,000[172] + $61,000,000[173] = $266,000,000 |
| 1997 | $14,000,000 + $104,000,000 + $26,000,000[174] = $144,000,000 | $4,000,000[175] + $11,000,000[176] + $62,000,000[177] = $77,000,000 |
| 1998 | $17,000,000 + $81,000,000 + $54,000,000[178] = $152,000,000 | $4,000,000[179] + $72,000,000[180] + $62,000,000[181] = $138,000,000 |
| 1999 | $14,000,000 + $58,000,000 + $0[182] = $72,000,000 | $4,000,000[183] + $244,000,000 + $62,000,000[184] = $310,000,000 |
| 2000 | $16,000,000 + $100,000,000 + $99,000,000[185] = $215,000,000 | $4,000,000[186] + $208,000,000[187] + $62,000,000[188] = $274,000,000 |
| 2001 | $18,000,000 + $149,000,000 + $125,000,000[189] = $292,000,000 | $4,000,000[190] + $52,000,000[191] + $104,000,000[192] = $160,000,000 |
| 2002 | $21,000,000 + $155,000,000 + $61,000,000[193] = $237,000,000 | $4,000,000[194] + $40,000,000[195] + $93,000,000[196] = $137,000,000 |
| Total | $1,841,920,000 | $2,925,064,000 |
| **Long-term Net Cost** | **$1,083,144,000** | |

166. To arrive at this result, Brazil notes that it did not rely on "estimates" of the programmes' costs.[197] The annual US budget documents upon which Brazil relied track CCC data for three consecutive years – the prior year, the current year and the budget year. The 2004 budget, for example, which is completed in 2003, includes data for 2002, 2003 and 2004. Budget year data is

indeed based on estimates. Current year data is revised to account for any change to the cost or revenue item at issue. Since the current year is not yet complete when the budget is issued, however, current year data remains, at least in part, based on estimates. Prior year data, however, is based on actual costs and revenues. In applying its formula, Brazil used the data in the prior year column, and therefore used actual costs and revenues, rather than estimates.[198]

167. Several other factors corroborate the fact that the CCC export guarantee programmes do not charge premia that allow them to meet their long-term operating costs and losses.

- First, in audit reports of the CCC's fiscal year 2000 and 2001 financial statements, the US Department of Agriculture's Office of the Inspector General noted that "the fees CCC charges for its GSM-102 and GSM-103 export credit guarantee programs have not been changed in 7 years and may not be reflecting current costs."[199] While Brazil does not have fee schedules for the entire period 1993-2002, it provides for the Panel's review fee schedules for GSM 102 and GSM 103 from November 1994, 4 September 2001 and 24 September 2002.[200] According to CCC's website, the latter is the fee schedule that is currently in force. The Panel will note that between November 1994 and 23 September 2002, CCC made only one change in its fee schedule for GSM 102: while the fee for a 12-month guarantee with semi-annual repayment intervals was $0.209 per $100 of coverage in November 1994, by 4 September 2001 it had changed to $0.229 per $100 of coverage. On 24 September 2002, one additional change was made: borrowers were offered the additional option of 30 and 60 day guarantees, at the same fee charged for 90-day and 4-, 6- and 7-month guarantees.

- Second, US Department of Agriculture Under Secretary August Schumacher testified to Congress in 1998 that the GSM 102 programme suffered nearly $2 billion in losses as a result of Iraqi defaults, and an additional nearly $2 billion resulting from Polish defaults.[201] GAO stated that liabilities on the Iraqi debt accrued over the period 1990-1997, as the guaranteed Iraqi borrowings came due.[202] As noted by Brazil in paragraph 284 of its First Submission, however, the maximum in GSM 102 premiums the United States could have generated from all export credit guarantees provided during the lifetime of the programmes up to 1998 – had it applied the highest possible

[198] Of the 1994-2003 period tracked in Figure 20 to Brazil's First Submission, the only figures that reflected estimates were those for the year 2003, since actual data is not yet available for that year. To correct this, and to ensure that the data is still sufficient to reveal whether the CCC export credit guarantee programmes incur "long term" operating costs and losses, the chart above tracks CCC guarantees for the period 1993-2002.

[199] Exhibit Bra-153 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, Audit Report No. 06401-14-FM (June 2001), p. 31). *See also* Exhibit Bra-154 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC (February 2002), p. 49 ("[T]he fees CCC charged for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed for many years and may not be reflecting current costs.").

[200] Exhibit Bra-155 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 and GSM-103 Programme Participants*, 24 September 2002); Exhibit Bra-98 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 & GSM-103 Programme Participants*, 4 September 2001); Exhibit Bra-156 (US Export-Import Bank, *Comparison of Major Features of Programmes Offered by Ex-Im Bank and Commodity Credit Corporation for Support of Bulk Agricultural Commodities*, available at http://www.exim.gov/pub/ins/pdf/eib99-13.pdf). Brazil was unable to locate from public sources other fee schedules from the period 1993-2002.

[201] Exhibit Bra-87 ("Testimony of August Schumacher Jr., Under Secretary, Farm and Foreign Agricultural Service, USDA, before the Subcommittee on General Farm Commodities, Hearing on the Asian Financial Crisis, 4 February 1998", p. 10-11).

[202] Exhibit Bra-157 (US General Accounting Office, REPORT TO THE CHAIRMAN, TASK FORCE ON URGENT FISCAL ISSUES, COMMITTEE ON THE BUDGET, HOUSE OF REPRESENTATIVES, *International Trade: Iraq's Participation in US Agricultural Export Programs*, GAO/NSIAD-91-76 (November 1990), p. 27 (Table IV.2)).

premium rate to all guarantees – is $358.54 million.[203] The total amount of received applications for GSM 102 export credit guarantees for the period 1999-2002 was $11.77 billion, resulting in a theoretical additional maximum premium of $78.08 million for that period.[204] Thus, the highest amount of premiums the United States could have generated under this programme from its inception through 2002 would amount to $436.62 million.[205] This does not come close to covering the programme's losses from the Iraqi and Polish defaults alone.

- Third, CCC financial statements for fiscal year 2002 report that uncollectible amounts on post-1991 CCC guarantees total $770 million.[206] As noted in the chart above at paragraph 165, CCC collected premiums of $222.641 million for GSM 102, GSM 103 and SCGP during the period 1992-2002.[207] Thus, even without accounting for other operating costs, or for receivables that CCC hopes to collect but may not, losses for the CCC export credit guarantee programmes outpace premiums during the period 1992-2002 by nearly $550 million.

- Fourth, CCC's 2002 financials also report uncollectible amounts on pre-1992 CCC guarantees of $2.567 billion.[208] While actual data concerning premiums during the period 1981-1991 (from the first year GSM 102 was available until the last year before credit reform was introduced with the Federal Credit Reform Act) is not publicly available, Brazil has applied a proxy based on the average annual fees collected during the period 1992-2002 ($20.24 million). Multiplying $20.24 million by the 11 years included in the 1981-1991 period results in total fees of $222.64 million. Thus, even without accounting for other operating costs, or for receivables that CCC hopes to collect but does not, losses for the CCC export credit guarantee programs outpace premiums during the period 1981-1991 by more than $2.3 billion.

- Finally, the US General Accounting Office ("GAO") estimated in 1992 that if GSM 102 and GSM 103 continued until 2007, costs for the programs would reach $7.6 billion.[209] Premium fees

---

[203] *See* Exhibit Bra-73 ("Summary of Export Credit Guarantee Programme Activity", USDA, covering GSM 102, GSM 103 and SCGP for US fiscal years 1999-2003) for the total amounts of allocations. These have been multiplied by 0.663 percent to obtain the theoretical maximum premium.

[204] Exhibit Bra-73 ("Summary of Export Credit Guarantee Programme Activity", USDA, covering GSM 102, GSM 103 and SCGP for US fiscal years 1999-2003).

[205] This amount is a substantial overstatement, as premiums for periods of coverage shorter than 3 years will yield substantially lower premiums of as low as 15.3 cents per $100 as compared to 66.3 cents for a 3-year coverage. Exhibit Bra-98 ("Guarantee Fee Rate Schedule Under GSM 102 and GSM 103").

[206] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 14). This figure theoretically includes not only uncollectible amounts for the GSM 102, GSM 103 and SCGP programs, but also uncollectible amounts for CCC's Facility Guarantee Programme ("FGP"). Brazil has not challenged the FGP in this dispute. Brazil notes, however, that in fiscal years 1999-2003 (for which programme activity data is available on CCC's website, at http://www.fas.usda.gov/excredits/Monthly/ecg.html), exporter applications were only received for a total of $4.8 million in coverage under the FGP. Thus, defaults on FGP guarantees, if any, would contribute only negligibly to the $770 million figure discussed above.

[207] The chart in paragraph 165 does not include premiums for 1992. Those premiums totalled $36.14 million. *See* Exhibit Bra-125 (US budget for FY 1994, p. 383). According to US budget documents, premiums for the FGP are included in the budget line item for fees on the GSM and SCGP programs.

[208] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 14). The FGP did not exist during this period, and thus is not a factor.

[209] Exhibit Bra-159 (US General Accounting Office, REPORT TO CONGRESSIONAL REQUESTERS, *Loan Guarantees: Export Credit Guarantee Programmes' Costs are High*, GAO/GGD-93-45 (December 1992), p.4). *See also* Exhibit Bra-115 (US General Accounting Office, Report to the Chairman, Subcommittee on Criminal Justice, US House of Representatives Committee on the Judiciary, "Loan Guarantees: Export Credit Guarantee Programmes' Long Run Costs are High," GAO/NSIAD-91-180, 19 April 1991, p. 2-3) ("We estimate that the

for the period 1992-2007 (assuming current rates) would only reach $323.84,[210] demonstrating that fees for the programme do not meet costs.

In sum, CCC financials state that during the period 1981-2002, costs and losses for CCC export credit guarantee programmes exceeded premiums collected.

**78. Can the United States provide supporting documentation for data used relating to "costs and losses" in paragraph 173? Could the United States confirm that the figures cited in paragraph 173 of its first written submission relate to the SCGP? Why did the United States cite these figures after stating that it is not possible to make any assessment of the long-term operating costs and losses of this programme? USA**

**79. In respect of what time periods does Article 13(c) require an assessment of conformity with Part V of the Agreement on Agriculture? How does this affect, if at all, your interpretation of Article 13(b)? BRA, USA**

Brazil's Answer:

168. Part V of the Agreement on Agriculture requires that Members grant export subsidies in conformity with that agreement and with that Member's export subsidy reduction commitments. These commitments are made on a commodity specific basis.[211] The relevant section of the US Schedule of Concessions (Part IV, Section II) clarifies that the US export subsidy commitments are to be assessed on a US fiscal year basis.[212] A Member's export subsidy reduction commitments cover annual budgetary outlays and quantitative reduction commitments – in the US case on a fiscal year basis.[213] It follows that the US compliance with its export subsidy reduction commitments must be assessed on the basis of specific agricultural products and fiscal years.

169. Thus, similar to domestic support measures, the conformity of a Member's export subsidies with Part V of the Agreement on Agriculture must be assessed by comparing the amounts actually granted (both in term of budgetary outlays as well as in terms of quantities of specific agricultural products benefiting from export subsidies) with a benchmark, i.e., with a Member's export subsidy reduction commitments.

170. According to Article 3.3 of the Agreement on Agriculture, for agricultural products not included in Part IV, Section II of a Member's Schedule (i.e. unscheduled products) any export subsidy granted leads to a violation of Part V of the Agreement on Agriculture. Brazil's claims against Step 2 export subsidies and against ETI Act subsidies benefiting upland cotton fall in this category, as the United States does not have an export subsidy reduction commitment for upland cotton.[214] Furthermore, Brazil's claims concerning export credit guarantee programs fall in this category, in as far as export credit guarantees are available for unscheduled agricultural products.

---

GSM programmes will cost the Corporation about $6.7 billion in the long run . . . This estimate assumes that the outstanding loans and guarantees remain at the same level for about 16 years and that their average risk remains unchanged as new guarantees replace old ones).

[210] This has been calculated based on actual fees for 1992-2002 and using average 1992-2002 fees as expected fees for the remainder of the time period (2003-2007).

[211] *See* Brazil's answer to Question 7.

[212] Exhibit Bra-83 (Schedule XX of the United States of America, Part IV, Section II entitled Export Subsidies: Budgetary Outlays and Quantitative Reduction Commitments).

[213] Exhibit Bra-83 (Schedule XX of the United States of America, Part IV, Section II entitled Export Subsidies: Budgetary Outlays and Quantitative Reduction Commitments).

[214] Exhibit Bra-83 (Schedule XX of the United States of America, Part IV, Section II entitled Export Subsidies: Budgetary Outlays and Quantitative Reduction Commitments).

171. For scheduled agricultural products, the Panel needs to determine whether the export subsidies for a particular scheduled agricultural product are in excess of the export subsidy reduction commitment levels for that agricultural product in the year in question, or whether the application of the export subsidies threatens to lead to circumvention of the export subsidy reduction commitments. More specifically, in this dispute, the Panel needs to assess whether the CCC export credit guarantee programmes threaten to circumvent the export subsidy reduction commitments of the United States for scheduled agricultural products.

**80. In Brazil's view, why did the drafters of the Agreement on Agriculture not include export credit guarantees in Article 9.1? BRA**

Brazil's Answer:

172. The negotiating history of the Agreement on Agriculture does not reveal why the drafters did not include export credits guarantees in Article 9.1, just as it does not reveal why the drafters did not include well-known and widely-used export subsidies like the United States' FSC regime in Article 9.1. Yet, the Appellate Body concluded that the FSC regime constitutes an export subsidy and is subject to the general export subsidy disciplines in the Agreement on Agriculture, including Article 10.1 thereto. As Brazil has previously noted, Article 1(e) defines export subsidies as "including" those listed in Article 9.1 of the Agreement on Agriculture, and Article 10.1 refers to a universe of export subsidies "not listed in" Article 9.1. As the Appellate Body's report in US – FSC illustrates, if a measure meets the definition of "export subsidy", it is subject to Article 10.1, even though it is not included in Article 9.1.

173. Under the Vienna Convention rules, Articles 9.1 and 10.1, as well as Article 10.2 of the Agreement on Agriculture, are to be interpreted according to their ordinary meaning, in their context, and according to the object and purpose of the Agreement on Agriculture. Brazil has demonstrated that the CCC export credit guarantee programs fulfill the definition of "export subsidy" in the Agreement on Agriculture and the SCM Agreement, and that export credit guarantees are not, under a Vienna Convention interpretation of Article 10.2, excluded from the general export subsidy disciplines in Article 10.1.

**81. How does the United States respond to the following in Brazil's oral statement: USA**

**(a) paragraph 122 (rescheduled guarantees)**
**(b) paragraph 123 (interest on debt to Treasury)**
**(c) paragraphs 125 ff. (guaranteed loan subsidy)**
**(d) paragraphs 127-129 (re-estimates, etc.)**
**(e) Exhibits BRA-125-127**
**(f) the chart on page 53 of Brazil's oral statement at the first session of the first Panel meeting relating to "Guaranteed Loan Subsidy and Administrative Expenses of US Export Credit Guarantee Programs GSM-102 GSM 103 and SCGP"?**
**(g) In respect of (a)-(f) above, how and to what extent do the information and data presented for the export guarantee programmes concerning "program" and "financing", "summary of loan levels", "subsidy budget authority", "outlay levels", etc., in particular in Exhibits BRA-125-127, reflect "actual costs and losses" of the GSM-102, GSM-102 and SCGP export credit guarantee programmes(see e.g. Brazil's closing oral statement at the first session of the first substantive meeting, paragraph 24)? USA**

Brazil's Comment on Question 81(g):

174. Brazil may wish to comment in its rebuttal submission on the response the United States ultimately provides to this and the other sub-parts of question 81. In the meantime, however, Brazil would like to comment on the distinction between actual and estimated costs and losses.

175. As noted above in comments on Question 77, Brazil has used data from the prior year column of the US budget. This column is titled "actual," since it reflects reconciled data for a full fiscal year. Data reported in the prior year column of the "guaranteed loan subsidy" row of the US budget is "actual" in this sense. Brazil explained in paragraph 127 of its Statement at the First Panel Meeting that the FCRA calls for the CCC to make annual "reestimates" to the cost calculation and thus to the "guaranteed loan subsidy" line in the budget. Reestimates "take into account all factors that may have affected the estimate of each component of the cash flows, including prepayments, defaults, delinquencies, and recoveries,"[215] to the extent that those factors have changed since the initial estimate was made for purposes of the budget year column of the budget.

176. The results of the reestimate process are captured in the US budget and in CCC's financial statements.[216] Reestimates made in a given fiscal year are netted and recorded in the "reestimates of subsidy" (line 00.07) and "interest on reestimate" (line 00.08) lines of the US budget. In the 2002 column of the 2004 budget, for example, "reestimates of subsidy" were recorded in the amount of $118 million, and "interest on reestimate" was recorded as $8 million.[217] In the 2002 column of the 2004 budget, the United States in fact aggregates these two amounts with the "guaranteed loan subsidy" amount of $97 million and the "administrative expenses" of $4 million to arrive at a total subsidy of $227 million (which is in turn deducted from the budgetary resources available to the CCC in line 23.95 of the budget).[218] While Brazil could have followed this same convention to accentuate the amount by which the CCC guarantee programmes' costs and losses outstrip revenue by even more than that listed in the chart included in paragraph 132 of Brazil's Statement to the First Panel Meeting, it chose to be conservative and did not do so.

177. The results of the reestimate process are also captured in a cumulative, "running tally" of the FCRA subsidy figure included in CCC's annual financial statements. CCC's fiscal year 2002 financial statements track the "credit guarantee liability" for post-1991 guarantees disbursed under the CCC export guarantee programmes. "Credit guarantee liability" is defined in the CCC financials as representing "the estimated net cash outflows (loss) of the guarantees on a net present value basis."[219] The Panel will recall that the "guaranteed loan subsidy" line in the US budget similarly tracks the net present value of payments to and from the government for CCC export guarantees, although only with respect to guarantees disbursed in one particular year. The 2002 financial statement provides a cumulative subsidy figure for all post-1991 guarantees under the CCC programmes. The analysis included in the 2002 financial statement begins with the credit guarantee liability included in the 2001

[215] Exhibit Bra-118 (Federal Accounting Standards Advisory Board, "Statement of Federal Financial Accounting Standards No. 19, Technical Amendments to Accounting Standards for Direct Loans and Loan Guarantees" in STATEMENT OF FEDERAL FINANCING ACCOUNTING STANDARDS NO. 2, March 2001, p. 15 (para. 32)). *See also* Exhibit Bra-160 (US Department of Agriculture, Office of the Chief Financial Officer, Credit, Travel, and Accounting Division, *Agriculture Financial Standards Manual* (May 2003), p. 80, 117, 199); Exhibit Bra-161 (US Federal Accounting Standards Advisory Board, FEDERAL FINANCIAL ACCOUNTING AND AUDITING TECHNICAL RELEASE 3, *Preparing and Auditing Direct Loan and Loan Guarantee Subsidies under the Federal Credit Reform Act* (31 July 1999), p. 17-21).

[216] According to OMB, reestimates are to be recorded in the budget. Exhibit Bra-116 (OMB Circular A-11, p. 185-4).

[217] Exhibit Bra-127 (US budget for FY 2004, p. 107).

[218] Exhibit Bra-127 (US budget for FY 2004, p. 107).

[219] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 4).

financial statement, makes adjustments for defaults, fees and reestimates undertaken in fiscal year 2002 with respect to all post-1991 guarantees, and results in a new subsidy figure of $411 million for those post-1991 guarantees.[220] This positive net present value means that CCC has "los[t] money" during the period 1992-2002.[221]

178. While Brazil has demonstrated that the reestimation process applied to the FCRA formula does in fact track actual data and does in fact account for actual performance of CCC export credit guarantees, Brazil notes that a certain degree of estimated data would be perfectly acceptable in an analysis of the costs and losses of guarantee programs under item (j). The purpose of the FCRA and its cost formula was, after all, "to measure more accurately the costs of Federal credit programmes," including contingent liabilities like export credit guarantees.[222] As the United States evidently agrees, accounting for the costs of contingent liabilities like guarantees on a cash basis is not appropriate, since it masks the real costs of those guarantees. Even if the FCRA cost formula does entail the use of some estimated data, the US Congress and the President consider that that formula is the most accurate way of tracking costs.

179. Brazil notes, finally, that it is not entirely accurate to call the data used to arrive at initial estimates of the "guaranteed loan subsidy" figure "estimated" data. The US Federal Accounting Standards Advisory Board, the Government-Wide Audited Financial Statements Task Force on Credit Reform, the Office of Management and Budget and the Department of Agriculture itself have emphasized that "[m]ethods of estimating future cash flows for existing credit programs need to take account of past experience,"[223] that "[a]ctual historical experience of the performance of a risk category is a primary factor upon which an estimation of default cost is based",[224] and that the technical assumptions underlying subsidy calculations reflect "historical cash reports and loan performance".[225] This demonstrates that "estimates" of the subsidy cost of CCC guarantees are informed by actual historical experience with borrowers.

180. Brazil also notes that a number of factors involved in setting the FCRA subsidy cost are "explicit" and not "forecast". The Office of Management and Budget identifies contract terms such as maturity, borrower's interest rate, fees and grace periods as "explicit," and therefore not "estimated".[226] Moreover, as the Panel is well aware, none of the "reestimates" at issue is Brazil's. They are all estimates by official agencies of the United States.

---

[220] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 19). As noted above in Brazil's comments on Question 77, while this figure theoretically includes CCC's Facility Guarantee Programme ("FGP"), activity under that programme is virtually non-existent.

**82. Please explain each of the following statements and any possible significance it may have in respect of Brazil's claims about GSM-102 and GSM-103 (7 CFR 1493.10(a)(2), Exhibit BRA-38): BRA, USA**

Brazil's Answer:

181. As discussed below, these passages corroborate evidence provided by Brazil to demonstrate that the CCC guarantee programmes constitute export subsidies within the meaning of Articles 1.1 and 3.1(a) of the SCM Agriculture, and thus within the meaning of Articles 1(e), 10.1 and 8 of the Agreement on Agriculture.

> **(a) "The programmes operate in cases where credit is necessary to increase or maintain US exports to a foreign market and where US financial institutions would be unwilling to provide financing without CCC's guarantee. (7 CFR 1493.10(a)(2) Exhibit BRA-38)**

Brazil's Answer:

182. The passage cited by the Panel provides corroborating evidence that CCC guarantees provide "benefits", within the meaning of Article 1.1(b) of the SCM Agreement. Specifically, the passage states that the CCC programmes "operate in cases . . . where US financial institutions would be unwilling to provide financing without CCC's guarantee". This demonstrates at least two things. First, it establishes that the CCC guarantee programs are used in situations where, without a CCC guarantee, a borrower could not secure financing at all – not just financing on less attractive terms than could be secured with the CCC guarantee (or on terms that would constitute a benefit under Article 14(c) of the SCM Agreement), but no financing at all. Second, it establishes that financing could not be secured without a CCC guarantee – a commercial guarantee would not do. This corroborates Brazil's assertion that CCC provides something that has no equivalent on the commercial market.

183. Brazil notes that the regulations for the SCGP programme contain an identical provision, in 7 CFR 1493.400(a)(2). That section states that "[t]he SCGP operates in cases where credit is necessary to increase or maintain US exports to a foreign market and where private US exporters would be unwilling to provide financing without CCC's guarantee".[227]

184. Moreover, in its Annual Performance Plans for fiscal years 2000, 2001 and 2002, the US Department of Agriculture's Foreign Agricultural Service similarly stated that the SCGP programme "was created to expand high-value product exports by facilitating credit for such purchases in foreign markets lacking sufficient liquidity to purchase openly on the commercial market".[228] This demonstrates that the SCGP programme extends "benefits," since it facilitates credit for the purchase of US agricultural commodities in circumstances where credit would not otherwise be available at all.

> **(b) "The programmes are operated in a manner intended not to interfere with markets for cash sales. The programs are targeted toward those countries where the guarantee is necessary to secure financing of the exports but which have sufficient financial strength so that foreign exchange will be available for scheduled payments." (7 CFR 1493.10(a)(2) Exhibit BRA-38)**

[227] Exhibit Bra-38 (7 CFR 1493.400 *et seq*.).

[228] Exhibit Bra-164 (US Department of Agriculture, Foreign Agricultural Service, *Revised FY 2001 and FY 2002 Annual Performance Plan*, p. 11); Exhibit Bra-165 (US Department of Agriculture, Foreign Agricultural Service, *Revised FY 2000 and FY 2001 Annual Performance Plan*, p. 17).

Brazil's Answer:

185. This passage also demonstrates that CCC guarantees confer "benefits". Specifically, the passage states that "[t]he programmes are targeted toward those countries where the guarantee is necessary to secure financing of the exports . . .". Like the passage included in 82(a), this passage establishes at least two things. First, that without a CCC guarantee, a borrower would not be able to secure financing at all – not just financing on less attractive terms than could be secured with the CCC guarantee (or on terms that would constitute a benefit under Article 14(c) of the SCM Agreement), but no financing at all. Second, that the CCC guarantee is necessary – a commercial guarantee would not be sufficient.

186. Brazil notes that the regulations for the SCGP programme contain an identical provision, in 7 CFR 1493.400(a)(2). That section states that "The programme is operated in a manner intended not to interfere with markets for cash sales. The programme is targeted toward those countries where the guarantees are necessary to secure financing of the exports but which have sufficient financial strength so that foreign exchange will be available for scheduled payments."[229]

**(c) "In providing this credit guarantee facility, CCC seeks to expand market opportunities for US agricultural exporters and assist long-term market development for US agricultural commodities." (7 CFR 1493.10(a)(2) Exhibit BRA-38)**

*Brazil's Answer:*

187. This passage demonstrates that the CCC guarantee programmes are contingent on export, within the meaning of Article 3.1(a) of the SCM Agreement. Specifically, the passage establishes that the CCC guarantee programs are for use by "US agricultural exporters". It also confirms that the programmes operate to the benefit of US exporters, who with the help of the programmes are able to expand their market share.

188. Brazil notes that the regulations for the SCGP programme contain an identical provision, in 7 CFR 1493.400(a)(2). That section states that "[i]n providing this credit guarantee facility, CCC seeks to expand market opportunities for US agricultural exporters and assist long-term market development for US agricultural commodities."[230]

**83. Could Brazil explain how the procedure in Annex V of the SCM Agreement would be relevant to its claims concerning agricultural export subsidies, prohibited subsidies and agricultural domestic support? (e.g. note 301 in Brazil's first submission and paragraph 4 of Brazil's oral statement at the first session of the first substantive meeting). BRA**

Brazil's Answer:

189. The United States failed to respond to Brazil's questions and document requests during the Annex V procedures. Indeed, the United States refused to participate in any way in the Annex V procedures mandated by Brazil's invocation of Annex V in its request for establishment of this Panel. This refusal to participate has consequences under the express terms of Annex V. The list of Annex V questions provided to the United States by Brazil is included in Exhibit Bra-49. As directed by paragraph 6 of Annex V, given the United States' failure to cooperate in the Annex V information-gathering process, Brazil has and will present its case regarding peace clause issues and serious prejudice claims based on evidence available to it. If there are gaps in the evidence provided to the Panel by Brazil in support of its prima facie case, and those gaps are due to the United States' failure

[229] Exhibit Bra-38 (7 CFR 1493.400 *et seq.*).
[230] Exhibit Bra-38 (7 CFR 1493.400 *et seq.*).

to cooperate with and participate in the Annex V process, Annex V, paragraph 6 provides that "the panel may complete the record as necessary relying on best information otherwise available".

190. As a final note, Brazil's Annex V questions to the United States included questions concerning US agricultural export subsidies and domestic content subsidies because these are also "actionable" subsidies that cause serious prejudice to Brazil's interests.

**84. Is the Panel correct in understanding that, under the GSM-102 and GSM-103 programmes, the exporter pays a fee calculated on the dollar amount guaranteed, based on a schedule of rates applicable to different credit periods? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates? USA**

Brazil's Comment:

191. The Panel is correct in stating that fees for GSM 102 and GSM 103 guarantees vary only according to the dollar value of the transaction and the length of the guarantee. GSM 102 and GSM 103 fees do not otherwise vary and are charged according to a fee schedule that does not account for the country risk involved or the credit rating of the borrower. Brazil attaches news releases from the US Department of Agriculture's Foreign Agricultural Service announcing GSM 102 and GSM 103 guarantees to Dominican Republic, Morocco, Ghana, South Korea, Vietnam and Algeria.[231] The Panel will note that the fees do not vary, and are based on the standard GSM 102 and GSM 103 fee schedule included as Exhibit Bra-155.[232]

192. As noted above in Brazil's comment on Question 77, the US Department of Agriculture's Office of the Inspector General has noted in June 2001 that "the fees CCC charges for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed in 7 years and may not be reflecting current costs".[233] It repeated this statement in February 2002.[234] Thus, GSM 102 and GSM 103 fees remained virtually unchanged from at least 1994 until February 2002. The current fee schedule demonstrates that this trend continues to the present.[235]

193. In reviewing the historical fee schedules available from public sources,[236] Brazil notes that from at least 1994 until the present, CCC made two changes in its fee schedule for GSM 102. First, it

[231] Exhibit Bra-166 (US Department of Agriculture Foreign Agricultural Service, News Releases regarding extension of GSM 102 and GSM 103 guarantees to Dominican Republic, Morocco, Ghana, South Korea, Vietnam and Algeria).

[232] Exhibit Bra-155 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 and GSM-103 Programme Participants*, 24 September 2002).

[233] Exhibit Bra-153 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, Audit Report No. 06401-14-FM (June 2001), p. 31).

[234] Exhibit Bra-154 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC (February 2002), p. 49 ("[T]he fees CCC charged for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed for many years and may not be reflecting current costs.").

[235] Exhibit Bra-155 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 and GSM-103 Programme Participants*, 24 September 2002).

[236] Exhibit Bra-155 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 and GSM-103 Programme Participants*, 24 September 2002); Exhibit Bra-98 (US Department of Agriculture Foreign Agricultural Service, *Notice to GSM-102 and GSM-103 Programme Participants*, 4 September 2001); Exhibit Bra-156 (US Export-Import Bank, *Comparison of Major Features of Programmes Offered by Ex-Im Bank and Commodity Credit Corporation for Support of Bulk Agricultural Commodities*, available at http://www.exim.gov/pub/ins/pdf/eib99-13.pdf). Brazil was unable to locate from public sources other fee schedules from the period 1993-2002.

changed the fee for a 12-month guarantee with semi-annual repayment intervals from $0.209 per $100 of coverage to $0.229 per $100 of coverage. Second, it decided to offer borrowers the additional option of 30- and 60-day guarantees, at the same fee charged for 90-day and 4-, 6- and 7-month guarantees.

**85. Is the Panel correct in understanding that, under the SCGP, the exporter pays a fee for the guarantee calculated on the guaranteed portion of the value of the export sales? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates? Please explain any "risk" assessment involved in the programme. USA**

Brazil's Comment:

194. The Panel is correct in stating that fees for SCGP guarantees vary only according to the dollar value of the transaction and the length of the guarantee. SCGP fees do not otherwise vary and are charged according to a fee schedule that does not account for the country risk involved or the credit rating of the borrower. For SCGP guarantees of up to 90 days, the fee is $0.45 per $100 of coverage, and for SCGP guarantees from 90-180 days, the fee is $0.90 per $100 of coverage.[237] Brazil attaches news releases from the US Department of Agriculture's Foreign Agricultural Service announcing SCGP guarantees to Tunisia, Azerbaijan, Vietnam, South Korea, Japan and Nigeria.[238] The Panel will note that the fees do not vary.

**86. Is there a risk categorization in relation to three export credit guarantee programmes (GSM-102, GSM-103 and SCGP)? Does this have any impact on premiums payable and the ability of the CCC to on-sell the guarantees ? USA**

Brazil's Comment:

195. Fees for GSM 102, GSM 103 and SCGP guarantees do not vary depending upon the credit rating of the borrower. As noted in Brazil's comments on Questions 84 and 85, guarantee fees for these three programs vary only according to the dollar value of the transaction and the length of the guarantee. Fees do not otherwise vary and are charged according to a fee schedule that does not account for the country risk involved or the credit rating of the borrower.

196. In calculating the "subsidy cost" for the purposes of the Federal Credit Reform Act, agencies like the CCC account for country risk. According to the narrative description included in the US budget,

> [t]he subsidy estimates for the GSM-102 and GSM-103 programs are determined in large part by the obligor's sovereign or non-sovereign country risk grade. These grades are developed annually by the International Credit Risk Assessment System Committee (ICRAS). . . . The default estimates for GSM guarantees are determined in large part by the risk premia assigned for each risk grade.[239]

197. According to the GAO, "OMB requires executive branch agencies to calculate the costs of foreign loans and guarantees using annually updated ICRAS ratings and . . . country risk interest premiums when foreign loans or guarantees are budgeted, authorized, disbursed, or modified. . . ."[240]

[237] Exhibit Bra-167 (12 Steps to Participating in the USDA Supplier Credit Guarantee Programme, Step 5).

[238] Exhibit Bra-168 (US Department of Agriculture Foreign Agricultural Service, News Releases regarding extension of SCGP guarantees to Tunisia, Azerbaijan, Vietnam, South Korea, Japan and Nigeria).

[239] Exhibit Bra-127 (US budget for FY 2004, p. 108).

[240] Exhibit Bra-121 (GAO/NSIAD/GGD-95-31, p. 7).

198. Thus, while CCC fees for GSM 102, GSM 103 and SCGP fees do not account for country risk or the credit risk of the borrower, the "guaranteed loan subsidy" line in the US budget and the subsidy figures in the CCC's financial statements do take account of country risk.

**87. What proportion of CCC (export-related and total) long term operating costs and losses are represented by GSM-102, GSM-103 and SCGP programmes? USA**

**88. (a) Is the Panel correct in understanding that the United States' argument is that, at present, by virtue of Article 10.2 of the Agreement on Agriculture, there are no disciplines on agricultural export credit guarantees under the Agreement on Agriculture (or the SCM Agreement)? USA**

**(b) Does the United States agree with the following proposition: a WTO Member may therefore extend agricultural export credit guarantees without charging a premium, and for an indefinite period, in addition to any other terms and conditions it may wish? How would this reconcile with the title of Article 10 of the Agreement on Agriculture ("Prevention of Circumvention on Export Subsidy Commitments"), and with other commitments contained in the Agreement on Agriculture? Please cite any relevant material, including any past WTO dispute settlement cases. How would this reconcile with the United States' own statement, at paragraph 21 of its closing oral statement that "of course, the United States may not provide subsidies without any limit". USA**

**(c) If, as the United States argues, there are no disciplines on export credit guarantees in the Agreement on Agriculture, how could export credit guarantees "conform fully to the provisions of Part V" of the Agreement on Agriculture within the meaning of Article 13 (how can you assess "conformity" or non-conformity when there are allegedly no disciplines against which such an assessment could occur)? USA**

Brazil's Comment:

199. As the Panel's question suggests, if the Panel determines that export credit guarantees are not subject to the export subsidy disciplines in the Agreement on Agriculture, the United States is nevertheless not entitled to the protection afforded by Article 13(c). Article 13(c) provides an exemption from action for those export subsidies that "conform fully to the provisions of Part V" of the Agriculture Agreement. If, as the United States argues, export credit guarantees are not subject to Part V, then they cannot "conform fully to the provisions of Part V," and are not entitled to the safe haven in Article 13(c).

200. The panel in Canada – Aircraft (21.5) took a similar approach with respect to the safe haven included in the second paragraph of item (k) to the Illustrative List of Export Subsidies appended to the SCM Agreement.[241] The second paragraph of item (k) provides as follows:

> Provided, however, that if a Member is a party to an international undertaking on official export credits to which at least twelve original Members to this Agreement are parties as of 1 January 1979 (or a successor undertaking which has been adopted by those original Members), or if in practice a Member applies the interest rates provisions of the relevant undertaking, an export credit practice which is in conformity with those provisions shall not be considered an export subsidy prohibited by this Agreement.

[241] Panel Report, *Canada – Aircraft (21.5)*, para. 5.143-5.145.

The "international undertaking on official export credits" cited in this provision is the Organization for Economic Co-operation and Development's Arrangement on Guidelines for Officially Supported Export Credits ("OECD Arrangement").[242]

201. To determine whether a particular Canadian measure could benefit from the safe haven in the second paragraph of item (k), the Panel first reviewed which types of "export credit practices" could potentially be "in conformity with" the "interest rates provisions" of the OECD Arrangement. According to the Panel, it could only "determine the conformity of a given export credit practice with those interest rate provisions . . . [if] it is of the type that conceptually could be subject to, and thus in conformity with, those provisions".[243] Similarly, if the United States is correct that CCC export credit guarantees are not subject to the disciplines in Part V of the Agriculture Agreement, then CCC guarantees cannot logically "conform fully to the provisions of Part V" and trigger the exemption from action provided for in Article 13(c).

**(d) Is the United States advocating the view that its own export credit guarantee programmes, which pre-dated the Uruguay Round, are effectively "grandfathered" so as to benefit from some sort of exemption from the export subsidy disciplines of the Agreement on Agriculture? How, if at all, is it relevant that the SCGP did not, according to the United States, become relevant for upland cotton until the late 1990's (i.e. after the entry into force of the WTO Agreement)? USA**

F. STEP 2 PAYMENTS

**89. Does the United States confirm Brazil's statement in paragraph 331 of its first submission that "The conditions and requirements for Step 2 domestic payments remain unchanged with the passage of the 2002 FSRI Act"? What is the relevance of this, if any, to this dispute? USA**

**90. Does the United States confirm Brazil's statement in paragraph 235 of its first submission that the changes concerning Step 2 export payments from the 1996 FAIR Act to the 2002 FSRI Act are: increase in the amount of the subsidy by 1.25 cents per pound and the removal of any budgetary limits that applied under the 1996 FAIR Act? What is the relevance of this, if any, to this dispute? USA**

**91. What is the significance of the elimination of the 1.25 cent threshold payment in the 2002 FSRI Act pertaining to Step 2 payments? USA**

**92. Does the United States confirm that Exhibit BRA-65 represents a sample contract for exporters of eligible upland cotton to conclude with the CCC under the FSRI 2002, and that an application form (Exhibit BRA-66) needs to be filled out with data on weekly exports and submitted to the USDA FAS. Is Exhibit BRA-66 - Form CCC 1045-2 – also a valid example? If not, please identify any differences or distinctions. USA**

[242] Available at http://www.oecd.org/dataoecd/52/3/2763846.pdf.

[243] WT/DS70/RW, para. 5.93. The Panel concluded that "the only forms of export credit practices" subject to the interest rate provisions of the *OECD Arrangement* are "direct credits/financing, refinancing and interest rate support," since only those forms of official financing support are subject to the *Arrangement*'s commercial interest reference rates ("CIRR") – "the only *existing* systems of minimum interest rates under the *Arrangement*." *Id*., paras. 5.98, 5.101 (emphasis in original). Since the CIRR are only expressed as fixed rates, the Panel concluded that they could only be applied to fixed (and not floating) interest rate transactions. *Id*., para. 5.102. Nor could the CIRR be applied to official support with a shorter maturity than two years (the minimum term expressly listed in the *OECD Arrangement*), or to guarantees or insurance. *Id*., para. 5.106.

Brazil's Comment:

202. Brazil includes a new version of the current "Upland Cotton Domestic User/Exporter Agreement" (Revision 7, in effect as of 1 August 2003 and issued on 17 June 2003), which replaces Revision 6 that Brazil has included as Exhibit Bra-65 to its First Submission.

**93. Please elaborate why the United States deems that Step 2 payments upon submission of proof of export are not subsidies contingent upon export. Is it the US contention that, in order to be contingent on export, exportation must be the exclusive condition for receipt of the payment? USA**

**94. Is the Panel correct in understanding that Brazil alleges an inconsistency with Article 3.1(b) of the SCM Agreement only with respect to Step 2 domestic payments? BRA**

Brazil's Answer:

203. Yes.

**95. Do the criteria in 7 CFR 1427.103(c)(2) (Exhibit BRA-37) that Step 2 "eligible upland cotton" must be "not imported cotton" apply to both domestic and export payments? USA**

**96. Is a domestic sale a "use" for the purposes of Step 2 payments? Is a sale for export, or export, considered a "use"? USA**

**97. How does the United States respond to Brazil's assertion, at paragraph 70 of Brazil's oral statement at the first session of the first substantive meeting, that "It is obvious that a single bale of cotton cannot be both exported and used domestically." Is this a relevant consideration? USA**

**98. How many Step 2 payments are received if a bale of upland cotton is exported, and then opened by a domestic user in the United States, or vice versa? USA**

**99. How does the United States respond to Brazil's arguments in paragraphs 71-75 of Brazil's oral statement at the first session of the first Panel meeting concerning the relevance of the Appellate Body Report in US-FSC (21.5). USA**

**100. How does Brazil respond to the statement in note 119 of the United States' first written submission that "...to the extent a consumer that had intended to export instead opens the bale, then that consumer could still obtain the Step 2 payment upon submission of the requisite documentation". The Panel notes that Step 2 payments all involve upland cotton produced in the United States. What are the two distinct factual situations that Step 2 payments involve? Other than the panel report in Canada-Dairy and the findings of the Appellate Body in US-FSC (21.5)[244], do any other dispute settlement reports offer guidance on this issue? For example, how, if at all is the Appellate Body's report in Canada-Aircraft relevant here?[245] BRA**

[244] "We recall that the ETI measure grants a tax exemption in two different sets of circumstances: (a) where property is produced *within* the United States and held for use *outside* the United States; and (b) where property is produced *outside* the United States and held for use outside the United States. Our conclusion that the ETI measure grants subsidies that are export contingent in the first set of circumstances is not affected by the fact that the subsidy can also be obtained in the second set of circumstances. The fact that the subsidies granted in the second set of circumstances *might* not be export contingent does not dissolve the export contingency arising in the first set of circumstances.[244] Conversely, the export contingency arising in these circumstances has no bearing on whether there is an export contingent subsidy in the second set of circumstances. Where a United States taxpayer is simultaneously producing property within and outside the United States, for direct use

Brazil's Answer:

204. The applicable regulations (7 CFR 1427.104)[246] define eligible domestic users and exporters of upland cotton.[247] To receive a Step 2 export payment, a person (including a cotton producer or a cooperative) must be "regularly engaged in selling eligible [US] upland cotton for export".[248] To receive a domestic payment, a person must be "regularly engaged in the business of opening bales of eligible [US] upland cotton to manufacture US upland cotton into cotton products in the United States".[249] The only actor who can be indifferent whether they export or use cotton domestically is a hypothetical domestic US cotton product manufacturer regularly engaged in opening US bales for domestic US manufacture that also regularly engages in exporting US cotton. In that situation, if a bale of cotton is opened by mistake instead of being exported, the exporter who is also the US cotton product manufacturer will receive a Step 2 domestic payment for that bale if the company has already entered into a contract with CCC for Step 2 payments, and subject to proof that bale is in fact used for manufacturing cotton products in the United States. But even if that hypothetical situation were to occur, then the payment would be contingent upon the domestic use of only US upland cotton (prohibited by Article 3.1(b) of the SCM Agreement). And if the bale were exported, the US exporter would receive the Step 2 payments subject to proof of export of US (not foreign) upland cotton (prohibited by Article 3.1(a) of the SCM Agreement).

205. It follows that the "two distinct factual situations" resulting in the payment of Step 2 subsidies are (1) the domestic "use" of eligible US upland cotton by a manufacturer of cotton products regularly engaged in opening bales; and (2) the "export" of eligible US cotton by exporters regularly engaged in selling US upland cotton. The United States argues that this case is distinguishable from US – FSC (21.5) because in that case one situation involved property produced within the United States and held for use outside the United States, and the other situation involved property produced outside the United States and held for use outside the United States.[250] This is irrelevant.

206. The point of the distinction by the Appellate Body in US – FSC (21.5) was not the geographic location of the property at issue, but rather whether one portion of payment under a programME was export contingent. In fact, in US – FSC (21.5), the products found to be subject to the export contingency were those produced within the United States and held for use outside the United States. This is exactly the situation with Step 2 export payments. Upland cotton produced in the United States receives Step 2 payment upon proof of export ("held for use outside the United States") outside the United States. As in US – FSC (21.5), the fact that subsidies available under the programme are also granted in a second situation, i.e., when upland cotton produced within the United States is used within the United States "does not dissolve the export contingency arising in the first set of circumstances".[251]

---

outside the United States, subsidies may be granted under the ETI measure in respect of both sets of property. The subsidy granted with respect to the property produced within the United States, and exported from there, is export contingent within the meaning of Article 3.1(a) of the *SCM Agreement*, irrespective of whether the subsidy given in respect of property produced outside the United States is also export contingent."

[245] There, the Appellate Body stated that,

"the fact that some of TPC's contributions, in some industry sectors, are *not* contingent upon export performance, does not necessarily mean that the same is true for all of TPC's contributions. It is enough to show that one or some of TPC's contributions do constitute subsidies "contingent ... in fact … upon export performance".

[246] Exhibit Bra-37 (7 CFR 1427.104).

[247] First Submission of Brazil, paras 92, 98.

[248] Exhibit Bra-37 (7 CFR 1427.104(a)(2)).

[249] Exhibit Bra-37 (7 CFR 1427.104(a)(1)).

[250] First Oral Statement of the United States, paras. 21-22.

[251] Appellate Body Report, *US – FSC (21.5)*, para. 119.

207. Concerning other relevant dispute settlement reports, Brazil believes that the Canada – Aircraft decision is useful precedent. In that case, Canada argued that Technology Partnership Canada (TPC) was a funding mechanism providing "support to a broad base of sectors and technologies" "that result in a high technology product or process for sale in domestic and export markets".[252] Canada claimed that "Brazil has not adduced any evidence to show that TPC contributions are contingent on export performance, in the sense that the contributions would not be paid unless exports took place, that there would be rewards if exports took place. . .".[253] The Appellate Body affirmed the panel's finding of export contingency, noting that "it is enough to show that one or some of TPC's contributions do constitute subsidies 'contingent . . . in fact . . . upon export performance.'"[254] This finding is consistent with the Appellate Body's later decision in US – FSC (21.5). It stands for the proposition that where a programme makes some payments contingent upon export of products, the fact that other payments under the programme are made for domestic use does not eliminate the export contingency of the programmes.

**101. How does Brazil respond to the United States' assertion at paragraph 22 of its oral statement that the programme involves "eligible users" who constitute the "entire universe" of potential purchasers of upland cotton? BRA**

Brazil's Answer:

208. Brazil considers that the United States' statement is not correct. As noted in the previous answer, an "eligible" user cannot include firms that are not "regularly engaged in" opening bales of upland cotton for manufacturing upland cotton products in the United States or exporting upland cotton from the United States.[255] The eligible domestic user criteria exclude all firms that are domestic cotton brokers or simple resellers. Nor would "eligible domestic users" include firms that have not entered into CCC contracts or who open bales but do not use them in the manufacture of upland cotton products or who only occasionally open bales of upland cotton for manufacture of upland cotton products. Similarly, the regulations for eligible "exporters" do not include persons who occasionally export and who are, thus, not considered to be persons "regularly engaged" in exporting upland cotton.[256] Furthermore, the regulations do not cover exporters who have not entered into a CCC contract as exporters eligible for payment.[257]

**102. How does Brazil respond to the United States' assertion at paragraph 129 of its first written submission, that "[t]he programme is indifferent to whether recipients of the benefit of this programme are exporters or parties that open bales for the processing of manufacturing raw cotton into cotton products in the United States." BRA**

Brazil's Answer:

209. Brazil notes that the same "programme indifference" argument could have been made by the United States in the US – FSC (21.5) case (tax deferred whether products produced within or outside the United States) or by Canada in the Canada – Aircraft case (TPC payments made whether products consumed or used domestically or exported). These two Appellate Body decisions clarify that what matters is whether one segment of the programme is contingent upon export. This is consistent with the Article 3.1(a) text that the export contingency be "solely or as one of several other conditions". Step 2 export payments are clearly contingent upon proof of export of US upland cotton by eligible exporters. The fact that another class of persons in a different situation (domestic users) also may

[252] WT/DS70/R, paras. 6.231, 6.235
[253] WT/DS70/R, para. 6.248.

[255] Exhibit Bra-37 (7 CFR 1427.104(a)(1)).
[256] Exhibit Bra-37 (7 CFR 1427.104(a)(2) and (b)).
[257] Exhibit Bra-37 (7 CFR 1427.104(a)(2) and (b)).

receive the payment does not remove this export contingency. Additionally, Brazil notes that Step 2 domestic payments violate Article 3.1(b).

**103. Is the Step 2 programme fund a unified fund that is available for either domestic users or exporters, without a specific amount earmarked for either domestic users or exporters? Please substantiate your response, including by reference to any applicable statutory or regulatory provisions. USA**

**104. How does the United States respond to the data presented in Exhibit BRA-69? Is it accurate? Please substantiate. USA**

**105. Why is the Step 2 programme separated into "domestic users" and "exporters"? Apart from differentiating between exporters and domestic users, with consequential differentiation as to the forms that must be filled out and certain other conditions that must be fulfilled, are the eligibility criteria for Step 2 payments identical? Are the form and rate of payment, as well as the actual payment made, identical? USA**

**106. With respect to paragraph 139 of the United States' first written submission, are Step 2 export payments included in the annual reduction commitments of the United States? If so, why? USA**

**107. Please comment on any relevance, to Brazil's de jure claims of inconsistency with the provisions of the Agreement on Agriculture, of Exhibit BRA-69, which shows Step 2 payments made to (i) domestic users and (ii) exporters. This Exhibit shows that, from FY 91/92 through 02, the Step 2 payments for exporters exceeded those for domestic users in FY 94; FY 95; FY 96 (in fact there were no domestic payments in FY 96); and FY 02. In the other years, the domestic payments are greater than export payments. BRA, USA**

Brazil's Answer:

210. This document is not relevant for either Brazil's Article 3.1(a) or Article 3.1(b) claims under the SCM Agreement. Even if the Step 2 export payments were zero in certain years (which they have never been), it would not remove the export contingency. Similarly, the fact that Step 2 domestic payments were not made in one time period does not resolve their contingency upon use of domestic over imported upland cotton. Brazil's claims are that whenever a Step 2 payment for exported or domestically used upland cotton takes place, this payment is required to be made in a manner inconsistent with Articles 3.1(a) or 3.1(b) of the SCM Agreement and with Articles 3.3 and 8 of the Agreement on Agriculture in the case of Step 2 export payments.

**108. At paragraph 135 of its first written submission, the United States states : "[T]he subsidy is not contingent upon export performance..." (emphasis added). Again, in the course of the first Panel meeting, the United States admitted that the Step 2 payments were "subsidies". Does the United States thus concede that Step 2 payments constitute a "subsidy" within the meaning of the WTO Agreement? USA**

**109. How does the United States respond to Brazil's arguments concerning a mandatory/discretionary distinction and the allegation that certain United States measures (including s.1207(a) of the 2002 FSRI Act) are mandatory? (This is referred to, for example, in paragraph 28 of Brazil's first written submission). Does the United States agree with the assertion that (subject to the availability of funds) the payment by the Secretary of Step 2 payments is mandatory under section 1207(a) FSRI upon fulfilment by a domestic user or exporter of the conditions set out in the legislation and regulations? If not, then why not? To what extent is this relevant here? What determines the "availability of funds"? Please cite any**

**other relevant measures or provisions which you consider should guide the Panel in respect of this issue. USA**

**110. Section 1207(a) of the 2002 FSRI Act provides that during the period beginning on the date of the enactment of the FSRI Act through July 31 2008, " .. the Secretary shall issue marketing certificates or cash payments, at the option of the recipient, to domestic users and exporters for documented purchases by domestic users and sales for export by exporters...". The Panel notes that Brazil does not appear to distinguish between the treatment of (i) cash payments and (ii) marketing certificates in terms of the issue of whether or not a "subsidy" exists. The United States refers to "benefits" and "payments" and "program" in asserting that Step 2 is not export contingent (paragraphs 127-135 of the United States' first written submission).**

**(a) Do the parties thus agree that there is no need to draw any distinction between the treatment of (i) cash payments and (ii) marketing certificates in terms of the issue of whether or not a "subsidy" exists for the purposes of the Agreement on Agriculture? BRA, USA**

Brazil's Answer:

211. Brazil agrees there is no need to draw any distinction between cash payments and "commodity certificates". The Step 2 regulations indicate that Step 2 payments "shall be made available in the form of commodity certificates issued under part 1401 of this Chapter, or in cash, at the option of the programme participants".[258] Part 1401 of the regulations indicated that commodity certificates may be exchanged for cash.[259]

**(b) Why would a domestic user or an exporter select to receive a marketing certificate over a cash payment? What is the proportion of cash payments vs. marketing certificates granted under the programme? USA**

**111. Does the United States maintain its argument that actions based on Article 3.1(b) of the SCM Agreement are conditionally "exempt from actions" due to the operation of Article 13 of the Agreement on Agriculture? USA**

**112. In the event that the Panel finds that Article 6.3 of the Agreement on Agriculture does not preclude an examination of Brazil's claims under Article 3.1 of the SCM Agreement and Article III:4 of GATT 1994, how does the United States respond to the merits of Brazil's claims relating to Step 2 payments under those provisions? USA**

**113. Is it necessary for measures directed at agricultural processors included in AMS to discriminate on the basis of the origin of goods? USA**

**114. With respect to the last sentence of paragraph 22 of Brazil's closing oral statement, could Brazil elaborate on the circumstances in which a local content subsidy would comply with Article 3.1(b) of the SCM Agreement? BRA**

Brazil's Answer:

212. Brazil believes the Panel is referring to paragraph 21 of the final "as delivered" version of Brazil's Closing Statement on 24 July 2003. The text of this sentence reads as follows: "There is also no conflict between Article 3.1(b) of the SCM Agreement and Agriculture Agreement Article 6 or

[258] Exhibit Bra-37 (7 CFR 1427.106).
[259] Exhibit Bra-34 (7 CFR 1401.4(a)).

Annex 3, paragraph 7, because there are two types of domestic subsidies – those that comply with Article 3.1(b) of the SCM Agreement and those that do not." Paragraph 85 of Brazil's First Oral Statement of 22 July 2003 was more precise in focusing on the relevant type of support, i.e., support provided to processors of agricultural products, stating that "[t]here are two types of 'non-green box' support to processors that could benefit producers of agricultural goods: support that violates ASCM Article 3.1(b) and GATT Article III:4 and support that does not."

213. There are no circumstances in which a "local content subsidy" would comply with Article 3.1(b) of the SCM Agreement.

**115. What is the meaning and relevance (if any) to Brazil's claims under Article 3 of the SCM Agreement and Article III:4 of GATT 1994 of the phrase "measures directed at agricultural processors shall be included to the extent that such measures benefit the producers of the basic agricultural products" in the Agreement on Agriculture? BRA, USA**

Brazil's Answer:

214. The phrase from Annex 3, paragraph 7 of the Agriculture Agreement cited by the Panel requires Members to tabulate and include as part of AMS to individual products an amount of benefit provided to producers of basic agricultural products resulting from "measures directed at agricultural processors. . . ". The obligations of Members to comply with reduction commitments tied to AMS, and the obligations of Members under SCM Article 3 and GATT Article III, all apply cumulatively and simultaneously. This phrase recognizes that subsidies to processors of agricultural products may benefit producers of the basic agricultural product and, thus, must be included within total AMS. However, as Brazil has argued, this phrase does not provide an exemption from the SCM Agreement or GATT Article III for such subsidies, and no such exemption can be interpolated into the text.[260] The cumulative nature of the obligations incurred under the WTO Agreement results in the prohibition of certain "measures directed at agricultural processors" that otherwise would be included in the AMS calculation, namely those that are contingent upon the use of domestic over imported agricultural products contrary to Article 3.1(b) of the SCM Agreement.

**116. With respect to paragraph 32 of the oral statement of the EC, are subsidies contingent on the use of domestic goods consistent with the Agreement on Agriculture? Does the phrase "provide support in favour of domestic producers" in Article 3.2 of the Agreement on Agriculture refer to, and/or permit such subsidies? BRA, USA**

Brazil's Answer:

215. Brazil agrees with the EC that Articles 1(a), 3.2, 6.3 of the Agreement on Agriculture include the phrase "domestic support in favour of agricultural producers". And Brazil further recognizes that all types of "domestic support in favour of agricultural producers" must be tabulated for the purposes of setting and enforcing a Member's domestic support reduction commitments (Total AMS). But Brazil notes that neither the EC nor the United States can point to any inherent conflict between these provisions and the prohibition of local content subsidies under Article 3.1(b) of the SCM Agreement for the reasons set forth in Brazil's First Oral Statement and in Brazil's answer to the Panel's Question 114.[261]

216. The EC and the United States fail to acknowledge that there can be subsidies/domestic support measures provided to processors of the basic agricultural product that can be consistent with Article 3.1(b) of the SCM Agreement and that also "provide support in favour of domestic producers". The EC appears to assume that all support to processors of a basic agricultural

[260] First Oral Statement of Brazil, paras. 81-86.
[261] First Oral Statement of Brazil, paras. 81-86.

commodity violates Article 3.1(b) of the SCM Agreement. That is simply not correct. Yet, without this assumption, there is no inherent conflict between the SCM Agreement and the Agreement on Agriculture. The absence of any conflict coupled with the absence of any explicit exemption for local content subsidies in Article 13(b) or anywhere else in the Agreement on Agriculture supports the conclusion that local content subsidies related to agricultural goods violate Article 3.1(b) of the SCM Agreement.

**117. What is the relationship between Step 2 payments to exporters and the marketing loan payments, both of which appear to compensate for the price differences relative to the Liverpool A-Index? For example, is there double compensation? Or is one of the explanations that these export-related price compensatory payments are paid to different operators (namely, the producer, on the one hand under the marketing loan arrangements, and the processor/users (Step 2 programme) arrangements on the other? USA**

**118. Can the United States confirm that it does not rely on Article III:8 of GATT 1994? USA**

G. ETI ACT

**119. How does the United States respond to Brazil's reference to the panel report in India - Patents (EC) (at paragraph 138 of its oral statement at the first session of the first substantive meeting)?[262] How, if at all, should the Panel take this report into account in considering the issues raised by Brazil's claims relating to the ETI Act? USA**

**120. Concerning its claims on the ETI Act, Brazil relies on the US – FSC case. However, it appears that the United States did not raise the issue of the Peace Clause in that case, nor did the United States appear to invoke Article 6 of the Agreement on Agriculture. If the Panel's understanding is correct, how, if at all, are these differences relevant here? Could you direct the Panel to any relevant findings or conclusions by the panel or Appellate Body in that case? BRA**

Brazil's Answer:

217. Brazil is not aware that there are any differences between the US position regarding the peace clause in the US – FSC case and the present case. There is no reference in the entire record of that dispute that the United States ever asserted that the EC's claims regarding the ETI Act were exempt by the peace clause. Also in this dispute, Brazil is not aware that the United States has ever asserted that Brazil's claims regarding the ETI Act were exempted by the peace clause. In this regard, the United States has taken a consistent approach in the present case and in US – FSC.

218. Because the United States never raised the peace clause as a defense in US – FSC, there were no findings by the panel or the Appellate Body regarding the peace clause. And neither the panel nor the Appellate Body held that the EC was required to demonstrate that the United States was not entitled to peace clause protection before proceeding to the substance of the EC's claims against the ETI Act. In any event, the United States has been unable to establish that the ETI Act is consistent

[262] That panel stated: "It can thus be concluded that panels are not *bound* by previous decisions of panels or the Appellate Body even if the subject-matter is the same. In examining dispute WT/DS79 we are not legally bound by the conclusions of the Panel in dispute WT/DS50 as modified by the Appellate Body report. However, in the course of "normal dispute settlement procedures" required under Article 10.4 of the *DSU*, we will take into account the conclusions and reasoning in the Panel and Appellate Body reports in WT/DS50. Moreover, in our examination, we believe that we should give significant weight to both Article 3.2 of the *DSU*, which stresses the role of the WTO dispute settlement system in providing security and predictability to the multilateral trading system, and to the need to avoid inconsistent rulings (which concern has been referred to by both parties). In our view, these considerations form the basis of the requirement of the referral to the "original panel" wherever possible under Article 10.4 of the *DSU*." (footnote omitted)

with Part V of the Agreement on Agriculture. Therefore, the United States does not enjoy peace clause exemption under Article 13(c) of the Agreement on Agriculture.

**121. How do you respond to the reference in paragraph 43 of EC third party oral statement with respect to the relevance of Article 17.14 of the DSU, and, in particular, the phrase "a final resolution to that dispute" (emphasis added)? Please explain the use, and relevance (if any) of the term "disputes" in Articles 9.3 and 12 and Appendix 3 of the DSU, and please cite any other provisions you consider relevant. USA, BRA**

Brazil's Answer:

219. Brazil is of the view that DSU Article 17.14 requires that following the adoption of an Appellate Body report, the parties to the dispute, i.e., the defending and complaining Member, are unconditionally bound by the results of that report. This interpretation is consistent with the Appellate Body decisions in US – Shrimps (21.5)[263] and EC – Bed Linen (21.5),[264] both confirming that panel and Appellate Body reports adopted by the Dispute Settlement Body must be considered final resolutions to a dispute between the parties to that dispute. There is no precedent in the WTO or GATT that would require the Panel to find that the United States alone is bound in this case. It is difficult to imagine, however, how the United States could take a different position in defending against Brazil's ETI claims in this case, in light of the adoption by the DSB of the Appellate Body and panel reports in US – FSC (21.5), and the recommendation by the DSB that the United States bring the ETI Act into conformity with the Agreement on Agriculture and the SCM Agreement.

220. In this case, Brazil challenges exactly the same measure as that found by the panel and the Appellate Body in US – FSC (21.5) to violate the Agreement on Agriculture and the SCM Agreement. There have been no changes to the ETI Act since the adoption of the panel and Appellate Body reports by the WTO Dispute Settlement Body.[265] Brazil challenges the ETI Act with exactly the same rationale as the EC. Thus, there is a complete identity between the "measure" and the "claims" in this case and the US – FSC (21.5) dispute (noting that upland cotton is a sub-set of all the products covered by the ETI Act). Under these circumstances, it is appropriate for the Panel to make similar findings of fact, conclusions of law, and recommendations as the panel and Appellate Body in US – FSC (21.5).[266]

221. Brazil does not consider any of the other provisions cited by the Panel to be relevant to this particular question. Should the Panel wish Brazil to elaborate on any of provisions more specifically, Brazil will be pleased to do so.

[263] Appellate Body Report, *US – Shrimps (21.5)*, para. 97.
[264] Appellate Body Report, *EC – Bed Linen (21.5)*, para. 90-96.
[265] The United States has indicated in its First Submission (para. 189) that both branches of Congress are considering legislative proposals that would repeal the ETI Act. However, Brazil notes that it has been over 18 months since 29 January 2002, the date on which the panel and Appellate Body reports on the ETI Act were adopted by the DSB.
[266] First Oral Statement of Brazil, paras. 138-39.

# ANNEX I-2

## ANSWERS OF THE UNITED STATES TO THE QUESTIONS FROM THE PANEL TO THE PARTIES FOLLOWING THE FIRST SESSION OF THE FIRST SUBSTANTIVE PANEL MEETING

(11 August 2003)

*UPLAND COTTON*

**1. Please confirm that all information and data that you have provided to the Panel relating to "cotton" in fact relates to upland cotton only. BRA, USA**

1. The United States can confirm that, with the exception of export credit guarantees, all of the information and data we have provided to-date relates to upland cotton only. With respect to export credit guarantees, the Commodity Credit Corporation does not maintain data to distinguish transactions involving different types of cotton (for example, upland cotton versus extra-long staple (ELS) cotton). However, the United States has no reason to believe that types of cotton other than upland cotton constitute a material percentage of such transactions.

*PRELIMINARY ISSUES*

*Product scope of Panel's terms of reference relating to Brazil's export credit guarantee claims*

**3. If the request for consultations in this dispute omitted certain products in relation to export credit guarantees, on what basis is it argued that it failed to identify the measures at issue in accordance with Article 4.4 of the DSU? USA**

2. The only export credit guarantee measures identified in the Brazilian consultation request were those in respect of upland cotton. The request for consultations did not identify export credit guarantee measures for any other agricultural commodities.

3. The request for consultations identified the measures subject to consultations in a single sentence:[1]

> The measures that are the subject of this request are prohibited and actionable subsidies provided to US producers, users and/or exporters of upland cotton[1], as well as legislation, regulations, statutory instruments and amendments thereto providing such subsidies (including export credits), grants, and any other assistance to the US producers, users and exporters of upland cotton ("US upland cotton industry").

[1] Except with respect to export credit guarantee programmes as explained below.

Another sentence followed this one, setting out (in a page and a half) a listing of measures that were included within the identification in the first sentence.

4. Apart from the footnote, the first two lines of the sentence quoted in the previous paragraph address "subsidies provided to US producers, users and/or exporters of upland cotton"; thus, apart

[1]WT/DS267/1, at 1.

from the footnote, it is clear that subsidies provided to US producers of, say, soybeans are not included within the scope of the request. Equally, apart from the footnote, it is clear that subsidies provided to, say, banks that finance US cotton exports (but do not produce, use or export cotton) are not included within the scope of the request. To give an example from another part of the request, Brazil's consultation request identified "[e]xport subsidies provided to exporters of US upland cotton under the FSC Repeal and Extraterritorial Income Exclusion Act of 2000" as a challenged measure. Having identified that measure at issue for purposes of DSU Article 4.4 as subsidies provided to upland cotton exporters under that legislation, Brazil could not then have included in its panel request such subsidies provided to exporters of all agricultural commodities or all industrial goods.

5. Brazil, however, contends that "[t]he footnote clarifies that Brazil's request with respect to export credit guarantees is *not* limited to upland cotton."[2] Brazil's contention is incorrect. The footnote does nothing more than direct the reader of the consultation request to look "below" for an explanation. The footnote by itself does not contain any "identification of [a] measure at issue" as required by DSU Article 4.4, and therefore cannot itself bring any additional measures within the scope of the consultation request. Any such additional measures would have to be found -- if anywhere -- in an explanation "below."

6. However, as described in the first US submission, no such explanation or identification of additional measures ever appears. In fact, though Brazil devoted several paragraphs to this issue in its oral statement, it has never pointed to any explanation of any kind -- or any other identification of additional measures -- "below."

7. In addition, the statement of evidence attached to Brazil's consultation request did not include any evidence related to measures other than those for upland cotton. For Brazil to now argue that its consultation request was broader than its statement of evidence is for Brazil to admit that its consultation request was in breach of Article 7.2 of the Subsidies Agreement. Brazil cannot have it both ways.[3]

8. In summary, while Brazil's consultation request did identify measures at issue for purposes of DSU Article 4.4, the measures it actually identified did not include export credit guarantees for agricultural commodities other than cotton. Thus, the latter measures were not within the scope of consultations, were not consulted upon, and could not have been included in Brazil's panel request.

**4. Is it argued that the export credit guarantee programmes concerning upland cotton are each a separate or independent measure, in that they operate independently? USA**

9. The CCC export credit guarantee programme (GSM-102), the CCC intermediate export credit guarantee programme (GSM-103), and the Supplier Credit Guarantee Programme (SCGP) each constitute separate programmes. The distinct operation of the programmes themselves is manifested in both the terms of the particular programmes as well as in the nature of the obligation guaranteed. The GSM-102 and GSM-103 programmes guarantee obligations of banks. SCGP extends exclusively to obligations of importers. Obligations guaranteed under the GSM-102 programme may not extend beyond three years. SCGP guarantees a far lower percentage of principal (65 per cent).

10. Within each programme, allocations are made by country, by commodity, and by amount.[4] Thus, discrete programming decisions are made in connection with each such country, commodity,

[2]Brazil's Opening Oral Statement, para. 90.

[3]In light of the Panel's intended finding on the scope of Brazil's consultation request with respect to export credit guarantees, the United States will be making a request for a preliminary ruling on this point.

[4]*See* 7 C.F.R. §§ 1493.4, 1493.5 (setting forth allocation criteria). These criteria also apply to SCGP. 7 C.F.R. § 1493.400.

programme, and amounts (in terms of a guarantee value).[5] As a result, for the last 10 fiscal years, for example, as described in the First Written Submission of the United States, no cotton transactions occurred under the GSM-103 programme.

11. Furthermore, each export credit guarantee issued is a separate measure. Under DSU Article 4.4, it is incumbent upon Brazil to identify in its consultation request "the measures at issue." Here, Brazil identified the measure as "export credit guarantees . . . to facilitate the export of US upland cotton," and the United States may, and did, rely on that consultation request (including the attached statement of evidence) for notice.

**5. Is there a specification in any legislation or regulation (or any other official government document) which limit or restrict the export credit guarantee programmes at issue exclusively to upland cotton? USA**

12. Programme announcements issued pursuant to applicable programme regulations (7 C.F.R. §§ 1493.10(d), 1493.400(d)) serve to limit the availability of CCC export credit guarantees. These limitations are expressed in terms of one or more of the following criteria: commodities, total guarantee value for individual commodities, destination, and time within which export must occur. Examples of such programme announcements are included as Exhibit US-12. Thus, export credit guarantee offerings through programme announcements may be limited to cotton, pursuant to the authority of programme regulations.

**6. For the purposes of the Panel's examination of Brazil's claims relating to GSM-102, GSM-103 and SCGP under the Agreement on Agriculture and the SCM Agreement, is accurate data and information available with respect to these export credit guarantee programmes concerning upland cotton alone (e.g. with respect to "long-term operating costs and losses")? In this respect, the Panel also directs the parties' attention to the specific questions below relating to the programmes. USA**

13. The United States endeavoured to provide precisely such data with respect to cotton alone in paragraph 173, and associated tables, in its First Written Submission.

**7. Are commitments with respect to export subsidies under the Agreement on Agriculture commodity-specific? How, if at all, is this relevant? BRA, USA**

14. Export subsidy commitments under the Agriculture Agreement are, indeed, commodity specific. Each Member may have a schedule of reduction commitments with respect to specified commodities. To illustrate, the export subsidy reduction commitment schedule of the United States is attached as Exhibit US-13. As reflected in that schedule, for each of the 12 scheduled commodities, the United States has a reduction commitment with respect to both budget outlays and subsidized quantities. Other Members have similar schedules involving different commodities and reduction commitments. In all cases, however, the budgetary and quantitative commitments are unique to each commodity on each Member's respective schedule of export subsidy reduction commitments.

15. An individual Member, therefore, could apply an export subsidy programme with respect to all commodities for which it has undertaken reduction commitments. By operation of such an export subsidy programme, however, a Member may be in conformity with none, some, or all of its commodity-specific reduction commitments. So long as a Member applies such export programme in a given year in accordance with the commodity-specific reduction commitment for each year, such export subsidy programme is permitted with respect to each commodity and conforms fully with respect to Part V of the Agreement on Agriculture. The fact that commitments are taken on a product-

[5] *See* Exhibit US-12.

specific basis confirms that alleged export subsidy measures can be defined on a product-specific basis – and that is exactly what Brazil did here.

16. In contrast, for those specific commodities for which such Member does not have a reduction commitment, then such Member may not provide export subsidies at all in connection with such specific commodities. As a result, the same programme that, as applied, may be entirely in conformity with that Member's reduction commitment vis-à-vis one commodity may be a prohibited subsidy with respect to another commodity.

**8. Does the United States confirm that the questions referred to by Brazil in paragraph 92 of Brazil's oral statement were posed to the United States in the consultations? USA**

17. Yes. When Brazil posed them during the consultations, the United States immediately objected to questions about commodities other than cotton as being outside the scope of the consultations (as paragraph 94 of Brazil's oral statement acknowledges).

**9. How does the United States respond to paragraph 94 of Brazil's oral statement? USA**

18. It is incumbent on the complaining party to identify the specific measure at issue, and it should not fall to the responding party to intuit that measures not specified in the request for consultations are considered included by the complaining party. This deprives the responding party of an opportunity to understand the measures that are at issue and to enjoy the benefit of appropriate consultations. In the final analysis, Brazil essentially argues that its consultation questions and statement at consultations could expand the scope of the measures at issue as identified in its consultation request beyond "export credit guarantees . . . to facilitate the export of US upland cotton." This is not the case. (For further information, please refer to the US answer to Question 3.)

**10. What actual prejudice, if any, has the United States suffered as a result of the alleged omission of products other than upland cotton from the request for consultations? USA**

19. The issue of prejudice is not relevant to the question of whether a measure not consulted upon may be the subject of panel proceedings. The requirement of consultations at the beginning of a dispute is a central characteristic of the dispute settlement system, and is reflected throughout DSU Article 4. Consultations serve a number of important functions, including helping the parties to understand each others' concerns and aiding in efforts to resolve the dispute. The DSU affirms the importance of consultations and *requires* that a Member cannot proceed to a panel unless the Member has consulted on that measure.

20. Article 4.4 delimits the scope of the consultations through its requirement that the complaining Member identify the measures at issue. In light of the jurisdictional nature of the consultation requirement, Article 4.4's explicit requirement that the measures be identified serves the useful role of establishing a bright line as to the matters which are within the scope of the consultations and the dispute. Any resort to an analysis of what topics were actually discussed at the consultations – beyond conflicting with the DSU Article 4.6 requirement that consultations "shall be confidential," designed to facilitate the resolution of the dispute – would invite litigation over the unverifiable recollections of each party.

21. The United States notes that in past disputes in which the scope of the dispute was at issue, it was accepted as a given that the consultation request defined the scope of the consultations. For example, in the *US – Import Measures* dispute, the European Communities did not assert that US actions taken on 19 April 1999 were the subject of consultations even though consultations took place two days later, on 21 April 1999. Instead, accepting that its 4 March 1999, consultation request delimited the scope of the consultations, and could not have covered measures taken after that time,

the EC argued (unsuccessfully) that the April 19 actions were the same measure as that identified in the 4 March consultation request.[6]

22. Brazil's consultation request identified export credit guarantees on upland cotton as the sole export credit guarantee measures within the scope of the consultations and, hence, the dispute. Had it wished to include export credit guarantees with respect to other products within the scope of the consultations, Brazil could have re-filed its consultation request to include these guarantees, much as other Members have re-filed consultation requests when they have wished to expand the scope of the dispute.[7] Brazil chose not to, instead apparently hoping to be relieved of the procedural requirements of the DSU, requirements enforced with respect to, and taken seriously by, other Members.[8]

23. While prejudice is not relevant to whether the scope of this dispute includes export credit guarantees for products other than upland cotton, the United States observes that, not only *has* it suffered prejudice as a result of Brazil's omission of allegations concerning products other than upland cotton, but more importantly, the United States *will* suffer even further prejudice if it is compelled to respond to allegations that Brazil never properly included in its request for consultations. The United States has suffered an inability to prepare, respond, and consult with respect to allegations on measures never presented to the United States in accordance with the DSU. The United States was entitled to rely on the measures identified by Brazil in its request for consultations and also rely on that which Brazil declined to put at issue by its failure to so state in its request. This justifiable reliance is furthered by Brazil's failure to amend its request for consultations after ample notice from the United States of its reasonable understanding of Brazil's request.

24. Consequently, the US has not had proper opportunity to consult with respect to the application of the three separate export credit guarantee programmes and their specific application to the myriad of commodities exported in connection with these programmes nor with respect to the conformity of the WTO obligations of the United States with the application of such programmes to such commodities. If export credit guarantees with respect to other eligible commodities were now included in this dispute, the United States will suffer the prejudice of having to prepare and defend its actions in a severely compressed time frame without the benefit of any consultations whatsoever.

**11. Does the United States agree that Brazil's request for establishment of the Panel can be understood to indicate that Brazil's export credit guarantee claims relates to products other than upland cotton? How, if at all, is this relevant? USA**

25. Brazil's panel request changed the language relating to export credit guarantees to include the words "other eligible agricultural commodities." However, Brazil may not unilaterally alter the scope of the "measures at issue" in its panel request simply by adding measures not previously identified. Thus, while Brazil would have been free to add additional *claims* in its panel request, it was not free to broaden the scope of the challenged *measures*.

26. Indeed, Brazil and at least one third party have argued that in two SPS disputes between the United States and Japan panels found that a complaining party may introduce new claims in its panel

---

[6] Appellate Body report, *United States - Import Measures on Certain Products of the European Communities*, WT/DS165/AB/R, adopted 10 January 2001, para.70.

[7] *See, e.g.*, WT/DS204/1& WT/DS204/1/Add.1 (consultation request supplemented to add measures); WT/DS174/1 & WT/DS174/1/Add.1 (consultation request to add consultations under additional covered agreement).

[8] The United States refers the Panel to the preliminary ruling of the panel in the *Canada Wheat Board* dispute, WT/DS276/12, which necessitated the refiling of the US panel request and establishment of a second panel. Likewise, the United States refers the panel to India's refiling of its panel request in the *US Rules of Origin* dispute (WT/DS243/5/Rev.1) when made aware of deficiencies in that request at the DSB meeting at which the request was considered. *See also* WT/DS210/2 & WT/DS210/2/Rev.1.

request that were not included in its consultation request. In both of these cases, Japan argued that the United States could not introduce new claims (cite to new legal provisions) not in its consultation request. The United States argued, and both panels agreed, that every legal claim need not be included in the consultation request. However, these disputes are not relevant here because they did not involve identifying a new *measure* in the panel request. As noted in the 3d party oral statement of Benin, "claims" and "measures" are distinct concepts; indeed, the distinction between "claims" and "measures" is fundamental.[9]

**12. Please address issues and submit evidence regarding the three export credit guarantee programmes concerned relating to upland cotton and other eligible agricultural commodities in your answers to questions and rebuttal submissions. BRA, USA**

27. In light of the Panel's preliminary ruling and without prejudice to the US position that these measures are not within the scope of this dispute, the United States will respond to Brazil's arguments in the US submissions.

**13. Please include any argumentation and evidence to support your statement during the Panel meeting that the inclusion of such other eligible agricultural commodities would create additional "work" for the Panel with respect to each of these commodities under Article 13 of the Agreement on Agriculture. USA**

28. Article 10.2 defers disciplines on, *inter alia*, export credit guarantees until such time as internationally agreed disciplines are reached – as Members hope to do in the Doha Development Round. Therefore, export credit guarantees are not export subsidies within the meaning of the Agriculture Agreement, and Article 13(c) does not apply. However, for purposes of argument, we note that Article 13(c)(ii) of the Agreement on Agriculture provides that:

> (c) export subsidies that conform fully to the provisions of Part V of this Agreement, as reflected in each Member's schedule, shall be:
>
> * * * * *
>
> (ii) exempt from actions based on Article XVI of GATT 1994 or Articles 3, 5, and 6 of the Subsidies Agreement.

Pursuant to Article 13(c)(ii), to the extent a Member *is* providing export subsidies in conformity with its reduction commitments under Part V of the Agreement on Agriculture, such export subsidies are exempt from action under Article XVI of the GATT and Articles 3, 5, and 6 of the SCM Agreement.

29. Article 13(c) is not relevant with respect to export subsidies granted in connection with commodities not subject to reduction commitments in the applicable schedule of the Member. For example, the United States does not have a reduction commitment with respect to upland cotton. Therefore, the United States may not provide any export subsidy for upland cotton. The Peace Clause protection of Article 13(c) therefore cannot apply to any theoretical export subsidy of the United States for upland cotton.

30. In contrast, however, the United States has reduction commitments for 12 commodities. (Please refer to the response of the United States to Question 7 for a description of how the export subsidy reduction commitments – and therefore export subsidy obligations – of the United States and all other members are, therefore, commodity specific.) Because such commitments are commodity specific, the extent to which Article 13(c)(ii) may apply to export subsidy measures of the United

[9]*See, e.g.*, Appellate Body Report, *Guatemala – Anti-Dumping Investigation Regarding Portland Cement from Mexico*, WT/DS60/AB/R, adopted 25 November 1998, para. 72.

States is also commodity specific. Conformity with WTO obligations and the application of Article 13(c)(ii) to export credit guarantees with respect to those twelve commodities could only be evaluated by an examination of *each* commodity subject to reduction commitments.

*Expired measures*

**14. Please submit evidence regarding the programmes under the 1996 FAIR Act, in particular, production flexibility contract payments and market loss assistance payments, to the extent that they would be relevant to the Panel's determination under Article 13 of the Agreement on Agriculture in your answers to questions and rebuttal submission. USA**

31. The United States will present evidence and arguments regarding payments under the 1996 Act as may be relevant to the Panel's Peace Clause analysis with respect to those measures.

**15. Do the parties agree that it is beyond a Panel's power to recommend a remedy for an expired measure? Could the Panel could be required to examine "expired measures" in order to conduct its assessment of the matter before it? How, if at all, is Article 7.8 of the SCM Agreement relevant to these matters? BRA, USA**

32. The United States agrees that it is beyond a panel's power to recommend that a Member bring into conformity a measure that no longer exists.[10] However, more fundamentally, the issue is whether the expired measures in this dispute could have been measures affecting the operation of any covered agreement within the meaning of DSU Article 4.2 or "measures at issue" within the meaning of DSU Article 6.2. Because the production flexibility contract payments and market loss assistance payments were completed, the programmes terminated, and the statutory instruments providing them superseded before Brazil's consultation and/or panel requests were filed, they could not have been "measures at issue," and they could not properly have been consulted upon or brought within the terms of reference of the Panel. This is a broader concern than whether the Panel may recommend a remedy since findings cannot be made with respect to such expired measures.

33. To determine whether past subsidies may currently be challenged, it is useful to distinguish between recurring and non-recurring subsidies. A non-recurring subsidy is a measure that continues in existence for the duration of the allocation of the subsidy to production.[11] For example, a subsidy to acquire capital stock to be used in future production would be non-recurring and allocated over the useful life of the stock. Where a subsidy is non-recurring and is allocated to future production[12], the measure (subsidy) may continue to be actionable even if the authorizing programme or legislation has expired. For example, in the *Indonesia – Autos* dispute, where a non-recurring subsidy was provided, the panel deemed the measure to continue even though the subsidy programme had allegedly been terminated (and it is worth noting that the termination allegedly occurred well after the panel and consultation requests– in fact, after the second panel meeting).

34. In contrast, a recurring subsidy is typically provided year-after-year and is made in respect of current rather than future production. Once production has occurred and the measure been replaced or

[10]Appellate Body Report, *United States – Import Measures on Certain Products from the European Communities*, WT/DS165/AB/R, adopted 10 January 2001, para. 81.

[11]*See, e.g.*, Report by the Informal Group of Experts to the Committee on Subsidies and Countervailing Measures, G/SCM/W/415, para. 12 (25 July 1997) ("Whether a subsidy is oriented towards production in future periods, consists of equity, or is carried forward in the recipient's accounts were viewed as related to the question whether its benefits persist beyond a single period, and hence whether it should be allocated to future periods.").

[12]Subsidies Agreement, Annex IV, para. 7 (referring to "[s]ubsidies . . . the benefits of which are allocated to future production).

superseded, there would no longer be any measure in existence to challenge. Accordingly, a Report by the Informal Group of Experts to the Committee on Subsidies and Countervailing Measures suggested that recurring subsidies – such as grants for purposes other than the purchase of fixed assets and price support payments – should be expensed, or attributed to a single year, rather than allocated over some multi-year period.[13]

35. In the case of production flexibility contract payments and market loss assistance payments, these measures were subsidies allocated to a particular crop or fiscal year by the respective authorizing legislation. Pursuant to the 1996 Act, the last production flexibility contract payment was made for fiscal year 2002 (1 October 2001 – 30 September 2002) "not later than" 30 September 2002.[14] Pursuant to legislation enacted on 13 August 2001, the last market loss assistance payment was for the 2001 marketing year (1 August 2001 – 31 July 2002), that is, for market conditions prevailing in that year.[15] Once the relevant fiscal year and marketing year, respectively, had been completed, these measures would no longer exist. Thus, by the time of Brazil's consultation and/or panel requests, there were no measures to consult upon nor to be at issue under the DSU; production flexibility contracts and market loss assistance payments therefore do not fall within the Panel's terms of reference.

*Agricultural Assistance Act of 2003*

**16. What, if any, prejudice in terms of the presentation of its case does the United States allege, should the Panel proceed to consider the measures constituting the cottonseed payments under the Agricultural Assistance Act of 2003? USA**

36. It has been a fundamental characteristic of both the GATT 1947 and the WTO dispute settlement systems that proposed measures may not be the subject of dispute settlement. This has meant that dispute settlement proceedings, including consultations, could not begin until the measure at issue actually came into existence. In seeking to bring into the scope of this dispute the Agricultural Assistance Act of 2003, Brazil is seeking to fundamentally expand and change the nature of WTO dispute settlement. This issue goes well beyond the question of whether a particular responding party is prejudiced in a particular dispute and cannot be resolved on the basis of whether such prejudice has occurred. The reasons that the United States would be prejudiced if the Panel considered any measure under the Agricultural Assistance Act of 2003, including a cottonseed payment under that Act, are the reasons that the dispute settlement system has been organized to only allow proceedings on actual, not proposed, measures. First, the responding party would have lost the benefit of consultations on these measures. Consultations serve a number of important functions, including helping the parties to understand each others' concerns and aiding in efforts to resolve the dispute. The DSU affirms the importance of consultations and *requires* that a Member cannot proceed to a panel unless the Member has consulted on that measure. Likewise, the DSU requires that the "measures at issue" be identified in the panel request, and non-existent measures quite simply are not measures at all.

37. Apart from reflecting the importance Members have placed on consultations, the DSU's requirement that a measure exist before it can be the subject of dispute settlement proceedings avoids a waste of resources since anticipated measures may never come into effect, or may, when enacted, be in substantially changed form. Further, allowing challenges to measures not yet in existence would

[13]G/SCM/W/415, paras. 1-12; *id.*, Recommendation 1, at 26-27.

[14]Federal Agriculture Improvement and Reform Act of 1996, § 112(d)(1), Public Law No. 104-127 (4 April 1996); 7 US Code § 7212(d)(1).

[15]Public Law No. 107-25, § 1(a) (23 Aug. 2001) ("The Secretary of Agriculture . . . shall, to the maximum extent practicable, use $4,622,240,000 of funds of the Commodity Credit Corporation to make a market loss assistance payment to owners and producers on a farm that are eligible for a final payment for fiscal year 2001 under a production flexibility contract for the farm under the Agriculture Market Transition Act.").

effectively authorize panels to issue advisory opinions. Should Members desire to expand the scope of the dispute settlement system in this manner, they may do so – indeed could only do so – through amendment of the DSU. The DSU now requires the existence of a measure before consultations may be requested or a panel established.

38. Finally, were the issue of the specific prejudice to the United States relevant in deciding whether a panel's terms of reference could include a measure not in existence at the time of consultations or the panel request, the United States notes that this dispute is already complex, with multiple measures at issue involving multiple claims. To require the United States to address Brazil's allegations on the Agricultural Assistance Act of 2003 would detract from the time and resources available to respond to questions and make arguments relating to those measures that *are* properly within the terms of reference.

**17. (a) What is the relationship of the Agricultural Assistance Act of 2003 to other legislation in the request for establishment of the Panel? BRA, USA**

**(b) Do the legal instruments follow directly one after another, or are there temporal gaps? Are payments authorized under a broad legislative authority or are they specific to each legal instrument? BRA, USA**

**(c) Please provide any implementing regulations. Do these implementing regulations resemble those relating to previous programmes or payments? Are payments made retrospectively? How if at all is this relevant? BRA, USA**

39. (a) The Agricultural Assistance Act of 2003[16] was part of a large piece of legislation covering a diverse range of topics. The Act had several disaster provisions including some relief for sugar interests and more generalized relief for persons who lost other crops. One of the provisions provided for a cottonseed payment to be applied to the 2002 cotton crop (the crop that was harvested in that calendar year):

> Sec. 206. COTTONSEED. The Secretary shall use $50,000,000 of funds of the Commodity Credit Corporation to provide assistance to producers and first-handlers of the 2002 crop of cottonseed.

No law compelled or authorized the cottonseed payment for the 2002 crop except for the 2003 Act, which bears no relation to other legislation cited by Brazil.

40. There was no cottonseed payment authorized in either 2002 or 2001 for the 2001 crop. Cottonseed payments were made for the 1999 and 2000 crops. Of the three pieces of legislation authorizing cottonseed payments for the 1999 and 2000 crops, only one arguably may be found in Brazil's consultation and panel requests. Brazil identifies the "Crop Year 2001 Agricultural Economic Assistance Act (August 2001)" as a challenged measure. The Emergency Agricultural Assistance Act, Public Law No. 107-25 (13 August 2001), authorized a cottonseed payment of $85 million. In addition, Section 204(e) of Public Law No. 106-224, enacted 20 June 2000, directed the Secretary to use $100 million of Commodity Credit Corporation (CCC) funds to provide assistance to producers and first handlers of the 2000 crop of cottonseed. Finally, the cottonseed payment for the 1999 crop was authorized by section 104(a) of Public Law No. 106-113, enacted 19 Nov. 1999; $79 million in residual funds were used for the 1999 crop programme.

41. (b) The temporal gaps between the various cottonseed payments are indicated in the answer to (a), above. That is, no cottonseed payments were made in 2001 or 2002 for the 2001 crop (nor

[16]Public Law No. 108-7 (Feb. 23, 2003).

prior to 1999). This gap serves to emphasize that these payments are *ad hoc*, and there was no legislative guarantee that there would be a payment for any of the years involved until the payment was actually authorized. Thus, what Brazil has termed the "cottonseed programme" is readily distinguished from those programmes under the 2002 Act that recur for each crop harvested from 2002 through 2007.[17] In contrast, the legal authority for each cottonseed payment was separate and distinct; no underlying piece of legislation mandated that cottonseed payments be made.

42. (c) We note that each time a cottonseed payment is authorized, new rules must be issued to disburse the funds because there is no ongoing cottonseed "programme"; thus, when new rules are issued, the old rules are either removed at the same time or had been removed previously. That is, there is no publication that included rules for all three programmes.

43. The cottonseed payment under the 2003 Agricultural Assistance Act is not related to the other cottonseed payments except by subject matter. As indicated at the panel hearing, the text in the Agricultural Assistance Act (quoted above) is broad and simple, leaving much to the Department of Agriculture. Because of the discretion vested in the Secretary to disburse the 2002 crop cottonseed payment, and for reasons of administrative convenience, the 2003 regulations borrow from the regulations that implemented the cottonseed payments for the 2000 crop and for the 1999 crop. On 25 April 2003, the Department published regulations at 68 Federal Register 20331 to disburse funds in respect of the 2002 crop.[18] The regulations to disburse the 2000 crop cottonseed payment were published at 65 Federal Register 65718 (2 November 2000).[19] The regulations to disburse the 1999 crop cottonseed payment were published on 8 June 2000 at 65 Federal Register 36550.[20]

*ARTICLE 13(B): DOMESTIC SUPPORT MEASURES*

*"exempt from actions"*

**20. In paragraph 8 of its initial brief (dated 5 June, 2003), the United States argued that the word "actions" as used in the phrase "exempt from actions" in Article 13 of the Agreement on Agriculture includes the "bringing of a case" and consultations. In paragraph 36 of its first written submission (dated 11 July, 2003), the United States stated as follows:**

**"[P]rior to this point in the process, the DSU rules did not afford the United States any opportunity to prevent the dispute from proceeding through consultations and panel establishment automatically, regardless of the US insistence that its measures conform to the Peace Clause."**

**Is it the United States' understanding that the drafters used the phrase "exempt from actions" knowing that under the DSU it would not be possible fully to exempt "actions", as the United States interprets that term? USA**

44. There is a difference between a commitment to exempt from action and the mechanism to enforce that commitment, just as there is a difference between rights and obligations under the WTO and the mechanism to enforce those rights and obligations. For example, where one Member

[17]Farm Bills are initiated by Agricultural Committees of the US Congress and recur every 5 or 6 years. Programmes provided for in a Farm Bill are generally not tied to finite amounts of money but rather make use of the funds of the Commodity Credit Corporation (CCC), which has borrowing authority in the US Treasury. *See* 15 US Code § 713 a-11 *et seq.* As a result, no appropriation is needed. By contrast, cottonseed payments (similar to other disaster payments) are *ad hoc* with targeted monies.

[18]Exhibit US-14.

[19]Exhibit US-15.

[20]Exhibit US-16.

breaches a tariff binding, another Member will need to resort to dispute settlement in order to resolve the issue. This does not mean that it is not possible to fully obligate the Member to observe its tariff bindings. The similar situation arises with respect to procedural obligations as well.

45. When responding Members have been confronted by situations in which they considered that complaining parties did not meet requirements for invoking dispute settlement procedures, those responding Members can voice their objections at consultations and the DSB meetings at which panel establishment has been considered, but then must accept that the issue will ultimately be decided by the panel. For example, notwithstanding that the DSU requires consultations on a measure before a panel may be established, there is no mechanism available to address a complaining party's failure to consult absent resolution by a panel.

46. Responding Members have allowed jurisdictional issues to go to the panel for resolution as a practical way forward that offers sufficient protection for their interests while also protecting the integrity of the dispute settlement system. This does not mean that responding Members in any way lost their rights, for example, to consult on the measures at issue before being subject to panel proceedings; it has simply been practical to allow the issue to be decided by panels.

47. Likewise, in this dispute, the fact that Brazil has attempted improperly to invoke dispute settlement procedures notwithstanding the Peace Clause – and the fact that the United States has accepted that the issue should be resolved by the Panel – does not and cannot diminish the right of the United States to be exempt from Brazil's action. The fact that Members may disregard their obligations, or act based on a misunderstanding of the facts or obligations, does not affect those obligations. In this case, Brazil considers that the Peace Clause is inapplicable. As our argumentation to date indicates, we disagree and consider that, based on a correct reading of the law and facts, the Peace Clause is applicable, and Brazil was obliged not to bring this dispute. Upon making a finding on this issue in our favour, the Panel would effectively be concluding that Brazil's invocation of dispute settlement was improper – even if undertaken in good faith – just as panels have in the past concluded that complaining parties have improperly included measures that were not consulted upon in their panel requests or claims that were not within the panel's terms of reference in their argumentation.

**21. In US - FSC and US - FSC (21.5) the Appellate Body made findings under the SCM Agreement relating to export subsidies in respect of agricultural products without making a finding in respect of Article 13 of the Agreement on Agriculture. How is this relevant to the United States' interpretation of the phrase "exempt from actions" as used in Article 13? USA**

48. The FSC findings are not relevant since they do not address the Peace Clause issue. The issue was not raised by either party, and so neither the panel nor the Appellate Body made any finding with respect to Article 13, nor did they offer any reasoning on this issue. Indeed, in the absence of any party raising or arguing this issue, it would be difficult to see how the panel or Appellate Body could have made any findings concerning Article 13. Those DSB recommendations and rulings thus provide no guidance for purposes of this dispute.

*"such measures" and Annex 2 of the Agreement on Agriculture*

**22. Please explain the difference, if any, between the meaning of "defined" and the meaning of "fixed" in the phrase "a defined and fixed base period" in paragraph 6(a) of Annex 2 of the Agreement on Agriculture. BRA, USA**

49. These terms should be interpreted according to the customary rules of interpretation of public international law. The ordinary meaning of "defined" is "clearly marked, definite" and "set out

precisely."[21] "Fixed" means "stationary or unchanging in relative position."[22] Thus, as used in paragraph 6(a), a "defined and fixed base period" means a base period that is "set out precisely" and "stationary or unchanging in relative position." That is, the "definite" base period must not be "changing in relative position"; for example, the "base period" for purposes of determining "base acres" for the deficiency payments under the 1990 Act was a farm's average acreage over the three most recent years[23], and so, was not a "fixed" base period but a moving one. On the other hand, US direct payments satisfy this criterion because eligibility is determined by historical production of any of a number of crops (including upland cotton) in a base period that is "definite" (set out in the 2002 Act) and "stationary or unchanging in a relative position" (does not change in relative position for the duration of the 2002 Act).

**23. Please explain the meaning of "a" in "a defined and fixed base period" in paragraph 6(a) of Annex 2 of the Agreement on Agriculture, the meaning of "the" in "the base period" in paragraphs 6(b), (c) and (d), and the difference between these and the phrase "based on the years 1986-88" in Annex 3. BRA, USA**

50. Paragraph 6(a) establishes that eligibility for payments under a decoupled income support measure shall be determined by clearly-defined criteria in "*a* defined and fixed base period." That is, paragraph 6(a) does not mandate that any particular base period be used for a decoupled income support measure and does not mandate that the same base period be used for all decoupled income support measures. This contrasts with the use of the phrase "*the* base period" in paragraph 9 of Annex 3, which is defined in that same paragraph as "the years 1986 to 1988."[24]

51. Paragraphs 6(b), (c), and (d) use the term "*the* base period." As these subparagraphs all follow paragraph 6(a), in which eligibility is set in "a" defined and fixed base period, the later references to "the base period" should be read to refer to the base period used for eligibility under paragraph 6(a). Again, because paragraph 6(a) does not mandate that any particular base period be used (as opposed to paragraph 9 of Annex 3), "the base period" for paragraphs 6(b), (c), and (d) will be the "defined and fixed base period" used for purposes of eligibility under the decoupled income support measure. The definite article "the" is commonly used to refer back to a member of a indefinite set identified by the indefinite article "a." For example, it would be common grammatically to say: "A Member may take action if the Member makes the appropriate notification to the WTO."

**24. How often can a Member define and fix a base period in accordance with paragraph 6 of Annex 2 of the Agreement on Agriculture? BRA, USA**

52. Paragraph 6 establishes policy-specific criteria applying to a decoupled income support measure. Under paragraph 6(a), eligibility for payments under such a measure shall be determined by criteria "in a defined and fixed base period." Other policy-specific criteria under paragraph 6 establish that the amount of payments under a decoupled income support measure shall not be related to or based on the type or volume of production, the prices, or the factors of production employed in any year after the base period used for purposes of determining eligibility under paragraph 6(a).

---

[21]*The New Shorter Oxford English Dictionary*, vol. 1, at 618 (1993 ed.).

[22]*The New Shorter Oxford English Dictionary*, vol. 1, at 962 (1993 ed.).

[23]*See* US First Written Submission, para. 101 n. 92.

[24]Agriculture Agreement, Annex 3, paragraph 9 ("The fixed external reference price *shall be based on the years 1986 to 1988* and shall generally be the average f.o.b. unit value for the basic agricultural product concerned in a net exporting country and the average c.i.f. unit value for the basic agricultural product concerned in a net importing country *in the base period*.") (emphasis added). *See also id.*, Annex 3, paragraph 5 ("The AMS calculated as outlined below for *the* base period shall constitute the base level for the implementation of the reduction commitment on domestic support.") (emphasis added). Appellate Body Report, *Korea - Measures Affecting Imports of Fresh, Chilled and Frozen Beef* , WT/DS161/AB/R - WT/DS169/AB/R, adopted 10 January 2001, paras. 115-16.

Thus, with respect to a decoupled income support measure, the base period used must be "defined and fixed."

53. There is no requirement in paragraph 6 that a *particular* base period be used for a decoupled income support measure nor that the *same* base period be used for purposes of every decoupled income support measure. Thus, so long as the base period for a particular measure is "defined and fixed," this element of the policy-specific criteria in paragraph 6 will be met.

54. For purposes of this dispute, the base period for US direct payments under the 2002 Act is defined by the 2002 Act and fixed for the duration of the 2002 Act – that is, for marketing years 2002-2007. Thus, one "defined and fixed base period" applies for payments under the US direct payment programme for the six-year period to which the 2002 Act applies.

**25. Does the United States consider that there is any ambiguity in the term "type of production" as used in paragraph 6(b) of Annex 2 of the Agreement on Agriculture? USA**

55. When read according to the customary rules of interpretation of public international law, the United States does not consider that the meaning of the term "type . . . of production" as used in paragraph 6(b) is ambiguous or obscure. This paragraph establishes that the amount of decoupled income support payments may not be "based on, or linked to, the type or volume of production . . . undertaken in any year after the base period." Interpreted according to the ordinary meaning of the terms, in context, and in light of the object and purpose of the Agriculture Agreement, this provision means that a decoupled income support measure may not base or link payments to production requirements, whether by type or volume.

**26. Can the United States confirm Brazil's assertions in paragraph 174 of its first written submission that the implementing regulations for direct payments prohibit or limit payments if base acreage is used for the production of certain crops? If so, can the United States clarify the statement in paragraph 56 of its first written submission that direct payments are made regardless of what is currently produced on those acres? Can the United States confirm the same point in relation to production flexibility contracts? USA**

56. The 2002 Act allows any commodity or crop to be planted on base acres on a farm for which direct payments are made with limitations regarding certain commodities. Those commodities are fruits, vegetables (other than lentils, mung beans, and dry peas), and wild rice. Planting of those commodities on base acres is prohibited, except: (1) in a region with a history of double-cropping those commodities with those crops the historical production of which makes acres eligible for direct payments, double-cropping is permitted; (2) on a farm with a history of planting those commodities, planting is permitted, and direct payments would be reduced for every acre so planted; and (3) for a producer with a history of planting those commodities, planting is permitted, and direct payments would be reduced for every acre so planted.[25]

57. To be more precise, the third sentence of paragraph 56 of the US first submission should have used the phrase "whether upland cotton" in place of "what." As the United States has previously indicated,[26] direct payments are not "related to, or based on, the type or volume" of current production

[25]Farm Security and Rural Investment Act of 2002, § 1106 ("2002 Act") (Ex. US-1).

[26]US First Submission, para. 22 ("These [direct] payments are made with respect to farm acreage that was devoted to agricultural production in the past; the payments, however, are made regardless of whether upland cotton is currently produced on those acres or whether anything is produced at all."); *id.*, para. 24 ("As stated, no current production of upland cotton (or any other crop) is required to receive payment – or, put another way, the payment is the same regardless of how much, or any, upland cotton is produced."); *id.*, para. 67 ("Not only is there no requirement that a direct payment recipient engage in any particular type or volume of

because there is *no requirement* that a recipient produce upland cotton or any other crop in order to receive these payments. Direct payments are made with respect to farm acreage that was devoted to agricultural production in the past. In its rebuttal submission, the United States will describe production flexibility contract payments, which would share these characteristics but not others with direct payments, and explain why production flexibility contract payments are "green box" measures.

**29. Please explain the meaning of the words "the fundamental requirement" as used in paragraph 1 of Annex 2 of the Agreement on Agriculture. USA**

58. "Fundamental" means "[s]erving as the base or foundation" and "primary, original; from which others are derived."[27] A "requirement" is "[s]omething called for or demanded."[28] Thus, the "fundamental requirement" that measures for which exemption from reduction commitments under Article 6 is claimed must have "no, or at most minimal, trade-distorting effects or effects on production" is "something called for or demanded" "from which others are derived."

59. The United States, perhaps in distinction from the European Communities, does not view this "requirement" ("something called for or demanded") as merely setting out in hortatory terms the objective of Annex 2. However, as suggested by the use of the word "fundamental" ("from which others are derived") and the structure of Annex 2 (that is, beginning the second sentence with the word "accordingly"), compliance with the fundamental requirement of the first sentence will be demonstrated by conforming to the basic criteria of the second sentence plus the applicable policy-specific criteria of paragraph 6 through 13. Relevant context supports this interpretation: Articles 6.1, 7.1, and 7.2 refer to measures which are not subject to reduction commitments because they qualify under "*the criteria* set out in Annex 2." Article 18.3 requires a Member to notify "details of the new or modified measure and its conformity with the *agreed criteria* as set out either in Article 6 or in Annex 2." Annex 2 itself, in describing the policy-specific criteria that must be met under paragraphs 2 and 5, emphasizes that measures must meet the "*basic criteria* set out in paragraph 1" rather than the "fundamental requirement" of that paragraph.

60. The text and context of paragraph 1 is also confirmed by the object and purpose of the Agriculture Agreement. Members need to be able to design green box measures with certainty that these measures will be exempt from reduction commitments so that they can meet their binding commitments on domestic support in furtherance of the goal of "substantial progressive reductions in agricultural support . . . sustained over an agreed period of time."[29] Assessing the conformity of a claimed green box measure against the "fundamental requirement" of the first sentence in isolation would be a difficult, if not impossible task, for a Panel. Members foresaw the problem and therefore provided guidance on how a measure would fulfill that fundamental requirement – that is, if the measures "conform to the . . . basic criteria" of the second sentence plus any applicable policy-specific criteria, they shall be deemed to have met the fundamental requirement of the first sentence of Annex 2.

**30. Do the parties consider that direct payments and production flexibility contract payments meet or met the basic criteria referred to in paragraph 1 of Annex 2 of the Agreement on Agriculture? BRA, USA**

61. The "basic criteria" referred to in paragraph 1 of Annex 2 are: (a) the support in question shall be provided through a publicly-funded government programme (including government revenue

---

production, a recipient need not engage in any current agricultural production in order to receive the direct payment."); US Opening Statement at the First Panel Meeting, para. 18 ("The payments, however, are made regardless of whether cotton is currently produced on those acres or whether anything is produced at all.").

[28]*The New Shorter Oxford English Dictionary*, vol. 2, at 2557 (1993 ed.)

[29]Agriculture Agreement, preamble.

foregone) not involving transfers from consumers and (b) the support in question shall not have the effect of providing price support to producers. Direct payments under the 2002 Act meet these basic criteria, and the expired production flexibility contract payments under the 1996 Act met these criteria as well.

62. As noted in the US first written submission, direct payments under the 2002 Act are support provided through a publicly-funded government programme not involving transfers from consumers. Under Section 1103 of the 2002 Act, the Secretary of Agriculture "shall make direct payments to producers on farms [including landowners where no production occurs] for which payment yields and base acres are established," and, under Section 1601 of the Act, the Secretary "shall use the funds, facilities, and authorities of the Commodity Credit Corporation to carry out this title." Thus, no transfers from consumers are involved.[30]

63. Direct payments under the 2002 Act also do not have the effect of providing price support to producers. Direct payments augment the income of persons on farms based on historic acres and yields. They are not made to support any "applied administered price" for upland cotton (or that for any other commodity), for example, by increasing upland cotton demand or reducing upland cotton supply.[31] To-date, Brazil has not contested that US direct payments satisfy both "basic criteria" under paragraph 1.

64. As set out in the US answer to Question 15 from the Panel, the expired production flexibility contract payments are not within the Panel's terms of reference. Nonetheless, as we shall explain in more detail in our rebuttal submission, these payments too satisfy the "basic criteria" referred to in paragraph 1 of Annex 2. Production flexibility contract payments provide support through a publicly-funded government programme not involving transfers from consumers.[32] In addition, production flexibility contract payments did not have the effect of providing price support to producers; these payments augmented the income of persons on farms based on historic acres and yields but were not made to support any "applied administered price" for upland cotton (or that for any other commodity). Again, Brazil has not contested that US production flexibility contract payments satisfy both "basic criteria" under paragraph 1.

**31. If the first sentence of paragraph 1 of Annex 2 is not a stand-alone obligation, then must new, non- or minimally trade-distorting measures that do not conform to the criteria listed in Annex 2 be classified as non-Green Box? BRA, USA**

65. As set out in the US answer to Question 29 from the Panel, the United States views the first sentence of paragraph 1 as an obligation in that it establishes a "fundamental requirement" for green box measures under Annex 2. This obligation is met when measures conform to the basic criteria of the second sentence plus the applicable policy-specific criteria of paragraphs 6 through 13. If a new measure does not conform to the basic and applicable policy-specific criteria in Annex 2, it will not have the benefit of the presumption that it meets the fundamental requirement of the first sentence.

**32. If the first sentence of paragraph 1 of Annex 2 expresses a general principle which informs the interpretation of the criteria in Annex 2, please explain how this affects the assessment of the direct payments programme's compliance with paragraph 6 of Annex 2. USA**

[30]*See* US First Written Submission, para. 65.

[31]*See* US First Written Submission, para. 66.

[32]Federal Agricultural Improvement Act of 1996, Title I, § 161(a) ("Use of Commodity Credit Corporation. — The Secretary shall carry out this title through the Commodity Credit Corporation."); *id.*, Title I, § 111 (providing for production flexibility contract payments).

66. As set out in the US answer to Question 29 from the Panel, the United States does not view the first sentence of paragraph 1 as merely setting out a general principle; according to its term, it establishes a "fundamental requirement" for green box measures under Annex 2. However, Annex 2 also indicates that measures that conform to the basic criteria of the second sentence plus the applicable policy-specific criteria of paragraphs 6 through 13 comply with that fundamental requirement. Thus, the first sentence of paragraph 1 provides important context for the interpretation of other provisions of Annex 2.

67. US direct payments satisfy the criteria set out in Annex 2 and therefore comply with the fundamental requirement of the first sentence of paragraph 1. As explained in the US answer to Question 30, US direct payments satisfy the two basic criteria under the second sentence of paragraph 1. In addition, as set out in the US first written submission,[33] direct payments satisfy the five policy-specific criteria set out in paragraph 6 of Annex 2 for decoupled income support.

68. The context provided by the first sentence of paragraph 1 indicates that Brazil's argument that direct payments do not satisfy paragraph 6(b) because payments are eliminated or reduced if payment recipients harvest certain fruits or vegetables is wrong.[34] Brazil's argument essentially is that paragraph 6(b) precludes a Member from requiring a recipient *not* to produce certain crops, rather than precluding a Member from requiring a recipient *to* produce certain crops. As indicated above, however, Brazil's interpretation leads to a conflict between paragraph 6(b) and the fundamental requirement of the first sentence. That is, a measure that demonstrably meets that fundamental requirement (there are no trade-distorting effects or effects on production because production of no crop is allowed) would be inconsistent with paragraph 6(b) (the amount of payment would be based on the type of production – production of no crops – in a year after the base period). In the context of the first sentence of paragraph 1, then, paragraph 6(b) should be read to prevent a Member from requiring a recipient *to produce* certain crops. US direct payments do not require a recipient to produce upland cotton or any other crop in order to receive payment.

*"do not grant support to a specific commodity"*

**33. According to the United States' interpretation of the word "grant", when can a Member claim that a measure is not exempt from action under Article 13(b)? What if the measure is enacted annually? Can the Member obtain a remedy in respect of that measure under the DSU? USA**

69. The United States has interpreted the word "grant" according to its ordinary meaning: to "bestow as a favour" or "give or confer (a possession, a right, etc.) formally."[35] Because the phrase "such measures do not grant support to a specific commodity" is expressed in the present tense, we have explained that this criterion indicates that whether measures currently in effect are exempt from actions depends upon the support they currently grant.[36] For example, whether payments under the 2002 Act can be challenged in the WTO at this time requires an examination of the product-specific support such measures currently grant (understood to be as of the date of the panel request or panel establishment), not the support measures granted 1, 2, or 3 years ago. A finding of a Peace Clause breach by current measures would allow a Member to proceed with an action based on Peace Clause-specified provisions and potentially obtain remedies with respect to those current subsidies.

70. A Member can make the claim that a measure is not exempt from action under Article 13(b) when the Member believes the measures at issue fail to conform to the Peace Clause, including that the Member believes the measure provides support in excess of that decided in 1992. It would not

[33]US First Written Submission, para. 67.
[34]*See also* US Answer to Question 25 from the Panel.
[35]*The New Shorter Oxford English Dictionary*, vol. 1, at 1131 (fourth & fifth definitions).
[36]US First Written Submission, paras. 79-81.

matter whether the measure were enacted annually. If there were a finding of a breach of the Peace Clause, then the complaining party could obtain a remedy in the form of a recommendation to bring the measure into conformity with the WTO agreements.

71. The issue of when a Member can claim that a measure is not exempt from action highlights the difficulty in adopting Brazil's interpretation that *only* budgetary outlays are relevant to the Peace Clause comparison. In the case of US domestic support measures, budgetary outlays are not known ahead of time. Accordingly, Brazil could only provide *estimates* of marketing year 2002 budgetary outlays in its first submission, explaining that "the evidence to tabulate the support granted to upland cotton during MY 2002 is not yet complete as the marketing year does not end until 31 July 2003."[37] Brazil has not demonstrated that US product-specific budgetary outlays for upland cotton exceeded marketing year 1992 outlays as of the time of its panel request, as of the time of panel establishment, nor, indeed, as of today.[38]

72. This problem is not presented when one looks at the support *as decided by* US domestic support measures. Because those measures, both in 1992 and today, set a rate of support (72.9 cents per pound during marketing year 1992; 52 cents per pound during marketing year 2002), the level of support is known at the outset (or even in advance) of the relevant crop year in which payments are made, permitting a rapid challenge and perhaps panel findings before a given crop year is over. Thus, a Member *would* be able to claim that a current measure is not exempt from action under Article 13(b) and *would* be able to obtain a remedy under the DSU.

**35. Does a failure by a Member to comply in a given year with either the chapeau of Article 13(b) or the proviso in subparagraph (ii) of Article 13(b) impact its entitlement to benefit in an earlier or a later year from the exemption from action provided by Article 13(b)? BRA, USA**

73. A failure by a Member to comply in a given year with either the chapeau of Article 13(b) or the proviso in subparagraph (ii) of Article 13(b) would only lift the exemption from action for those measures for the year of that breach. Measures (subsidies) in a later year would remain exempt from action so long as those measures in the given year comply with the conditions in Article 13(b)(ii).

74. This conclusion flows from the text of the Peace Clause as well as the nature of the subsidies challenged by Brazil. The universe of measures exempt from actions under Article 13(b)(ii) is "domestic support measures that conform fully to the provisions of Article 6 of this Agreement including direct payments that conform to the requirements of paragraph 5 thereof, as reflected in each Member's Schedule, as well as domestic support within *de minimis* levels and in conformity with paragraph 2 of Article 6." Because the fundamental commitment under Article 6 is to limit domestic support as measured by the Current Total Aggregate Measurement of Support to a Member's final bound commitment level, and that commitment is judged on a year-by-year basis[39], a Member may breach its commitments under Article 6 in one year and come back into compliance in the following year. Thus, conformity with this element of Article 13 must be judged on a year-by-year basis.

75. The proviso to Article 13 states that such measures shall be exempt from actions "provided that such measures do not grant support to a specific commodity in excess of that decided during the 1992 marketing year." Thus, with respect to past subsidies (and putting aside the issue of whether there is a measure that can be challenged under the DSU), the Peace Clause proviso would require an

[37]Brazil's First Written Submission, para. 149.

[38]*See* US Answer to Question 67 from the Panel.

[39]Agriculture Agreement, Article 6.3 ("A Member shall be considered to be in compliance with its domestic support reduction commitments *in any year* in which its domestic support in favour of agricultural producers expressed in terms of Current Total AMS does not exceed the corresponding annual or final bound commitment level specified in Part IV of the Member's Schedule.") (emphasis added).

examination of the support those measures were granting as of the time such measures were in existence. Were the Peace Clause breached in any particular year, a Member could bring an action against such measure (subsidy), but only for the year of the breach. For example, where subsidies were provided on a yearly basis, a Member could breach the Peace Clause in one year in which the support such measures grant is in excess of that decided during the 1992 marketing year but could be in conformity in the following year if support were again within the 1992 marketing year level. Only the subsidies for the year in which the Peace Clause were breached would not be exempt from actions.

76. Finally, we note that payments under the 2002 Act are recurring subsidies, expensed in the crop year to which they apply and superseded by new payments in the following crop year.[40] (So too were past payments under the expired 1996 Act.) Thus, whether such measures conform fully to Article 6 and do not grant support in excess of that decided during the 1992 marketing year – that is, whether such measures are exempt from action under Article 13(b) – must be judged on a year-by-year basis. A breach of the Peace Clause in any particular year would allow a Member to bring an action against such measures, but only for the year of the breach.

**36. Does a failure by a Member to comply with Article 13(b) in respect of a specific commodity impact its entitlement to benefit in respect of other agricultural products from the exemption from action provided by Article 13(b)? BRA, USA**

77. No. For example, were the Panel to find a breach of the Peace Clause because the product-specific support US measures grant for upland cotton is in excess of that decided during the 1992 marketing year, this would not remove Peace Clause protection for support for soybeans (or any other commodity). In any subsequent action, a complaining Member would have to demonstrate that the challenged measures breach the Peace Clause with respect to that commodity and support.

**37. In the United States' view, why did the drafters not use the exact term "product-specific" in Article 13(b)(ii)? USA**

78. It is not possible to determine exactly why the drafters of Article 13(b)(ii) did not use the term "product-specific support" in place of "support to a specific commodity." Nonetheless, the phrase "support to a specific commodity" must be interpreted according to its ordinary meaning, in context, and in light of the object and purpose of the Agreement. As the United States has explained, this phrase means "product-specific support."[41] We note that while it is no doubt a good *drafting* rule to use one and only one term for any given concept in an agreement, the drafters' failure to follow that rule does not alter a treaty *interpreter's* obligation to interpret under the customary rules of public international law the words that actually are in the treaty.

79. Further, it is not surprising that this exact phrase is not used in the Peace Clause. The phrase "product-specific support" is not a defined term to be found in Agriculture Agreement Article 1. Not surprisingly, then, in different provisions the Agriculture Agreement uses different words to describe the concept of product-specific support. For example, in Article 1(a), the basic definition of product-specific support (although not identified as such) is given as "support . . . provided *for* an agricultural product in favour of the *producers* of the basic agricultural product." In Article 1(h), the Agreement again refers to product-specific support not by using that term but by using the words "support for basic agricultural products."[42] None of these references to "product-specific support" even uses the term "specific" whereas the phrase "support to a specific commodity" contains all three elements of that phrase (that is, product, specific, and support), using "commodity" in place of

[40]*See* US Answer to Question 15 from the Panel.

[41]US First Written Submission, paras. 77-78.

[42]Similarly, in Annex 3, paragraph 6, the Agreement refers to a "product-specific" AMS not by using those words but by using the phrase "for each basic agricultural product, a specific AMS shall be established."

"support."[43] The use of the phrase "support to a specific commodity" in the Peace Clause to refer to "product-specific support" is not remarkable in light of these multiple examples of different words in the Agreement that describe the same concept.[44]

**38. Given the fact that subsidies available for more than one product could have various effects on production, how does the United States demarcate between product-specific support and non-product specific support ? USA**

80. The phrase "support to a specific commodity" in the Peace Clause proviso, read according to its ordinary meaning, in context, and in light of the object and purpose of the Agreement, means "product-specific support." The United States finds the demarcation between product-specific and non-product-specific support in the Agriculture Agreement. Specifically, Article 1(a) defines the universe of support making up the Aggregate Measurement of Support as follows:

> "Aggregate Measurement of Support" and "AMS" mean the annual level of *support,* expressed in monetary terms, *provided for an agricultural product in favour of the producers of the basic agricultural product or non-product-specific support provided in favour of agricultural producers in general,* other than support provided under programmes that qualify as exempt from reduction under Annex 2 to this Agreement . . . (italics added).

Article 1(h), which defines the "Total Aggregate Measurement of Support,"[45] and paragraph 1 of Annex 3, explaining the calculation of the Aggregate Measurement of Support[46], also distinguish between product-specific and non-product-specific support, without providing additional detail to that found in Article 1(a).

81. Article 1(a), therefore, provides the basic demarcation between product-specific and non-product-specific support; as mentioned at the first panel meeting, Brazil has not contested this point. Product-specific support, then, is "support . . . provided for an agricultural product in favour of the producers of the basic agricultural product." This definition contains two elements. First, the support must be provided "*for an agricultural product*," which suggests that the subsidy is given "in favour of"[47] a product and not in respect of criteria not related to the product or in respect of multiple products. Second, such support is "in favour of the *producers of the basic agricultural product*,"

---

[43]Again, the use of the term "commodity" in place of "product" may result from the unique negotiating history of the Peace Clause. While the term "product" is used exclusively elsewhere in the Agreement, in the course of the Uruguay Round agriculture negotiations, the term "commodity" had been commonly used. *See, e.g.*, Framework Agreement on Agriculture Reform Programme, Draft Text by the Chairman, MTN.GNG/NG5/W/170, paras. 3, 5, 6, Annex I (11 July 1990). Despite the fact that the Peace Clause uses "commodity" in place of "product," Brazil has not suggested that "commodity" should be interpreted as anything other than agricultural "products" subject to the Agreement.

[44]The United States also notes that under paragraph 1 of Annex 3, non-product-specific support is to be aggregated into one separate AMS, which supports the notion that non-product-specific support is *not* to be allocated to specific products, contrary to what Brazil urges the Panel to do here.

[45]Agriculture Agreement, Article 1(h) ("'Total Aggregate Measurement of Support' and 'Total AMS' mean the sum of all domestic support provided in favour of agricultural producers, calculated as the sum of all aggregate measurements of *support for basic agricultural products*, all *non-product-specific aggregate measurements of support* and all equivalent measurements of support for agricultural products . . . .").

[46]Agriculture Agreement, Annex 3, paragraph 1 ("Subject to the provisions of Article 6, an Aggregate Measurement of Support (AMS) shall be calculated *on a product-specific basis for each basic agricultural product* receiving market price support, non-exempt direct payments, or any other subsidy not exempted from the reduction commitment ('other non-exempt policies'). *Support which is non-product specific shall be totalled into one non-product-specific AMS* in total monetary terms." (emphasis added)).

[47]*The New Shorter Oxford English Dictionary*, vol. 1, at 996 (1993 ed.) (definition of "for": "in favour of"; "[w]ith the purpose or result of benefitting").

which suggests that subsidy benefits those who produce the product – that is, production is necessary for the support to be received.

82. Article 1(a) explains non-product-specific support as "support provided in favour of agricultural producers in general." That is, non-product-specific support is not support provided "for *an* agricultural product" and is not support in favour of "the *producers* of the basic agricultural product" but rather is support in favour of agricultural producers "generally."[48] Thus, read according to its ordinary meaning and in the context of Article 1(a), non-product-specific support is a residual category of support covering those measures that do not fall within the more detailed criteria set out in the definition of product-specific support.

83. Finally, we note Brazil's argument that "[t]he term 'product-specific' that the United States seeks to read into Article 13(b)(ii) has a very technical and particular meaning as set out in Article 6(4), and Annex 3 to the Agreement on Agriculture."[49] As explained above, while both of these provisions use the term "product-specific" as well as "non-product-specific," the Panel will search these provisions in vain for a "technical and particular meaning" of either of these terms. Brazil fails to direct the Panel's attention to the only explanation of the meaning of those terms, Article 1(a), perhaps because this explanation of the "technical and particular meaning" of product-specific support suggests that several of the measures challenged by Brazil provide non-product-specific support and are not part of the comparison under the Peace Clause proviso.

**39. If "such measures" in Article 13(b)(ii) refers to all those in the chapeau of Article 13(b), why are they not all included in the potential comparisons with 1992? In what circumstances can measures which grant non-product specific support lose exemption from action under Articles 5 and 6 of the SCM Agreement and Article XVI of GATT 1994? USA**

84. The introductory phrase of Article 13(b) establishes the full universe of measures that are potentially exempt from actions under this provision – that is, domestic support measures "that conform fully to the provisions of Article 6." The phrase "such measures" in Article 13(b)(ii) occurs in the proviso, and the use of the word "such" refers back to those measures identified in the introductory phrase. However, the type of support that must be compared pursuant to the proviso is set out by the *text* of the proviso: the comparison is not between the *total* (product-specific and non-product-specific) support provided by all measures that existed in 1992 versus those that exist currently; rather, the proviso comparison is between the "support to a specific commodity" that challenged measures grant versus that decided during the 1992 marketing year.

85. With respect to Article 13(b), then, the Peace Clause has two tiers of analysis and effect. First, non-green box domestic support measures collectively lose Peace Clause protection if they do not conform fully to the provision of Article 6 – that is, if they exceed a Member's domestic support commitment level. Second, even if a Member's Current Total Aggregate Measurement of Support is within the reduction commitment, the support to a specific commodity can still lose its Peace Clause protection if it exceeds the level decided during marketing year 1992. This second tier was intended to prevent a Member from increasing its non-green box support to a specific commodity while staying within the domestic support commitment level. When a Member *has* disciplined its product-specific support, however, by staying within the level decided during the 1992 marketing year (as the United States has done), it is entitled to the benefit of observing that commitment.

86. Finally, we note that Brazil's interpretation of the proviso calls for allocating support from all non-green box measures to an agricultural product regardless of whether that support is product-

[48] "In general" means "in general terms, generally" and "as a rule, usually." *The New Shorter Oxford English Dictionary*, vol. 1 , at 1073 (1993 ed.).

[49] Brazil's Opening Oral Statement at the First Panel Meeting, para. 16.

specific or non-product-specific. This analysis has no foundation in the Agriculture Agreement. In fact, Brazil has not followed its own approach through to its logical conclusion: as alluded to by Question 41 from the Panel, presumably Brazil could have taken *all* non-product-specific support provided by the United States and allocated some portion of that support to upland cotton producers. Brazil has not done so, but there is no basis in the Agreement to distinguish the non-product-specific support Brazil excluded from the non-product-specific support Brazil *included* for purposes of its Peace Clause analysis (for example, counter-cyclical payments and crop insurance). The only basis to distinguish whether a measure provides "support to a specific commodity" that is found in the Agriculture Agreement is to rely on the distinction between product-specific and non-product-specific support as explained in Article 1(a).

**43. What are the precise differences between deficiency payments and counter-cyclical payments that lead you to classify the former as product-specific and the latter as non-product specific? How do you classify market loss assistance payments? USA**

87. As indicated in the US answer to Question 38 from the Panel, Article 1(a) of the Agriculture Agreement provides the demarcation between product-specific and non-product-specific support. The definition of product-specific support contains two elements. First, the support must be provided "*for an agricultural product*," which suggests that the subsidy is given in respect of a product and not in respect of criteria not related to the product or in respect of multiple products. Second, such support is "in favour of the *producers of the basic agricultural product*," which suggests that subsidy recipients are those who produce the product – that is, production is necessary for the support to be received. Non-product-specific support is a residual category of "support provided in favour of agricultural producers in general" – that is, "generally."

88. In light of these definitions, it follows that deficiency payments under the 1990 Act were product-specific support whereas counter-cyclical payments are non-product-specific. The relevant differences may be summarized as follows:

| **Deficiency Payments** | **Counter-Cyclical Payments** |
|---|---|
| Farmer must plant upland cotton to receive payment | No requirement to plant upland cotton (or any crop) |
| Payment based on acres "planted for harvest" to upland cotton in that crop year | Payment based on historical "base acres" irrespective of acres currently planted to upland cotton |

In short, deficiency payments required production of upland cotton whereas counter-cyclical payments do not. Thus, deficiency payments were support *for* upland cotton in favour of *the producers* of upland cotton.

89. In order to receive a deficiency payment, a producer was *required* to plant upland cotton for harvest. The "farm programme payment acreage" for an individual farm – that is, the acres on the farm for which the producer would receive a deficiency payment in a given crop year – was defined as "the smaller of the maximum payment acreage or *the acreage planted to the crop on the farm for harvest* within the permitted acreage of the crop of the farm."[50] That is, a farmer would be paid on the acres planted to upland cotton for harvest up to the maximum payment acreage. Under the programme regulations, "crop acreage planted for harvest" was generally defined as "[t]he acreage

[50]7 Code of Federal Regulations § 1413.108(d) (1 Jan. 1993) (emphasis added) (Exhibit US-3); 7 US Code § 1444-2(c)(1)(B)(i) (1992 Supp.) (4 January 1993) (Exhibit US-5).

harvested."[51] Thus, in a given crop year, production was required to receive a deficiency payment, and the amount of the deficiency payment was based on the acreage on which upland cotton was harvested. Thus, both elements of the definition of product-specific support in Article 1(a) are satisfied. The deficiency payment was support for an agricultural product in favour of the producers of the product because recipients had to have planted upland cotton for harvest to receive payment in a given crop year.

90. On the other hand, counter-cyclical payments are decoupled from production requirements. Counter-cyclical payments are made to persons with farm acres that were devoted to production of any of a number of crops, including upland cotton, during an historical base period. That base period was defined in the 2002 Act and is fixed for the life of the legislation (that is, for marketing years 2002-2007).[52] However, a person with "upland cotton base acres" need not produce upland cotton (nor any other particular crop) to receive the counter-cyclical payment. A person with "upland cotton base acres" also need not produce any crop at all. Thus, counter-cyclical payments do not satisfy the definition of product-specific support: they are not payments *for* an agricultural product in favour of *the producers* of the product since *no production of any product, including upland cotton, need occur for payment*.

91. As indicated in our 1999 WTO domestic support notification (G/AG/N/USA/43), the United States believes that market loss assistance payments are non-product-specific amber box support. As with production flexibility contract payments, market loss assistance payments were made to persons with farm acres that previously had been devoted to production of certain crops, including upland cotton, during an historical base period. No production of upland cotton or of any other crop was required to receive payment, and no production was required at all. Thus, these payments do not meet the definition of product-specific support in Annex 1(a).

92. However, the United States did notify these payments as amber box because they were made in response to low prevailing commodity prices. As such, the United States does not consider that they conform to the criterion in paragraph 6(c) of Annex 2 that the amount of decoupled income support payments "in any given year shall not be related to, or based on, the prices, domestic or international, applying to any production undertaken in any year after the base period". We note that while Brazil has included market loss assistance payments in its Peace Clause comparison, it has not contested the US position (as evidenced by G/AG/N/USA/43) that these payments are non-product-specific amber box support.[53]

**45. If the Panel considered that Step 2 payments paid to exporters were an export subsidy, would the United States count them as domestic support measures for the purposes of Article 13(b)? Please verify Brazil's separate data for Step 2 export payments and Step 2 domestic payments in Exhibit BRA-69 or provide separate data. BRA, USA**

[51]7 Code of Federal Regulations § 1413.4(b) (1 Jan. 1993) (Exhibit US-3). Under the 1990 Act, there were so-called 50-92 provisions, under which a producer could devote part of the maximum payment acreage (that is, 85 per cent of the established crop acreage base less any acreage under an acreage reduction programme) to conserving uses and still receive deficiency payments on the acreage. To take advantage of that provision, the producer was still required to plant upland cotton for harvest on *at least* 50 per cent of the maximum payment acreage. 7 US Code § 1444-2(c)(1)(D)(ii) (1992 Supp.) (4 Jan. 1993) ("To be eligible for payments . . . the producers on a farm must actually plant upland cotton for harvest on at least 50 per cent of the maximum payment acres for cotton for the farm.") (Exhibit US-5).

[52]By way of contrast, under the deficiency payment program, "base acres" were determined by a farmer's yearly upland cotton planting decisions. Base acres were defined as "the average of the acreages planted and considered planted to such crop for harvest on the farm in each of the 3 crop years preceding such crop year." 7 Code of Federal Regulations § 1413.7(c) (1 Jan. 1993) (Exhibit US-3).

[53]*See* Brazil's First Written Submission, paras. 60-62.

93. If the Panel were to conclude that the Step 2 programme and payments made thereunder could be separated in to domestic and export components, and the export component were deemed to be an export subsidy, logically, that component would no longer constitute domestic support. Therefore, that measure would not form part of an analysis under Article 13(b), but rather would fall under Article 13(c). For data relating to Step 2 payment by fiscal year and use, please see the US answer to Question 104 from the Panel.

**46. What is the relevance, if any, of the concept of "specificity" in Article 2 of the SCM Agreement and references to "a product" or "subsidized product" in certain provisions of the SCM Agreement to the meaning of "support to a specific commodity" in Article 13(b)(ii) Agreement on Agriculture? BRA, USA**

94. The concept of specificity in Article 2 of the Subsidies Agreement is entirely unrelated to the meaning of "support to a specific commodity" in Article 13(b)(ii) of the Agreement on Agriculture. Generally, under Article 2 of the Subsidies Agreement, a subsidy is specific if it is limited, in law or in fact, to "an enterprise or industry or group of enterprises or industries." The relevant context for "support to a specific commodity" is found in Articles 1(a), 1(h), 6.4, and Annex 3 of the Agriculture Agreement.

*"in excess of that decided during the 1992 marketing year"*

**47. Where does Article 13(b)(ii) require a year-on-year comparison? BRA, USA**

95. Please see the US answer to Question 35 from the Panel for a reply to this question.

**48. Does Article 13(b)(ii) require a comparison of support granted with support decided? How could such a comparison be made? BRA, USA**

96. The proviso to Article 13(b)(ii) requires a comparison of the product-specific support that challenged measures grant (in this case, for upland cotton) to the product-specific support decided during the 1992 marketing year. The United States agrees with Brazil that the Peace Clause proviso requires an apples-to-apples comparison. However, while Brazil's proposed comparison (the budgetary outlays that may be allocated to a commodity, whether product-specific or non-product-specific) has no grounding in the text or context of the Peace Clause, the United States believes the basis for this comparison is established by the use of the word "decided."

97. The term "decided" is not explicitly defined in the Agreement and is not used elsewhere in the Agriculture Agreement nor in the Subsidies Agreement to refer to support or subsidies. Members' unique choice of words must be given meaning. "Decide" means to "[d]etermine on as a settlement, pronounce in judgement" and "[c]ome to a determination or resolution *that, to do, whether*."[54] Thus, the basis for the comparison under the Peace Clause proviso is the product-specific support that was "determined" or "pronounced" during the 1992 marketing year. US measures "decided" product-specific support for upland cotton in terms of a rate of 72.9 cents per pound through the combination of marketing loans and deficiency payments. Thus, to make an apples-to-apples comparison, this rate of support must be compared to the rate of support that challenged measures "grant."

98. Contrary to Brazil's assertion, the use of the term "grant" does not compel an examination of budgetary outlays. The ordinary meaning of "grant" is to "bestow as a favour" or "give or confer (a possession, a right, etc.) formally".[55] Thus, the use of the term "grant" would permit an evaluation of the rate of support that challenged measures "give or confer . . . formally". Brazil's reference to

[54]*The New Shorter Oxford English Dictionary*, vol. 1, at 607 (first and third definitions) (italics in original).

[55]*The New Shorter Oxford English Dictionary*, vol. 1, at 1131 (fourth & fifth definitions).

footnote 55 of the Subsidies Agreement[56] is not pertinent as this is one of several Subsidies Agreement references to a *Member* granting a *subsidy*,[57] which differs from the Peace Clause phrase, "such *measures* do not grant support". More importantly, Members did not choose to use the word "granted" in place of "decided", and a valid interpretation must make sense of that choice rather than reading it out of the Agreement. In addition, had Members intended the Peace Clause comparison to be made *solely* on the basis of budgetary outlays, they could have used that term. After all, "budgetary outlays" is a defined term in Article 1(c) and repeatedly referred to in the Agreement.[58]

99. Thus, the comparison of the product-specific support "decided" during the 1992 marketing year to the support challenged measures "grant" must be made on the terms established by US measures themselves. The United States decided to ensure producer support at a rate of 72.9 cents per pound of upland cotton during the 1992 marketing year. In this case, the comparison presents no difficulty because the challenged measures also grant a rate of support (52 cents per pound). Because the latter is not in excess of the former, challenged US domestic support measures are exempt from actions pursuant to Article 13(b)(ii).

**50. Please provide any written drafting history which could shed light on why the proviso was added to what is now Article 13(b)(ii) and, in particular, why both words "grant" and "decided" were used. USA**

100. The United States is not aware of any written drafting history on this point.

**51. Could the United States please comment on the interpretation advanced by the EC, in paragraphs 16 and 18 of its oral statement, of the words "decided during the 1992 marketing year"? USA**

101. The United States agrees with parts of the interpretation advanced by the EC. The Communities too see the use of the term "decided" in the Peace Clause as notable and suggest that it compels an examination of "an amount of support adopted by some form of decision". The Communities argues that a Member cannot be deemed to have "decided" all of the "applications for support under a particular programme" (as is implied by an examination of budgetary outlays) and that the term "decided" cannot "set up a comparison between domestic support [actually] granted in 1992 and domestic support granted in a more recent period". The United States agrees with these statements.

102. The Communities also advance argumentation that may not flow from the ordinary meaning of the term "decided." For example, the Communities suggests that the term "implies a one-off decision", without further explanation. It would appear that the support "decided" during a marketing

[56]*See* Subsidies Agreement, fn. 55 ("For a developing country Member not granting export subsidies as of the date of entry into force of the WTO Agreement, this paragraph shall apply on the basis of the level of export subsidies granted in 1986.").

[57]*See, e.g.*, Subsidies Agreement, Article 2.1(c) ("Such factors are: . . . the manner in which discretion has been exercised by the granting authority in the decision to grant a subsidy"); *id.*, Article 3.2 ("A Member shall neither grant nor maintain [prohibited] subsidies referred to in paragraph 1."); *id.*, Article 4.1 ("Whenever a Member has reason to believe that a prohibited subsidy is being granted or maintained by another Member, such Member may request consultations with such other Member."); *id.*, Article 7.1 ("Except as provided in Article 13 of the Agreement on Agriculture, whenever a Member has reason to believe that any subsidy referred to in Article 1, granted or maintained by another Member, results in injury to its domestic industry, nullification or impairment or serious prejudice, such Member may request consultations with such other Member."); *id.*, Article 9.2 ("Upon request for consultations under paragraph 1, the Member granting or maintaining the subsidy programme in question shall enter into such consultations as quickly as possible."); *id.*, Article 25.2 ("Members shall notify any subsidy as defined in paragraph 1 of Article 1, which is specific within the meaning of Article 2, granted or maintained within their territories.").

[58]*See* Agriculture Agreement, Articles 3.3, 9.2; *id.*, Annex 3, paras. 2, 10, 12, 13; *id.*, Annex 4, para. 2.

year could be made through more than one decision, however. In addition, the Communities suggests that this decision is one "in which support for a specific product is decided and allocated for future years." While it may be that a Member decided support for a future year during the 1992 marketing year, forming the benchmark for the comparison under the Peace Clause proviso, it would also appear likely that a Member decided on a level of support for the marketing year during that marketing year. Thus, the support decided during the 1992 marketing year would not appear to be necessarily limited to support for future years.

**52. Please comment on an interpretation of the words "decided during" in Article 13(b)(ii) that would read them as synonymous with the words "authorized during". BRA, USA**

103. The ordinary meaning of the words "decided during" would be "determined or pronounced during" or "having come to a determination or resolution that or to do during." The United States understands that the term "decided during" was intended to capture not just a decision during 1992 for 1992, but also, as the EC indicates, a decision in 1992 of the support to be granted in a future year, in particular the EC's decision during 1992 for future years. The term "authorized during" would not appear to capture all of these dimensions of the term "decided during". In fact, a measure could be "authorized" during 1992 based on a "decision" during an earlier year so the two terms are not synonymous.

**54. Please identify all United States legal and regulatory and administrative instruments decided during the marketing year 1992, with the respective dates of decision, that decided support for upland cotton. BRA, USA**

104. The level of support decided during marketing year 1992 was to ensure a rate of return to producers of 72.9 cents per pound. Numerous legal, regulatory, and administrative instruments "determined" or "pronounced" this support. This level of support was first determined or pronounced by the 1990 Act, which covered the 1991-1995 marketing years. This legislation stated that "[t]he established price for upland cotton shall not be less than $0.729 per pound" for deficiency payments[59] and promised to make up the difference between that price and the higher of the (1) marketing loan rate or (2) market price. The 1990 Act was enacted on 28 November 1990. We note that the established price was set at "not less than" 72.9 cents per pound; that is, the Secretary of Agriculture was given some discretion to set the effective price so long as this did not fall below 72.9 cents. The Secretary, in fact, did not decide to alter this effective price prior to, during, or after the 1992 marketing year.

105. The Secretary decided on the marketing loan rate applicable for the 1992 crop via a series of regulations. A proposed rule was published on 13 September 1991, at 56 Federal Register 46574. The final decision on a loan rate of 52.35 cents per pound was announced on 31 October 1991, published on 20 April 1992, at 57 Federal Register 14326.[60] Those determinations applied to all marketings during marketing year 1992.

106. The United States decided to maintain the effective price for deficiency payments and loan rate for marketing loans at those levels during the 1992 marketing year as reflected in several published documents. The 1 January 1993, Code of Federal Regulations (Exhibit US-3) codified these levels of support.[61] The 1992 Supplement to the US Code also codified the legislated effective price of "not less than" 72.9 cents per pound. In addition, the Department of Agriculture published an upland cotton fact sheet in September 1992 announcing that "[t]he 1992 target price [for deficiency payments] is 72.9 cents per pound" and the "1992 loan rate . . . is 52.35 cents per pound".[62]

[59]7 US Code § 1444-2(c)(1)(B)(ii) (1992 Supp.) (4 Jan. 1993) (Exhibit US-5).
[60]Exhibit US-2.
[61]7 Code of Federal Regulations § 1413.104(a) (1 Jan. 1993) (Exhibit US-3).
[62]US Department of Agriculture, Upland Cotton Fact Sheet, at 2 (September 1992) (Exhibit US-17).

107. Finally, we note that in anticipation of the 1993 crop year the Department of Agriculture also initially pronounced the level of support for the 1993 crop year during the 1992 marketing year. On 24 March 1993, regulations were published at 58 Federal Register 15755 setting the marketing loan rate at 52.35 cents per pound and leaving undisturbed the effective price for deficiency payments at 72.9 cents per pound.[63] Thus, the support decided for the 1993 crop was the same as that decided for the 1992 crop: to ensure producer support of 72.9 cents per pound of upland cotton.[64]

**55. Please provide a copy of the instrument in which the rate of support for upland cotton during the marketing year 1992 was decided, indicating the date of the decision. USA**

108. As indicated in the US answer to Question 54 from the Panel, the United States has provided copies of multiple legal, regulatory, and administrative instruments and publications reflecting the rate of support decided during marketing year 1992. These multiple decisions stem from the fact that an effective price and marketing loan rate were first published in advance of the 1992 marketing year in order to allow producers to become familiar with the programmes; subsequently, the Secretary of Agriculture decided not to change either the effective price (72.9 cents per pound) or the marketing loan rate (52.35 cents per pound), despite having the authority to do so.

**56. Could the United States please explain how support granted under legislation that dates back to 1990 can have been support "decided during the marketing year 1992"? USA**

109. Payments during the 1992 marketing year were made pursuant to the 1990 Act, which directed the Secretary of Agriculture to make marketing loan payments and deficiency payments (as well as Step 2 payments). The 1990 Act, however, was only the first decision on the level of support. The Act provided that the marketing loan rate could "not be reduced below 50 cents per pound".[65] The 1990 Act also stated that the "established price for upland cotton shall not be less than $0.729 per pound".[66] Thus, the Secretary had discretion to alter those rates of support.

110. The Secretary decided to set the marketing loan rate at 52.35 cents per pound in April 1992 but also decided not to change the implementing regulations establishing the effective price for deficiency payments. Similarly, during the 1992 marketing year, the Secretary had the discretion *to raise* the deficiency payment target price above 72.9 cents per pound and *to raise* the marketing loan rate above 52.35 cents per pound but decided not to. Documents published during 1992 evidence this decision: the 1992 supplement to the United States Code published in January 1993 reflects the decision not to alter the statutory provisions relating to upland cotton rates. The 1993 Code of Federal Regulations was published in January 1993 and also reflects the decision not to alter the regulatory rate provisions. Finally, when the upland cotton fact sheet was published in September 1992, the effective price and marketing loan rate were left unchanged, reflecting the Secretary's decision not to change the level of support.

111. In this case, the support determined or pronounced by US measures during the 1992 marketing year was also the support determined or pronounced for the 1992 marketing year. This result is entirely consistent with the Peace Clause text; in fact, it provides certainty to both Members seeking to provide support within Peace Clause limits and Members seeking to understand whether the Peace Clause has been breached.

[63]A proposed rule for the 1993 crop was published on 29 September 1992. The 1993 rates were announced on 2 November 1992, and published in the 24 March Notice.

[64]We note that one distinction made by the 24 March 2003 regulations between the 1993 crop and the 1992 crop was that the acreage reduction program percentage was lowered from 10 per cent in 1992 to 7.5 per cent in 1993.

[65]7 U.S.C. 1444-2(a)(1), (2)(A) (1992 Supp.) (Jan. 4, 1993) (Exhibit US-5).

[66]7 U.S.C. 1444-2(c)(1)(B)(ii) (1992 Supp.) (Jan. 4, 1993) (Exhibit US-5).

112. Thus, the 1990 Act initially established a level of support applicable to the 1991-95 crops. The US Congress could have changed the 72.9 cents per pound level at any time during MY 1992, but it decided not to. The Secretary of Agriculture also had discretion to alter the level of support (that is, to raise it) but also decided not to. Thus, 72.9 cents per pound was decided and remained decided as the level of support for each day of the 1992 marketing year.

**57. If the United States decided on a rate of support for MY1992, does that not mean that it decided on whatever budgetary outlay was required to meet that rate of support, even if the exact amount was not known at that time? USA**

113. The Peace Clause proviso establishes the benchmark for comparison: the support "decided" during the 1992 marketing year. To say that the United States "determined" or "pronounced" an indefinite amount of budgetary outlays would not fit those meanings of the term. The United States could also not have come to a "determination or resolution" to make any budgetary outlay since that outlay would be determined by market prices during the year, *not* by the US Government. To read support "decided" as encompassing not only the explicit rate of support set out in US measures but also "whatever budgetary outlay was required to meet that rate of support, even if the exact amount was not known at the time," would also appear to make the Peace Clause comparison impossible. That is, because both during the 1992 marketing year and under the 2002 Act the support decided would be "whatever budgetary outlay was required to meet that rate of support," both budgetary outlay "decisions" by the United States would appear to be unlimited, and one could not be in excess of the other. Alternatively, one could reason that a decision to provide whatever budgetary outlays would be necessary implies that the 1992 decided level would be higher because, even if prices fell to zero, the higher nominal level in 1992 would mean higher budgetary outlays.

114. The only support "decided" by the United States was the 72.9 cents per pound level of support. In effect, the United States provided a revenue floor for producers by guaranteeing a rate of income for plantings. The United States has never exceeded that level of incentive "for the commodity." Brazil's approach, which would ascribe to the United States a decision to make budgetary outlays resulting from differences between market prices and the level of support, is an effort to impose something akin to an AMS limit on US support for upland cotton. (We note, however, that Brazil cannot simply argue for calculating an AMS for upland cotton because that would exclude non-product-specific support, which Brazil wishes to include in the Peace Clause comparison, and would not require that support be measured through budgetary outlays.) Members considered and rejected any product-specific AMS limits in the Uruguay Round, however, and such a concept may not be overlaid onto the Article 13 language. The United States has introduced payments decoupled from production precisely to lower the incentive to produce the marginal pound of cotton and avoid exceeding the product-specific level of support of 72.9 cents per pound.

**59. Should the rate of support as indicated in Article 13(b)(ii) include the market price? If so, why is it appropriate to include it in the comparison under Article 13(b)(ii)? BRA, USA**

115. No, the market price is not relevant for purposes of the Peace Clause comparison. As indicated in the US answers to Questions 48 and 57 from the Panel, the benchmark for that comparison is the support "decided" during the 1992 marketing year. That support was decided by the United States as a rate of support: 72.9 cents per pound. The actual amount of expenditures necessary to provide that support depended on the market prices during the marketing year. However, these prices were not "determined" or "pronounced" by the United States and therefore cannot have been (or be) part of any US decision.

**60. Can you provide information on support decided in 1992 and the years with which you believe it should be compared, on a per support programme / per unit of production/per**

**annum basis? If possible, please specify how, if at all, budget outlays may be transposed into units of production, and which units of production are best to use. BRA, USA**

116. The United States has explained that the product-specific support decided during the 1992 marketing year for upland cotton was 72.9 cents per pound through the combined effect of the target price for deficiency payments and the loan rate for marketing loans. This rate was the only support "decided" by the United States as evidenced by the relevant legislation, regulations, and programme announcements. By comparison, the product-specific support that upland cotton support measures currently grant is only 52 cents per pound through the loan rate for the marketing loan programme.

117. The United States believes that any analysis that takes budgetary outlays into account necessarily will not reflect the support "decided" by the United States. Because US domestic support measures are largely dependent on a price-gap, budgetary outlays will reflect prevailing market prices during the applicable marketing year, prices the United States cannot decide. Budgetary outlays will also reflect, for the product-specific support that marketing loans grant, various *producer* decisions on programme participation, timing of receipt of payments, and production levels. Again, these factors cannot be decided by the United States. Thus, given the way in which the challenged US measures decide the level of support, the Peace Clause comparison may only be made on the basis of rates of support, not budgetary outlays.

**61. Does the United States consider that Article 13(b)(ii) permits a comparison on any basis other than a per pound basis? USA**

118. Article 13(b)(ii) requires that the benchmark for comparison be the support "decided" during the 1992 marketing year. The United States decided on an a rate of support of 72.9 cents per pound during the 1992 marketing year. Therefore, the evaluation must be whether challenged measures grant product-specific support in excess of that decided during the 1992 marketing year – that is, in excess of the 1992 rate of support. Were the relevant US domestic support measures structured differently, the term "decided" might imply a different comparison.

**66. Could you please comment on the relative merits of each of the following calculation methods for the purposes of the comparison of support to upland cotton with 1992, irrespective of whether a particular measure should be included or excluded:**

**(a) Total budgetary outlays (Brazil's approach). USA**

119. As stated in the US answer to Question 60 from the Panel, the United States believes that any analysis that takes budgetary outlays into account necessarily will not reflect the support "decided" by the United States. Because some US domestic support measures are dependent on a price-gap (for example, marketing loans), budgetary outlays will reflect prevailing market prices during the applicable marketing year, prices the United States cannot decide. Budgetary outlays will also reflect, for the product-specific support that marketing loans grant, various *producer* decisions on programme participation, timing of receipt of payments, and production levels. Again, these factors cannot be decided by the United States. Thus, given the way in which the challenged US measures decide the level of support, the Peace Clause comparison may only be made with respect to these measures on the basis of rates of support, not budgetary outlays.

**(b) Budgetary outlays per unit of upland cotton: Could you please calculate and provide an estimate for the marketing years 1992 and 1999-2002, respectively, and draw attention to any factors/qualifications that the Panel would need to be aware of. BRA, USA**

120. For the reasons stated in response to Question 66(a), any analysis involving budgetary outlays necessarily will not reflect the support "decided" by the United States. A budgetary outlays per unit

of upland cotton approach thus would not only be based on a faulty premise, but to calculate outlays per unit might also necessitate an *ex post* or retrospective analysis. Again, this cannot reflect the support "decided" by the United States.

**(d) Per unit rate of support for upland cotton (Prof. Sumner's approach at the first session of the first substantive meeting ). USA**

121. The United States continues to examine Mr. Sumner's approach to calculating a per-unit subsidy rate. We will present a detailed critique of Mr. Sumner's analysis in our rebuttal submission. Here, we limit our comments to two points.

122. First, as with the budgetary outlays approach favoured by Brazil, this per unit rate of support analysis ascribes to the United States choices made by producers themselves. For example, the first line of Sumner's analysis of the deficiency payment programme stated: "The following qualifications and adjustments must [] be made to the level of support provided by the deficiency payment programme: (1) payments were made *only if a farm chose to participate* in the deficiency payment programme; in 1992, farms representing 11 per cent (1.64 million acres) of the total 'effective' upland cotton acreage base (14.9 million acres) *did not agree to participate in the programme* and hence cotton production on this land could not receive support."[67] Sumner makes a similar argument and adjustment for the 1992 loan rate.[68]

123. Attempting to adjust the per unit rate of support to take account of producers that chose not to participate in the programme is a serious conceptual error. In economic terms, a farmer that participated in the upland cotton programme received full programme benefits; a farmer who chose not to participate did not. Averaging these numbers produces a "per unit rate of support" that no cotton farmer ever could have expected to receive.

124. Nor could a Member have "decided" such a level of support. In legal terms, an individual producer's choices on programme participation do not reflect any decision by the US Government. Thus, estimated rates of support that reflect these producer decisions are not relevant to the Peace Clause analysis under Article 13(b)(ii). We will discuss other conceptual errors in Sumner's approach in our rebuttal submission.

125. In reviewing Sumner's analysis, the United States was particularly struck by another point. The Panel may recall Brazil commenting at the first panel meeting that Sumner's calculations were not entirely unfavourable to the US position. A look at Appendix Table 1 to Sumner's statement (Exhibit BRA-105) reveals why.

126. Even using Sumner's flawed calculations, if one excludes the non-product-specific support that Brazil is attempting to "allocate" to upland cotton from the table, Sumner's analysis supports the United States, not Brazil. That is, Sumner's estimated per unit rate of support was *lower* in every year from marketing year 1999 through marketing year 2002 than the level of support during marketing year 1992:

[67]Exhibit BRA-105 (Statement of Mr. Daniel Sumner, para. 10) (emphasis added).
[68]Exhibit BRA-105 (Statement of Mr. Daniel Sumner, para. 12).

| Product-Specific Support in Sumner's per Unit Subsidy Rates (Cents per Pound) by Programme and Year | | | | | |
|---|---|---|---|---|---|
| | **MY1992** | **MY1999** | **MY2000** | **MY2001** | **MY2001** |
| Marketing Loan | 44.34 | 50.36 | 50.36 | 50.36 | 52.00 |
| Deficiency | 13.25 | na | na | na | na |
| Step 2 | 2.46 | 2.46 | 2.46 | 2.46 | 3.71 |
| Cottonseed | na | 0.97 | 2.27 | na | 0.61[69] |
| ***Total*** | **60.05** | **53.79** | **55.09** | **52.82** | **56.32** |

127. Thus, even were one to accept for purposes of argument Sumner's approach, comparing the product-specific support the challenged measures grant to the product-specific support decided during marketing year 1992 reveals that *in no marketing year from 1999 through 2002 did the level of support exceed the marketing year 1992 level*. Under Article 13(b)(ii), then, Sumner's own analysis reveals that US domestic support measures that conform fully to the provisions of Article 6 are exempt from actions based on Peace Clause-specified WTO subsidies provisions.

**67. The Panel requests the parties to calculate and submit estimates of the AMS for upland cotton for marketing years 1992, 1999, 2000, 2001 and 2002. For this purpose the parties are each requested to submit AMS calculations for upland cotton (using the budgetary-outlay/non-price gap methodology employed by the United States in respect of cotton in its DS Notifications (e.g., G/AG/N/USA/43) and using the formats and supporting tables in document G/AG/2) on the same basis as would be the case in calculating a product specific AMS for the purposes of the calculation of the "Total Current AMS" in any year in accordance with the relevant provisions, including as appropriate Article 1(a), (b) and (h), Article 6 and Annex 3 to the Agreement. BRA, USA**

128. The United States has calculated a product-specific Aggregate Measurement of Support for upland cotton for marketing years 1992, 1999, 2000, 2001, and 2002, as explained below. This table summarizes the results of those calculations, and the following paragraphs provide additional detail:

| US Upland Cotton Aggregate Measurement of Support | |
|---|---|
| **Marketing Year** | **AMS (US $, millions)** |
| 1992 | 2,085 |
| 1999 | 2,262 |
| 2000 | 1,057 |
| 2001 | 2,804 |
| | |

[69]The United States includes the cottonseed amount from the table without prejudice to our preliminary ruling request that the Panel find the 2003 cottonseed payment not to be within the scope of this dispute.

| US Upland Cotton Aggregate Measurement of Support | |
|---|---|
| 2002[70] | 970 |

129. For marketing year 1992, the United States has used official data on budgetary outlays[71] to calculate the upland cotton Aggregate Measurement of Support, except for other product-specific support in the form of storage payments and interest subsidies. The latter payment amounts are based on estimates by the US Department of Agriculture. The calculations, in millions of US dollars, are as follows:

| **Crop year 1992 (estimate)** | **Payments** | **Source** |
|---|---|---|
| Deficiency payments | 1,017 | US Department of Agriculture (USDA), Upland Cotton Fact Sheet (Ex. Bra-4) |
| Marketing loan gains / Certificate exchange gains | 476 | USDA budget data (Ex. Bra-6) |
| Loan deficiency payments | 268 | USDA budget data (Ex. Bra-76) |
| User marketing certificates | 207 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| Commodity loan forfeit | (5) | USDA estimate |
| Other payments | 122 | USDA estimate of storage payments & interest subsidy |
| *Product-Specific AMS* | 2,085 | |

130. To calculate the upland cotton Aggregate Measurement of Support for marketing year 1999, the United States has used official budgetary outlays data for loan deficiency payments, marketing loan gains, certificate exchange gains, user marketing certificates, and the 1999 crop year cottonseed payment. For storage payments and interest subsidies, we have used estimates by the US Department of Agriculture as notified to the WTO. The calculations, in millions of US dollars, are as follows:

[70]As explained further below, the United States has calculated the 2002 Aggregate Measurement of Support for upland cotton as of the date of panel establishment, 18 March 2003.

[71]In light of the question from the Panel, we have used budgetary outlays to estimate payments.

| Crop year 1999 | Payments | Source |
|---|---|---|
| Marketing loan gains/ Certificate exchange gains | 860 | USDA budget data (Ex. Bra-55) |
| Loan deficiency payments | 685 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| User marketing certificates | 422 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| Cottonseed payments | 79 | G/AG/N/USA/43 |
| Other payments | 216 | USDA estimate of storage payments & interest subsidy (G/AG/N/USA/43) |
| *Product-Specific AMS* | 2,262 | |

131. To calculate the upland cotton Aggregate Measurement of Support for marketing year 2000, the United States has again used official budgetary outlays data for loan deficiency payments, marketing loan gains, certificate exchange gains, and user marketing certificates; the amounts set by legislation for the 2000 crop year cottonseed payments; and estimates by the US Department of Agriculture for storage payments and interest subsidies. The calculations are as follows:

| Crop year 2000 (estimate) | Payments | Source |
|---|---|---|
| Marketing loan gains | 61 | USDA budget data (www.fsa.usda.gov/dam/ BUD/estimatesbook.htm)[72] |
| Loan deficiency payments | 152 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| User marketing certificates | 236 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| Cottonseed payments | 185 | Public Law 106-224, § 204(e) (20 June 2000); Public Law 107-25, § 6 (13 Aug. 2001) |
| Certificate exchange gains | 360 | USDA budget data (www.fsa.usda.gov/dam/ BUD/estimatesbook.htm) |
| Other payments | 63 | USDA estimate of storage payments & interest subsidy |
| *Product-Specific AMS* | 1,057 | |

132. For marketing year 2001, the United States has used estimates by the US Department of Agriculture for storage payments and interest subsidies and official data on budgetary outlays for all other payments to calculate the upland cotton Aggregate Measurement of Support. The calculations, in millions of US dollars, are as follows:

[72]Exhibit US-18.

| Crop year 2001 (estimate) | Payments | Source |
|---|---|---|
| Marketing loan gains | 47 | USDA budget data (www.fsa.usda.gov/dam/BUD/estimatesbook.htm) |
| Loan deficiency payments | 744 | USDA budget data (Ex. Bra-76) |
| User marketing certificates | 196 | USDA, Upland Cotton Fact Sheet (Ex. Bra-4) |
| Certificate exchange gains | 1,750 | USDA budget data (www.fsa.usda.gov/dam/BUD/estimatesbook.htm) |
| Other payments | 68 | USDA estimate of storage payments & interest subsidy |
| *Product-Specific AMS* | 2,805 | |

133. For crop year 2002, the United States has provided unofficial data on budgetary outlays as of 18 March 2003, the date of establishment of the Panel, for marketing loan gains, certificate exchange gains, loan deficiency payments, and user marketing certificates. Because the crop year has just ended (as of 31 July 2003), official budgetary outlay data is not yet available. For the 2002 crop year cottonseed payment, the United States has used the amount set by legislation ($50 million). We use a crop-year's-end estimate by the US Department of Agriculture for storage payments and interest subsidies. The calculation, in millions of US dollars, is as follows:

| Crop year 2002 (estimate as of panel establishment) | Payments | Source |
|---|---|---|
| Marketing loan gains/ Certificate exchange gains | 563 | USDA unofficial data (www.fsa.usda.gov/pscad/answer82rnat.asp (18 March 2003))[73] |
| Loan deficiency payments | 202 | USDA unofficial data (www.fsa.usda.gov/pscad/answer82rnat.asp (18 March 2003)) |
| User marketing certificates | 137 | USDA unofficial data |
| Other payments | 68 | USDA estimate of storage payments & interest subsidy |
| *Product-Specific AMS* | 970 | |

134. We note that it would not be appropriate for the Panel to examine payments made after the date of panel establishment, on which the Panel's terms of reference were set. Measures taken after the Panel was established cannot be within the Panel's terms of reference. However, for the Panel's convenience, we have also estimated an Aggregate Measurement of Support for the entire crop year 2002, using US Department of Agriculture projections of all payments with respect to the 2002 crop

[73]*See* Exhibit US-19 (Marketing Year 2002 Loan Deficiency Payment and Price Support Cumulative Activity As of 3/12/2003). Upland cotton data is shown in the row marked "UP." The loan deficiency payment amount is shown in the third column, and the marketing loan gain and certificate exchange gain amounts are shown in the eighth column (second from left). This Report, the PSL-82R, provides weekly, unofficial data. Brazil provided the same report as Bra-55 but chose to present the report with data as of 13 June 2003.

year. These projections show no dramatic change from the unofficial budgetary outlays as of 18 March. The full-year 2002 crop year estimate, in millions of US dollars, is as follows:

| Crop year 2002 (full-year estimate) | Payments | Source |
|---|---|---|
| Marketing loan gains | 11 | USDA estimate (www.fsa.usda.gov/dam/BUD/estimatesbook.htm)[74] |
| Loan deficiency payments | 206 | USDA estimate (www.fsa.usda.gov/dam/BUD/estimatesbook.htm) |
| User marketing certificates | 217 | USDA estimate (www.fsa.usda.gov/dam/ BUD/estimatesbook.htm) |
| Cottonseed payments | 50 | Public Law 108-7, § 206 (24 Feb. 2003) |
| Certificate exchange gains | 701 | USDA estimate (www.fsa.usda.gov/dam/BUD/estimatesbook.htm) |
| Other payments | 65 | USDA estimate of storage payments & interest subsidy |
| *Product-Specific AMS* | 1,250 | |

**68. Could you please clarify the result of the calculations of, and the meaning of the title, in Appendix Table 1 "Estimated per unit Subsidy Rates by Programme and Year" in Annex 2 to Exhibit BRA-105, page 12. Why are the numbers calculated for marketing loans considered to be subsidies? Could the Panel, for example, read the "total level of support" (bottom line of the table) as the effective support price for upland cotton or the maximum rate of support for upland cotton? BRA, USA**

135. The United States looks forward to reviewing Brazil's explanation of its Appendix Table 1 to Annex 2 to Exhibit BRA-105.

**69. Can the United States confirm that the "marketing year" for upland cotton is 1 August to 31 July ? Can the United States confirm the Panel's understanding that USDA data for the "crop year" corresponds to the "marketing year"? USA**

136. The United States confirms that the "marketing year" for upland cotton is 1 August to 31 July.[75] In response to a question from the Panel at the first meeting, we also communicate that payments listed in the Upland Cotton Fact Sheet (Ex. Bra-4) are for monies spent with respect to cotton harvested in a particular crop year, not necessarily for payments made during the marketing year.

*EXPORT CREDIT GUARANTEE PROGRAMMES*

**71. (a) Is an export credit guarantee a financial contribution in the form of a "potential direct transfer of funds or liabilities (e.g. loan guarantee)" within the meaning of Article 1.1(a)(1)(i) of the SCM Agreement? Why or why not? Does it confer a benefit within the meaning of Article 1.1(b)? Why or why not? If so, to whom? USA**

[74]Exhibit US-19.
[75]7 Code of Federal Regulations 1412.103.

**(b) How, if at all, would these elements be relevant to the claims of Brazil, and the United States response thereto? BRA, USA**

137. (a) For the reasons stated in its first written submission[76] and in response to Question 71(b), the United States does not believe that the appropriate analysis of the US export credit guarantee programme should begin with the Subsidies Agreement, much less Article 1of that Agreement. The text of Article 10.2 defers WTO obligations for export credit guarantees until disciplines are internationally agreed, such as within the OECD or WTO. Under the Agriculture Agreement, the provisions of the Subsidies Agreement "apply subject to the provisions of this Agreement,"[77] and the export subsidy disciplines of Article 3.1(a) of the Subsidies Agreement expressly apply "[e]xcept as provided in the Agreement on Agriculture."[78] Thus, the appropriate analysis would begin and end with Agriculture Agreement Article 10.2.

138. Even were the Subsidies Agreement relevant to US export credit guarantees, given that export credit guarantees are covered by item (j) of the Illustrative List of Export Subsidies, the appropriate mode of analysis under the Subsidies Agreement is to examine whether the programme is covering its long-term operating costs and losses.

139. (b) Article 3 of the SCM Agreement specifically states that Article 3.1(a), prohibiting export subsidies, applies "[e]xcept as provided in the Agreement on Agriculture". Article 21.1 of the Agriculture Agreement states that "[t]he provisions of GATT 1994 and of other Multilateral Trade Agreements in Annex 1A to the WTO Agreement shall apply subject to the provisions of this Agreement". Under Article 10.2 of the Agreement on Agriculture, the negotiators specifically deferred the application of export subsidy disciplines on agricultural export credit guarantee programmes like those of the United States. Any incidental "benefit" of any such measures is therefore irrelevant. Similarly, even if a particular (non-export credit) measure comprised a contribution and conferred a benefit for purposes of the Subsidies Agreement, to the extent the resulting subsidy was contingent on export performance, such export subsidy might nevertheless be permitted under the Agreement on Agriculture if within a Member's applicable reduction commitment.

**73. The Panel could arguably take the view that Articles 1 and 3 of the SCM Agreement were relevant in assessing the WTO-consistency of United States export credit guarantees. The United States has yet to submit any evidence or argumentation on this point, either as potential context for interpretation of the terms in Article 10 of the Agreement on Agriculture or in relation to Brazil's claims under the SCM Agreement. The Panel would therefore appreciate United States views in respect of this situation, and invites the United States to submit relevant argumentation and evidence. USA**

140. The United States does not believe that Brazil has submitted evidence and argumentation that would establish a *prima facie* case in favour of Brazil's claims, in particular in light of Article 10.2 of the Agriculture Agreement. However, the United States will review Brazil's submissions, including its responses to these questions, and provide any further response in the US submission.

**74. If the Panel decides to refer to provisions of the SCM Agreement for contextual guidance in the interpretation of the terms in Article 10 of the Agreement on Agriculture, should the Panel refer to item (j) or Articles 1 and 3 of the SCM Agreement or both? BRA, USA**

[76]US First Written Submission, paras. 167-170.
[77]Agriculture Agreement, Article 21.1.
[78]Subsidies Agreement, Article 3.1.

141. As the United States has argued, the first point of analysis is Article 10.2 of the Agreement on Agriculture, in which Members agreed that they would only provide export credit guarantees in conformity with internationally agreed disciplines, which they undertook to develop. That is, Article 10.2 indicates that no "internationally agreed disciplines" currently exist. The obligation with respect to export credit guarantees is, in effect, a work programme to establish a future discipline. Brazil has not contested that challenged US export credit guarantee programmes are within the scope of Article 10.2. Therefore, neither item (j) nor Articles 1 and 3 of the Subsidies Agreement are relevant to the Panel's analysis of Article 10.2. We do note, however, that item (j) of the Illustrative List of Export Subsidies was agreed in the Uruguay Round, and, in fact, had previously formed part of the Illustrative List under the Tokyo Round Subsidies Code. Thus, the fact that Members had agreed on item (j) and yet, in Article 10.2, agreed to "undertake to work toward *the development* of internationally agreed disciplines to govern the provision of export credits, export credit guarantees" and, once agreed, only to provide export credit guarantee programmes "in conformity with" such developed and agreed disciplines, suggests that item (j) does *not* impose disciplines on export credit guarantees for agricultural goods.

142. Context for Article 10 is found in Article 9.1 of the Agreement on Agriculture, which describes specific practices that constitute export subsidies for purposes of the Agreement on Agriculture. Export credit guarantees were not listed among such practices. As to the practices described in Article 9.1, no recourse is necessary to Articles 1 and 3 of the SCM Agreement to determine whether a particular practice is an export subsidy. Article 1(e) of the Agreement on Agriculture defines an export subsidy only as a subsidy contingent on export performance. To determine the applicability of Article 10.1 to a particular measure not described in Article 9.1 first requires a determination whether a subsidy exists. In this regard, Article 1of the SCM Agreement would provide relevant context.

**75. The Panel's attention has been drawn to Article 14(c) of the SCM Agreement (see e.g. written third party submission of Canada) and to the panel report in DS 222 Canada-Export Credits and Loan Guarantees. How and to what extent are Article 14(c) of the SCM Agreement, and the cited panel report, relevant to the issue of whether or not the United States export credit guarantee programmes confer a "benefit"? What would be the appropriate market benchmark to use for any comparison? Please cite any other relevant material. BRA, USA**

143. For reasons set out in more detail in the US answer to Question 71(b) and Question 71(c) from the Panel, the United States does not believe that Article 14(c) is relevant to the Panel's analysis. An appropriate analysis of the US export credit guarantee programme begins and ends with Article 10.2 of the Agreement on Agriculture. Even were the Subsidies Agreement relevant to US export credit guarantees, the only appropriate mode of analysis under the Subsidies Agreement is to examine whether US export credit guarantee programmes are covering their long-term operating costs and losses under item (j) of the Illustrative List of Export Subsidies.

**76. How does the United States respond to Brazil's statement that : "...export credit guarantees for exports of agricultural exports [sic] are not available on the marketplace by commercial lenders."? USA**

144. Brazil is incorrect. Commercial insurers do offer export credit insurance covering agricultural commodities. According to a background paper on export credits prepared by the WTO Secretariat, "While guarantees could be unconditional, they usually have conditions attached to them, so that in practice there is little distinction between credits which are guaranteed and credits which are subject to insurance."[79] However, for the sake of completeness we wish to note that such private insurance is structured differently than CCC credit guarantees. Most commonly, private insurers offer portfolio

[79]*See Export Credits and Related Facilities*, G/AG/NG/S/13 (26 June 2000).

coverage, covering multiple customers and transactions for a particular exporter. Because the coverage is not based on individual transactions (like CCC's coverage), it may be difficult or impossible to discern which particular transactions involve agricultural commodities.

**77. How does the United States interpretation of "long term operating costs and losses" in item (j) as claims paid give meaning to both "costs" and "losses"? Do claims paid represent "losses" or "costs" or both? If claims paid is represented by "losses", what would go into the "cost" element of item (j)? Could the United States expand on why it disagrees with the items which Brazil identifies for inclusion in the examination to be conducted under item (j)? USA**

145. Item (j) applies to three different types of programmes: export credits, export credit guarantees, and insurance. In the case of the latter two types of programmes, the provider will necessarily incur claims from time to time. In the case of direct export credits (the first type of programme), the provider will experience defaults on occasion. To the extent such claims or defaults exceed revenue from whatever source it may be derived, the net result would be a loss arising from operations. In an accounting sense such result would constitute an "operating loss."

146. In addition, it is appropriate to identify and allocate costs necessary to operate such programmes. For example, the United States agrees that certain administrative expenses should be allocated to the operation of the export credit guarantee programmes, and an annual figure is attributed as administrative expense in the budget of the United States. Other costs necessary for the operation of a programme would constitute "operating costs" of such programme.

147. Were item (j) to be relevant in this dispute, therefore, that item compels an examination of losses derived from the operation of the programme plus the costs necessarily allocable to the programme for its operation. In the case of US export credit guarantee programmes, as reflected in paragraph 173 and accompanying tables of the US first written submission, the Commodity Credit Corporation (CCC) charges and receives premiums from applicants. In addition, CCC receives post-claim revenue through late payments and rescheduling. As reflected in the tables, with respect to cotton, such revenue exceeds the relevant claims experience. The United States has, therefore, not incurred an operating loss.

148. It is appropriate to allocate operating costs of the programme in the final analysis within the meaning of item (j). The United States disagrees, however, with the allegation of Brazil concerning interest allocation and the manner in which it attempts to ascribe figures from the US budget to operating costs for purposes of item (j). These items are addressed specifically in the US response to Question 81 from the Panel.

**78. Can the United States provide supporting documentation for data used relating to "costs and losses" in paragraph 173? Could the United States confirm that the figures cited in paragraph 173 of its first written submission relate to the SCGP? Why did the United States cite these figures after stating that it is not possible to make any assessment of the long-term operating costs and losses of this programme? USA**

149. The United States maintains a comprehensive electronic data base of export credit guarantee programme activity. The data base is updated on a regular basis and is the source of the data shown in paragraph 173 and accompanying table. Data is recorded in the system at the time of each transaction. These include such items as claim payments, recoveries, rescheduling agreements, and fees received.

150. As indicated in the tables accompanying paragraph 173, the figures shown in paragraph 173 relate to GSM-102 in the first table and SCGP in the second table. During the ten fiscal years reflected in the tables, no GSM-103 export credit guarantees were issued with respect to cotton.

**79. In respect of what time periods does Article 13(c) require an assessment of conformity with Part V of the Agreement on Agriculture? How does this affect, if at all, your interpretation of Article 13(b)? BRA, USA**

151. Article 13(c) applies to "export subsidies that conform fully to the provisions of Part V of th[e Agriculture] Agreement, as reflected in each Member's Schedule." Part V of the Agreement, and in particular Article 8, establishes that "Each Member undertakes not to provide export subsidies otherwise than in conformity with this Agreement and with the commitments as specified in that Member's Schedule." Those export subsidy reduction commitments, which are expressed in both export quantity and budgetary outlay terms, apply on a yearly basis.[80] Accordingly, a Member may be in conformity one year and not in conformity in another with regard to any particular commodity subject to reduction commitments.

152. If a Member has provided export subsidies to a particular commodity in any one year in excess of the applicable reduction commitments, then export subsidies for that commodity during such year would not "conform fully to the provisions of Part V", and those subsidies would not have Peace Clause protection. In a subsequent year, a Member may again comply with its export subsidy commitments. Its export subsidies would then conform fully to Part V of the Agreement and would again receive Peace Clause protection.

153. Similarly, a failure by a Member to comply in a given year with the criteria in Article 13(b) would lift the exemption from action for those domestic support measures only for the year of the breach. Measures (subsidies) in a later year would remain exempt from action so long as those measures in the given year comply with the conditions in Article 13(b)(ii). This conclusion flows from the text of the Peace Clause (measures must conform to Article 6, and Members' final bound commitment levels are expressed in yearly terms) as well as the nature of the subsidies challenged by Brazil (recurring subsidies that are provided yearly and expensed in the year given). For further explanation of the US interpretation of Article 13(b), please see the US answers to Questions 33 and 35 from the Panel.

**81. How does the United States respond to the following in Brazil's oral statement: USA**

**(a) paragraph 122 (rescheduled guarantees)**

154. Brazil is correct to assert "debt rescheduling does not involve any reduction in the value of outstanding debt". A rescheduling does not involve debt forgiveness. As reflected in the terms of the various rescheduling agreements, outstanding interest is capitalized, and interest accrues on such capitalized interest as well as on outstanding principal. Further, the United States expects to recover in full pursuant to such rescheduling.

155. Therefore, from an accounting perspective, rescheduled amounts are counted as *receivables*, not losses, and are reflected as such in paragraph 173 of the US First Written Submission. Contrary to the assertion of Brazil, the United States does in fact collect on the rescheduling. The history of rescheduled Commodity Credit Corporation (CCC) export credit guarantee claims over the long-term (the 10-year period 1993-2002) confirms this position. All rescheduled claims are currently performing. In other words, all payments due up to this point under these agreements have been received.

[80]With the exception of Agriculture Agreement Article 9.2(b), which is no longer applicable.

**(c) paragraphs 125 ff. (guaranteed loan subsidy)**[81]

156. The Credit Reform Act of 1990 establishes the procedures and parameters for US credit and credit guarantee programmes. In accordance with the provisions of that Act, the budgeting and accounting for US credit programmes, including the CCC export credit guarantee programmes, are based on the estimated lifetime costs to the Federal Government of making the credit available. In the case of credit guarantees, those costs are based on estimated payments by the Government to cover defaults and delinquencies, interest subsidies, and other requirements, and payments to the Government, including origination and other fees, penalties, and recoveries.

157. In presenting the annual budget, the subsidy costs of the programme reflect an *estimate* of the long-term costs to the Government. This estimate reflects various assumptions regarding credit risk, interest costs, and other factors that will apply over the lifetime period of the credit. At the time the budget is prepared, these costs are presented as estimates as of the date the budget is prepared – that is, they are a snapshot of the estimated costs. In fact, Brazil acknowledges in paragraph 125 of its oral statement that the "guaranteed loan subsidy" entry in the annual US budget is an estimate of the cost of the guarantees projected to be issued.

158. A fundamental tenet of credit reform accounting is the requirement that the performance of the credit be tracked over its lifetime. This is accomplished by tracking each cohort of credit until the credit period has expired or lapsed. A cohort consists of all transactions associated with each type of guarantee issued during a particular year – for example, all guarantees issued during fiscal year 2002 comprise a distinct cohort.

159. Activity (disbursement, repayment, claims, etc.) occurs within a given cohort over the life of all guarantees that were disbursed against that cohort. To view the data and activity strictly on an annual basis and not by cohort limits the utility of the data and distorts the costs of the programme. Not until the cohort is closed can one make an assessment as to whether or not that particular cohort represents a cost to the Federal Government.

160. All cohorts for the CCC export credit guarantee programmes under credit reform are still open although cohorts for 1994 and 1995 should close this year. At present, the 1994 cohort has a total net downward subsidy re-estimate of $116 million. The original subsidy cost estimate for the 1994 programme was $123 million; thus, applying the downward re-estimate, the net cost of the programme to the US Government is currently projected at $7 million. The 1995 cohort has a total net downward subsidy re-estimate of $149 million, versus an original subsidy estimate of $113 million. Thus, the net cost of the 1995 programme is a receipt of $36 million to the US Government. For 1994 and 1995 together, the total net receipt to the US Government is $29 million.

161. The experience of 1994 and 1995 is viewed as representative of the costs of the CCC export credit programmes generally, and it is expected that, once the cohorts for other years of credit activity are closed, they will follow closely the experience of the 1994 and 1995 programmes.

**(d) paragraphs 127-129 (re-estimates, etc.)**

162. As discussed in response to Question 81(c), it is necessary to understand the difference between activity that occurs on a fiscal year basis as opposed to the estimates and re-estimates of subsidy that calculate net present value over the life of the programme. Although estimates and re-estimates are made annually for each cohort, these include both actual data to date and estimates of future activity for the remainder of the life of the cohort.

[81]The US answer to Question 81(b) follows the answer 81(d), which discusses budget re-estimates.

163. With the exception of 2002, all cohorts for annual export credit programming since the inception of credit reform accounting in 1992, have a cumulative downward re-estimate. The net total for all cohorts for guarantees issued since 1992 currently stands at a downward re-estimate of $1.9 billion. This experience with re-estimates indicates that performance under the programme has been better than originally projected and that the original cost estimates for those programming years as presented in the annual US budget were too high. This experience also demonstrates that the assertion by Brazil at paragraph 129 of its oral statement that the original estimate of "guaranteed loan subsidy" line in the budget is an "ideal basis" for determining the costs of the programme is in error. Those estimates will be re-estimated on an annual basis until each cohort is closed and, as demonstrated above, to date the re-estimates for each cohort on a net basis have been almost exclusively downward.

**(b) paragraph 123 (interest on debt to Treasury)**

164. Under the guidelines for credit reform budgeting as established in the Credit Reform Act of 1990, there are two kinds of interest calculations that affect the CCC export guarantee programmes. These calculations are "snapshots" in time and will change annually for a cohort until the cohort has closed. Therefore, any one number shown in the budget for a given year is an estimate. The actual cost of the programme can be determined only when all financial activity for the cohort is completed.

165. An interest rate re-estimate is a component of the annual re-estimates of a cohort, which are made for as long as the guarantees are outstanding. The interest rate re-estimate calculates the difference between the estimated interest at the time the guarantee programme was budgeted and the actual interest at the time the guarantee is disbursed. If the actual interest is higher, the additional cost is shown in the programme account as a re-estimate. It should be noted that this cost would change with subsequent re-estimates in future years depending on the timing of the guarantee disbursement.

166. Interest on borrowings occurs in the financing account only if additional funds beyond those budgeted for a cohort is needed to pay claims. Again, these costs will vary from year to year as borrowings with a particular cohort change and the interest rate varies.

167. It is important to understand that should any interest on borrowings occur, they would be fully reflected in the costs attributed to the individual cohort. Thus, as the costs of the cohort are adjusted during the period it is active, any costs associated with the interest on borrowings are fully reflected in the programme costs. It is, therefore, incorrect to state as Brazil asserts in paragraph 123 that those payments are not fully reflected in the operating costs of the CCC export credit guarantee programmes.

**(e) Exhibits BRA-125-127**

168. Exhibits BRA-125-127 are pages from the Budget Estimates for the United States Government for fiscal years 1994, 1995, and 2004. These particular pages show one aspect of the budgeting for the CCC export credit guarantee programmes, the Export Loans Programme Account. In and of themselves, they do not reflect all aspects of the budgeting and financing transactions for the programmes. For example, Exhibit 127 for the fiscal year 2004 budget estimates excludes the Export Guarantee Financing Account, which appears on the following page. The data presented in the financing account is important because it presents information on both downward and upward re-estimates for the programme.

**(f) the chart on page 53 of Brazil's oral statement at the first session of the first Panel meeting relating to "Guaranteed Loan Subsidy and Administrative Expenses of US Export Credit Guarantee Programmes GSM-102 GSM 103 and SCGP"?**

169. The table on page 53 of Brazil's oral statement at the first panel meeting presents information on budget estimates for the CCC export credit programmes for fiscal years 1992 through 2004. The data presented in the table are correct. However, as discussed previously in the answers to questions 81(c) and 81(d) above, the "guaranteed loan subsidy" is a snapshot estimate of the lifetime costs of the guarantees issued during the course of a given fiscal year. As the cohorts for those guarantees are reviewed annually over their lifetime, those estimates will change and, until the cohorts are closed out, the estimated costs of the programmes are simply that, estimates. Accordingly, Brazil is incorrect in asserting in paragraph 132 of its oral statement that, because the guaranteed loan subsidy line of the annual budget has always reflected a positive net present value, that fact indicates the programmes are "extending a subsidy to borrowers". That statement misinterprets and misrepresents the information presented in the budget.

170. In addition, Brazil makes a statement in paragraph 131 of its oral presentation with regard to the table on page 53 that likewise is incorrect. Brazil asserts that the column heading in the budget for the last completed fiscal year represents "actual" costs for the programme for that particular year. In fact, the numbers appearing in that column simply represent the latest, revised *estimate* of the costs of the programme for the fiscal year just completed. The estimate of those costs will change over the lifetime of the credit as the cohort for that year is tracked. The term "actual" is used in the column because the revised estimate is based on an actual level of guarantees issued by CCC during the year just completed.

171. Frequently, the level of guarantees issued by CCC in any given year is less than the level projected in the original budget for that year. In the case of the 2002 budget that was released in February 2001, it projected that $3.9 billion of guarantees would be issued by CCC during that year. However, only $3.4 billion of guarantees were actually issued. Thus, the estimate of programme costs in 2002 column of the 2004 budget has been revised to reflect that actual level of activity. Nevertheless, the cost presented in the column remains an estimate, and the estimate will continue to be revised as long as the cohort for 2002 remains active.

172. With respect to the "administrative expenses" that are displayed in the table on page 53 of Brazil's oral statement, the United States has noted elsewhere that those are imputed costs ascribed to the operation of the CCC export credit programmes as a whole.

**(g) In respect of (a)-(f) above, how and to what extent do the information and data presented for the export guarantee programmes concerning "programme" and "financing", "summary of loan levels", "subsidy budget authority", "outlay levels", etc., in particular in Exhibits BRA-125-127, reflect "actual costs and losses" of the GSM-102, GSM-102 and SCGP export credit guarantee programmes (see e.g. Brazil's closing oral statement at the first session of the first substantive meeting, paragraph 24)? USA**

173. The closing oral statement of Brazil at the first session of the first substantive meeting of the Panel, and paragraph 24 in particular, display a fundamental misunderstanding of the budget and accounting for the CCC export credit programmes. Contrary to what is asserted in that paragraph, the information presented in the annual budget of the United States does in fact represent estimates of the lifetime costs of the programmes. Those estimates are being revised annually to reflect actual performance and, until the cohorts for the annual programmes have been closed out, the actual costs cannot be determined definitively. However, as demonstrated in response to Question 81(d), the

re-estimates thus far have resulted in a net reduction in the estimated costs of these programmes of over $1.9 billion since the inception of credit reform budgeting in fiscal year 1992.

174. Further, as discussed in response to Question 81(c), the combined net costs of the cohorts associated with the 1994 and 1995 guarantee programmes, which are expected to close this year, are a receipt of $29 million to the Federal Government. Based on those results, the Brazilian claim in paragraph 24 that "operating costs and losses for GSM 102, GSM 103, and SCGP have outpaced premiums collected in every single year since the United States started applying the formula in 1992" is not supportable.

**82. Please explain each of the following statements and any possible significance it may have in respect of Brazil's claims about GSM-102 and GSM-103 (7 CFR 1493.10(a)(2), Exhibit BRA-38): BRA, USA**

**(a) "The programmes operate in cases where credit is necessary to increase or maintain US exports to a foreign market and where US financial institutions would be unwilling to provide financing without CCC's guarantee. (7 CFR 1493.10(a)(2), Exhibit BRA-38)**

175. The export credit guarantee programmes are generally made available in connection with middle-tier economies in which liquidity is constricted. In such cases, cash sales for all suppliers are not occurring readily. US financial institutions may face requirements regarding loan-loss reserves that impede their ability to lend.

**(b) "The programmes are operated in a manner intended not to interfere with markets for cash sales. The programmes are targeted toward those countries where the guarantee is necessary to secure financing of the exports but which have sufficient financial strength so that foreign exchange will be available for scheduled payments." (7 CFR 1493.10(a)(2) Exhibit BRA-38)**

176. The export credit guarantee programmes are intended to operate and indeed are applied in a manner not to displace cash sales. As liquidity improves in certain countries, the use of the programme recedes. This explains, in part, the dramatic reduction in US export credit guarantees since the years immediately preceding the inception of the WTO Agreement.

177. The following table shows the dollar value of guarantees provided by the United States in US fiscal years 1992-1994, along with the average value of guarantees for fiscal years 1995 - 2002:

| Fiscal Year(s) | Guarantee Value (Millions of USD) |
|---|---|
| 1992 | $5,671.8 |
| 1993 | $3,853.7 |
| 1994 | $3,177.4 |
| 1995 - 2002 | $3,061.9 |

**(c) "In providing this credit guarantee facility, CCC seeks to expand market opportunities for US agricultural exporters and assist long-term market**

**development for US agricultural commodities." (7 CFR 1493.10(a)(2) Exhibit BRA-38)**

178. Although the goal of the export credit guarantee programmes is to expand market opportunities, such goal alone has no bearing on the proper characterization of the programmes, the measures in dispute, or the conformity of the application of such programmes with the WTO obligations of the United States. Moreover, the United States is statutorily compelled to be mindful not to provide any such guarantees in connection with any country that the Secretary of Agriculture determines cannot adequately service the debt associated with such sales, nor does the United States provide guarantees in connection with any foreign bank that it has not approved and with respect to which it has not established an exposure limit.

**84. Is the Panel correct in understanding that, under the GSM-102 and GSM-103 programmes, the exporter pays a fee calculated on the dollar amount guaranteed, based on a schedule of rates applicable to different credit periods? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates? USA**

179. Fees paid by an exporter participating in either the GSM-102 or GSM-103 programme vary by the guaranteed dollar value of the transaction, the repayment period, and the principal repayment interval (annual or semi-annual). A schedule of current fees is attached as Exhibit US-20. Section 211(b)(2) of the Agricultural Trade Act of 1978, 7 U.S.C. 5641(b)(2), limits the origination fee in connection with transactions under the GSM-102 programme, except for those transactions under the CCC Facility Guarantee Programme, to no more than 1 per cent of the amount of credit to be guaranteed. There is no other legislation or regulation addressing the specific fee rates.

180. Other than the legislative restriction noted above, the CCC sets and changes the fee rates as it deems appropriate. Fee rates are changed via a press announcement to the public. The most recent change in guarantee fee rates occurred on 1 October 2002, at which time the fee schedule was modified to include rates for transactions with 30- and 60-day repayment periods. Previously, the fee schedule had been adjusted to accommodate variable interest rates as opposed to fixed rates. Legislative amendment is not required to change the fee rates unless the rates for the GSM-102 programme are to exceed 1 per cent of the guaranteed dollar value of a transaction. Neither is it necessary to amend the programme regulations in order to change the fee rates.

**85. Is the Panel correct in understanding that, under the SCGP, the exporter pays a fee for the guarantee calculated on the guaranteed portion of the value of the export sales? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates? Please explain any "risk" assessment involved in the programme. USA**

181. Under the SCGP, the exporter pays a fee to CCC based on the guaranteed dollar value of the export transaction and the repayment period. The current guarantee fee rates are $0.45 per $100 of coverage for credit terms up to 90 days, and $0.90 per $100 of coverage for credit terms up to 180 days. Section 211(b)(2) of the Agricultural Trade Act of 1978, 7 U.S.C. 5641(b)(2), limits the origination fee in connection with transactions under the SCGP to no more than 1 per cent of the amount of credit to be guaranteed. There is no other legislation or regulation addressing the specific fee rates.

182. Other than the legislative restriction noted above, the CCC sets and changes the fee rates as it deems appropriate. For example, fee rates for the SCGP were changed in US fiscal year 2000 (beginning 1 October 1999) and set at their current level. Prior to that time, the fee rate was $0.95 per

$100 of coverage regardless of the repayment period. The fee rates were changed to give exporters and importers an incentive to negotiate repayment terms of less than 180 days. Legislative amendment is not required to change the fee rates unless the rates for the SCGP are to exceed 1 per cent of the guaranteed dollar value of a transaction. It is not necessary to amend the programme regulations in order to change the fee rates.

183. CCC carries out a country risk assessment for each country prior to announcing its eligibility for SCGP participation. Country risk assessment entails a review of the economic and political situation in each country to ensure there is a reasonable expectation that the country's importers will be able to repay debts incurred under the programme. CCC does not determine the creditworthiness of importers participating in the SCGP. CCC provides a guarantee covering 65 per cent of the export transactions under the programme; the exporter or his assignee (US bank) must accept the remaining 35 per cent of the transaction's risk. This "risk sharing" between CCC and the exporter/assignee is intended to ensure that due diligence is performed in assessing an importer's creditworthiness before undertaking a transaction with that importer.

**86. Is there a risk categorization in relation to three export credit guarantee programmes (GSM-102, GSM-103 and SCGP)? Does this have any impact on premiums payable and the ability of the CCC to on-sell the guarantees ? USA**

184. All countries eligible for any of the CCC export credit guarantee programmes are categorized according to risk. CCC categorization of countries is based on a US government internal risk classification system. This system is administratively controlled and may not be released outside of the US Government. A country's risk classification has no impact on the premiums payable under the US export credit guarantee programmes. There is no secondary market for CCC guarantees; therefore, CCC does not "on-sell" the guarantees.

**87. What proportion of CCC (export-related and total) long term operating costs and losses are represented by GSM-102, GSM-103 and SCGP programmes? USA**

185. With the advent of the Credit Reform Act, the export guarantee programmes are not financed out of the Commodity Credit Corporation. While the programmes continue to be run through the authorities and facilities of the CCC, all budget authority (funding) for the guarantee programmes is provided directly to accounts for those programmes from the US Treasury.

**88. (a) Is the Panel correct in understanding that the United States' argument is that, at present, by virtue of Article 10.2 of the Agreement on Agriculture, there are no disciplines on agricultural export credit guarantees under the Agreement on Agriculture (or the SCM Agreement)? USA**

186. Article 10.2 provides: "Members undertake to work toward the development of internationally agreed disciplines to govern the provision of export credits, export credit guarantees or insurance programmes and, after agreement on such disciplines to provide export credits, export credit guarantees or insurance programmes only in conformity therewith." Article 10.2 imposes an obligation on Members to work toward "internationally agreed disciplines" and, upon agreement on such disciplines, to provide export credit guarantees only in conformity with such disciplines. This was the purpose of the negotiations in the OECD that followed the Uruguay Round, and which now are occurring under the aegis of the WTO. If and when such disciplines are agreed upon, they are WTO obligations under the Agreement on Agriculture.[82]

[82]This is similar to other work programs that continued beyond the close of the Uruguay Round. *See* US First Written Submission, paras. 154-66.

187. Brazil's argument is that such "internationally agreed disciplines" already apply. If export credit guarantee programmes were already subject to export subsidy disciplines, then Article 10.2 would be unnecessary. That is, Members would *already* have "to provide . . . export credit guarantees . . . only in conformity" with the internationally agreed disciplines of the WTO. In Brazil's oral statement, Brazil attempts to avoid this implication of its reading by repeatedly attempting to insert the word "specific" into the text of Article 10.2 – that is, "undertake to work toward the development of *specific* internationally agreed disciplines ."[83] That word is not there, however. The United States' interpretation of Article 10.2 gives meaning to the text of Article 10.2 as drafted and agreed by Members whereas Brazil's reading would effectively read it out of the Agreement on Agriculture.

**(b) Does the United States agree with the following proposition: a WTO Member may therefore extend agricultural export credit guarantees without charging a premium, and for an indefinite period, in addition to any other terms and conditions it may wish? How would this reconcile with the title of Article 10 of the Agreement on Agriculture ("Prevention of Circumvention on Export Subsidy Commitments"), and with other commitments contained in the Agreement on Agriculture? Please cite any relevant material, including any past WTO dispute settlement cases. How would this reconcile with the United States' own statement, at paragraph 21 of its closing oral statement that "of course, the United States may not provide subsidies without any limit". USA**

188. Article 10.2 applies only to export credit guarantees (and export credits and insurance programmes) properly characterized as such. In the case of the United States, export credit guarantees are offered pursuant to programmes which charge premiums; impose limits on tenor; impose limits on exposure to individual bank obligations; impose limits on exposure to risk of default from different countries; define shipping periods; and issue allocations (value limitations) of potential guarantee availability for specific commodities to be exported to specific destinations. The United States also guarantees only a relatively small portion of interest. Consequently, participants remain exposed to a significant component of the over-all risk of default.

189. The United States submits that the deferral of disciplines under Article 10.2 properly applies to export credit guarantees offered pursuant to a programme with such characteristics; indeed, Brazil has not contested that US export credit guarantee programmes are encompassed by the terms of Article 10.2. Illegitimate attempts to characterize export subsidy programmes as export credit guarantee programmes would be subject to the anti-circumvention provisions of Article 10.1 and the other commitments of the Agreement on Agriculture.[84]

190. The US interpretation of Article 10.2 presents no conflict with the title of Article 10, which provides relevant context in interpreting the provisions of Article 10. Article 10 is entitled "Prevention of Circumvention on Export Subsidy Commitments." Article 10.2 contributes to the prevention of circumvention of export subsidy commitments by imposing two obligations on Members: first, they must undertake to work toward the development of internally agreed disciplines

[83]*See, e.g.*, Brazil's Oral Statement, para. 100 ("Article 10.2 instead announces Members' intent to work toward negotiations on *specific* disciplines for export credits.") (italics in original); *id.* ("In the meantime, while those *specific* disciplines are being discussed . . .") (emphasis added); *id.*, para. 102 ("Under the first part of Article 10.2, therefore, WTO Members have pledged to work toward the development of *specific* disciplines . . . .") (emphasis added); *id.*, para. 103 ("If Members do conclude an agreement on these *specific* disciplines . . . .") (emphasis added); *id.* (Brazil and the United States agree that there has been no agreement on any such *specific* disciplines . . . .") (emphasis added).

[84]For example, the United States could not simply change the name of the FSC Repeal and Extraterritorial Income Exclusion Act to the "FSC Repeal and Extraterritorial Income Exclusion Export Credit Guarantee Program" and successfully assert that the deferral of disciplines contemplated by Article 10.2 applies to such re-named program.

on export credit guarantees; second, "after agreement on such disciplines," they must provide export credit guarantees "only in conformity therewith". Thus, Members agreed that those internationally agreed disciplines would constrain the provision of export credit guarantees, which in turn would contribute to the goal of Article 10, to prevent the circumvention of export subsidy commitments.

191. Although the language quoted from paragraph 21 of the United States' closing oral statement was intended to address concerns involving domestic support for upland cotton,[85] it also applies in the case of export subsidies. The United States also cannot provide export subsidies without limit. It has a schedule of export subsidy reduction commitments for 12 commodities. For these commodities, export subsidies can only be provided in accordance with such schedule. For the remainder of agricultural commodities, the United States cannot provide export subsidies at all.

192. Although internationally agreed disciplines on export credit guarantee programmes have yet to be agreed, the characteristics of such programmes and the discipline inherent in the risk-sharing aspects of such programmes impose an internal constraint on their use. Indeed, the use of US export credit guarantee programmes has *declined* since the period before the inception of Uruguay Round commitments. As shown in the US answer to Question 82(b), the dollar value of guarantees provided by the United States in US fiscal year 1992 was $5,671.8 million, in fiscal year 1993 was $3,853.7 million, and in fiscal year 1994 was $3,177.4 million. In contrast, the average value of guarantees for fiscal years 1995 - 2002 was only $3,061.9 million. Any concerns about unchecked use of export credit guarantee programmes, then, are not supported by the post-Uruguay Round experience.

**(c) If, as the United States argues, there are no disciplines on export credit guarantees in the Agreement on Agriculture, how could export credit guarantees "conform fully to the provisions of Part V" of the Agreement on Agriculture within the meaning of Article 13 (how can you assess "conformity" or non-conformity when there are allegedly no disciplines against which such an assessment could occur)? USA**

193. US export credit guarantee programmes provide "export credit guarantees" within the meaning of Article 10.2 and therefore will be subject to disciplines only as contemplated by that Article. Because no such disciplines currently exist, these programmes cannot be out of compliance with Part V of the Agriculture Agreement. Moreover, export credit guarantees are not export subsidies within the meaning of either Article 9.1 or 10.1, and since they are not export subsidies, Article 13(c) does not apply to them.

**(d) Is the United States advocating the view that its own export credit guarantee programmes, which pre-dated the Uruguay Round, are effectively "grandfathered" so as to benefit from some sort of exemption from the export subsidy disciplines of the Agreement on Agriculture? How, if at all, is it relevant that the SCGP did not, according to the United States, become relevant for upland cotton until the late 1990's (i.e. after the entry into force of the WTO Agreement)? USA**

194. It is not entirely clear what is meant by the term "grandfathering" in this connection. Agriculture Agreement Article 10.2 defers the imposition of disciplines on export credits, export

[85]The statement itself was intended to note that the United States is subject to the limit set forth in its domestic support reduction commitments for the Current Total Aggregate Measurement of Support. This amount, across all US commodities, is $19.1 billion. In addition, a very specific limit applies with respect to domestic support for upland cotton under the Peace Clause. It may not exceed the rate of 72.9 cents per pound, as decided in 1992, without removing the Peace Clause protection of Article 13 of the Agreement of Agriculture.

credit guarantees, and insurance programmes until internationally agreed disciplines are reached, and in that sense the export subsidy disciplines of the Agreement do not apply to the export credit guarantee programmes at issue in this dispute.

195. The SCGP began in 1996, and no transactions occurred under this programme in connection with cotton until fiscal year 1998, which began in September 1997. Although the negotiators obviously could not have considered the application of this specific programme, it is substantially similar in its operation to other US export credit guarantee programmes. Again, Brazil has not contested that SCGP provides export credit guarantees within the meaning of Article 10.2. Thus, the deferral of disciplines under Article 10.2 similarly applies.

*STEP 2 PAYMENTS*

**89. Does the United States confirm Brazil's statement in paragraph 331 of its first submission that "The conditions and requirements for Step 2 domestic payments remain unchanged with the passage of the 2002 FSRI Act"? What is the relevance of this, if any, to this dispute? USA**

196. While the Step 2 programme under the 2002 Act is largely consistent with the programme under the 1996 Act, there have been some modifications since the inception of the programme, relating to the precise nature of the price differential formula and the price ceiling for the Step 2 payments. The 2002 programme was unchanged from the 1996 Act programme, as amended, except for suspending the 1.25 cent differential. In the end, this is inconsequential because it does not materially affect the levels of support decided in marketing year 1992 (72.9 cents per pound) or that measures currently grant (52 cents per pound).

**90. Does the United States confirm Brazil's statement in paragraph 235 of its first submission that the changes concerning Step 2 export payments from the 1996 FAIR Act to the 2002 FSRI Act are: increase in the amount of the subsidy by 1.25 cents per pound and the removal of any budgetary limits that applied under the 1996 FAIR Act? What is the relevance of this, if any, to this dispute? USA**

197. As noted in the US answer to Question 89, the 2002 Act suspended the 1.25 cents differential, but the United States disagrees with the assertion of increased budgetary exposure for the programme. First, we note that Step 2 for the 1992 crop and marketing years was covered by the provisions of the 1990 Act, which had no limit on the amount of expense that could be undertaken in Step 2. For the 1996 Act, which covered the 1996-2002 crops until supplanted by the 2002 Act, there was a limit of $701 million for the six-year duration of the Act, and in fact that money did run out in December 1998. However, the Congress removed the budgetary limit of the 1996 Act as of October 1999 (Public Law No. 106-78, 22 Oct. 1999). Therefore, neither the 2002 Act, nor the 1996 Act (as of October 1999), nor the 1990 Act had budgetary limits on Step 2 expenditures.

198. While the potential step 2 payment (when price conditions in the statute are met) is higher in the 2002 Act than under the 1996 Act by as much as (but not more than) 1.25 cents per pound, step 2 merely changes the vehicle of support.

**91. What is the significance of the elimination of the 1.25 cent threshold payment in the 2002 FSRI Act pertaining to Step 2 payments? USA**

199. Please see the US answers to Question 89, 90, and 117.

**92. Does the United States confirm that Exhibit BRA-65 represents a sample contract for exporters of eligible upland cotton to conclude with the CCC under the FSRI 2002, and that an application form (Exhibit BRA-66) needs to be filled out with data on weekly**

**exports and submitted to the USDA FAS. Is Exhibit BRA-66 - Form CCC 1045-2 - also a valid example? If not, please identify any differences or distinctions. USA**

200. The Brazilian exhibits appear to be accurate versions of old Step 2 programme documents. Some of the documents in the exhibit are for domestic handlers and involved programme payment assignments. We also note that, in making an export claim, other documentation like bills of lading may be needed.

201. The official documents for the upland cotton step 2 programme can be found at the Farm Services Agency website (www.fsa.usda.gov/daco, click on "cotton" and on "upland cotton user marketing certificate programme".) There is a common contract that exists for both domestic users and exports under the Step 2 programme, CCC Form CCC-1045UP. Because of the different nature of uses and therefore applications, there are separate reporting forms: CCC-1045UP-1 for domestic users and CCC-1045UP-2 for Exporter Users. Recently updated documents used for this programme are attached as Exhibit US-21.

**93. Please elaborate why the United States deems that Step 2 payments upon submission of proof of export are not subsidies contingent upon export. Is it the US contention that, in order to be contingent on export, exportation must be the exclusive condition for receipt of the payment? USA**

202. As the United States has indicated, all upland cotton produced in the United States is eligible for the benefit of the Step 2 cotton subsidy. If the statutory price condition applies, all US upland cotton used during the applicable period of time will received the subsidy. "Use" in domestic manufacture or export constitutes the universe of potential use of US upland cotton. The United States submits that when the entirety of production of a good in a country is eligible to receive a subsidy, no contingency on export exists. The Step 2 subsidy is entirely distinct in this regard from a hypothetical situation in which a subsidy is theoretically available for domestic use, but in reality is exclusively or nearly exclusively available in connection with exports.

**95. Do the criteria in 7 CFR 1427.103(c)(2) (Exhibit BRA-37) that Step 2 "eligible upland cotton" must be "not imported cotton" apply to both domestic and export payments? USA**

203. Only domestic cotton is eligible for Step 2 payment, which is made if the statutory price conditions are met and requisite proof of use is submitted.

**96. Is a domestic sale a "use" for the purposes of Step 2 payments? Is a sale for export, or export, considered a "use"? USA**

204. A sale is not a use for purposes of the Step 2 subsidy. For domestic manufacture, opening the cotton bale constitutes use. For exports, similarly, the sale alone does not itself constitute use; the exporter must demonstrate actual exportation.[86]

**97. How does the United States respond to Brazil's assertion, at paragraph 70 of Brazil's oral statement at the first session of the first substantive meeting, that "It is obvious that a single bale of cotton cannot be both exported and used domestically." Is this a relevant consideration? USA**

205. It is unclear what Brazil's assertion is intended to demonstrate. The Step 2 programme makes payments to documented users of US upland cotton. If a bale cannot be both opened domestically and exported (although it is not clear why that would be so), that amounts to arguing that a single bale

[86]7 Code of Federal Regulations 1427.103(a).

cannot be "used" twice. The fact remains that *either* opening the bale domestically *or* exporting it – that is, the universe of activities resulting in use of US upland cotton – is entitled (given certain market conditions) to a Step 2 payment.

206. The United States notes, moreover, that it may actually be possible (economic realities aside) that the same bale could be exported and then brought back into the country and opened for domestic use. (Please see the US answer to Question 98 for more detail.) The US Department of Agriculture's position would be that the payment should be made on the bale once only. The purpose of the programme is to provide support to upland cotton farmers. Once the bale has been purchased by an upland cotton user, there would be no additional support for upland cotton farmers from providing Step 2 payments on additional "uses" of the same bale.

**98. How many Step 2 payments are received if a bale of upland cotton is exported, and then opened by a domestic user in the United States, or vice versa? USA**

207. If a bale were exported and then imported and opened up (or vice versa) it would be the US position that only one payment would be made. It does not appear that this situation has ever arisen in fact, but we note that the Step 2 regulations specifically provide that "imported" cotton is not eligible for payment. Such cotton may include any cotton that was imported, even if it had been produced in the United States.

**99. How does the United States respond to Brazil's arguments in paragraphs 71-75 of Brazil's oral statement at the first session of the first Panel meeting concerning the relevance of the Appellate Body Report in US-FSC (21.5). USA**

208. In contrast to the facts of the *United States – FSC (21.5)* dispute, in this dispute all of the product is produced in the United States; all of the product is eligible to receive the benefit of the subsidy; and all of the potential uses of the product are similarly eligible. If the statutory formula of price conditions applies, all US upland cotton used during that time – regardless of how such use is manifested – will receive the subsidy. This case involves only one factual situation: use of cotton during a particular period of time. The only factual distinction applicable here is whether the applicable price conditions are on or off. Brazil's emphasis on the "different instructions" in the programme regulations is misplaced. Such instructions are simply to demonstrate the requisite use and to assure payment is made to the proper party. If upland cotton could be used in a third or fourth way, this would not change the eligibility for subsidy but would necessitate a parallel third or fourth set of instructions to demonstrate that form of use as well.

**103. Is the Step 2 programme fund a unified fund that is available for either domestic users or exporters, without a specific amount earmarked for either domestic users or exporters? Please substantiate your response, including by reference to any applicable statutory or regulatory provisions. USA**

209. The upland cotton user marketing certificate programme (Step 2) makes no differentiation between funds for payments to exporters and domestic handlers – it is all one programme. The first paragraph of the Step 2 rule states:

> These regulations set forth the terms and conditions under which CCC shall make payments, in the form of commodity certificates or cash, to eligible domestic users and exporters of upland cotton who entered into an Upland Cotton Domestic User/Exporter Agreement with CCC to participate in the upland cotton user marketing certificate

The Step 2 rule was published on 18 October 2002, at 67 Federal Register 64454, and is codified at 7 Code of Federal Regulations 1427.100-.108.

210. As with other US domestic support measures, Step 2 payments are funded through the Commodity Credit Corporation, which has a borrowing authority in the Treasury and as such does not rely on appropriations. This is provided for in Sections 1207 and 1601(a) of the 2002 Act and codified at 7 US Code 7937 and 7991.

**104. How does the United States respond to the data presented in Exhibit BRA-69? Is it accurate? Please substantiate. USA**

211. The data in Exhibit BRA-69 is not official US Government data, and Brazil has not indicated the source of the information. Thus, we cannot confirm its reliability. The United States has tried in any event to obtain information in the format of Bra-69, which is not maintained and published by the US Government in that manner. The following data has been collected by the US Department of Agriculture and attempts to designate (as in Bra-69) Step 2 payments by fiscal year[87] and use.

| User Marketing Certificate (Step 2) Payments, by Fiscal Year and Use | | |
|---|---|---|
| **Fiscal Year** | **Mill Use (US $)** | **Export Use (US $)** |
| 1991 | 4,311,991 | 17,259 |
| 1992 | 102,769,543 | 30,852,107 |
| 1993 | 113,401,813 | 89,095,640 |
| 1994 | 28,251,613 | 178,266,742 |
| 1995 | 17,571,224 | 75,200,203 |
| 1996 | 0 | 34,798,579 |
| 1997 | 6,201,540 | 2,875,936 |
| 1998 | 255,502,154 | 158,924,004 |
| 1999 | 165,831,362 | 113,521,476 |
| 2000 | 260,075,318 | 185,273,956 |
| 2001 | 144,849,807 | 90,903,021 |
| 2002 | 72,425,112 | 105,415,152 |

A comparison with Exhibit BRA-69 suggests that the Brazilian data is inaccurate.

212. During the first panel meeting, the Panel asked about the figures shown for fiscal year 1996, which showed a zero payment for mill use and a positive number for export use. We suggested that perhaps appropriated amounts had suddenly run out, but our suggestion was not accurate. Rather, the odd numbers for fiscal year 1996 resulted because, at the time, payments for export use accrued when the contract for export was made. However, such payments were not paid until the export actually took place, at which time the exporter would be paid based on the Step 2 rates that applied when the

[87]The US fiscal year runs from October 1 - September 30, such that the 2002 fiscal year would run from 1 October 2001, through 30 September 2002.

contract was made. As the Panel is aware, Step 2 payments can be made only when there is a difference between world and US prices for cotton for a certain time period. In the case of fiscal year 1996, these prices did not satisfy the Step 2 conditions, but there were some payments that were made during that fiscal year because they had accrued by an export contract made in the previous fiscal year. That rule is now changed[88] so that the rate that applies for export use is the rate that is in effect when the export is made not when the contract for export was made.

**105. Why is the Step 2 programme separated into "domestic users" and "exporters"? Apart from differentiating between exporters and domestic users, with consequential differentiation as to the forms that must be filled out and certain other conditions that must be fulfilled, are the eligibility criteria for Step 2 payments identical? Are the form and rate of payment, as well as the actual payment made, identical? USA**

213. US law does not separate the Step 2 programme into domestic users and exporters. There is but one Step 2 statute – codified at 7 US Code 7937 – and but one Step 2 rule for all users – found at 7 Code of Federal Regulations 1427.100-.108. The statute and rule do identify "domestic users" and "exporters" as the universe of *bona fide* users of upland cotton and thus potential recipients for Step 2 payments. Therefore, the only distinction drawn between these recipients is the proof of use: domestic handlers are paid when they open a bale, and exporters are paid when they export. The form and rate of payment are identical.

**106. With respect to paragraph 139 of the United States' first written submission, are Step 2 export payments included in the annual reduction commitments of the United States? If so, why? USA**

214. The United States does not distinguish between the uses of US upland cotton for purposes of reporting the subsidy because the subsidy is not contingent on export performance. *All* Step 2 payments are reported as product-specific domestic support for upland cotton and are included within the Total Aggregate Measurement of Support calculation for purposes of *domestic support* reduction commitments.

**107. Please comment on any relevance, to Brazil's de jure claims of inconsistency with the provisions of the Agreement on Agriculture, of Exhibit BRA-69, which shows Step 2 payments made to (i) domestic users and (ii) exporters. This Exhibit shows that, from FY 91/92 through 02, the Step 2 payments for exporters exceeded those for domestic users in FY 94; FY 95; FY 96 (in fact there were no domestic payments in FY 96); and FY 02. In the other years, the domestic payments are greater than export payments. BRA, USA**

215. Without commenting on the accuracy of the specific numbers set forth in Exhibit BRA-69, it is entirely possible that in certain years one type of user happened to receive a larger share of payments than another type of user. This would entirely be a function of market conditions and relative demand for manufacture or for export. That is, differences in amounts paid to exporters and domestic users during any time period are happenstance based on actual use of US upland cotton.

216. The United States notes that payments to exporters were previously made based on when exporters finalized the sale contract, not on when the cotton was actually exported. In the specific case of fiscal year 1996, it appears that payments for exported upland cotton *accrued* during a period when Step 2 payments were allowed by the statute, but that the payments were actually made at a time when market conditions no longer met the statutory criteria for payment. The rule has been changed,[89] and that situation can no longer recur.

[88] *See* 61 Federal Register 37544, 37548 (18 July 1996).
[89] *See* 61 Federal Register 37544, 37548 (July 18, 1996).

**108. At paragraph 135 of its first written submission, the United States states : "[T]he subsidy is not contingent upon export performance..." (emphasis added). Again, in the course of the first Panel meeting, the United States admitted that the Step 2 payments were "subsidies". Does the United States thus concede that Step 2 payments constitute a "subsidy" within the meaning of the WTO Agreement? USA**

217. The United States has always maintained that Step 2 payments are subsidies that provide domestic support in favour of US agricultural producers.

**109. How does the United States respond to Brazil's arguments concerning a mandatory/discretionary distinction and the allegation that certain United States measures (including s.1207(a) of the 2002 FSRI Act) are mandatory? (This is referred to, for example, in paragraph 28 of Brazil's first written submission). Does the United States agree with the assertion that (subject to the availability of funds) the payment by the Secretary of Step 2 payments is mandatory under section 1207(a) FSRI upon fulfilment by a domestic user or exporter of the conditions set out in the legislation and regulations? If not, then why not? To what extent is this relevant here? What determines the "availability of funds"? Please cite any other relevant measures or provisions which you consider should guide the Panel in respect of this issue. USA**

218. The United States does not disagree that, subject to the availability of funds (that is, the availability of CCC borrowing authority), Step 2 payments must be made to all those who meet the conditions for eligibility. With respect to the well-accepted mandatory/discretionary distinction reflected in GATT 1947 and WTO panel and Appellate Body reports, the United States notes that the distinction is the natural consequence of the fact that there can be no presumption of bad faith in WTO dispute settlement, a fact that numerous Members, including the European Communities, have emphasized.[90] Thus, to the extent that a Member retains discretion under a measure to act in accordance with a WTO obligation, it may not be presumed that the Member will violate that obligation, or to conclude that the measure itself – separately from the measure's application in a specific instance – may be found inconsistent with that obligation.

**110. Section 1207(a) of the 2002 FSRI Act provides that during the period beginning on the date of the enactment of the FSRI Act through July 31 2008, " .. the Secretary shall issue marketing certificates or cash payments, at the option of the recipient, to domestic users and exporters for documented purchases by domestic users and sales for export by exporters...". The Panel notes that Brazil does not appear to distinguish between the treatment of (i) cash payments and (ii) marketing certificates in terms of the issue of whether or not a "subsidy" exists. The United States refers to "benefits" and "payments" and "programme" in asserting that Step 2 is not export contingent (paragraphs 127-135 of the United States' first written submission).**

**(a) Do the parties thus agree that there is no need to draw any distinction between the treatment of (i) cash payments and (ii) marketing certificates in terms of the issue of whether or not a "subsidy" exists for the purposes of the Agreement on Agriculture? BRA, USA**

219. The United States agrees that there is no need to draw a distinction between cash payments and marketing certificates in terms of whether a subsidy exists for purposes of the Agreement on Agriculture.

[90] *See* Appellate Body Report, *United States - Section 211 Omnibus Appropriations Act of 1998*, WT/DS176/AB/R, adopted 1 February 2002, para. 259.

**(b) Why would a domestic user or an exporter select to receive a marketing certificate over a cash payment? What is the proportion of cash payments vs. marketing certificates granted under the programme? USA**

220. A user of upland cotton that elects to receive payment in the form of a marketing certificate is entitled to redeem that certificate for an equivalent amount of upland cotton held by the Commodity Credit Corporation (CCC). Although authorized by statute, no Step 2 payments have been made in recent times in the form of certificates. Marketing certificates in lieu of cash payments for Step 2 were last used heavily in the early to mid-1990s. The CCC does not currently maintain high upland cotton inventories from which such certificates if issued could be redeemed.

**111. Does the United States maintain its argument that actions based on Article 3.1(b) of the SCM Agreement are conditionally "exempt from actions" due to the operation of Article 13 of the Agreement on Agriculture? USA**

221. Article 13(c) provides that "export subsidies that conform fully to the provisions of Part V of this Agreement, as reflected in each Member's Schedule, shall be . . . exempt from actions based on Article XVI of GATT 1994 or Articles 3, 5 and 6 of the Subsidies Agreement." Article 13(b), which applies to domestic support measures, does not reference Subsidies Agreement Article 3. Brazil has advanced claims under Article 3.1(b) of the Subsidies Agreement only with respect to Step 2 payments, which are domestic support measures and not export subsidies. Thus, on the US view the Peace Clause would not appear to be applicable; however, to the extent Brazil asserts that Step 2 payments (or some part thereof) are export subsidies, Article 13(c) would be relevant.

222. We also note that paragraph 7 of Annex 3 requires that support in favour of domestic agricultural producers that is provided through payment to processors shall be included in the AMS of the Member. If payments are made in connection with both domestic and foreign product then such payments are not support in favour of domestic agricultural producers. Consequently, the Agriculture Agreement necessarily contemplates that support paid to processors may be paid solely with respect to domestic production. Under Article 6.3 of the Agriculture Agreement, if a Member is providing support within its domestic support reduction commitments, then such support may not be challenged under Article 3.1(b) because that Article applies "[e]xcept as provided in the Agreement on Agriculture". If a Member exceeds its domestic support reduction commitments, on the other hand, then such support paid to processors would be actionable under Article 3.1(b).

**112. In the event that the Panel finds that Article 6.3 of the Agreement on Agriculture does not preclude an examination of Brazil's claims under Article 3.1 of the SCM Agreement and Article III:4 of GATT 1994, how does the United States respond to the merits of Brazil's claims relating to Step 2 payments under those provisions? USA**

223. As indicated in the US answer to Question 111 from the Panel, and as the European Communities has noted in its third party submission, inasmuch as paragraph 7 of Annex 3 of the Agreement on Agriculture requires support in favour of agricultural producers that is paid to processors to be included in the Member's Aggregate Measurement of Support, then the Agreement on Agriculture necessarily contemplates that such payments to processors may apply solely with respect to domestic product. Otherwise, as in the case of Step 2 payments, domestic cotton producers would not receive the relative price benefit conferred by the payment. Consequently, such discrimination in favour of domestic production is permitted under the Agreement on Agriculture and, under Article 21.1 of that Agreement, the provisions of GATT 1994 and of other Multilateral Trade Agreements in Annex 1A to the WTO Agreement are expressly "subject to the provisions of [the Agriculture] Agreement." For that reason, neither Article 3.1(b) of the Subsidies Agreement nor GATT 1994 Article III:4 precludes such payments to users of US upland cotton, unless the United States exceeds its domestic support reduction commitments.

**113. Is it necessary for measures directed at agricultural processors included in AMS to discriminate on the basis of the origin of goods? USA**

224. The United States does not express an opinion whether it is necessary in all circumstances for all Members with respect to all commodities. However, paragraph 7 of Annex 3 of the Agreement on Agriculture certainly contemplates that support in favour of domestic producers provided by payments to processors is included in the Aggregate Measurement of Support. In the case of Step 2 payments on upland cotton, if payments were provided in favour of all upland cotton, whether domestic or foreign, used by domestics mills or exporters, the price benefit for US producers would not be achieved. Without such a benefit to US producers, these payments would not need to be included in the Aggregate Measurement of Support. The Agreement on Agriculture does not preclude payments that solely benefit domestic producers; indeed, paragraph 7 contemplates such discriminatory subsidy payments. Accordingly, the United States reports all Step 2 payments as domestic support in favour of US producers of upland cotton.

**115. What is the meaning and relevance (if any) to Brazil's claims under Article 3 of the SCM Agreement and Article III:4 of GATT 1994 of the phrase "measures directed at agricultural processors shall be included to the extent that such measures benefit the producers of the basic agricultural products" in the Agreement on Agriculture? BRA, USA**

225. The United States directs the Panel's attention to the US answers to Questions 111, 112, and 113 from the Panel.

**116. With respect to paragraph 32 of the oral statement of the EC, are subsidies contingent on the use of domestic goods consistent with the Agreement on Agriculture? Does the phrase "provide support in favour of domestic producers" in Article 3.2 of the Agreement on Agriculture refer to, and/or permit such subsidies? BRA, USA**

226. Subsidies contingent on the use of domestic goods may be consistent with the Agreement on Agriculture. Paragraph 7 of Annex 3 of the Agreement requires the United States to include its Step 2 payments in favour of domestic upland cotton producers, even though such payments are made to processors, within its calculation of its Aggregate Measurement of Support. The United States has complied with its domestic support reduction commitments. Therefore, Step 2 payments to upland cotton users that provide support to domestic producers contingent on the use of domestic goods is consistent with the Agreement on Agriculture. If Members could not discriminate in favour of domestic producers when making subsidy payments through processors, there would be no reason for paragraph 7 of Annex 3. Such payments that are not limited to domestic products would not be in favour of domestic producers because the relative economic benefit of the subsidy vis-à-vis foreign production would not exist.

**117. What is the relationship between Step 2 payments to exporters and the marketing loan payments, both of which appear to compensate for the price differences relative to the Liverpool A-Index? For example, is there double compensation? Or is one of the explanations that these export-related price compensatory payments are paid to different operators (namely, the producer, on the one hand under the marketing loan arrangements, and the processor/users (Step 2 programme) arrangements on the other? USA**

227. Both marketing loan payments and Step 2 payments are domestic support for upland cotton, but the marketing loan payment is made directly to the producer whereas the Step 2 payment is made to users of the cotton. The marketing loan repayment formula, in section 1204 of the 2002 Act, and the Step 2 payment formula in section 1207 of the 2002 Act, differ by their terms and are simply

different forms of support, the latter (Step 2) being a form of support that can facilitate higher market prices for US cotton. We will address this more fully in our rebuttal submission.

**118. Can the United States confirm that it does not rely on Article III:8 of GATT 1994? USA**

228. The United States can confirm that the Step 2 payment is not made exclusively to domestic producers.

*ETI ACT*

**119. How does the United States respond to Brazil's reference to the panel report in India - Patents (EC) (at paragraph 138 of its oral statement at the first session of the first substantive meeting)? How, if at all, should the Panel take this report into account in considering the issues raised by Brazil's claims relating to the ETI Act? USA**

229. We agree with the passage quoted from the *India – Patents* dispute and consider it relevant to the extent that: Brazil has identified the challenged measure; Brazil has argued why the reasoning of the panels and Appellate Body are relevant in determining that the measure is inconsistent; and the Panel finds the reasoning in *FSC/ETI* persuasive. Our argument in the first written submission went to whether Brazil had carried its burden of bringing a *prima facie* case, in order to assist the Panel to fulfill its obligation under DSU Article 11 to make an objective assessment of the matter before it. Brazil may consider that it should not have to meet this burden, but under DSU rules as currently agreed, it must.[91] Finally, we note our statement in the first submission that "[w]hile the United States cannot specify the precise date on which this will occur, the United States is confident that the ETI Act will be repealed in the reasonably near future."[92]

**121. How do you respond to the reference in paragraph 43 of EC third party oral statement with respect to the relevance of Article 17.14 of the DSU, and, in particular, the phrase "a final resolution to that dispute" (emphasis added)? Please explain the use, and relevance (if any) of the term "disputes" in Articles 9.3 and 12 and Appendix 3 of the DSU, and please cite any other provisions you consider relevant. USA, BRA**

230. The United States considers the EC's references to be irrelevant to the resolution of this dispute. As noted in the US first written submission, the United States intends to implement the DSB's recommendations and rulings in the *FSC/ETI* dispute. Further, the issues raised in the US first written submission related solely to whether Brazil had met its burden of argumentation in this dispute and not to the substantive correctness and applicability, or lack thereof, of the adopted findings in *FSC/ETI*. Nor did the US arguments relate to the breadth of the US obligation to implement the DSB's rulings and recommendations in that dispute. The United States considers that Brazil's burden in this dispute requires, at a minimum, that it identify those aspects of the measure which are WTO-consistent and explain why that is the case.

[91]*See* TN/DS/W/45 (Brazilian proposal in ongoing DSU review: "Brazil understands that one of the drawbacks of the current dispute settlement mechanism is the necessity for a Member to litigate a case *de novo* through all the established phases even if the same measure nullifying or impairing benefits of this Member has already been found WTO inconsistent in previous panel or appeal proceedings initiated by another Member.").

[92]US First Written Submission, para. 189.

# ANNEX I-3

## COMMENTS OF BRAZIL TO ANSWERS TO QUESTIONS POSED BY THE PANEL FOLLOWING THE FIRST SUBSTANTIVE MEETING OF THE PANEL

22 August 2003

TABLE OF CONTENTS

**Table of Cases Cited**

| Short Title | Full Case and Citation |
|---|---|
| EC – Bananas (III) | Appellate Body Report, *European Communities – Regime for the Importation, Sale and Distribution of Bananas*, WT/DS27/AB/R, adopted 25 September 1997 |

## I. PRELIMINARY ISSUES

**(3) If the request for consultations in this dispute omitted certain products in relation to export credit guarantees, on what basis is it argued that it failed to identify the measures at issue in accordance with Article 4.4 of the DSU?**

**Brazil's Comment on US Answer:**

1. In paragraphs 5-6 of its 11 August Answer to Question 3, the United States argues that footnote 1 to Brazil's request for consultations does not expand the scope of the request, with regard to the US export credit guarantee programmes, beyond upland cotton. This is inaccurate. The footnote number falls *immediately after the words "upland cotton"* in the first sentence of the first paragraph of the request. With reference to "upland cotton", the footnote reads, "[e]xcept with respect to export credit guarantee programmes as explained below".[1] Although the United States claims that there is no explanation "below", there is indeed such an explanation. In particular, Brazil described its potential claim as follows, on page 4 of the request:

> Regarding export credit guarantees, export and market access enhancement provided under the Agricultural Trade Act of 1978, as amended, and other measures such as GSM-102, GSM-103, and SCGP programmes, Brazil is of the view that these programmes, as applied and as such, violate Articles 3.3, 8, 9.1, and 10.1 of the Agreement on Agriculture and are prohibited export subsidies under Article 3.1(a) and item (j) of the Illustrative List of Export Subsidies included in Annex I to the SCM Agreement.[2]

The Panel will note that there is no limitation in this sentence to any particular commodity or commodities.

2. At paragraph 7 of its 11 August Answer, the United States asserts that "the statement of evidence attached to Brazil's consultation request did not include any evidence related to measures other than those for upland cotton." This too is inaccurate. The United States conveniently leaves the word "available" out of the term "statement of available evidence" used in Articles 4.2 and 7.2 of the SCM Agreement. Brazil was required to provide a statement of the evidence available to it at the time. It was not required to attach exhibits with the evidence; nor was it required to provide a statement regarding all of the evidence that it would eventually present to this Panel. In paragraph 3 of its statement of available evidence, Brazil addressed what it knew at that point about the US export credit guarantee programmes:

> US export credit guarantee programmes, since their origin in 1980 and up [to] the present, provide premium rates that are inadequate to cover the long-term operating costs and losses of the programmes; in particular there were losses caused by large-scale defaults totaling billions of dollars that have not been reflected in increased premiums to cover such losses.

3. This sentence speaks not just to the existence of the US export credit guarantee programmes, but also to the way in which they constitute export subsidies, given the explicit use of the language included in item (j) of the Illustrative List of Export Subsidies. The statement fulfils the requirement in Articles 4.2 and 7.2 of the SCM Agreement. The Panel will also note that there is no limitation in this sentence to any particular commodity or commodities.

4. In footnote 3 to its response, the United States states that it "will be making a request for a preliminary ruling" that Brazil's consultation request was broader than its statement of evidence, in

[1] WT/DS/267/1, p. 1.
[2] WT/DS/267/1, p. 4.

violation of Article 7.2.[3] As demonstrated above, Brazil's request, and the accompanying statement of available evidence, do not support the United States' assertion. Both the request and the statement of available evidence address the US export credit guarantee programmes without limitation to any particular commodity or commodities.

5. Moreover, even if the United States were to make this request for a preliminary ruling and the Panel were to grant it, it would not affect Brazil's claims. Brazil's compliance with Article 7.2 of the SCM Agreement can have no effect on its claims under the Agreement on Agriculture, or on its prohibited subsidy claims under the SCM Agreement, or on its actionable subsidy claims with respect to upland cotton.

6. Finally, according to the Panel's Working Procedures, requests for preliminary rulings by a party were to have been made "not later than its first submission to the Panel".[4] Thus, the US request would not be timely. Brazil submits this information at this stage in the hope of avoiding another lengthy procedural objection by the United States.

**(4) Is it argued that the export credit guarantee programmes concerning upland cotton are each a separate or independent measure, in that they operate independently?**

**Brazil's Comment on US Answer:**

7. In paragraph 11 of its 11 August Answer to Question 4, the United States argues that "each export credit guarantee issued is a separate measure". It is not for the United States to define the measures that are the subject of Brazil's challenge. Brazil's requests for consultations and establishment identify the measures at issue as the GSM 102, GSM 103 and SCGP programs, both as such and as applied. In its submissions, Brazil has demonstrated that the programmes constitute export subsidies under Articles 1.1 and 3.1(a) of the SCM Agreement, since they are unique financing vehicles that are not available on the market for agricultural commodity transactions and as such provide something better than is available on the market. Brazil has also demonstrated that the long-term operating costs and losses for the programs outpace premiums collected, under item (j) of the Illustrative List (item (j) speaks to the long-term operating costs and losses of "programmes," and not individual guarantees).

**(8) Does the United States confirm that the questions referred to by Brazil in paragraph 92 of Brazil's oral statement were posed to the United States in the consultations?**

**Brazil's Comment on US Answer:**

8. In paragraph 17 of its 11 August Answer, the United States concedes that Brazil posed the questions included at Exhibit Bra-101. The Panel will note that many of the questions included in Section 9 of Brazil's list of questions cover export credit guarantees for all commodities. The United States therefore concedes that Brazil consulted with it on the matters raised in those questions. As Brazil discussed in paragraphs 95-98 of its Statement at the First Meeting of the Panel, panels and the Appellate Body have concluded that for a matter to be properly within the scope of a request for establishment, actual consultations must have been held. That has also been the United States' position in a number of other disputes, including *US – DRAMS* and *Japan – Agricultural Products*.[5]

9. The refusal of the United States to answer Brazil's questions cannot hinder Brazil's ability to pursue its claims against the CCC export guarantee programmes without any limitation to a particular

[3] US 11 August Answer to Question 3, para. 7 and footnote 3 to that paragraph.
[4] Working Procedures of the Panel, 27 May 2003, para. 12.
[5] Oral Statement of Brazil, para. 96-97.

commodity or commodities. If it did, responding Members would have every incentive to refuse to answer any questions during consultations, thereby halting dispute settlement proceedings altogether.

**(10) What actual prejudice, if any, has the United States suffered as a result of the alleged omission of products other than upland cotton from the request for consultations?**

**Brazil's Comment on US Answer:**

10. Brazil agrees that "a Member cannot proceed to a panel unless the Member has consulted on that measure", as the United States argues in paragraph 19 of its response. Brazil's request for consultations included the CCC export guarantee programmes in connection with all commodities, however, and the United States concedes, in paragraph 17 of its answer to Question 8, that it consulted with Brazil via the list of questions included in Exhibit Bra-101.

11. Brazil does not agree with the United States' assertion, at paragraph 20 of its 11 August Answer, that the consultation request is of a "jurisdictional nature". While the Appellate Body has concluded that a complaining Member's request for *establishment* is jurisdictional in nature, and strictly delimits a panel's terms of reference[6], it has not made this statement with respect to a request for *consultations*. In fact, in *Brazil – Aircraft*, the Appellate Body concluded that there is no requirement for a "*precise and exact identity*" between a request for consultations and a request for establishment, which suggests that a request for consultations is *not* jurisdictional in nature.[7]

12. In paragraph 23 of its 11 August Answer, the United States argues, without any proof, that it "has suffered an inability to prepare, respond, and consult with respect to allegations on measures never presented to the United States in accordance with the DSU". As noted above, Brazil's request for consultations specifically addressed potential claims against the US export credit guarantee programs in connection with all commodities, and not just upland cotton. Moreover, the United States acknowledges that Brazil posed questions to it regarding those programmes in connection with all commodities. The questions were provided to the United States in writing on 22 November, in advance of the consultations session.[8] In paragraph 92 of its Oral Statement at the First Meeting of the Panel, Brazil offered extracts from those questions, which clarify that consultations regarding the US export credit guarantee programs were not limited to upland cotton.

13. The United States, therefore, was aware, both from Brazil's request for consultations and from Brazil's extensive list of questions, that the consultations included US export credit guarantee programs with respect to all commodities, and not just upland cotton. That the United States refused to respond to Brazil's questions does not mean that it had an "*inability*" to prepare, respond, and consult with Brazil – it means that the United States made a strategic decision not to do so. The United States had more than seven months from receipt of Brazil's questions until it filed its First Submission to "prepare and respond" to Brazil's claims. This demonstrates that no due process rights were violated nor any prejudice caused. The United States alone bears responsibility for any alleged "prejudice" it has suffered as a result of its own strategic decision.

14. In paragraph 24 of its 11 August Answer, the United States argues that it "has not had [sic] proper opportunity to consult" with Brazil on the US export credit guarantee programs with respect to all commodities. In paragraph 17 of its 11 August Answer to Question 8, however, the United States concedes that Brazil did pose questions on the US export credit guarantee programmes with respect to all commodities. Consultations did, therefore, occur with respect to export credit guarantees covering all eligible agricultural products. The United States refused during meetings on 3-4 December, 19 December 2002 and 17 January 2003 to provide answers to Brazil's questions. With its

[6] Appellate Body Report, *EC – Bananas III*, WT/DS27/AB/R, para. 142.
[7] Appellate Body Report, *Brazil – Aircraft*, WT/DS46/AB/R, para. 132.
[8] Exhibit Bra-101 (Brazil's Questions for the Purposes of Consulations, 22 November 2002).

consultations request and its extensive list of questions, however, Brazil fulfilled the requirement to consult with the United States on the full scope of the programmes.

**(11) Does the United States agree that Brazil's request for establishment of the Panel can be understood to indicate that Brazil's export credit guarantee claims relates to products other than upland cotton? How, if at all, is this relevant?**

**Brazil's Comment on US Answer:**

15. At paragraphs 96-97 of its Statement at the First Panel Meeting, Brazil noted that in other disputes, the US position has been that "'a Member should be permitted to refer a claim to a panel if it was actually raised during consultations, even though it may not have been included in the written request for consultations.'"[9] In its 11 August Answer to Question 11, the United States now suggests that its position is different with respect to measures than it is with respect to claims. According to the United States, while a Member can add *claims* not present in its consultations request to its panel request, it cannot add *measures*.[10]

16. Brazil repeats that its request for consultations does in fact address the US measures (the GSM 102, GSM 103 and SCGP programs) in connection with all commodities. Every measure included in its request for establishment was similarly included in its request for consultations. The US argument is therefore irrelevant.

17. In any event, the US reliance on the Appellate Body's decision in *Guatemala – Cement (I)* is misplaced.[11] In that case, the Appellate Body explained that the text of Article 6 of the DSU and Article 17.4 of the Anti-Dumping Agreement required a distinction between measures and claims. The United States has, however, failed to explain the textual reason why the distinction between measures and claims is relevant *for the purpose of comparing a request for consultations with a request for establishment*. In fact, the Appellate Body has specifically held that Articles 4 and 6 of the DSU do not "require a *precise and exact identity* between the specific measures that were the subject of consultations and the specific measures identified in the request for the establishment of a panel".[12] Nor has the United States offered any logical reason why a Member should be allowed to add claims not covered by its consultations request to its request for establishment, but not measures. If anything, a defending Member would seem to suffer greater prejudice by the addition of claims than by the addition of measures, since the Member is likely more familiar with its *own* measures than it would be with *another Member's* claims.

**(16) What, if any, prejudice in terms of presentation of its case does the United States allege, should the Panel proceed to consider the measures constituting the cottonseed payments under the Agriculture Assistance Act of 2003?**

**Brazil's Comment on US Answer:**

18. There have been many disputes in which Panel found that measures, which were replacement measures to measures originally consulted on, were included in the panel's terms of reference, *Korea – Beef*[13] *and Chile- Agricultural Products (Price Band)*[14], to name a few. The Agricultural Assistance Act of 2003 is in the nature of a revised measure, as Brazil has argued in paragraphs 145-150 of its

[9] Panel Report, *US – DRAMS*, WT/DS99/R, para. 6.8.
[10] US 11 August Answer to Question 11, para. 25.
[11] US 11 August Answer to Question 11, para. 26 note 9
[12] Appellate Body Report, *Brazil – Aircraft*, WT/DS46/AB/R, para. 132.
[13] Panel Report, *Korea – Beef*, WT/DS161/R and WT/DS169/R, para. 563-564.
[14] Appellate Body Report, *Chile – Agricultural Products (Price Band)*, WT/DS207/AB/R, para. 143-144.

Oral Statement. Brazil also notes that the United States has identified no prejudice to its ability to defend this measure in this dispute.

**(17) (a) What is the relationship of the Agricultural Assistance Act of 2003 to other legislation in the request for establishment of the Panel?**

**(b) Do the legal instruments follow directly one after another, or are there temporal gaps? Are payments authorized under a broad legislative authority or are they specific to each legal instrument?**

**(c) Please provide any implementing regulations. Do these implementing regulations resemble those relating to previous programmes or payments? Are payments made retrospectively? How if at all is this relevant?**

**Brazil's Comment on US Answer**

19. The United States argues that the four legislative acts that authorize cottonseed payments for the MY 1999, 2000 and 2002 crop are completely unrelated measures and that – while the regulations implementing these payments are very similar – this is immaterial to the question of whether such payments are part of a single programme.[15]

20. If a Member like Brazil would be prevented from challenging yearly renewed measures that provide support under the very same mechanism – and in fact under nearly identical regulations[16] – than another Member like the United States could continue to enact yearly measures and limit the challenge by WTO Members to old measures without a prevailing challenge having any effect on its current and future identical measures. The result would put a complaining Member in the impossible situation of having to challenge identical measures year after year, just because they are based on legislation that "bears no relation"[17] to preceding *identical* legislation *on the same matter*.

21. The Panel in *Argentina – Footwear* rejected similar arguments to those made by the United States:

Moreover, it appears that an interpretation whereby these subsequent Resolutions are considered to be measures separate and independent from the definitive safeguard measure, and thus outside our terms of reference, could be contrary to Article 3.3 of the DSU. Such an interpretation could allow a situation where a matter brought to the DSB for prompt settlement is not *resolved when the defendant changes the legal form of the measure through a separate but closely related instrument, while the measure in dispute remains essentially the same in substance*. In this way, Members could always keep one step ahead of any WTO dispute settlement proceeding because in such a situation, the complaining Member would indeed, challenge a "moving target", and panel and Appellate Body's findings could already be overtaken by events when they are rendered and adopted by the DSB.[18]

22. Brazil maintains that the Agricultural Assistance Act of 2003 constitutes a subsequent, separate but closely related instrument, that is essentially the same as the legal instruments authorizing the MY 1999 and MY 2000 cottonseed payments and that is, therefore, within the Panel's terms of reference.

## II. ARTICLE 13(B): DOMESTIC SUPPORT MEASURES

### A. "EXEMPT FROM ACTIONS"

**(20) In paragraph 8 of its initial brief (dated 5 June, 2003), the United States argued that the word "actions" as used in the phrase "exempt from actions" in Article 13 of the Agreement on Agriculture includes the "bringing of a case" and consultations. In paragraph 36 of its first written submission (dated 11 July, 2003), the United States stated as follows:**

**"[P]rior to this point in the process, the DSU rules did not afford the United States any opportunity to prevent the dispute from proceeding through consultations and panel establishment automatically, regardless of the US insistence that its measures conform to the Peace Clause."**
**Is it the United States' understanding that the drafters used the phrase "exempt from actions" knowing that under the DSU it would not be possible fully to exempt "actions", as the United States interprets that term?**

**(21) In US - FSC and US - FSC (21.5) the Appellate Body made findings under the SCM Agreement relating to export subsidies in respect of agricultural products without making a finding in respect of Article 13 of the Agreement on Agriculture. How is this relevant to the United States' interpretation of the phrase "exempt from actions" as used in Article 13? USA**

**Brazil's Comment on US Answers:**

23. The United States and the European Communities maintain that the complaining party has the burden of proof under Article 13 of the Agreement on Agriculture. More specifically, they claim that Article 13 is not in the nature of an affirmative defence. Brazil's comment will again show that their position is untenable.

24. In its 11 August Answer to Question 20 of the Panel, the United States asserts, under the "exempt from action" argument, that "Brazil has attempted to improperly invoke dispute settlement procedures notwithstanding the Peace Clause."[19] According to the United States, a dispute settlement procedure could only be initiated after a determination of non-compliance with Article 13 has been made. In its 11 August Answer to Question 21, the United States then dismisses the findings in *US – FSC* by simply stating that they do not address the peace clause and that the issue was not raised by either party in that case.[20] Therefore, those rulings and recommendations "provide no guidance for purposes of this dispute".

25. The EC maintains that "Article 13 is more akin to a threshold permitting further action if the threshold is not complied with."[21] The EC affirms that Article 13 "is an integral part of the *Agreement on Agriculture*".[22] In that sense it would be comparable to Article 6 of the ATC, Article 3.3 of the SPS Agreement, and Article 2.4 of the TBT Agreement, which were found not to be affirmative defences by the Appellate Body.[23] According to the EC, those provisions, like Article 13 of the Agreement on Agriculture, "provide certain rights to WTO Members, but cannot be seen as exceptions".[24]

[19] US 11 August Answer to Question 20, para. 47.
[20] US 11 August Answer to Question 21, para. 48.
[21] Third Party Submission of the EC, para. 11.
[22] Third Party Submission of the EC, para. 12.
[23] Third Party Submission of the EC, para. 12.
[24] Third Party Submission of the EC, para. 12.

26. Brazil disagrees. The Appellate Body addressed the issue of burden of proof on numerous occasions. In *US – Shirts and Blouses*, the Appellate Body made a general finding stating that

... the burden of proof rests upon the party, whether complaining or defending, who asserts the affirmative of a particular claim or defence. If that party adduces evidence sufficient to raise a presumption that what is claimed is true, the burden then shifts to the other party, who will fail unless it adduces sufficient evidence to rebut the presumption.
In the context of the GATT 1994 and the WTO Agreement, precisely how much and precisely what kind of evidence will be required to establish such a presumption will necessarily vary from measure to measure, provision to provision, and case to case.[25]

27. When examining Article 6 of the ATC, Article 3.3 of the SPS Agreement, and Article 2.4 of the TBT Agreement, the Appellate Body did not stray from this principle. In fact, it was the cornerstone of all determinations concerning the above-cited provisions. Paragraph 275 of the Appellate Body report in *EC – Sardines* reads:

> In EC – Hormones, we found that a "general rule-exception" relationship between Articles 3.1 and 3.3 of the SPS Agreement does not exist, with the consequence that *the complainant had to establish a case of inconsistency with both Articles 3.1 and 3.3*.[196] We reached this conclusion as a consequence of our finding there that "Article 3.1 of the SPS Agreement simply excludes from its scope of application the kinds of situations covered by Article 3.3 of that Agreement".[197] Similarly, the circumstances envisaged in the second part of Article 2.4 are excluded from the scope of application of the first part of Article 2.4. Accordingly, as with Articles 3.1 and 3.3 of the SPS Agreement, there is no "general rule-exception" relationship between the first and the second parts of Article 2.4. Hence, in this case, it is for Peru – *as the complaining Member seeking a ruling on the inconsistency with Article 2.4 of the TBT Agreement* of the measure applied by the European Communities – to bear the burden of proving its claim. (emphasis added) (footnotes omitted)[26]

28. With regard to Article 6 of the ATC, the Appellate Body found that provision to be a fundamental part of the rights and obligations of WTO Members concerning non-integrated textile and clothing products covered by the ATC during the transition period. Consequently a party claiming a violation of a provision of the WTO Agreement by another Member must assert and prove its claim. In this case, *India claimed a violation by the United States of Article 6 of the ATC.* We agree with the Panel that it, therefore, was up to India to put forward evidence and legal argument sufficient to demonstrate that the transitional safeguard action by the United States was inconsistent with the obligations assumed by the United States under Articles 2 and 6 of the ATC. (emphasis added)[27]

29. Unlike the EC, Brazil believes that these Appellate Body findings underscore the striking differences between Article 13 of the Agreement on Agriculture and the other provisions cited by the EC and which the Appellate Body found not to be in the nature of an affirmative defence.

30. First, Brazil notes that in all Appellate Body findings, the complaining party claimed a violation of the provision at issue. The complaining party tried to impute the burden of proof on the respondent by alleging that those provisions also contained language that provided an opportunity for an affirmative defence under an “exception” to the general rule.

[25] Appellate Body Report, *US – Shirts and Blouses*, p. 14.
[26] Appellate Body Report, *EC – Sardines*, para. 275.
[27] Appellate Body Report, *US – Shirts and Blouses*, p. 16.

31. Article 13 of the Agreement on Agriculture is entirely different. The peace clause imposes no obligations on WTO Members. As the EC rightfully stated in paragraph 6 of its Initial Submission of 10 June 2003:

> a Member is not under an obligation to act consistently with Article 13 of the *Agreement on Agriculture* – failing to respect Article 13 implies that a Member no longer enjoys protection thereof. Consequently ... Article 13 of the *Agreement on Agriculture* can only be seen as a defence against a claim brought under other aspects of the WTO Agreements which regulate the provision of subsidies. It would seem bizarre if before Brazil could bring a claim with respect to subsidies which it considered did not respect the US's obligations, Brazil had first to establish that potential defences did not apply. (italics in original) (underlining added)[28]

32. Brazil entirely agrees with the characterization of Article 13 as a potential defence against claims brought before the WTO. In fact, as the Panel is well aware, in Brazil's request for the establishment of the Panel, Brazil does not claim that the United States violated Article 13. Such violation is indeed impossible, since Article 13 of the Agreement on Agriculture imposes no obligations whatsoever on WTO Members. Article 13 simply provides shelter to Members that invoke its exemption from actions based on certain other provisions of the WTO Agreements. Again, as the Appellate Body stressed every single time it addressed the issue, "the burden of proof rests upon the party, whether complaining or defending, who asserts the affirmative of a particular claim or defence."[29]

33. Second, Brazil's interpretation is entirely compatible with the findings of the panel and the Appellate Body in *US – FSC*. Brazil, unlike the United States, considers these finding to be very relevant to this dispute. In *US – FSC*, the United States decided not to invoke Article 13 of the Agreement on Agriculture as a possible defence against the challenges brought by the EC. The panel and the Appellate Body did not need to address Article 13 simply because it was not used as a defence by the respondent. This situation is not necessarily unusual. For example, a respondent that knows, in advance, that it is not complying with the requirements of Article 13, may well choose to directly rebut the prima facie case of the complainant by providing rebuttal arguments and evidence without attempting to use the Article 13 shelter.

34. Indeed, interpreting Article 13 of the Agreement on Agriculture as a "threshold"[30] provision is at odds with the Appellate Body's findings in *US – FSC*, *US– FSC* (21.5), *Mexico – HFCS* (21.5) and *US – Byrd Amendment*. In Mexico – HFCS (21.5), the Appellate Body held that

> We believe that a panel comes under a duty to address issues in at least two instances. First, as a matter of due process, and the proper exercise of the judicial function, panels are required to address issues that are put before them by the parties to a dispute. Second, *panels have to address and dispose of certain issues of a fundamental nature, even if the parties to the dispute remain silent on those issues*. In this regard, we have previously observed that '[t]he vesting of jurisdiction in a panel is a fundamental prerequisite for the lawful panel proceeding.' For this reason, panels cannot simply ignore issues which go to the root of their jurisdiction – that is, to their authority to deal with and dispose of matters. Rather, *panels must deal with such issues – if necessary, on their own motion – in order to satisfy themselves that they have authority to proceed*. (emphasis added) (footnote omitted)[31]

---

[28] Initial Third Party Submission of the EC, para. 6.
[29] Appellate Body Report, *US – Shirts and Blouses*, p. 14.
[30] Third Party Submission of the EC, para. 11.
[31] Appellate Body Report, *Mexico – HFCS (21.5)*, WT/DS132/AB/RW, para. 36.

35. The Appellate Body applied this reasoning to itself in *US – Byrd Amendment*. In that case, the Appellate Body examined an issue related to the Panels jurisdiction, although it was not addressed before the Panel or, indeed mentioned in the notice of appeal.[32] If Article 13 of the Agreement on Agriculture were a threshold provision affecting the jurisdiction of a panel or the Appellate Body, both the panels and the Appellate Body in *US – FSC* and *US – FSC* (21.5) would have had to address the issue of peace clause exemption of the claims brought by the EC. The fact that none of them did is further evidence that Article 13 is not a "threshold" or jurisdictional provision. As Brazil maintains, Article 13 of the Agreement on Agriculture is an affirmative defence.

36. Further, Brazil does not claim that Article 13 is an "exception". Brazil does not claim that the United States "violated" Article 13 and, therefore, Brazil does not bear the burden of proving any such assertion. Actually, Brazil simply does not believe that Article 13 is at all relevant to claims raised under the SCM Agreement or GATT Article XVI until the respondent claims that it is exempt by the provisions of the peace clause. The respondent claiming such exemption has the burden of proving that it is entitled to it.[33] If the respondent does not claim such protection, Article 13 is moot, as demonstrated by the *US – FSC* case.

37. In paragraph 11 of its Oral Statement of 24 July, the EC points out that no "credible response" was given to the argument it put forward suggesting that Brazil's approach "has perverse effects".[34] The EC claimed that

> if Article 13 is considered an affirmative defence, when a complainant brings a dispute under Articles 5 and 6 of the SCM Agreement and, for instance, Article 6 of the *Agreement on Agriculture*, the complainant would be required to prove a breach of Article 6 while at the same time the defendant would also be required to prove that it had not infringed Article 6 of the Agreement. The burden of proof cannot switch between parties simply on the basis of whether the complainant cites the *SCM Agreement* or not ..." (italics on the original)[35]

38. Brazil fails to see the conundrum that seems to puzzle the EC. If the complainant cites the SCM Agreement or, better still, alleges a violation of the SCM Agreement together with a violation of Article 6 of the *Agreement on Agriculture*, the burden of proving both assertions rests on the complainant irrespective of the fact that the respondent may invoke Article 13. If the complainant fails to establish the violation of Article 6 of the *Agreement on Agriculture*, then the task of the respondent to invoke the Article 13 shelter against a possible violation of the SCM Agreement is made that much easier. In fact, the burden of proof concerning the violation of Article 6 of the *Agreement on Agriculture* will simply *start* with the complainant. As the Appellate Body noted in *US – Shirts and Blouses*, if the complainant "adduces evidence sufficient to raise a presumption that what is claimed is true, the burden shifts to the other party, who will fail unless it adduces sufficient evidence to rebut the presumption". Therefore, the burden of proof may well switch between parties, but not "on the basis of whether the complainant cites the *SCM Agreement*", as the EC suggested in its Oral Statement.

39. In sum, Brazil reemphasizes that the peace clause is in the nature of an affirmative defence.

B. "SUCH MEASURES" AND ANNEX 2 OF THE AGREEMENT ON AGRICULTURE

**(22) Please explain the difference, if any, between the meaning of "defined" and the meaning of "fixed" in the phrase "a defined and fixed base period" in paragraph 6(a) of Annex 2 of the Agreement on Agriculture.**

**Brazil's Comment on US Answer:**

40. The United States 11 August Answer to Question 22 renders the meaning of the word "fixed" meaningless by isolating the phrase "relative position" from the full dictionary definition.[36] The complete definition includes the phrase "definite, permanent, and lasting".[37] There is nothing "permanent" about the US interpretation of the meaning of "fixed base period" for the PFC and direct payment programmes. For further comments on the issue, Brazil refers the Panel to paragraphs 10-12 of its Rebuttal Submission.

**(24) How often can a Member define and fix a base period in accordance with paragraph 6 of Annex 2 of the Agreement on Agriculture?**

**Brazil's Comment on US Answer:**

41. Brazil agrees with the United States' statement that there is "no requirement in paragraph 6 that a particular base period be used for a decoupled income support measure nor that the same base period be used for purposes of every decoupled income support measure."[38] But this misses the point. The legal and factual question is whether a measure for which a new base period is "*fixed*" has the same structure, design, and eligibility criteria as an older replaced measure which had a *different* base period. The evidence demonstrates that PFC payments and direct payments have a similar structure, design, and eligibility criteria.[39]

**(29) Please explain the meaning of the words "the fundamental requirement" as used in paragraph 1 of Annex 2 of the Agreement on Agriculture.**

**Brazil's Comment on US Answer:**

42. The United States argues in response to this question that "compliance with the fundamental requirement of the first sentence will be demonstrated by conforming to the basic criteria of the second sentence plus the applicable policy-specific criteria of paragraphs 6-13."[40] Brazil disagrees that compliance with the basic and policy-specific criteria is a sufficient condition for compliance with the fundamental requirement. For example, the volume of direct payments that conform to the criteria in paragraph 6 is not limited. However, the amount of support a Member provides may be so large that the payments create significant production and trade-distorting effects. Therefore, even if direct payments conform to the basic and policy-specific criteria in Annex 2, they may still have considerable production and trade-distorting effects. Brazil refers to its arguments in support of the "stand-alone" nature of the fundamental requirement.[41]

[36] Brazil 11 August Answer to Question 22, para. 20.
[37] The New Shorter Oxford English Dictionary, 1993 edition, p. 962.
[38] US 11 August Answer to Question 24.
[39] *See* Rebuttal Submission of Brazil, para. 10.
[40] US 11 August Answer to Question 29, para. 59.
[41] First Submission of Brazil, para. 163-165; Brazil's 11 August Answer to Questions 27-28, para. 32-43.

**(32) If the first sentence of paragraph 1 of Annex 2 expresses a general principle which informs the interpretation of the criteria in Annex 2, please explain how this affects the assessment of the direct payments programme's compliance with paragraph 6 of Annex 2.**

**Brazil's Comment on US Answer:**

43. Contrary to the US argument at paragraph 68 of its 11 August Answers, there is no conflict between the Brazil's position regarding the fruits, vegetables and wild rice prohibition and Annex 2, paragraph 1 "fundamental requirement". The undisputed facts show that this prohibition on the production of certain crops channels production to other crops that are permitted to be produced to receive the payment.[42] This channeling of payments creates production and trade distorting effects inconsistent with Annex 2, paragraph 1.

44. Further, the United States engages in a wishful interpretation when it states in paragraph 68 of its 11 August Answer that "paragraph 6(b) should be read to prevent a Member from requiring a recipient *to produce* certain crops". This interpretation would render Annex 2, paragraph 6(e) a nullity. Paragraph 6(e) provides that "no production shall be required in order to receive such payments". The US interpretation of paragraph 6(b) as not requiring the production of "certain crops" is the same as 6(e)'s prohibition on not requiring production of "any crops".

45. Paragraph 6(b) is distinct from paragraph 6(e) because it provides a clear test that *the amount* of payment cannot be related to the type of production. There is no factual dispute among the parties that the amount of PFC and direct payments *falls* when base acres are used to produce fruits, vegetables, tree nuts, and wild rice. There is no factual dispute that the 1996 FAIR Act and the 2002 FSRI Act *require* the prohibition or reduction in payments if these crops are produced on base acreage. Given these two undisputed facts and the clear text of Annex 2, paragraph 6(b), the only conclusion is that PFC and direct payments do not meet the policy specific criteria of Annex 2.

C. "DO NOT GRANT SUPPORT TO A SPECIFIC COMMODITY"

**(33) According to the United States' interpretation of the word "grant", when can a Member claim that a measure is not exempt from action under Article 13(b)? what if the measures is enacted annually? Can the Member obtain a remedy in respect of that measure under the DSU?**

**Brazil Comment to US Answer:**

46. Brazil's addresses in detail the US "statute of limitations" argument at paragraphs 88-96 of its Rebuttal Submission, as well as at paragraphs 40-47 of its Oral Statement.

**(37) In the United States' view, why did the drafters not use the exact term "product-specific" in Article 13(b)(ii)?**

**Brazil Comment on US Answer:**

47. The United States' 11 August Answer once again reveals that it equates the term "support to a specific commodity" with "product-specific". Brazil notes again that neither the phrase "product-specific" nor "AMS" is found in the text of Article 13(b). Given the use of such terms in the Agreement on Agriculture, the Drafters must be presumed to have used the term "support to a specific commodity" for a reason. The US answer ignores the likely reason which is that "support to a specific commodity" is qualified by the term "such measures" which includes the universe of non-

[42] *See* Rebuttal Submission of Brazil, para. 7.

green box support measures in the *chapeau* to Article 13(b). This universe of measures from which such support may be found is not limited to simply "product-specific" measures.

**(38) Given the fact that subsidies available for more than one product could have various effects on production, how does the United States demarcate between product-specific support and non-product specific support?**

**Brazil's Comment on US Answer:**

48. The United States demarcation line does not take into account the definition of "non-product specific" in Article 1(a) which is "provided in favour of agricultural producers *in general*". This "in general" language shows where the line between product-specific and non-product specific must be drawn. Any support that is *not* provided to producers "*in general*" cannot, by definition, be non-product specific support. It must instead fall into the category of "product-specific support". The United States fails to recognize that the term "in general" is directly related to and qualifies the phrase "support . . . provided for an agricultural product in favour of the producers of the basic agricultural product".

49. The "demarcation" line drawn by the United States between "product-specific" and "non-product specific" support is necessary to justify the narrow US specificity test for Article 13(b)(ii). The United States argues that support could only be "product-specific" if "production is necessary for the support to be received."[43] Yet, the Article 1(a) notion of "support" "provided for an agricultural product in favour of the producers of the basic agricultural product" is very broad. It could include any *type* of support, regardless of whether production was required or not. For example, if the facts demonstrate that $1 billion of support were received by the "producers of a basic agricultural product" (such as in the case of CCP payments to upland cotton producers in MY 2002), the language of Article 1(a) would support the finding that this support is "product-specific". The only restraint on such a conclusion is if it could be shown that all, or most of the producers of agricultural products received the same type of support. However, none of the five domestic support payments at issue in this dispute comes even close to such an "in general" finding. The inclusion of such subsidies as "support to a specific commodity" is confirmed by the context of Article 13(b)(ii) which includes Annex 3 of the Agreement on Agriculture as discussed in paragraphs 17-22 of Brazil's Rebuttal Submission.

50. Further, the United States never addresses the premise of the Panel's question, i.e, that subsidies for more than one product could have various effects on production. This is exactly the situation with PFC, market loss, direct payments, CCP payments, and crop insurance subsidies. The evidence (which consists in large part of the statements of present or former USDA economists) shows the production enhancing effects of each of these subsidies.

51. The US 11 August Answer highlights the narrowness of its Article 13(b)(ii) specificity test. Trade and production-distorting amber box support from each of these five subsidies increases US production and sustains high levels of US exports of upland cotton. Yet, under the US specificity test, it could never be deemed "support to" upland cotton because no production of upland cotton is legally required. The Panel should reject this approach and find that these programmes provide support to upland cotton.

**(39) If "such measures" in Article 13(b)(ii) refers to all those in the chapeau of Article 13(b), why are they not included in the potential comparisons with 1992? In what circumstances can measures which grant non-product specific support lose exemption from action under Articles 5 and 6 of the SCM Agreement and Article XVI of GATT 1994?**

[43] US 11 August Answer to Question 38, para. 81.

**Brazil Comment to US Answer:**

52. The United States 11 August Answer does not address the second of the Panel's questions directly. But based on the argument in the "answer," the direct answer to the question would have been "*there are no circumstances in which measures which grant non-product specific support lose exemption from action under Articles 5 and 6 of the SCM Agreement and Article XVI of GATT 1994*." The arguments presented by the United States in its answer confirms that its interpretation creates a broad new category of "exempt" non-green box support – those presumptively trade and production-distorting measures it labels "non-product specific". The US constructs this new exempt category by improperly interpreting the phrase "product-specific" to include only non-green box support legally requiring the production of upland cotton. This incorrect definition is inconsistent with the fact that in analogous situations involving calculation of AMS, paragraphs 12-13 of Annex 3 of the Agreement on Agriculture require all types of non-green box support providing support to the producers of an agricultural commodity be included in the amount tabulated. These points are further discussed in paragraphs 13-67 of Brazil's Rebuttal Submission.

53. The US 11 August Answer to the first question in paragraph 84 indicates that it interprets the phrase "such measures" as only including "product-specific" support. Even apart from the incorrect US definition, such an interpretation renders a nullity the reference to most of the "measures" referred to in the "such measures" phrase of Article 13(b)(ii). If the drafters had intended to limit the universe of non-green box support in the manner suggested by the United States, they would have used the phrase "product-specific" instead of "such measures". The better interpretation that does not render the *chapeau* a nullity is that suggested by Brazil: any type of support listed in the chapeau which provides "support to a specific commodity" must be included within the support to be counted for the purpose of the required 13(b)(ii) comparison.

D. "IN EXCESS OF THAT DECIDED DURING THE 1992 MARKETING YEAR"

**General Comment by Brazil on the US Answers to Questions 47-69**

54. Brazil notes that the United States has not fully answered many of the questions posed by the Panel. The United States further announced in various questions that it would provide its views on certain questions posed by the Panel in its rebuttal submission. In the answers provided, the United States has continued to pursue its overly simplistic view of an alleged "decision" to provide a rate of support of 72.9 cents per pound in MY 1992. Brazil has pointed out that this rate of support does not accurately reflect the operation of the US support system to upland cotton and that it ignores restrictions on the availability of support and costs associated with the participation in the support programmes.[44] Professor Sumner has attempted to correct the overly simplistic US approach and has presented data to that respect.[45]

55. A fundamental flaw exposed by the US 11 August Answers is the inability of the US "72.9 methodology" to account for a number of different types of "support to upland cotton". In its 11 August Answer to Question 67, the United States provides a calculation of upland cotton AMS that lists as "product-specific" support Step 2 payments (user marketing certificates), cottonseed payments, storage payments, and interest subsidies, in addition to deficiency payments, and marketing loan payments. Yet, the United States "72.9 methodology" does not – and cannot – account for cottonseed payments, Step 2 payments, storage payments and interest rate subsidies. The United States takes no account of these subsidies – no matter how large the expenditures may be – because they do not fit within the US methodology. So they simply disappear.

[44] Oral Statement of Brazil, para. 36; Brazil's 11 August Answer to Question 66(c), para. 120-128.
[45] *See* Exhibit Bra-105 (Statement of Professor Sumner at the First Meeting of the Panel).

56. Any methodology that cannot account for *all* of the support "decided" and "granted" in MY 1992 and during the implementation period cannot be legitimate. A methodology that would sanction the cover-up of hundreds of millions – if not billions – of dollars of expenditures cannot be justified by the object and purpose of Agreement on Agriculture or by any reasonable reading of the text of Article 13(b)(ii).

57. With these general points in mind, Brazil comments on the answers provided by the United States.

**(43) What are the precise differences between deficiency payments and counter-cyclical payments that lead you to classify the former as product-specific and the latter as non-product specific? How do you classify market loss assistance payments?**

**Brazil's Comment on US Answer:**

58. The US 11 August Answer at paragraph 87-90 reveals its erroneous interpretation of the phrase "product-specific" in Article 1(a) of the Agreement on Agriculture. The United States ignores the phrase "in general" and assumes that "non-product specific" support is a huge residual category of support that includes everything *except* support which *requires* production of a specific product. Further, the United States' answer ignores the fact that all types of support in favour of domestic producers of a basic commodity are included in the analogous AMS calculation of Annex 3 – including "product-specific" support where the recipient is *not* required to produce a specific commodity. Brazil outlines the erroneous US interpretation in paragraphs 13-23 of its Rebuttal Submission.

59. The improper narrow US interpretation of "product-specific" is highlighted in its discussion of counter-cyclical payments where the only relevant fact is that a producer receiving CCP payments need not plant any crop at all. Brazil addresses in detail the evidence demonstrating that CCP payments are "support to" upland cotton in paragraphs 48-52 of its Rebuttal Submission.

60. With respect to market loss assistance payments, Brazil notes that it provides a detailed analysis of how such payments are "support to upland cotton" in paragraphs 29-35 of its Rebuttal Submission, as well as in paragraphs 50-54 of its Oral Statement. Contrary to the US statement in paragraph 92 of its 11 August Answers, Brazil has always asserted that market loss assistance payments are "support to a specific commodity", i.e., to upland cotton.

**(46) What is the relevance, if any, of the concept of "specificity" in Article 2 of the SCM Agreement and reference to "a product" or "subsidized product" in certain provisions of the SCM Agreement to the meaning of "support to a specific commodity" in Article 13(b)(ii) Agreement on Agriculture?**

**Brazil's comment to US Answer:**

61. For the reasons set forth in Brazil's 11 August Answer to this question, Brazil believes that Article 2 of the SCM Agreement provides useful context in interpreting the concept of specificity in Article 13(b)(ii). Brazil notes that the very narrow US notion of specificity (only support *requiring* recipients to produce the commodity in question) for Article 13(b)(ii) is quite different than the very broad concept of specificity applying to all commodities (including agricultural commodities) as set out in the US SAA referred to in Brazil's answer. The United States has not provided any reasons why there should be such a radically different concept of specificity involving non-green box domestic support measures under Article 13(b)(ii) and all types of products (including agricultural goods) under the SCM Agreement. Brazil sees no basis for such a significant difference.

**(48) Does Article 13(b)(ii) require a comparison of support granted with support decided? How could such a comparison be made?**

**Brazil's Comment on US Answer:**

62. Brazil comments on the US 11 August Answer to Question 48 in the context of its Rebuttal Submission at paragraphs 68-96.

**(54) Please identify all United States legal and regulatory and administrative instruments decided during the marketing year 1992, with the respective dates of decision, that decided support for upland cotton.**

**Brazil's Comment on US Answer:**

63. As Brazil has noted in its general comment at paragraphs 54-57 above, the United States focuses solely on the alleged target price decision of 72.9 cents per pound. This simplistic approach does not accurately reflect the actual operation of the US support programmes to upland cotton. As detailed by Professor Sumner in his Statement at the First Meeting, the United States took a number of decisions concerning support for the 1992 marketing year.[46]

64. Professor Sumner – who actually participated in the decision making process concerning the MY 1992 acreage reduction programme decision – explained during the First Meeting of the Panel that the decision on the percentage of upland cotton base that farmers participating in the deficiency payment programme had to leave idle was a conscious decision based on, *inter alia*, budgetary considerations. Given expectations about production and prices in the upcoming marketing year, the decision on the acreage reduction programme was also a decision on expected participation. The United States could base expected participation on historical experience about participation in the deficiency payment program. Professor Sumner indicated that USDA was able to fairly accurately predict actual participation. The decision on the amount of mandatory acreage reduction is, thus, a decision on the level of participation.

65. Professor Sumner's testimony is supported by the Chief and Deputy Chief Economist of USDA who have explained that the aim of the acreage reduction programme was "to balance supply and demand"[47], i.e., to influence prices and thereby US budgetary outlays. They furthermore report that the United States implemented the acreage reduction programme with a view of reducing costly government stocks, and that the United States – with further budget considerations in mind – reduced target prices.[48]

66. Furthermore, the United States ignores various required additional administrative decisions that were necessary to make its domestic support programmes operative. These decisions include decisions on the deficiency payment rate, on weekly Step 2 payment rates and on a weekly-determined adjusted world price setting the amounts of marketing loan benefits available for that week. By taking all of these decisions, the United States directly influenced the expenditures related to the MY 1992 crop.[49] In addition, as the United States now reflects in its AMS data, the

[46] Exhibit Bra-105 (Statement of Professor Daniel Sumner at the First Meeting, para. 7-8).

[47] Exhibit Bra-180 ("Will Policy Changes Usher in a New Era of Increased Agricultural Market Variability?," Keith J. Collins, Joseph W. Glauber, Choices, Second Quarter 1998, p. 27).

[48] Exhibit Bra-180 ("Will Policy Changes Usher in a New Era of Increased Agricultural Market Variability?," Keith J. Collins, Joseph W. Glauber, Choices, Second Quarter 1998, p. 27).

[49] Brazil acknowledges that the United States could not possible determine its expenditures as they would depend to a certain extent on market prices that were also influenced by factors outside the control of the US Government.

United States considers storage payments and interest subsidies[50] as product-specific support to upland cotton. Consequently, under the US approach, these product-specific domestic support measures need to be taken into account for purposes of the Article 13(b)(ii) decision. Yet, the United States fails to account for these programmes in its list of decisions taken concerning support to upland cotton, just as it failed to account for various decisions relating to the deficiency payment, marketing loan and Step 2 programmes.

67. Brazil also notes that the United States failed to answer Question 54 that asked the United States to identify "all" instruments that decided support for upland cotton. This would also cover instruments other than product-specific instruments. However, the United States has only followed its simplistic view of what kind of decision it took and has not provided information on other decisions. This appears to be an attempt to avoid the conclusion under all other approaches: that the United States provided support in MY 1999-2002 in excess of that decided during the 1992 marketing year.

**(55) Please provide a copy of the instruments in which the rate of support for upland cotton during the marketing year 1992 was decided, indicating the date of the decision.**

**Brazil's Comment on US Answer:**

68. As noted in Brazil's Comment to the previous question, the United States failed to identify a list of decisions taken with respect to support for upland cotton in MY 1992. As a consequence, the United States also failed to provide copies of those instruments.[51]

**(57) If the United States decided on a rate of support for MY1992, does that not mean that it decided on whatever budgetary outlay was required to meet that rate of support, even if the exact amount was not known at that time?**

**Brazil's Comment on US Answer:**

69. At the outset, Brazil refers the Panel to the general comment made in respect of the set of questions referring to the term "decision" in Article 13(b)(ii) of the Agreement on Agriculture. Also this answer suffers from the simplistic picture the United States draws of its MY 1992 support programmes to upland cotton.

70. Brazil disagrees with the United States that it could not be said that the United States decided on budgetary outlays. Indeed, for *all* of the US programmes, there was a decision to authorize whatever budgetary outlays would be necessary to meet the rate of support.[52] In addition, the United States ignores that it has admitted that there were other programmes that meet its definition of "product-specific" and that do not provide a rate of support: Step 2, cottonseed, storage payments and interest subsidies. The United States accounted for those subsidies by providing budgetary outlays in its upland cotton AMS calculation, but it does not provide any information on the decision taken with respect to those domestic support measures and the rate of support provided by them. In addition, the United States took specific administrative decisions on the deficiency payment rate for MY 1992 (20.3 cents per pound[53]), weekly Step 2 payment rates as well as weekly decision on the adjusted world price and, thus, the rate of marketing loan benefits. By taking these decisions, the United States decided on the payment rates that resulted from the "rate of support" and, therefore, on the amount of budgetary outlays it would use from its unlimited spending authority.

[50] Brazil notes that the United States nowhere provides any information concerning the type and conditions of payments that are covered by these terms.

[51] *See* paras. 63-67 *supra*.

[52] First Submission of Brazil, para. 141.

[53] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5).

71. Brazil further disagrees with the US assertion at paragraph 113 of its 11 August Answers that the programs decided by the United States required an unlimited budgetary authority in both MY 1992 and in later marketing years.[54] Even at prices of zero cents per pound, the amount of US expenditure for the deficiency payment and the marketing loan programme in MY 1992 was, in fact, limited by decisions restricting the participation in the programs to farmers that historically had grown upland cotton, who were eligible, and who decided to participate based on the eligibility criteria. By contrast, participation in the MY 2002 marketing loan programme, the crop insurance programme, and the Step 2 programme, for instance, is no longer limited and now has an unlimited budgetary authority coupled with mandatory payment provisions. In particular, the marketing loan programme is now unlimited whereas in MY 1992, eligibility to marketing loan benefits was restricted to upland cotton grown on acreage that was enrolled in the deficiency payment programme.

72. In sum, the United States not only "decided on whatever outlay was required to meet that rate of support", it also took various administrative decisions that implemented the rate of support and transposed it into specific payment rates that resulted in identifiable budgetary outlays. The United States took those decisions with respect to all of the programmes including crop insurance and Step 2, as well as with respect to storage payments and interest subsidies.[55] Thus, the collective effect of these multiple decisions was to decide on the amount of expenditures for MY 1992. The only way to express this multitude of decisions and conduct the required comparison with MY 1999-2002 is to use total monetary amounts of budgetary expenditures.

**(60) Can you provide information on the support decided in 1992 and the years with which you believe it should be compared, on a per support programme / per unit of production basis / per annum basis? If possible, please specify how, if at all, budget outlays may be transposed into units of production, and which units of production are best to use.**

**Brazil's Comment on US Answer:**

73. Brazil notes that the United States has not provided, as requested, any per support measure, per unit figures of support that it decided in 1992 and support it granted in other years. Nor did the United States provide any information whatsoever on how to account for Step 2 payments, cottonseed payments, storage payments and interest subsidies because there is no way such measures could be measured using the simplistic US rate of support only approach.

74. In addition, the United States does not respond to the Panel's request to transpose this rate of support into budgetary outlays per pound of production. Brazil refers the Panel to paragraphs 84-85 of its Rebuttal Submission, where it provides a new chart reflecting new information provided by the United States for various programmes.[56]

**(61) Does the United States consider that Article 13(b)(ii) permits a comparison on any other than a per pound basis?**

**Brazil's Comment on US Answer:**

75. The United States admits that Article 13(b)(ii), and in particular the term "decided", permit a comparison different from comparing a rate of support, *had the US domestic support measures been structured* (*i.e.* decided) *differently* than characterized by the United States.[57] This admission is significant, because, in fact, the US measures *were structured quite differently* from what the

[54] US 11 August Answer to Question 57, para. 113.
[55] US 11 August Answer to Question 67.
[56] US 11 August Answer to Question 67, para. 129-134.
[57] US 11 August Answer to Question 61, para. 118.

United States asserts. Professor Sumner[58] established that the US support programmes in MY 1992 did *not* provide a rate of support of 72.9 cents per pound to each pound of upland cotton produced in the United States. Numerous restrictions on the availability of the support by the deficiency payment programme and the marketing loan programme existed. In addition, participation in both programmes was costly to farmers, as farmers were mandated to set aside a certain percentage of acreage every year. USDA Chief Economist Keith J. Collins and USDA Deputy Chief Economist Joseph W. Glauber explain that

> [s]everal programme changes beginning with the 1985 Farm Act reduced the ability of deficiency payments to stabilize incomes by fixing programme payment yields, reducing the amount of acreage eligible for payments, and tightening payment limits. In addition, many producers elected not to participate in farm programs, making a large portion of production not covered by payments and a large portion of producers ineligible for them by the early 1990s.[59]

76. This statement confirms the existence of severe restrictions on the availability of deficiency payments and the cost of participating in the programmes. Were there no cost associated with the programme, no rational farmer would opt to not take the "free money", *i.e.*, nearly everybody would participate. These conscious decisions by USDA and other US Government agencies must, therefore, be reflected in the claimed rate of support provided by the various non-green box domestic support measures during MY 1992.

77. Brazil agrees with the European Communities that such a mélange of domestic support measures decided in MY 1992 must be accounted for "in monetary terms".[60] While the European Communities advocates using an AMS-like approach for the support decided in MY 1992,[61] Brazil considers that an expenditure approach more accurately reflects the text of Article 13(b)(ii), which does not refer to AMS or "product-specific". Brazil emphasizes that the domestic support measures that need to be included in this approach are all those domestic support measures that provide support to upland cotton.

78. Furthermore, the US "72.9 methodology" is inconsistent with the object and purpose of Article 13(b)(ii) and of the Agreement on Agriculture to correct and prevent restrictions and distortions in world agricultural markets.

79. Accepting the US interpretation that eligibility criteria and participation costs of a programme are irrelevant would enable Members like the United States to avoid the disciplines of the SCM Agreement on trade-distortive subsidies. For example, the United States in MY 1992 decided and applied restrictive support programmes that required costly land set aside programs, low payment yields, restricted payments to 85 per cent of eligible acres, tied benefits from the marketing loan programme to participation in the costly deficiency payment programs, and applied payment limitations, among others. The US interpretations would allow it in MY 2002 to lift all of these restrictions and maintain the rate of support without affecting its entitlement to peace clause exemption. The approach taken to its extreme would allow a Member that decided a rate of support of 72.9 cents per pound for 0.0001 per cent of its production in MY 1992, to provide a rate of support of 72.9 cents per pound to 100 per cent of its production in MY 2002 without affecting its entitlement to peace clause exemption. Every legitimate comparison must take account of economic realities of support regimes in MY 1992 and in later marketing years during the implementation period. And these realities show that the support increased massively.

---

[59] Exhibit Bra-180 ("Will Policy Changes Usher in a New Era of Increased Agricultural Market Variability?," Keith J. Collins, Joseph W. Glauber, Choices, Second Quarter 1998, p. 28).

[60] EC Answer to Third Party Question 22, para. 47 and 49.

[61] EC Answer to Third Party Question 22, para. 49.

**(66) Could you please comment on the relative merits of each of the following calculation methods for purposes of the comparison of support to upland cotton with 1992, irrespective of whether a particular measure should be included or excluded:**

**(a) Total budgetary outlays (Brazil's approach)**

**(b) Budgetary outlays per unit of upland cotton: Could you please calculate and provide an estimate for the marketing years 1992 and 1999-2002, respectively, and draw the Panel's attention to any factors / qualifications that the Panel would need to be aware of.**

**Brazil's Comment on US Answers:**

80. Brazil comments jointly on both of the 11 August Answers provided by the United States. In essence, the United States rejects any approach based on budgetary outlays as *ex post* or retrospective and as does not reflecting its alleged single decision taken during MY 1992.[62] Based on the same argument, the United States also declines the Panel's request for information on how to calculate budgetary outlays per unit of upland cotton.[63] Therefore, Brazil refers the Panel to its own 11 August Answer to Question 60 and 66(b) for the only evidence in that respect as well as to Brazil's reservations concerning this approach.[64]

81. The United States maintains that because its support programmes depend on a price-gap, only a rate of support approach can reflect the US decision.[65] It further maintains, that any budgetary approach would automatically reflect also producers' planting and participation decisions and market prices, factors that the United States alleges, it could not have decided.[66] However, Brazil has demonstrated that the anticipated participation in the deficiency payment and marketing loan programme was an important aspect of the decision on the acreage reduction programme. Professor Sumner has indicated that, based on historical participation data and projections about other programme parameters, the United States in MY 1992 had a very good idea of the participation rate that would result from the setting of a 10-per cent acreage reduction rate under the deficiency payment programme.

82. Further, Brazil has demonstrated above that the range of programme decisions the United States has taken, including decisions on deficiency payment rates, adjusted world prices and Step 2 payment rates in connection with decisions on other programme parameters, impacted the amount of budgetary outlays. Thus, while the United States certainly did not decide on market prices, it took a number of decisions that translated these market prices into actual expenditures for MY 1992.

83. The European Communities and other third parties to this dispute agree with Brazil that the appropriate basis for a comparison of the support decided in MY 1992 with support granted in later marketing years during the implementation period is a approach based "on monetary terms".[67] Given the special situation of the EC with respect to the peace clause decision, it may be appropriate to use an *ex ante* AMS-like approach to its decision during MY 1992 compared to the actual AMS for later marketing years.[68] But even that decision would be expressed in "monetary terms".

[62] US 11 August Answer to Question 66, para. 119-120.
[63] US 11 August Answer to Question 66, para. 120.
[64] *See* Brazil's 11 August Answer to Question 60, para. 94-98 and Brazil's Answer to Question 66(b), para. 117-119.
[65] US 11 August Answer to Question 66, para. 119.
[66] US 11 August Answer to Question 66, para. 119.
[67] EC Answer to Third Party Question 22, para. 47.
[68] EC Answer to Third Party Question 22, para. 47-49.

84. Total expenditures for MY 1992 and total expenditures for marketing years during the implementation period are the only legitimate bases for the comparison required by Article 13(b)(ii) of the Agreement on Agriculture. All other calculation methods are either not supported by a *Vienna Convention* analysis of Article 13(b)(ii) (US rate of support approach; US rate of support approach as modified by Professor Sumner), or have major shortcomings that should lead them to be used them with extreme caution (budgetary outlays per unit). Brazil notes that its expenditure approach and the analogous AMS calculation yield identical results, if one were to account for deficiency payments in terms of expenditures rather than by using the formula approach offered by Annex 3, paragraph 10-11 of the Agreement on Agriculture.[69]

*(d) Per unit rate of support for upland cotton (Prof. Sumner's approach at the first session of the first substantive meeting).*

**Brazil's Preliminary Comment on US Answer:**

85. Brazil will further comment on any answer pursuant to the US promise to provide "a detailed critique of Mr. Sumner's analysis."[70] As for the 11 August US comments, Brazil has earlier in its 22 August Comments to Questions 66(a) and (b) argued that Professor Sumner properly accounted for all US decisions.[71] Concerning the inclusion of crop insurance subsidies, PFC and market loss assistance payments, as well as direct and counter-cyclical payments, Brazil has demonstrated in its Rebuttal Submission[72] and in comments to Questions 38 and 43 that these domestic support measures constitute support to upland cotton as well as product-specific support. Thus, there is no basis to exclude these payments from any US calculation of upland cotton AMS.

**(67) The Panel requests the parties to calculate and submit estimates of the AMS for upland cotton for marketing years 1992, 1999, 2000, 2001 and 2002. For this purpose the parties are each requested to submit AMS calculations for upland cotton (using the budgetary-outlay/non-price gap methodology employed by the United States in respect of cotton in its DS Notifications (e.g., G/AG/N/USA/43) and using the formats and supporting tables in document G/AG/2) on the same basis as would be the case in calculating a product specific AMS for the purposes of the calculation of the "Total Current AMS" in any year in accordance with the relevant provisions, including as appropriate Article 1(a), (b) and (h), Article 6 and Annex 3 to the Agreement.**

**Brazil's Comment on US Answers:**

86. The United States' calculation of upland cotton AMS is incomplete because it does not account for the product-specific support provided to upland cotton from PFC and market loss assistance payment, direct and counter-cyclical payments and crop insurance subsidies. Brazil has discussed the nature of these programs as product-specific (and as constituting "support to upland cotton") and the incorrect US interpretation of "product-specific" elsewhere.[73] Brazil further notes that the United States has included in its calculation of upland cotton AMS storage payments and interest subsidies – product-specific support measures that the United States has not mentioned so far during this dispute.[74] Based on this and other new data supplied by the United States, Brazil provides an update of its AMS calculation and of its analysis of total budgetary outlays.[75]

[69] Brazil's 11 August Answer to Question 60, para. 97, and to Question 67, para. 130.
[70] US 11 August Answer to Question 66, para. 121.
[71] *See* para. 81-85 *supra*.
[72] Rebuttal Submission of Brazil, paras. 24-67.
[73] Rebuttal Submission of Brazil, para. 13-67.
[74] Brazil notes that it has asked the United States in consultations for information on any other domestic support measures the provides support to upland cotton and that the United States did not mention these

## III. EXPORT CREDIT GUARANTEES

**71 (a) Is an export credit guarantee a financial contribution in the form of a "potential direct transfer of funds or liabilities (e.g. loan guarantee)" within the meaning of Article 1.1(a)(1)(i) of the SCM Agreement? Why or why not? Does it confer a benefit within the meaning of Article 1.1(b)? Why or why not? If so, to whom?**

**(b) How, if at all, would these elements be relevant to the claims of Brazil, and the United States response thereto?**

87. In responding to this Question, the United States relies solely on Article 10.2 of the Agreement on Agriculture and – alternatively – restricts the use of context from the SCM Agreement to item (j) only.[76] Brazil addresses the United States' arguments regarding Article 10.2 of the Agreement on Agriculture at paragraphs 99-100 of its Rebuttal Submission. In determining what constitutes an export subsidy within the meaning of Article 10.1 of the Agreement on Agriculture, Brazil considers that the Panel should refer to Articles 1(e) and 10.1 of the Agreement on Agriculture itself, as well as to contextual guidance included in Articles 1 and 3 of the SCM Agreement, and in item (j) of the Illustrative List of Export Subsidies annexed to the SCM Agreement. This is consistent with the Appellate Body's decisions in *US – FSC*[77] and *Canada – Dairy*.[78]

**(73) The Panel could arguably take the view that Articles 1 and 3 of the SCM Agreement were relevant in assessing the WTO-consistency of United States export credit guarantees. The United States has yet to submit any evidence or argumentation on this point, either as potential context for interpretation of the terms in Article 10 of the Agreement on Agriculture or in relation to Brazil's claims under the SCM Agreement. The Panel would therefore appreciate United States views in respect of this situation, and invites the United States to submit relevant argumentation and evidence.**

**Brazil's Comment on US Answer:**

88. The United States argues that it does not need to address Articles 1 and 3 of the SCM Agreement because it "does not believe that Brazil has submitted evidence and argumentation that would establish a *prima facie* case in favour of Brazil's claims . . ."[79] Since the United States has surpassed its quantitative export quantity reduction commitment levels, Article 10.3 of the Agreement on Agriculture allocates the burden to the United States to prove that its excess exports did not benefit from export subsidies, including export credit guarantees.[80] Therefore, it is not Brazil, but the United States, that is faced with satisfying the elements of a *prima facie* case in favour of its defence.

**(74) If the Panel decides to refer to provisions of the SCM Agreement for contextual guidance in the interpretation of the terms in Article 10 of the Agreement on Agriculture, should the Panel refer to item (j) or Articles 1 and 3 of the SCM Agreement or both?**

[78] Appellate Body Report, *Canada – Dairy*, WT/DS103/AB/R and WT/DS113/AB/R, para. 87-90.

[79] US 11 August Answer to Question 73, para. 140.

[80] *See* First Submission of Brazil, paras. 263-268.

**Brazil's Comment on US Answer:**

89. In paragraph 141 of its 11 August Answer to Question 74 (and again in paragraphs 189 and 195 of its 11 August Answers to Questions 88(b) and (d), respectively), the United States asserts that "Brazil has not contested that challenged US export credit guarantee programs are within the scope of Article 10.2." The United States is incorrect. While it is possible that GSM 102, GSM 103 and SCGP export credit guarantees might be included in any international agreement that Members might some day reach in negotiations pursuant to Article 10.2 of the Agreement on Agriculture, no one knows at this stage what the scope of that agreement, if any, will be. The agreement might only cover export credits other than guarantees, like the OECD Arrangement on Guidelines for Officially Supported Export Credits, which does not cover export credit guarantees.

90. In any event, the relevant question is not whether export credit guarantees are "covered" by Article 10.2, but whether they are "exempted" by Article 10.2 from the general export subsidy disciplines of the Agreement on Agriculture. Brazil's position is that Article 10.2 does not exempt export credits like export credit guarantees from the general export subsidy disciplines of the Agreement on Agriculture, including Article 10.1 thereof. If those export credit guarantees constitute export subsidies, then they are subject to those disciplines. (In paragraph 142 of its 11 August Answer, the United States appears to concede this point, when it acknowledges that "[t]o determine the applicability of Article 10.1 to a particular measure not described in Article 9.1 first requires a determination whether a subsidy exists.")

**(75) (identical to Third Party Question 32)**

**The Panel's attention has been drawn to Article 14(c) of the SCM Agreement (see third party submission of Canada) and to the panel report in DS 222 Canada- Export Credits and Loan Guarantees. How and to what extent are Article 14(c) of the SCM Agreement, and the cited panel report, relevant to the issue of whether or not the United States export credit guarantee programmes confer a "benefit"? What would the appropriate market benchmark be to use for any comparison? Please cite any other relevant material.**

**(Third Party Question 33)**

**What is the relevant (if any) of Brazil's statement that: " … export credit guarantees for exports of agricultural products [sic] are not available on the marketplace by commercial lenders."**

**Brazil's Comment on EC Answers on Third Party Question 32 (identical to Question 75) and 33 and on US Answer to Question 75:**

91. The United States argues that item (j) alone is relevant context for a determination whether CCC export credit guarantee programmes are export subsidies.[81] The European Communities argues that the fact that a particular financing instrument offered by a government (such as CCC guarantees) is not available on the marketplace does not mean that such financing confers a benefit *per se* within the meaning of Article 1.1(b) of the SCM Agreement.[82] The European Communities maintain that in circumstances in which a comparable type of financing is not available on the marketplace, an "alternative" benchmark such as item (j) has to be used for determining whether a benefit exists.[83] While Brazil agrees with the European Communities that item (j) is an *alternative* test for the existence of an export subsidy, Brazil strongly disagrees that Article 1.1 of the SCM Agreement is – as the European Communities effectively and the United States explicitly argues – inapplicable in

[81] US 11 August Answer to Question 75, para. 143.
[82] EC's Answers to Third Party Questions, para. 68.
[83] EC's Answer to Third Party 35, para. 67.

such situations. Article 1.1 defines the existence of a subsidy for the purposes of the SCM Agreement and provides relevant context for the interpretation of the term "export subsidy" under the Agreement on Agriculture. Article 1.1(b) requires a comparison between what the recipient of a financial contribution received from the government and what the recipient could have received on the marketplace.[84] The Appellate Body clarified that the standard under Article 1.1(b) is not the cost incurred by the government (as under item (j)).[85] The relevant standard is the "benefit to the recipient" standard.

92. This definition of a subsidy cannot simply be read out of the SCM Agreement in a situation where there is no comparable commercial financing available. Nothing suggests that Article 1.1(b) is inapplicable in such a situation. The United States and the European Communities would certainly agree that a direct transfer of funds without consideration is not commercially available. In these circumstances, a benefit within the meaning of Article 1.1(b) of the SCM Agreement is conferred. A similar situation exists with respect to CCC guarantees. A recipient of CCC guarantees cannot receive a similar financial contribution on commercial terms, as no such financing is available on the marketplace.[86] Thus, the CCC export credit guarantee programmes confer benefits. Brazil notes that the United States agreed, in its third party submission in *Canada – Aircraft II*, that where there is no comparable financial product on the market, a programme confers benefits *per se*.[87]

**(76) How does the United States respond to Brazil's statement that : "...export credit guarantees for exports of agricultural exports [sic] are not available on the marketplace by commercial lenders."?**

**Brazil's Comment on US Answer:**

93. The United States asserts that export credit insurance may be a comparable commercial product to CCC export credit guarantees.[88] As noted in paragraph 103-104 of Brazil's Rebuttal Submission, the United States acknowledges that there are distinctions between insurance coverage and guarantees. Thus, the terms of insurance coverage by private, market-based financial institutions cannot serve as a benchmark against which to determine whether the CCC guarantee programmes confer "benefits," within the meaning of Article 1.1(b) of the SCM Agreement. As the United States has elsewhere noted, "[i]f the commercial market does not offer a particular borrower the *exact terms* offered by a government, then the government is providing a benefit to the recipient whenever those terms are more favourable than the terms that are available in the market."[89] Moreover, the United States has not provided actual terms for insurance coverage by private, market-based financial institutions. Brazil understands that private, market-based insurance coverage for agricultural products is not available for periods extending nearly as long as periods provided by CCC guarantees.

**(77) How does the United States interpretation of "long term operating costs and losses" in item (j) as claims paid give meaning to both "costs" and "losses"? Do claims paid represent "losses" or "costs" or both? If claims paid is represented by "losses", what would go into the "cost" element of item (j)? Could the United States expand on why it disagrees with the items which Brazil identifies for inclusion in the examination to be conducted under item (j)?**

[84] Appellate Body, *Canada – Aircraft*, WT/DS70/AB/R, para. 157.
[85] Appellate Body, *Canada – Aircraft*, WT/DS70/AB/R, para. 160.
[86] *See* also Rebuttal Submission of Brazil, paras. 103-105.
[87] Panel Report, *Canada – Aircraft II*, WT/DS222/R, Annex C-2 (para. 7). *See* also Answers to Questions by Brazil, para. 151.
[88] US 11 August Answer to Question 76, para. 144.
[89] Panel Report, *Canada – Aircraft II*, WT/DS222/R, Annex C-2 (para. 7).

**Brazil's Comment on US Answer:**

94. In paragraph 145 of its response, the United States suggests that claims and defaults must exceed "revenue from whatever source it may be derived" to meet the elements of item (j), despite the fact that item (j) limits the revenue to be used to offset operating costs and losses to "premium rates". On the other hand, the United States maintains that it is only legitimate to account for claims and defaults in the context of item (j), and not for other operating costs and losses such as interest on debt to Treasury[90], even though those sorts of other costs and losses are covered by the ordinary meaning of the terms included in item (j).[91] This is incongruous, and not supported by the text of item (j).

95. Further, Brazil refers the Panel to its Rebuttal Submission and to its 22 August Comments to the US Answers to Question 81 below for a more detailed discussion on the elements that are to be included in an item (j) analysis.

**(78) Can the United States provide supporting documentation for data used relating to "costs and losses" in paragraph 173? Could the United States confirm that the figures cited in paragraph 173 of its first written submission relate to the SCGP? Why did the United States cite these figures after stating that it is not possible to make any assessment of the long-term operating costs and losses of this programme?**

**Brazil's Comment on US Answer:**

96. The United States has failed to provide the supporting documentation requested by the Panel. The data mentioned in paragraph 149 of the United States' 11 August Answer could have been provided for review and analysis by the Panel and Brazil. As a result, Brazil requests that the Panel reject the United States' assertions in paragraph 173 of the US First Submission.

**(80) (identical to Third Party Question 35)**

**Did the drafters of the Agreement on Agriculture include export credit guarantees in Article 9.1 of the Agreement on Agriculture? Why of why not?**

**Brazil's Comment on EC Answer:**

97. Brazil agrees with the European Communities that "Article 9.1 represents a list of export subsidies … that are subject to reduction commitments."[92] Export credit guarantees are not included, as they do not constitute *per se* export subsidies subject to reduction commitments. Only if export credit guarantees confer a benefit within the meaning of Article 1.1(b) and/or Article 14(c) of the SCM Agreement, or if they are provided at premium rates that are inadequate to cover the long-term operating costs and losses of the export credit guarantee programme, do they constitute export subsidies to be assessed against the export subsidy reduction commitments of a Member. In these circumstances, export credit guarantees must not be provided in a manner inconsistent with Article 10.1 of the Agreement on Agriculture.

98. Because export credit guarantees are not – under a *Vienna Convention* interpretation of Article 10.2 of the Agreement on Agriculture – excluded from the general export subsidy disciplines in AoA Article 10.1, their provision counts towards the export subsidy reduction commitments of a Member. Article 10.2 states that after agreement on disciplines governing the provision of export credits is reached, these credits can only be provided in conformity therewith. Brazil does not want to speculate on whether the internationally-agreed disciplines will subject export credit guarantees to

[90] First Submission of the United States, para. 178.
[91] *See* Oral Statement of Brazil, para. 123.
[92] EC's Answers to Third Party Questions 35, para. 70.

reduction commitments. In any event, under the current regime governing the provision of export credit guarantees, they are subject to the anti-circumvention disciplines in Article 10.1 of the Agreement on Agriculture and count towards a Member's export subsidy reduction commitments, if they constitute export subsidies within the meaning of the Agreement on Agriculture (and, by context, the SCM Agreement).

**(81) How does the United States respond to the following in Brazil's oral statement**

**(a) paragraph 122 (rescheduled guarantees)**

**Brazil's Comment on US Answer:**

99. Although "rescheduled amounts are counted as *receivables*, not losses," that does not mean that rescheduled amounts are actually collected, or even expected to be collected. CCC's 2002 financial statements demonstrate that many of CCC receivables are classified as "uncollectible" – in fact, $3.34 billion of total receivables of $6.93 billion are classified as "uncollectible."[93] Moreover, as noted in Brazil's 11 August Comment on Question 77 (at paragraph 162), the US General Accounting Office has stated that historically, the majority of GSM support that is rescheduled is "in arrears".[94] Based on this evidence, it is simply not accurate for the United States to argue, in paragraph 155 of its 11 August Answer, that "[t]he history of rescheduled Commodity Credit Corporation (CCC) export credit guarantee claims over the long-term (the 10-year period 1993-2002) confirms" that "the United States does in fact collect on the rescheduling."

100. Brazil also notes that the United States has not provided any documentary evidence that would support its assertion.

**(c) paragraphs 125 ff. (guaranteed loan subsidy)**

**Brazil's Comment on US Answer:**

101. In paragraphs 108-110 of its Rebuttal Submission, Brazil summarizes the several bases on which the Panel can rest a finding that the GSM 102, GSM 103 and SCGP programmes constitute export subsidies under item (j). The United States criticizes one of those bases – the FCRA cost formula – as inappropriate because it allegedly relies on "estimated" rather than "actual" data about the costs of the programmes.[95] This appears to be the United States' sole defence, which Brazil again notes applies only to the FCRA cost formula and not the other evidence and bases summarized by Brazil in paragraphs 108-110 of its Rebuttal Submission. In any event, Brazil rebuts the US arguments concerning "estimated" versus "actual" data in paragraphs 111-119 of its Rebuttal Submission, and asks the Panel to refer to Brazil's arguments therein.

[93] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 14).

[94] Exhibit Bra-152 (GAO, Statement of Allan I. Mendelowitz, Director, Trade, Energy and Finance Issues, National Security and International Affairs Division, before the Task Force on Urgent Fiscal Issues of the Committee on Budget of the US House of Representatives, *Status Report on GAO's Reviews of the Targeted Export Assistance Programme, the Export Enhancement Programem, and the GSM-102/103 Export Credit Guarantee Programmes*, GAO/T-NSIAD-90-53, 28 June 1990, p. 14). *See also* Exhibit Bra-181 (US General Accounting Office, Report to the Ranking Minority Member, Committee on Agriculture, Nutrition, and Forestry, US Senate, *Former Soviet Union: Creditworthiness of Successor States and US Export Credit Guarantees*, GAO/GGD-95-60 (February 1995), p. 50-52 (demonstrating that most of the rescheduled Russian and Former Soviet Union GSM claims have been in arrears)).

[95] *See* US 11 August Answers to Questions, paras. 157-161, 162-163, 169-172, 173.

102. Brazil notes that the United States has offered no documentation and data to support the figures included in paragraph 160 of its 11 August Answer. The Panel should not accept these unsupported assertions by the United States.

103. At paragraphs 122-123 of its 11 August Answer to Question 81(c), the United States asserts that "[a] cohort consists of all transactions associated with each type of guarantee issued during a particular year", and that "[n]ot until the cohort is closed can one make an assessment as to whether or not that particular cohort represents a cost to the Federal Government". Brazil notes that a "cohort" is not necessarily composed of *all* guarantees issued in a particular year. As the US Office of Management and Budget notes, cohorts may also be divided according to risk categories, with annual reestimates calculated according to those risk category-based cohorts.[96] The United States in fact acknowledges at paragraph 148 of its 11 August Answer to Question 86 that "[a]ll countries eligible for any of the CCC export credit guarantee programmes are categorized according to risk".

**(d) paragraphs 127-129 (re-estimates, etc.)**

**Brazil's Comment on US Answer:**

104. In paragraph 163 of its 11 August Answer, the United States asserts that the "net total for all cohorts for guarantees issued since 1992 currently stands at a downward re-estimate of $1.9 billion", suggesting that by the time a cohort is closed and final data becomes available, the cohort becomes profitable. Although the United States offers no citation, the $1.9 billion lifetime reestimate figure appears to be taken from the Federal Credit Supplement attached to the 2004 US budget. As discussed further in paragraphs 115-117 of Brazil's Rebuttal Submission, however, the United States fails to note that when these total lifetime reestimates for all cohorts of guarantees disbursed since 1992 are netted against the total *original* subsidy estimates adopted each budget year during the period 1992-2002, *the resulting loss is nearly $1.75 billion.*

**(b) paragraph 123 (interest on debt to Treasury)**

**Brazil's Comment on US Answer:**

105. The United States' 11 August Answer addresses interest rate reestimates under the FCRA cost formula. Paragraph 123 of Brazil's Statement at the First Panel Meeting, however, to which the Panel's question refers, does not address the treatment of interest paid by the CCC to the Treasury Department under the FCRA cost formula. Rather, in paragraph 123 of its Oral Statement at the First Meeting of the Panel, Brazil was responding to the US assertion that *Brazil's constructed formula* for determining whether the CCC guarantee programmes' operating costs and losses outpaced premiums collected should not have included interest paid by the CCC to the Treasury Department. In paragraph 123 of its Oral Statement, Brazil argued that under the ordinary meaning of the term "operating costs", interest paid by the CCC to the Treasury Department should be included in an assessment of the programmes under item (j). Brazil's arguments have nothing to do with interest rate reestimates under the FCRA cost formula. The United States' answer is, therefore, only relevant in so far as the United States now seems to acknowledge that, for the purposes of Brazil's revised constructed formula, interest payments to Treasury are properly included.[97]

[96] Exhibit Bra-116 (OMB Circular A-11, p. 185-16 – 185-17).
[97] US 11 August Answer to Question 81(b), para. 167.

**(e) Exhibits BRA-125-127**

**Brazil's Comment on US Answer:**

106. The United States' 11 August Answer is incorrect. Reestimates are recorded in the "programme account" segment of the CCC guarantee programme budget, in line item 00.07 (interest on reestimates is recorded in line 00.08).[98] Furthermore, Brazil has consistently also included the financing account in its exhibits, including – contrary to the US allegation[99] – in Exhibit Bra-127.

**(f) the chart on page 53 of Brazil's oral statement at the first session of the first Panel meeting relating to "Guaranteed Loan Subsidy and Administrative Expenses of US Export Credit Guarantee Programmes GSM-102 GSM 103 and SCGP"?**

**Brazil's Comment on US Answer:**

107. Brazil refers the Panel to paragraphs 111-119 of Brazil's Rebuttal Submission for discussion of the US arguments concerning "estimated" versus "actual" data.

**(g) In respect of (a)-(f) above, how and to what extent do the information and data presented for the export guarantee programmes concerning "programme" and "financing", "summary of loan levels", "subsidy budget authority", "outlay levels", etc., in particular in Exhibits BRA-125-127, reflect "actual costs and losses" of the GSM-102, GSM-102 and SCGP export credit guarantee programmes(see e.g. Brazil's closing oral statement at the first session of the first substantive meeting, paragraph 24)?**

**Brazil's Comment on US Answer:**

108. Brazil refers the Panel to paragraphs 111-119 of Brazil's Rebuttal Submission for discussion of the US arguments concerning "estimated" versus "actual" data.

**(84) Is the Panel correct in understanding that, under the GSM-102 and GSM-103 programmes, the exporter pays a fee calculated on the dollar amount guaranteed, based on a schedule of rates applicable to different credit periods? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates?**

**Brazil's Comment on US Answer:**

109. As noted in Brazil's 11 August Comment on Question 84 (at paragraphs 192-194), GSM 102 and GSM 103 fees are charged according to a fee schedule that does not account for the country risk involved or the credit rating of the borrower. The US Department of Agriculture's Office of the Inspector General noted in June 2001 that "the fees CCC charges for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed in 7 years and may not be reflecting current costs".[100] It repeated this statement in February 2002.[101]

[98] *See* Exhibits Bra-88 to Bra-95 (US budgets for the years 1996-2003); Exhibits Bra-125 to Bra-127 (US budgets for the years 1994, 1995 and 2004). *See also* Exhibit Bra-184 (US budget for fiscal year 1993); Exhibit Bra-183 (US budget for fiscal year 1992).

[99] US 11 August Answer to Question 81(e), para. 168.

[100] Exhibit Bra-153 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, Audit Report No. 06401-14-FM (June 2001), p. 31).

110. Moreover, the US General Accounting Office ("GAO") analyzed CCC's failure to charge guarantee fees that take account of country risk or the creditworthiness of individual borrowers. Brazil quotes at length from the GAO study, since it provides further corroborating evidence that beneficiaries of CCC guarantees receive terms better than available on the market, and that CCC guarantee fees do not cover the costs of the CCC guarantee programmes:

> Although GSM-102 recipient countries vary significantly from one another in terms of their risk of defaulting on GSM-102 loans, CCC does not adjust the fee that it charges for credit guarantees to take account of country risk. CCC fees are based upon the length of the credit period and the number of principal payments to be made. For example, for a 3-year GSM-102 loan with semiannual principal payments, CCC charges a fee of 55.6 cents per $100, or 0.56 per cent of the covered amount. For 3-year loans with annual principal payments, the fee is 66.3 cents per $100.[ ] CCC fees that included a risk-based component might not cover all of the country risk, but they could help to offset the cost of loan defaults.
>
> USDA officials told us that including a fee for country risk could reduce the competitiveness of GSM-102 exports. However, they said they did not have recent or current data to support their claim.
>
> The US Export-Import Bank, which provides credit guarantees to promote a variety of US exports, uses risk-based fees to defray the cost of defaults on its portfolio. Under its system, each borrower/guarantor is rated in one of eight country risk categories. Exposure fees vary based on both the level of assessed risk and the length of time provided for repayment. For example, in the case of repayment over 3 years, a country rated in the lowest risk category is charged a fee of 75 cents per $100, whereas a country in the highest risk category is charged a fee of $5.70 per $100 of coverage. Thus, the bank's fee structure includes a substantial added charge for high country risk. According to the bank, its system is designed to remain as competitive as possible with fees charged by official export credit agencies of other countries.
>
> Under section 211(b)(1)(b) of the 1990 Farm Bill, CCC is currently restricted from charging an origination fee for any GSM-102 credit guarantee in excess of an amount equal to 1 per cent of the amount of credit extended under the transaction.[102] This restriction was initially enacted in 1985 following proposed administration legislation to charge a 5-per cent user fee for exports backed with credit guarantees. Some Members of Congress were concerned that such a fee would adversely affect the competitiveness of GSM-102 exports. Under the 1-per cent restriction, CCC would be considerably limited in the size of the fee that it could charge to take account of country risk should it decide to do so. For example, as previously noted, CCC charges 0.56 per cent for a loan payable in 3 years and with principal payments due annually. The most it could increase the fee would be 0.44 per cent. In contrast, the Export-Import Bank currently charges fees as high as 5.7 per cent for 3-year loans.[103]

---

[101] Exhibit Bra-154 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC (February 2002), p. 49 ("[T]he fees CCC charged for its GSM-102 and GSM-103 export credit guarantee programs have not been changed for many years and may not be reflecting current costs.").

[102] The United States confirmed in paragraphs 179-180 of its 11 August Answer that this remains the case.

[103] Exhibit Bra-181 (US General Accounting Office, Report to the Ranking Minority Member, Committee on Agriculture, Nutrition, and Forestry, US Senate, *Former Soviet Union: Creditworthiness of Successor States and US Export Credit Guarantees*, GAO/GGD-95-60 (February 1995), p. 135-136). Although government support from the Export-Import Bank does not constitute a market benchmark for the purposes of

111. Brazil notes that CCC fees for GSM 102 have not changed materially since the GAO published its report in 1995.[104] Moreover, the United States confirmed in its 11 August Answer to Question 84 (at paragraph 180) that US law prohibits CCC from charging fees in excess of one per cent of the guaranteed dollar value of the transaction.

**(85) Is the Panel correct in understanding that, under the SCGP, the exporter pays a fee for the guarantee calculated on the guaranteed portion of the value of the export sales? How and on what basis are the fee rates fixed? Do the fee rates ever change? If so, how and for what reason? Would it be necessary to amend the legislation and/or regulations in order to adjust the fee rates? Please explain any "risk" assessment involved in the programme**.

**Brazil's Comment on US Answer:**

112. As noted in Brazil's 11 August Comment on Question 85 (at paragraph 195), SCGP fees do not vary according to the country risk involved or the credit rating of the borrower. With or without the "risk sharing" described in paragraph 183 of the United States' 11 August Answer, Brazil notes the United States' acknowledgement that "CCC does not determine the creditworthiness of importers participating in the SCGP."[105] This presents further corroborating evidence that beneficiaries of CCC guarantees receive terms better than available on the market, and that CCC guarantee fees do not cover the costs of the CCC guarantee programmes.

**(86) Is there a risk categorization in relation to three export credit guarantee programmes (GSM-102, GSM-103 and SCGP)? Does this have any impact on premiums payable and the ability of the CCC to on-sell the guarantees ?**

**Brazil's Comment on US Answer:**

113. Brazil notes the United States' acknowledgement that "[a] country's risk classification has no impact on the premiums payable under the US export credit guarantee programmes". CCC's failure to account for country risk provides further corroborating evidence that beneficiaries of CCC guarantees receive terms better than available on the market, and that CCC guarantee fees do not cover the costs of the CCC guarantee programmes.

**(87) What proportion of CCC (export-related and total) long term operating costs and losses are represented by GSM-102, GSM-103 and SCGP programmes?**

**Brazil's Comment on US Answer:**

114. The United States asserts that funding for the CCC export guarantee programs is provided from the US Treasury, and is not "financed out of" the CCC. This suggests that the CCC export guarantee programs are not self-sustaining. This suggests in turn that the CCC export guarantee programmes meet the elements of item (j) and, thus, constitute export subsidies.

**(88a) Is the Panel correct in understanding that the United States' argument is that, at present, by virtue of Article 10.2 of the Agreement on Agriculture, there are no disciplines on agricultural export credit guarantees under the Agreement on Agriculture (or the SCM Agreement)?**

---

Article 1.1(b) of the SCM Agreement, Brazil offers this example to demonstrate that the CCC guarantee programs do not even meet *non-market* benchmarks.

[104] Brazil's 11 August Answer to Question 77 and 84, para. 167, 193-194.

[105] US 11 August Answer to Question 85, para. 138.

**Brazil's Comment on US Answer:**

115. The United States incorrectly argues, in paragraph 187 of its 11 August Answer, that "[i]f export credit guarantee programmes were already subject to export subsidy disciplines, then Article 10.2 would be unnecessary." The negotiators may have considered it useful to negotiate additional disciplines for export credit guarantees one day, but that does not mean that they intended for export credits to be exempted from the general disciplines of the Agreement on Agriculture while those negotiations were pending.

116. The United States also argues in paragraph 187 that Brazil's use of the term "specific" disciplines somehow defeats Brazil's interpretation of Article 10.2. Brazil uses the term "specific" disciplines merely as a way of distinguishing between one actual and one potential category of export subsidy disciplines under the Agreement on Agriculture: (i) those "general" disciplines that apply to export credit guarantees today; and (ii) those "specific" disciplines that would additionally apply to export credits upon the completion of the negotiations called for by Article 10.2.

> **(b) Does the United States agree with the following proposition: a WTO Member may therefore extend agricultural export credit guarantees without charging a premium, and for an indefinite period, in addition to any other terms and conditions it may wish? How would this reconcile with the title of Article 10 of the Agreement on Agriculture ("Prevention of Circumvention on Export Subsidy Commitments"), and with other commitments contained in the Agreement on Agriculture? Please cite any relevant material, including any past WTO dispute settlement cases. How would this reconcile with the United States' own statement, at paragraph 21 of its closing oral statement that "of course, the United States may not provide subsidies without any limit".**

**Brazil's Comment on US Answer:**

117. Please see Brazil's 22 August Comment on the United States' 11 August Answer to Question 74 for observations on the United States' assertion, in paragraph 189, that "Brazil has not contested that US export credit guarantee programmes are encompassed by the terms of Article 10.2."

118. The United States argues that an interpretation of Article 10.2 of the Agreement on Agriculture that exempts export credits from the general export subsidy disciplines of that agreement is consistent with the title of Article 10 – "Prevention of Circumvention of Export Subsidy Commitments."[106] The United States' argument is absurd. Since negotiations on specific disciplines pursuant to Article 10.2 have not been concluded, the United States' interpretation of Article 10.2 would leave export credit support completely undisciplined, and open to the abuse outlined in the text of the Panel's question. In this way, the United States' interpretation of Article 10.2 *facilitates*, rather than *prevents*, circumvention of its export subsidy commitments.

119. The United States also argues that the portion of Article 10.2 calling for Members to work toward the negotiation of specific disciplines on export credits also contributes to the prevention of circumvention. As the ordinary meaning of the first portion of Article 10.2 demonstrates, however[107], Members are not even required to actually negotiate specific disciplines for export credits, let alone to reach actual agreement on those specific disciplines. All Members have agreed to do is to work toward the development of those specific disciplines, which does not in itself prevent circumvention.

> **(c) If, as the United States argues, there are no disciplines on export credit guarantees in the Agreement on Agriculture, how could export credit guarantees**

[106] US 11 August Answer to Question 88(b), para. 190.
[107] *See* Oral Statement of Brazil, para. 102.

**"conform fully to the provisions of Part V" of the Agreement on Agriculture within the meaning of Article 13 (how can you assess "conformity" or non-conformity when there are allegedly no disciplines against which such an assessment could occur)?**

**Brazil's Comment on US Answer:**

120. The United States argues that since export credit guarantees are not subject to export subsidy disciplines in the Agreement on Agriculture, they "cannot be out of compliance with Part V" of the that agreement. The pertinent question is whether export credit guarantees can, under the terms of Article 13(c), "conform fully to the provisions of Part V" of the Agreement on Agriculture. In this regard, the United States ignores the conclusions of the panel in *Canada – Aircraft (21.5)*.[108] As noted in Brazil's 11 August Comment on Question 88(c) (paragraphs 200-202), if the United States is correct that CCC export credit guarantees are not subject to the disciplines in Part V of the Agreement on Agriculture, then CCC guarantees cannot logically "conform fully to the provisions of Part V" and trigger the exemption from action provided for in Article 13(c).

121. Alternatively, the United States suggests that Article 13(c) does not apply to export credit guarantees because "export credit guarantees are not export subsidies within the meaning of either Article 9.1 or 10.1" of the Agreement on Agriculture. This assertion is not supported by the United States with any reference to the tools of interpretation included in the *Vienna Convention*, and is fundamentally incorrect. Brazil has demonstrated that the GSM 102, GSM 103 and SCGP export credit guarantee programs administered by the CCC constitute export subsidies within the meaning of Articles 10.1, 1(e) and 8 of the Agriculture Agreement, Article 3.1(a) of the SCM Agreement, and item (j) of the Illustrative List of Export Subsidies attached as Annex I to the SCM Agreement.[109]

**(d) Is the United States advocating the view that its own export credit guarantee programmes, which pre-dated the Uruguay Round, are effectively "grandfathered" so as to benefit from some sort of exemption from the export subsidy disciplines of the Agreement on Agriculture? How, if at all, is it relevant that the SCGP did not, according to the United States, become relevant for upland cotton until the late 1990's (i.e. after the entry into force of the WTO Agreement)?**

**Brazil's Comment on US Answer:**

122. Please see Brazil's comment on the United States' 11 August Answer to Question 74 for observations on the US assertion in paragraph 189 that "Brazil has not contested that SCGP provides export credit guarantees within the meaning of Article 10.2."

## IV. STEP 2 PAYMENTS

**(92) Does the United States confirm that Exhibit Bra.65 represents a sample contract for exporters of eligible upland cotton to conclude with the CCC under the FSRI 2002, and that an application form (Exhibit Bra-66) needs to be filled out with data on weekly exports and submitted to the USDA FAS. Is Exhibit Bra-66- Form CCC 1045-2 also a valid example? If not, please identify any differences or distinctions.**

**(96) Is a domestic sale a "use" for the purposes of Step 2 payments? Is a sale for export, or export, considered a "use"?**

[108] Panel Report, *Canada – Aircraft (21.5)*, WT/DS70/RW, para. 5.143-5.145.

[109] First Submission of Brazil, para. 271-294; Oral Statement of Brazil, para. 116-133; Brazil's 11 August Answers to Quetions, para. 139-168, 175-189 and 192-199.

**Brazil's Comments to the US Answers:**

123. Brazil notes that the Step 2 regulations make a clear distinction between "domestic *users*" and "exporters".[110] "Domestic *users*" may only receive payment upon "proof of purchase and *consumption of eligible cotton by the domestic user*. . .".[111] The agreement for domestic users provides that a domestic user is a person regularly engaged in manufacturing eligible upland cotton into cotton products in the United States and that "in the event that the cotton is not used for that purpose, the payment received shall be returned immediately and with interest".[112] There is no requirement that "exporters" prove, prior to receiving payment, that exported US upland cotton be "used" for anything upon export. Rather, the payment is a function of "proof of export of eligible cotton by the exporter".[113] Thus, the structure of the Step 2 programme clearly differentiates between "export" and "use". Article 3.1(b) applies the phrase "contingent upon *use*." Article 3.1(a) uses the phrase "contingent . . . upon export performance".

124. In relation to Exhibit US-21, Brazil agrees with the United States that the two different forms that have to be annexed to the User/Exporter Agreement have different objectives depending on the final destination of upland cotton. That is, if the upland cotton is *used* domestically, then the CCC-1045UP-1 form has to be completed and annexed to the User/Exporter Agreement. If the cotton is exported, then the CCC-1045UP-2 form has to be used. However, contrary to the US statement at paragraph 201 of its 11 August Answer to Question 92, the latter makes no reference whatsoever to an "Exporter User." Indeed, the term "exporter user" is not contained either in the Step 2 regulations nor in the form that has to be annexed to the User/Exporter Agreement if the upland cotton will be exported. This is consistent with the fact that an exporter is not a "user" under the Step 2 programme and the act of exporting is unlikely a final "use" of upland cotton. In sum, Step 2 export payments are not made contingent upon "use," but contingent upon "*export*".

**(93) Please elaborate why the United States deems that Step 2 payments upon submission of proof of export are not subsidies contingent upon export. Is it the US contention that, in order to be contingent on export, exportation must be the exclusive condition for receipt of the payment?**

**(99) How does the United States respond to Brazil's arguments in paragraphs 71-75 of Brazil's Oral Statement at the first session of the first panel meeting concerning the relevance of the Appellate body Report in US- FSC(21.5)**

**Brazil's Comment on US Answers:**

125. The United States in its 11 August Answer to Question 93 states at paragraph 202 that "all upland cotton produced in the United States is eligible for the benefit of the Step 2 cotton subsidy".[114] Furthermore, it submits that "when the entirety of production of a good in a country is eligible to receive a subsidy, no contingency on export exists".[115]

126. Brazil provides a detailed comment to these assertions in its Rebuttal Submission.[116] In fact, Step 2 payments are not made to every pound of upland cotton that is "used". Rather, Step 2 payments are made on every pound of upland cotton that is *exported by <u>eligible</u> <u>exporters</u>* or that is

[110] Exhibit Bra-37 (7 CFR 1427.104)
[111] Exhibit Bra-37 (7 CFR 1427.108(d)).
[112] Exhibit US-21 (Upland Cotton Domestic User / Exporter Agreement, Section, Section B1)
[113] Exhibit Bra-37 (7 CFR 1427.108(d))
[114] US 11 August Answer to Question 93, para. 202.
[115] US 11 August Answer to Question 93, para. 202.
[116] *See* Rebuttal Submission of Brazil, paras. 129-130.

*used by eligible domestic users*. No Step 2 payment is made for upland cotton exported or used by ineligible persons, or for upland cotton that is neither used domestically nor exported, but that is for instance stored, stolen or incidentally destroyed by for example fire.

127. Furthermore, the criterion whether Step 2 payments are available to all upland cotton produced in the United States is entirely irrelevant for Brazil's claims under Article 3 of the SCM Agreement. That provision prohibits the payment of subsidies that are contingent upon export or contingent upon the use of domestic over imported goods. It follows that a subsidy is prohibited if its payment is conditional on the existence of one of the two situations: export or use of local content.

**(107) At paragraph 135 of its first written submission, the United States states: "The subsidy is not contingent upon export performance…"(emphasis added). Again, in the course of the first Panel meeting, the United States admitted that the Step 2 payments were "subsidies". Does the United States thus concede that Step2 payments constitute a "subsidy" within the meaning of the WTO Agreement?**

**Brazil's Comment on US Answer:**

128. The arguments provided by the United States are not responsive to the question posed by the Panel. Brazil reiterates that Exhibit Bra-69 is not relevant for its *de jure* claims. Whenever a Step 2 payment for exported or domestically used upland cotton takes place, the payment is made inconsistently with Articles 3.1(a) or 3.1(b) of the SCM Agreement and with Articles 3.3 and 8 of the Agreement of Agriculture in the case of Step 2 export payments. Step 2 export payments are contingent upon export performance and Step 2 domestic payments are contingent upon use of domestic over imported upland cotton. Neither the respective share of Step 2 export and domestic payments nor the share of eligible US upland cotton production materially affects this conclusion.

**(111) Does the United States maintain its argument that actions based on Article 3.1(b) of the SCM Agreement are conditionally « exempt from actions » due to the operation of Article 13 of the Agreement on Agriculture?**

**(112) In the event that the Panel finds that Article 6.3 of the Agreement on Agriculture does not preclude an examination of Brazil's claims under Article 3.1 of the SCM Agreement and Article III:4 of GATT 1994, how does the United States respond to the merits of Brazil's claims relating to Step 2 payments under those provisions?**

**(113) Is it necessary for measures directed at agricultural processors included in AMS to discriminate on the basis of the origin of goods?**

**(115) What is the meaning and relevance (if any) to Brazil's claims under Article 3 of the SCM Agreement and Article III:4 of GATT 1994 of the phrase "measures directed at agricultural processors shall be included to the extent that such measures benefit the producers of the basic agricultural products" in the Agreement on Agriculture?**

**(116) With respect to paragraph 32 of the oral statement of the EC, are subsidies contingent on the use of domestic goods consistent with the Agreement on Agriculture? Does the phrase "provide support in favour of domestic producers" in Article 3.2 of the Agreement on Agriculture refer to, and/or permit such subsidies?**

**Brazil's Comment to the US Answers:**

129. Brazil addresses the US 11 August Answers to the questions listed above in its Rebuttal Submission at paragraphs 131-144. Brazil further refers the Panel to paragraphs 78-86 of its Oral Statement and to its 11 August Answers to Questions 100-102 and 115-116.

A. REQUEST FOR PRELIMINARY RULINGS

**122. Does Brazil allege that cottonseed payments, interest subsidies and storage payments are included in the subsidies that cause serious prejudice? Do they appear in the economic calculations? BRA**

Brazil's Answer:

1. Cottonseed payments, interest subsidies and storage payments are included in the set of subsidies that Brazil alleges cause serious prejudice to its interests within the meaning of Articles 5(c) and 6.3 of the SCM Agreement and Article XVI of GATT 1994. The amounts of cottonseed payments and interest subsidies/storage payments range from $50 million to $216 million per year.[1] To appreciate the size of these subsidies, the annual amount of each of them separately far exceeds the total amount of Brazilian assistance to its upland cotton farmers of $10 million in MY 2001 by a factor of 4 to 21.[2] Indeed, the annual, individual amount of US cottonseed payments, interest subsidies and storage payments also by far exceeds the amounts of subsidies paid by most other cotton-producing countries.

2. The United States has notified cottonseed payments as trade-distorting amber box subsidies to the WTO.[3] Thus, these payments are presumed to be trade-distortive. Interest subsidies and storage payments appear to be part of the operation of the marketing loan programme that has also been notified to the WTO as a trade-distortive amber box subsidy, and is therefore presumed to be trade-distortive. The United States has not notified them separately to the WTO.[4]

3. The economic calculations provided by Brazil on the effect of US subsidies in filling the cost revenue gap include cottonseed payments and interest subsidies/storage payments.[5] They are also included as part of the overall level of US subsidization provided. However, they are not part of the econometric model developed by Professor Daniel Sumner.[6]

**123. Does Brazil's request for the establishment of the Panel name the statute authorizing cottonseed payments for the 1999 crop? BRA**

Brazil's Answer:

4. To the extent that cottonseed payments for the MY 1999 crop were authorized by Section 204(e) of the Agricultural Risk Protection Act of 2000, Brazil's request for the establishment of the Panel names the statute authorizing these payments.[7] This act authorized the payment of $100 million in cottonseed payments. However, Brazil did not explicitly identify in its request for establishment P.L. 106-113, which serves as the legal basis for a further $79 million in cottonseed payments for the MY 1999 cottonseed payments.

[1] Brazil's 9 September Further Submission, Table 1, p. 4.

[2] Exhibit Bra-284 ("Production and Trade Policies Affecting the Cotton Industry," ICAC, September 2003, p. 6).

[3] Exhibit Bra-47 (G/AG/N/USA/43, p. 20).

[4] Exhibit Bra-47 (G/AG/N/USA/43, p. 20).

[5] Brazil's 22 August Rebuttal Submission, para. 30 and 40.

[6] To the extent that interest subsidies and storage payments operate to compensate for any cost incurred by US upland cotton producers from the participation in the marketing loan program (for instance, for the storage cost resulting from storing physical upland cotton as collateral for the marketing loan), these subsidies have been considered in Professor Sumner's model. However, those costs do not occur, if a producer decides to opt for a loan deficiency payment rather then taking out a marketing loan.

[7] WT/DS267/7, p. 2.

5. Brazil emphasizes that it is not challenging the underlying statutes authorizing the payment of cottonseed payments in MY 1999, 2000 and 2002, *i.e.*, Brazil does not challenge those payments *per se*. Brazil challenges as "measures" the payments of those subsidies as causing adverse effects to its interests. The United States and Brazil have consulted about those payments.[8] Brazil properly included reference to all "payments" for upland cotton in its request for the establishment of the Panel.[9] This is sufficient to properly identify cottonseed payments as measures for the purposes of Brazil's request for the establishment of the Panel.

B. EXEMPTION FROM ACTIONS

**6. According to its revised timetable, the Panel will issue its report to the parties after the end of the 2003 calendar year. Does this have any impact on "exempt[ion] from actions" under Article 13(b)(ii) and 13(c)(ii) of the *Agreement on Agriculture*? BRA, US**

Brazil's Answer:

6. No. Brazil's claims relate to prohibited and actionable subsidies provided during MY 1999-2002 when the United States had no peace clause protection. Brazil's threat of serious prejudice claims relate to the present threat of serious prejudice caused by subsidies provided during MY 1999-2002, as well as the threat caused by subsidies that are required to be provided through the end of MY 2007 by the 2002 FSRI Act and the 2000 ARP Act. The fact that the Panel will issue its determination regarding these subsidies after the termination of the "peace clause" in 2004 has no impact on the analysis of these claims.

C. IDENTIFICATION OF THE SUBSIDIZED PRODUCT

**125.**

**(2) Brazil has submitted that "The record suggests that *historic* producers are *current* producers." It points to factors including the specialization of upland cotton producers, the need to recoup expensive investments in cotton-specific equipment, and the geographic focus and climatic requirements of upland cotton production in the "cotton belt". (Brazil's rebuttal submission, footnote 98, on page 24)**

**(a) Regarding the specialization of upland cotton producers and the geographic focus of upland cotton production, how does Brazil take account of the fact that cotton is produced in 17 of the 50 states of the United States and that average cotton area is approximately 38% of a cotton farm's acres? (This information is taken from the US's response to question 67*bis*, footnote 35). BRA**

[8] Exhibit Bra-101 (Questions for the Purposes of the Consultations, Questions 14.1 *et seq.*, p. 13).

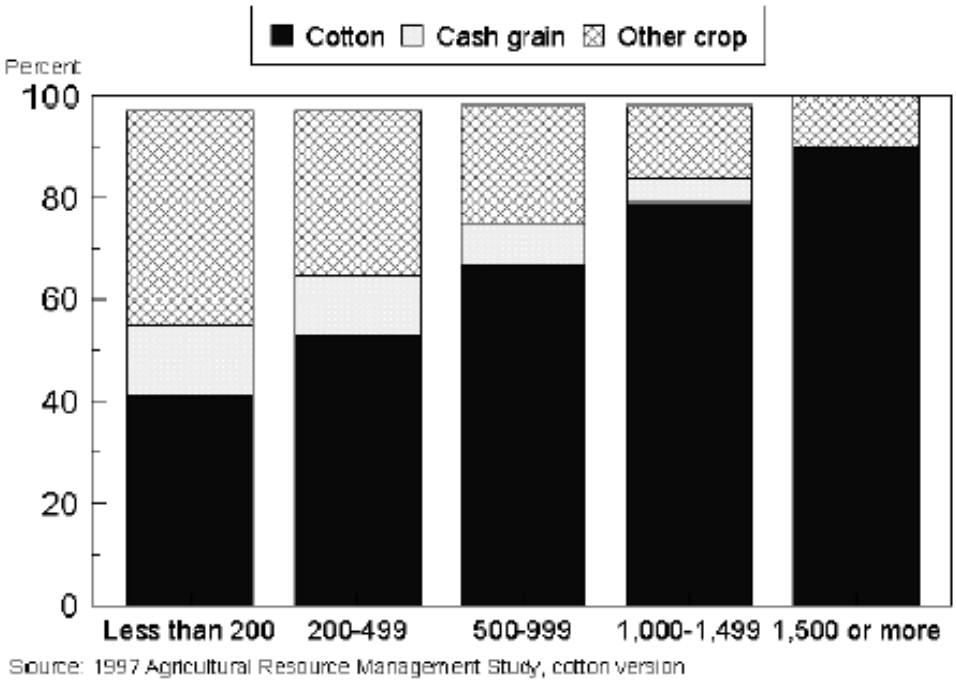
[9] The "measures" identified include (1) "domestic support subsidies provided to the US upland cotton industry during marketing years 1999-2001", (2) "domestic support subsidies that are mandated to be provided to the US upland cotton industry during marketing years 2002-2007", (3) "all subsidies benefiting upland cotton that have trade distorting effects or effects on production by the US upland cotton industry", (4) "domestic support, and all other subsidies provided under regulations, administrative procedures . . . for the production, use and/or export of US upland cotton and upland cotton products". WT/DS267/7, pages 1, 2, 3.

Brazil's Answer:

7. In contrast to the information cited in the Panel's question, more relevant information concerning specialization of cotton producers in cotton farms is set out in Exhibit Bra-16, which is a 2001 USDA report on the cost of production of cotton farms. That report contains the following figure:[10]

**Figure 3 Specialization of cotton farms**

Ninety percent of farms with 1,500 or more cotton acres specialized in cotto while roughly 40 percent of farms with less than 200 cotton acres specialized in either cotton or other crops.



Source: 1997 Agricultural Resource Management Study, cotton version

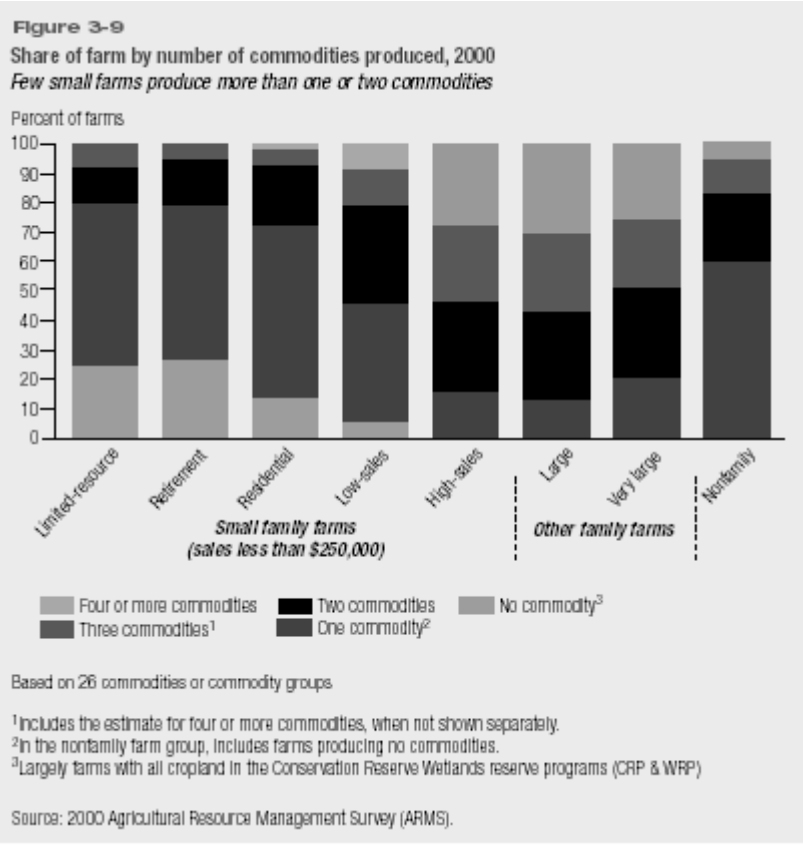
8. This evidence shows that farms with 500 or more acres of upland cotton are heavily specialized in the production of cotton. While these farms represented 33 per cent of US farms producing upland cotton, they produced 75 per cent of total US upland cotton in MY 1997.[11] Thus, the great majority of US production of upland cotton takes place on farms that largely specialize in the production of upland cotton.

9. Other data regarding specialization is found in a 1998 USDA report indicating that most smaller farms – defined as farms with income below $250,000 and which account for 92 per cent of all US farms – tend to produce only one or at most two crops.[12] This is illustrated in the chart below:

[10] Exhibit Bra-16 ("Characteristics and Production Costs of US Cotton Farms", USDA, October 2001, p. 9).

[11] Exhibit Bra-16 ("Characteristics and Production Costs of US Cotton Farms". USDA, October 2001, p. 7).

[12] Exhibit Bra-285 ("Agriculture Fact Book 2001-2002", Chapter 3 - American Farms, p. 32).



10. Approximately 55 per cent of upland cotton is produced on such smaller farms.[13] Thus, even for those smaller farms producing upland cotton, the evidence suggests that over 50 per cent produce mainly upland cotton and the rest produce at most one additional crop. This evidence is consistent with Brazil's argument concerning cotton specialization.

11. With respect to the Panel's question, the 38 per cent figure cited by the United States refers to "planted cotton acreage" as a percentage of "total acreage operated".[14] The United States provides no information on what "total acreage *operated*" means. Nor does the United States provide the Panel with the amount of "planted cotton acreage" as a percentage of "total PFC/DP base acreage". It may be that the cotton acreage accounts for most of a farm's "base acreage". Thus, the "total acreage operated" is not the appropriate basis to calculate a percentage of base acreage for farms producing upland cotton. The best evidence of specialization is the actual payments made to upland cotton producers discussed in Brazil's Answer to Question 125 (5). The next best evidence is the USDA data on specialization of cotton farms cited above.

12. Moreover, Brazil's arguments are not dependent on proof that the majority of cotton farms produce *only* upland cotton. The evidence suggests that larger farms tend to grow at least some other crops and, therefore, may have more than one type of PFC/market loss assistance or direct and counter-cyclical payment "base acreage".[15] As Christopher Ward testified, farmers rotate the production of several different crops, planting one crop on a certain portion of the farmland, and then

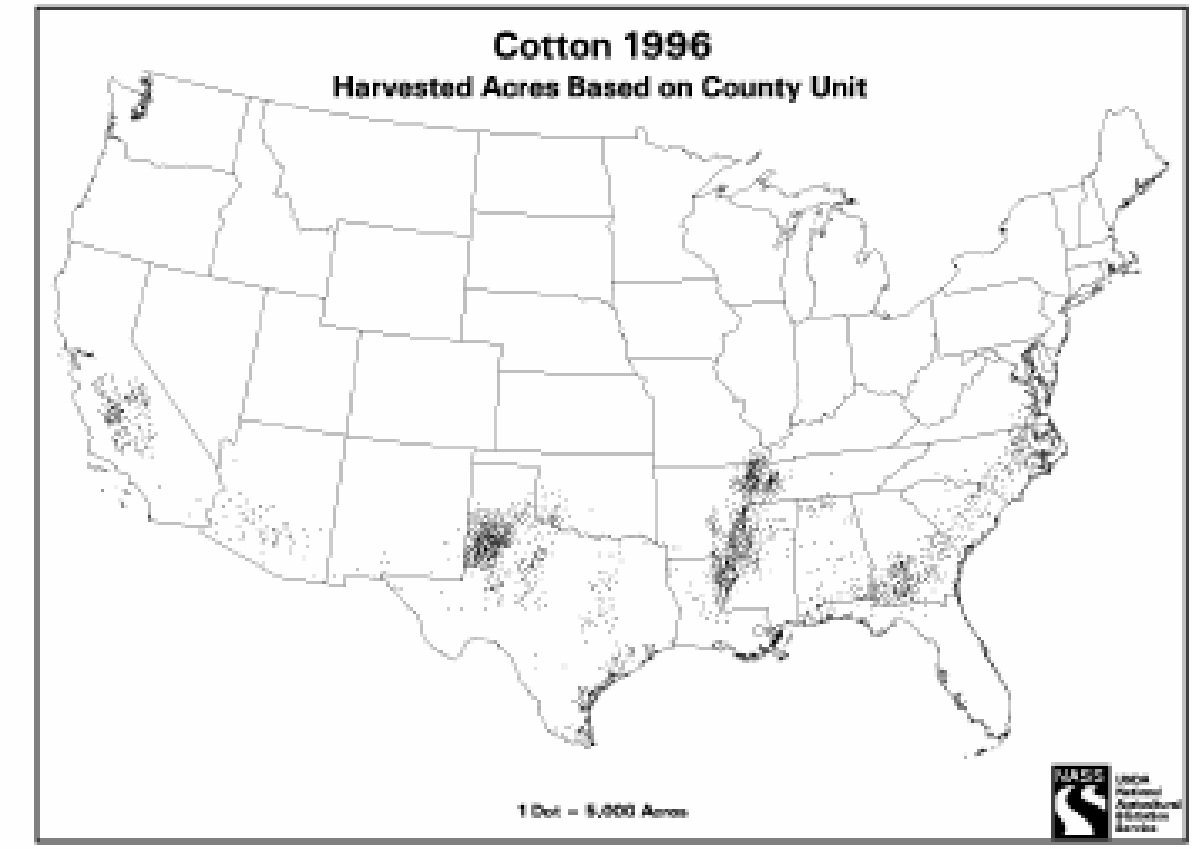
[13] Exhibit Bra-16 ("Characteristics and Production Costs of US Cotton Farms," USDA, October 2001, Table 7) tabulating farms with value of production less than $250,000.

[14] Exhibit Bra-16 ("Characteristics and Production Costs of US Cotton Farms," USDA, October 2001, Table 3).

[15] This is also demonstrated by Exhibit Bra-286 (Direct and Counter-cyclical Program Contract, Form CCC-509, USDA, Commodity Credit Corporation), which provides for the possibility to establish base acres for different crops.

moving the production of that same crop to another portion of the farmland.[16] But the fact that crops are rotated or that some farmers have multiple types of "base acres" and produce more than one crop on their farm does not mean that farmers do not continue to plant upland cotton and use cotton-specific machinery and ginning facilities. This is confirmed by the fact that between MY 1999-2002, there were no wide swings in planted upland cotton acreage.[17]

13. Finally, while the United States is correct in stating that upland cotton is produced in 17 states, 66 per cent of upland cotton is produced in only 5 states, and 90 per cent is produced in only 10 out of the 50 US states.[18] In addition, even within each of these 10 states, upland cotton tends to be grown in relatively distinct geographical regions. This is shown in the graph below:[19]



**(c) Regarding the high cost of upland cotton production, can Brazil show that farms who planted upland cotton could only have covered their costs by receiving upland cotton, rice or peanut payments in every year from 1999 through 2002? BRA**

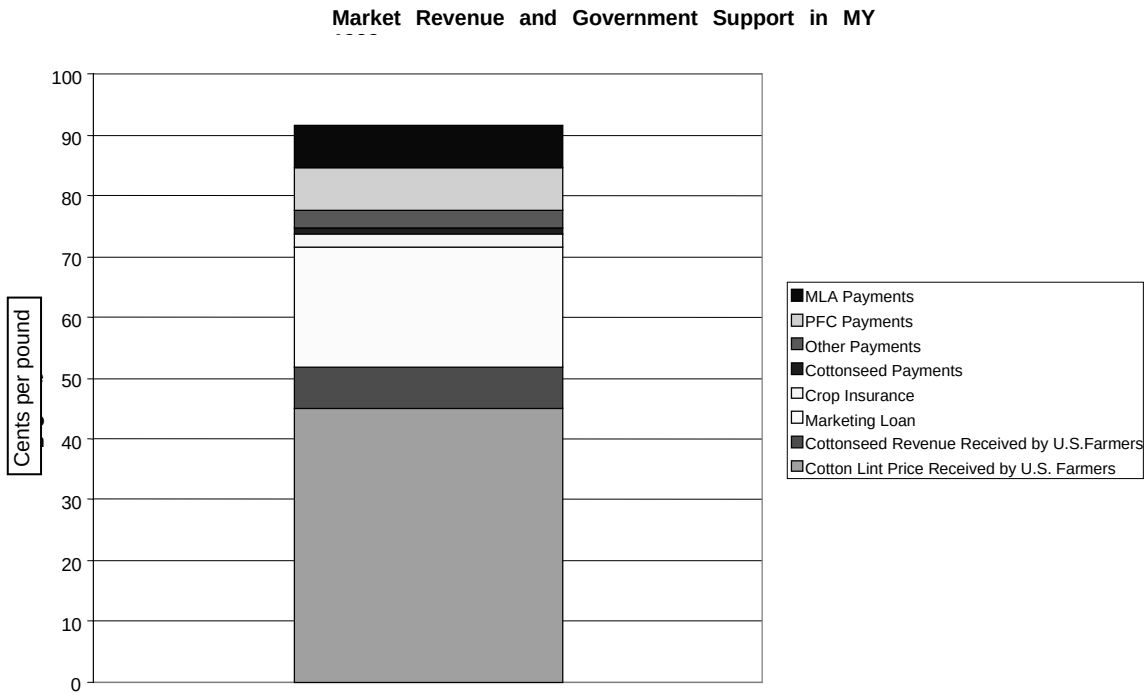
Brazil's Answer:

14. Between MY 2000-2002, US upland cotton producers could not make a profit, unless they grew upland cotton on upland cotton or rice (or peanut in MY 2002) base acreage. Brazil provides data below for each of the four marketing years covering the period of investigation (MY 1999-2002). This evidence is consistent with a conclusion that the great majority of upland cotton was produced on upland cotton base acreage. In responding to this question from the Panel, Brazil took into account

[16] Exhibit Bra-283 (Statement of Christopher Ward – 7 October 2003, para. 2)
[17] *See* Brazil's Answer to Question 125(6).
[18] Exhibit Bra-107 (US and State Farm Income Data, Farm Cash Receipts, ERS, USDA, June 2003).
[19] http://usda.mannlib.cornell.edu/reports/nassr/field/planting/uph97.pdf , Usual Planting and Harvesting Dates for US Field Crops, National Agricultural Statistics Service, USDA, December 1997, p. 7.

Dr. Glauber's comment that Step 2 payments are not received by US upland cotton producers but rather by exporters and domestic users.[20] Brazil generally agrees with this statement. Therefore, Brazil has excluded Step 2 payments from the pool of revenue received by US upland cotton producers.[21] It presents data on the total amount of market revenue for upland cotton lint and seed, marketing loan benefits, crop insurance payments, cottonseed payments, so-called "other payments"[22] and PFC, market loss assistance, direct and counter-cyclical payments.

15. The following chart shows revenues of upland cotton producers in MY 1999:[23]



16. The chart shows that US upland cotton producers received total revenue of 91.54 cents per pound of upland cotton produced. At the same time, the average cost of production was 82.03 cents per pound in MY 1999[24] and prices received by producers were 45 cents per pound.[25] It follows that US producers could not produce upland cotton without the financial assistance of the US Government in the form of large amounts of subsidies. US producers needed 4.46 cents per pound from the total combined upland cotton PFC and market loss assistance payment of 13.97 cents per pound to recover their costs.[26]

[20] Exhibit US-24, p. 3 fifth and sixth paragraph.

[21] This does not affect Brazil's view that Step 2 payments are properly included in the peace clause analysis under Article 13(b)(ii) of the Agreement on Agriculture as "support to upland cotton". While Step 2 payments may not directly benefit domestic producers of upland cotton, they do so indirectly. As they increase demand for US upland cotton, they increase prices received by US producers and are, therefore, properly described as "support to upland cotton".

[22] Interest subsidies and storage payments.

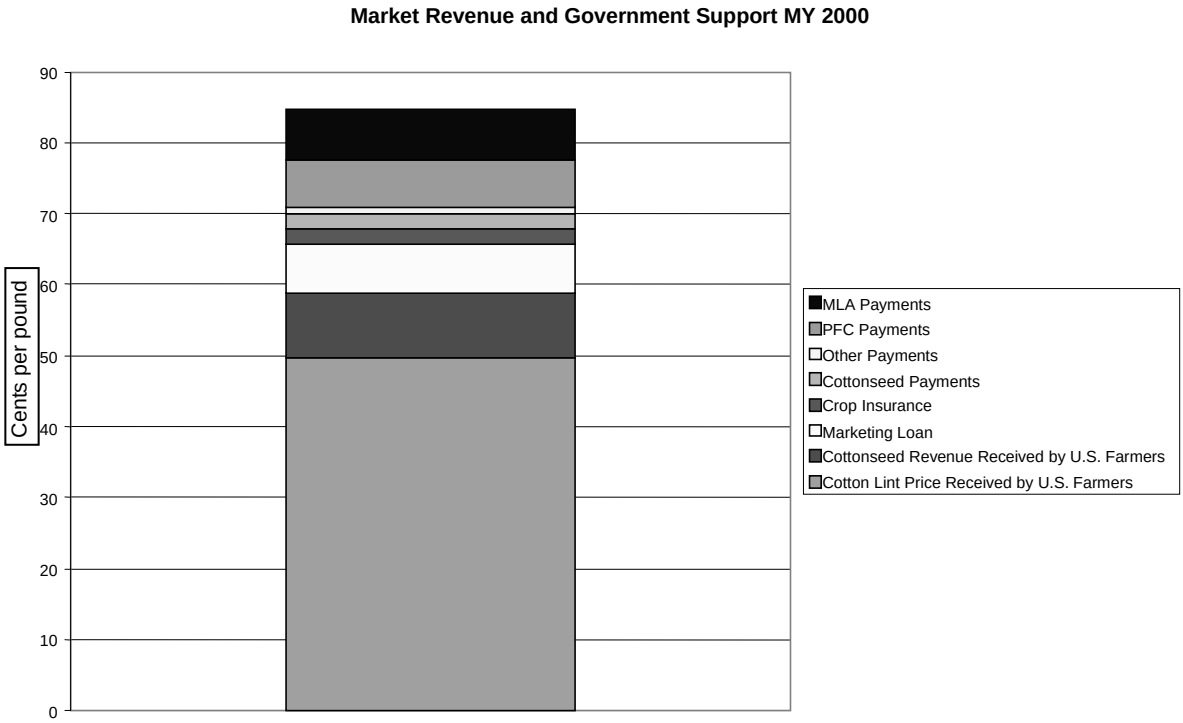
[23] *See* Exhibit Bra-287 (Market Revenue and US Government Payment to US Upland Cotton Producers).

[24] Exhibit Bra-205 (Costs and Revenues of US Upland Cotton Producers).

[25] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5).

[26] Thus, they could have produced upland cotton on wheat, corn, grain sorghum, cotton and rice base acreage without suffering a loss.

17. In MY 2000, the financial situation of US upland cotton producers worsened. While the price they received for upland cotton lint increased to 49.8 cents per pound[27], their total revenue fell to 84.74 cents per pound[28], only slightly above their average cost of production of 82.69 cents per pound.



18. Again, large amounts of US subsidies were instrumental in closing the gap between the US cost of production and the market returns of producers. For MY 2000, the 13.86 cents per pound in upland cotton PFC and market loss assistance payments as well as all other subsidies were needed to close the gap between the cost of production and the market returns.[29] Average US upland cotton producers could also have covered their total costs had they planted upland cotton on rice base acres. But they would have suffered a marginal loss on corn or other crop base acres.

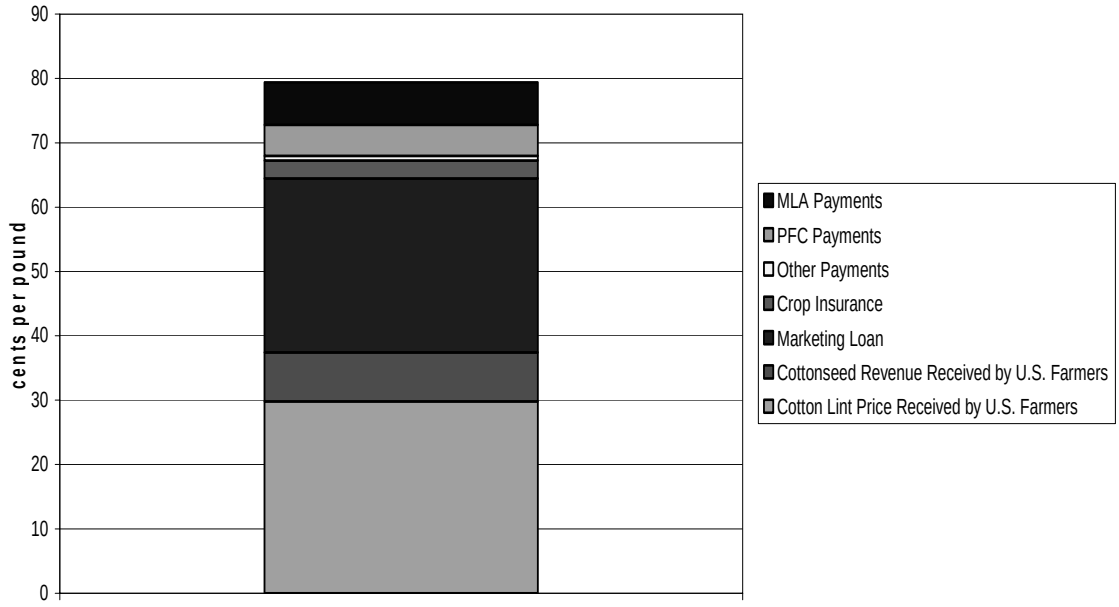
19. The results for MY 2001 show a similar result:

[27] Exhibit Bra-4 ("Fact Sheet: Upland Cotton", USDA, January 2003, p. 5).

[28] *See* Exhibit Bra-287 (Market Revenue and US Government Payment to US Upland Cotton Producers).

[29] *See* Exhibit Bra-287 (Market Revenue and US Government Payment to US Upland Cotton Producers).

**Market Revenue and Government Support in MY 2001**



20. US producers received a total revenue of 79.41 cents per pound,[30] only 29.8 cents per pound of which was market revenue for upland cotton lint. At the same time, they faced an average cost of production of 76.44 cents per pound.[31] Thus, the average US producer of upland cotton needed an upland cotton or rice PFC and market loss assistance payment to break even, while upland cotton production on corn or any other crop base acreage would have generated a loss.

21. For MY 2002, average US producers even suffered a loss from upland cotton production on upland cotton base acres[32], let alone corn or other crop base acres, except for rice and peanuts.[33] The average US upland cotton producer received total revenues of 82.96 cents per pound[34], while their average total cost for MY 2002 was 83.59 cents per pound.[35]

[30] *See* Exhibit Bra-287 (Market Revenue and US Government Payment to US Upland Cotton Producers).

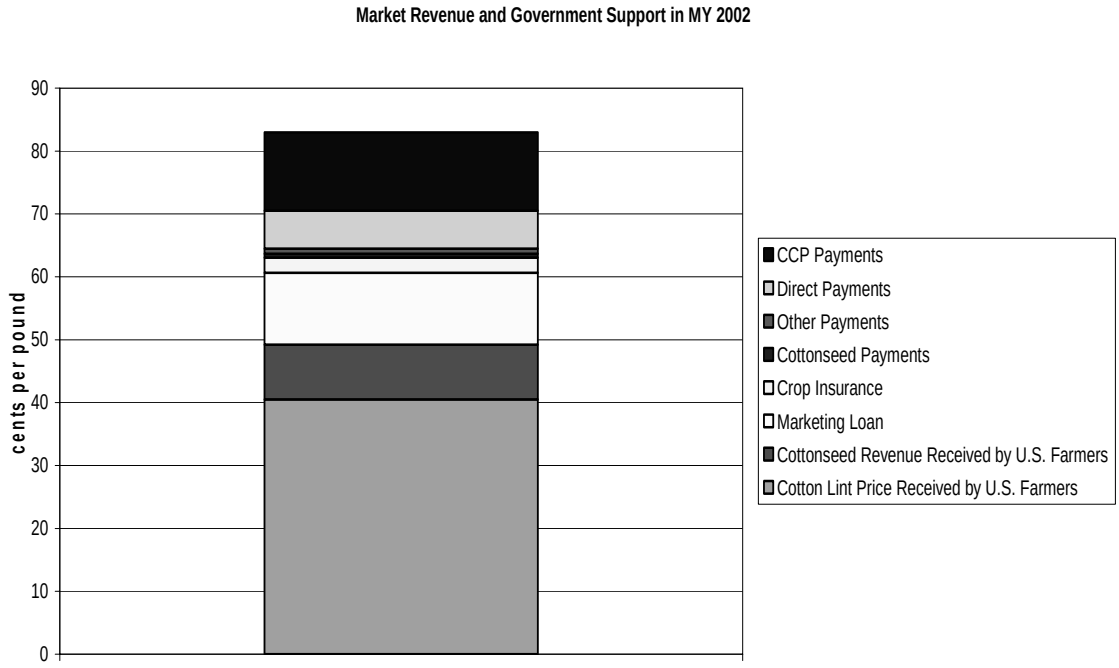
[31] Exhibit Bra-205 (Costs and Revenues of US Upland Cotton Producers).

[32] Brazil notes that it is not in a position to quantify the effect of the yield update for purposes of the counter-cyclical payments and, thus, likely underestimated the amount of those payments (*See* Brazil's Answer to Questions 125 (8)). With slightly higher counter-cyclical payments than assumed by Brazil, US producers of upland cotton might have made a small profit in MY 2002.

[33] Brazil notes that while evidently some former corn producers had shifted to upland cotton production, the fact that they were allowed to update their base acres to upland cotton base acres meant that they could now receive upland cotton payments (*See* Brazil's Answer to Question 125 (7)).

[34] *See* Exhibit Bra-287 (Market Revenue and US Government Payment to US Upland Cotton Producers).

[35] Exhibit Bra-205 (Costs and Revenues of US Upland Cotton Producers).



22. The overall conclusion of this analysis is that, on average over the period of investigation, US upland cotton producers needed and received upland cotton or rice programme payments to cover (or almost cover) their total cost of production. At the same time, as total revenue decreased relative to the cost of production, US upland cotton acreage increased between MY 1999-2001.[36] Because upland cotton producers with non-upland cotton or rice base acreage would have lost money (even with the subsidies), they would have been forced to switch out of upland cotton production. This means that the only producers that could remain were those with upland cotton or rice base. The fact that upland cotton acreage increased through MY 2001 suggests that only a small portion of upland cotton in the United States could have been grown on non-upland cotton base acres.

23. Similarly, in MY 2002, the option to update the base acreage (and yield for the CCP payment programme) allowed those producers that produced on non-upland cotton base acres in MY 1998-2001 to receive the considerably higher upland cotton payments under the 2002 FSRI Act. Because it is not economically sustainable to grow upland cotton on non-upland cotton (-rice or -peanut) base, the ability to update suggests that by MY 2002 nearly all US producers grew on upland cotton base.

24. Moreover, the data above indicates that even with subsidies, the average US producers did not earn any or, at most, a small profit during MY 1999-2002. As Christopher Ward testified, there is a strong need to generate profits to stay in the upland cotton business.[37] These profits pay for investments in new machinery and technologies, as well as for losses incurred in years with low prices. But even with large subsidies, US producers only met their costs. Without subsidies, they were not even able to meet their variable cost in MY 2001.

25. In sum, during most of the period of investigation, US producers of upland cotton needed the high upland cotton payments from the PFC, market loss assistance, direct and counter-cyclical payment programmes to generate sustainable returns (MY 1999), simply break even (MY 2000-

[36] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4). *See* also Brazil's Answer to Question 125 (6).

[37] Exhibit Bra-283 (Statement of Christopher Ward – 7 October 2003, para. 10).

2001), or almost meet their total costs (MY 2002). It is, therefore, reasonable to assume that the great majority of US upland cotton was grown on upland cotton base acres.

**(3) In calculating the amount of PFC, MLA, direct and counter-cyclical payments that went on upland cotton, Brazil made an adjustment for the ratio of current acreage to base acreage (see its answer to question 67, footnotes 2, 3, 4 and 5). Is this an appropriate adjustment for the particular factors referred to above? Why or why not? BRA, US**

Brazil's Answer:

26. Brazil refers the Panel to its answers to Question 125 (8), Question 125(2)(a), and to Question 125(2)(c) for Brazil's arguments why its methodology is reasonable to use in the absence of direct evidence collected and controlled exclusively by the United States concerning the amount of those payments to upland cotton producers.[38] In the absence of such direct evidence, Brazil has set forth[39] extensive circumstantial evidence that US producers of upland cotton received such payments.[40]

**(4) Dr. Glauber has alleged that there are statistical problems in comparing planted acres to programme acres because of abandonment of crops and also because planted acres are only survey estimates, not reported figures (See Exhibit US-24, the first full paragraph in P2). Would it be more appropriate to divide harvested acreage by base acreage? What margin of error is there between the survey estimates and reported figures? BRA, US**

Brazil's Answer:

27. The appropriate figures to use for farmers' decisions on upland cotton acreage are the official USDA figures for acres planted to upland cotton. Dr. Glauber discussed certain programme and statistical issues that may have applied in the early 1990s, but which – with the termination of the deficiency payment programme from MY 1996 on – are no longer relevant.[41]

28. The planted acre figures used by Brazil are the only official USDA data for planted acres of crops. These data are reported by the Farm Service Agency (FSA) in its Fact Sheet on Upland Cotton.[42] Planted acres reflect the choice by farmers to commit land to upland cotton production by cultivating, fertilizing, seeding and applying other inputs during the pre-planting and planting period. In some parts of the United States, variable weather and other conditions mean that some land that has been planted to upland cotton, or to some other crops, is not harvested. But, there is no question that this land was committed at the time of planting to upland cotton production. Further, once the planting takes place, that decision generally precludes further upland cotton production (or other crops) for that marketing year.

29. According to USDA's National Agricultural Statistics Service (NASS), the procedure for measuring and reporting planted acres for upland cotton and other crops starts with a June survey of planted acres for each crop, which is well after planting commitments for upland cotton have been made early in spring. The June planted acre figures are updated in NASS files each month as additional data becomes available. Revisions in the figures on planted acres are determined in December and reported in the Crop Production report each year. These data include revisions based

[38] *See* also Brazil's 9 October Closing Statement, para. 2.

[39] Inferences drawn from this evidence satisfy Brazil's burden of proof in the absence of direct evidence. *See* Panel Report, *Argentina – Textiles and Apparel*, WT/DS56/R, para. 6.39.

[40] *See* Brazil's 9 October Closing Statement, Annex I for a summary of the evidence and further references.

[41] Brazil notes that Dr. Glauber's assertions were made in the context of the acreage reduction and set aside requirements under the US deficiency payment programme.

[42] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

on FSA's certified acreage information. As Exhibit Bra-288 makes clear, NASS reported the 2003 revisions using FSA information in the October Crop Production report, rather than waiting until December.[43]

**(5) Do the acreage reports under section 1105(c) of the FSRI Act of 2002 indicate or assist in determining the number or proportion of acres of upland cotton planted on upland cotton base acres? Was there an acreage reporting requirement for upland cotton during MY1996 through 2002? BRA, US**

Brazil's Answer:

30. The short answer to both of the Panel's questions is "yes". Regrettably, the United States has refused to provide Brazil or the Panel with the number or proportion of acres of upland cotton planted on upland cotton base acres for MY 1999-2002, despite Brazil's repeated efforts to obtain this information over the past year and despite the Panel's Question 67bis, in which the United States claimed incorrectly that it did not have access to this information.[44]

31. As implemented, Section 1105(c) of the 2002 FSRI Act requires any recipient of direct and counter-cyclical payments to submit, as a condition of eligibility of receiving the payments, "annual acreage reports with respect to all cropland on the farm".[45] This means that the precise acreage for each crop grown on the farm must be tabulated and identified in an annual report. Depending on the state and the county, these acreage reports are generally due by the middle of each calendar year.[46]

32. In addition to the annual acreage reports, the 2002 FSRI Act required all farms eligible for direct and counter-cyclical payments to file application forms establishing and proving their historic production of the 10 programme crops.[47] The required information includes the types, amount, and yields of all direct and counter-cyclical payment base acreages during the period 1998-2001 or reference to the earlier PFC base acreage. All of these applications were due no later than 1 June each year.[48] USDA reported in July 2003 that 99.6 per cent of eligible farms had completed the required applications and signed up for the direct and counter-cyclical programme.[49] Farms submitting both the annual programme acreage reports and the historic base-acreage application form were required to provide a specific farm identification number. This farm "ID" would appear to permit USDA to determine for each reporting farm the annual *acreage* mix of crops and the amount of direct and counter-cyclical base acreage for each one of those crops.

33. With respect to the period 1996-2001, the regulations under the 1996 FAIR Act required any recipient of PFC payments and marketing loans (or loan deficiency payment) to submit annual acreage reports for each of the commodities planted for harvest on a farm enrolled in such a programme.[50] This reporting requirement was a mandatory condition to receive payment. It would

[44] *See* US 27 August Comments on Brazil's Rebuttal Submission and Answer to Question 67bis, para. 21 (The United States admitted that it "tracked total expenditures," but denied that it collected or could derive the information requested by the Panel).

[45] Exhibit Bra-29 (Section 1105 of the 2002 FSRI Act) and Exhibit Bra-289 (7 CFR 1412.606) and Exhibit Bra-289 (7 CFR 718.102, 2003 edition).

[46] Exhibit Bra-290 ("Farmers must file acreage to receive 2002 payments," Kansan Online Ag Briefs, second paragraph); Exhibit Bra-290 (AFBIS Inc. Crop Watch, June 2003).

[47] Exhibit Bra-286 (Direct and Counter-cyclical Program Contract, Form CCC-509, USDA, Commodity Credit Corporation)

[48] Exhibit Bra-291 ("Direct and Counter-Cyclical Payment Program," Farm Service Agency, USDA, April 2003).

[49] Annex 2 to Exhibit Bra-105 (National Enrollment Report, USDA, 17 July 2003, last attachment).

[50] Exhibit Bra-292 (7 CFR 718.102, 2002 edition)

appear that the United States has collected precise acreage and payment information on (1) farms with PFC cotton base acreage, and (2) farms that produced upland cotton and received PFC and marketing loan payments. Combined with the specific farm identification number, this information would clearly permit the matching of information on a farm's crop base acreage and current planting and, thus, the collection of the amount and type of PFC (and market loss assistance) payments made to producers of upland cotton between MY 1999-2001.

34. In sum, the United States has exclusive control of the information that would provide the *amount* and *type* of PFC, market loss assistance, direct and counter-cyclical payments made by the US Government to US cotton producers during MY 1999-2002. The United States also has not provided information regarding the amount of updated upland cotton direct and counter-cyclical payment base acreage, the average yields applying to that (updated) base acreage, or the total amount of direct and counter-cyclical payment funds paid to holders of upland base acreage for MY 2002. All of this information is exclusively in the control of the United States and was first requested by Brazil over a year ago.[51] The Panel first requested this information in August 2003.[52] If the United States continues to refuse to provide this information, then Brazil submits that the Panel must either (1) draw adverse inferences that the information retained by the United States reflects greater payments than those estimated by Brazil,[53] or alternatively, (2) rely on Brazil's estimate that the payments equal total upland cotton base acreage payments times the ratio of upland cotton planted acreage to upland cotton base acreage.

**(6) Please prepare a chart showing upland cotton base acreage, planted acreage and harvested acreage for MY1996 through 2002. Does the planted acreage fluctuate within a broad band? If not, does this indicate any stability in decisions to plant the same acres to upland cotton? BRA, US**

Brazil's Answer:

35. Brazil has prepared the requested chart showing the developments of upland cotton base acreage, planted acreage and harvested acreage between MY 1996-2002.[54] The chart below shows that planted acreage does *not* fluctuate within a *broad* band. Instead, planted acreage fluctuates between a low of 13.1 million acres in MY 1998 and a high of 15.5 million acres in MY 2001.[55]

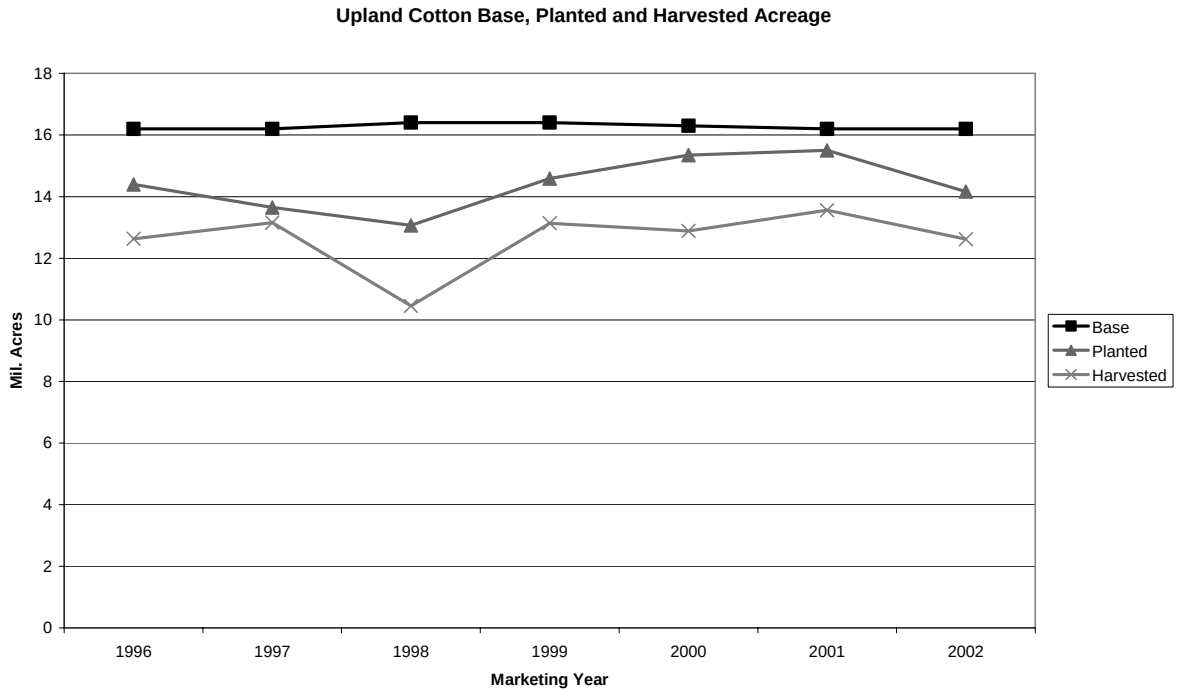
[51] Exhibit Bra-49 (Brazil's Questions for the Purposes of Annex V Procedure, March 2003) and Exhibit Bra-101 (Brazil's Questions for the Purposes of the Consultations, 22 November 2002)

[52] Question 67bis.

[53] The Appellate Body in *Canada – Aircraft* addressed the issue of drawing adverse inferences from a party's refusal to provide information requested by a panel. It stated that "a panel has the legal authority and the discretion to draw inferences from the facts before it." Moreover, it stated that a panel should examine very closely whether the full *ensemble* of the facts on the record reasonably permits the inference urged by one of the parties to be drawn, because a party's refusal to collaborate has the potential to undermine the functioning of the dispute settlement system. Furthermore, the Appellate Body noted that if it had been "deciding the issue that confronted the Panel, we might well have concluded that the facts of record did warrant the inference that the information Canada withheld . . . included information prejudicial to Canada's denial that the EDC had conferred a benefit and granted a prohibited export subsidy." (Appellate Body Report, *Canada – Aircraft*, WT/DS70/AB/R, para. 205).

[54] Brazil again notes that it is not in a position to provide the updated MY 2002 base acreage, but uses the upland cotton PFC base acreage for that year.

[55] Exhibit Bra-293 (Data for Acreage Chart).



36. Indeed, aggregate producers' decisions to plant upland cotton are fairly stable. Despite drastic changes in upland cotton prices, the amount of planted acres only varies within a narrow range, confirming that US producers are largely isolated from upland cotton market price incentives. The data shown in this chart is also consistent with Brazil's argument that most upland cotton was planted on upland cotton base acreage. The amount of acreage planted to upland cotton always remains *below* the amount of upland cotton base acreage – a fact that supports Brazil's assumption that upland cotton producers receive payments related to upland cotton base.[56]

**(7) Brazil states that one third of all US farms with eligible acreage decided to update their base acreage under the direct payments and counter-cyclical payments programmes using their MY1998-2001 acreage. What is the proportion of the current base acreage for upland cotton resulting from such updating? Is the observed updating of base acreage consistent with Brazil's argument that it is only profitable to grow upland cotton on base acreage (and peanut and rice base acreage)? BRA**

Brazil's Answer:

37. Regarding the first question, Brazil does not know the proportion of current base acreage for upland cotton resulting from the 2002 updating of the base acreage. This information is exclusively collected and maintained by the United States. As indicated in answer to Question 125(5), USDA required all eligible farms to file applications by 1 June 2002 establishing and updating their base acreage. Brazil notes that the United States was quickly able to report that *overall* 99.6 per cent of eligible farms enrolled in the programme. This suggests that the United States is in possession of farm-specific information regarding the percentage of (1) the total amount of upland cotton direct and counter-cyclical payment base acreage, and (2) the number of farms growing upland cotton that chose to update their base acreage. Brazil reiterates its request to the United States for this information.[57]

[56] Brazil has discussed the validity of this assumption in its answers to Questions 125 (3) and (8).

[57] Exhibit Bra-49 (Brazil's Questions for the Purposes of Annex V Procedure, March 2003) and Exhibit Bra-101 (Brazil's Questions for the Purposes of the Consultations, 22 November 2002)

38. The answer to the second question is yes. As indicated in Brazil's Answer to Question 125(2)(c), upland cotton producers would lose money in MY 2000-2001 (even with the subsidies) if they grew upland cotton on anything other than upland cotton or rice base acreage. The record indicates that PFC per acre payments were $30.84 for upland cotton and $23.48 per acre for corn in MY 2001.[58] There were no PFC or market loss payments for peanut base under the 1996 FAIR Act.[59] Testimony from NCC representatives indicated that a number of producers in the south-eastern part of the United States grew upland cotton on corn base acreage during MY 1999-2001.[60] NCC representatives argued that it would only be "fair" for producers with corn base acreage that had switched into upland cotton production to be able to update their base acreage to receive *upland cotton* direct and counter-cyclical payments.[61] NCC's efforts were successful, as reflected in the fact that under the 2002 FSRI Act, maximum total direct and counter-cyclical per acre payments for upland cotton base acreage is $109.50, while for corn it is $54.10 per acre. This large increase in per acre payment for cotton relative to corn in the 2002 FSRI Act reflects the much higher cost of producing upland cotton – and the expectation that historic cotton producers receiving such high payments will continue to grow high-cost upland cotton.

39. Given the much higher per acre payments in MY 2002 for upland cotton base acreage, any producer who could gain more upland cotton base acreage would certainly take advantage of the chance to update. Thus, any increases in the updated upland cotton base in MY 2002 reflect the economic incentive to obtain significantly greater additional revenue by switching to upland cotton acreage than in staying with historical corn, wheat, oats, barley sorghum and barley acreage. Finally, the higher per acre payments for upland cotton also reflect the squeeze in profits for those cotton producers that grew upland cotton in MY 1999-2001 on corn base acreage, as testified to by NCC representatives, discussed above.

**(8) How could one take account of upland cotton producers who receive PFC, MLA, direct and counter-cyclical payments for other covered commodity base acreage? BRA, US**

Brazil's Answer:

40. The best information to use would be the actual data collected by the United States concerning the amount of PFC, MLA, DP, and CCP payments to US upland cotton producers. In the absence of this information, Brazil's methodology assumes that US producers of upland cotton grew upland cotton on upland cotton base acreage. This is a reasonable proxy, because there will be some upland cotton that is grown on rice (and peanut) base receiving higher payments, and some upland cotton that is grown on, *e.g.*, corn base receiving somewhat lower payments. On average, Brazil's approach would roughly cancel out the *over*-counting of rice and peanut payments and the *under*-counting of corn and any other lower-paying programme crop payments.

[59] Brazil's 24 June First Submission, para. 45; Brazil's 22 August Rebuttal Submission, para. 24

[60] *See* NCC testimony quoted in Brazil's 24 June 2003 First Submission, para. 53 *citing* Exhibit Bra-41 (Congressional Hearing, "The Future of Federal Farm Commodity Programs (Cotton)," House of Representatives, 15 February 2001, p.32).

[61] "[W]hat has happened is, under Freedom to Farm . . . in the Southeast we moved from corn, like I have done, to cotton. *So the last few years we have increased our cotton acreage in Georgia, for instance, to about a million and a half acres; we are getting [PFC] payments on about 900,000 acres*. [W]e have a tremendous production in the Southeast that is not getting a [Market Loss] payment or a regular [PFC] payment. So we are recommending . . . to this committee that a farmer have a choice with remaining with his existing acreage and yield, *or he has an option to move to a modified acreage and yield on his farm or acreage on his farm, and this would make this, we think, fair*. . . And this happened . . . outside the Southeast, but it is been more pronounced in the Southeast than any other section of the Country." (emphasis added) Exhibit Bra-41 ("The Future of Federal Farm Commodity Programs (Cotton)," Hearing before the House of Representatives Committee on Agriculture, 15 February 2001, p. 32). Brazil's 24 June First Submission, para. 53.

F. PROHIBITED SUBSIDIES

**128. Could the US respond to Brazil's assertions relating to the meaning and effect of the introductory phrase of Article 3 ("Except as provided in the *Agreement on Agriculture*....")? Would the meaning/effect change if Article 13 of the *Agreement on Agriculture* did not exist? BRA, US**

Brazil's Answer:

41. In commenting on the first question directed to the United States, Brazil notes that the United States argues that the phrase "except as provided in the Agreement on Agriculture" necessarily means that negotiators intended to carve out both domestic local content and export subsidies for agricultural products from the disciplines of Article 3 of SCM Agreement.[62] But the United States' argument twists the meaning of the phrase "*except* as provided". The word "except" does not imply that there *must* be something in the Agreement on Agriculture that carves out the disciplines on local content subsidies in the SCM Agreement. The phrase only means that *if* the Agreement on Agriculture clearly and unambiguously (i) exempts such agricultural subsidies from the SCM Agreement, or (ii) changes the obligations contained in the SCM Agreement, then the provisions of the Agreement on Agriculture that conflict with those of the SCM Agreement will prevail. The Appellate Body's jurisprudence teaches that it is only where the text clearly and unambiguously provides for modified obligations does the "except as provided" language become operational.[63]

42. In essence, what the United States seeks from the Panel is an interpretation that the prohibition on local content subsidies does not apply to agricultural goods. Yet, nothing in the Agreement on Agriculture or the SCM Agreement provides the carve-out the United States now seeks.

43. Brazil agrees that the Agreement on Agriculture constitutes *lex specialis* as opposed to the *lex generalis* of the SCM Agreement. The Agreement on Agriculture applies to a subset of goods covered by the SCM Agreement and, in case of conflicting provisions, the rights and obligations contained therein should prevail over those of the SCM Agreement. Brazil agrees that the introductory phrase of Article 3 of the SCM Agreement makes explicit the *lex specialis* nature of the Agreement on Agriculture.

44. However, the US argument goes further than the principle of *lex specialis derogat generalis* as it is normally applied. The United States wants the Panel to apply this principle in a way that effectively derogates explicit and specific provisions of the SCM Agreement whenever the Agreement on Agriculture is silent about such provisions. This is an absurd application of the *lex specialis* principle. The *lex specialis* is to be read together with the *lex generalis*. In fact, every effort must be made to read the two provisions in a harmonious manner. The derogation of the *lex generalis* is called for only in situations when an irreconcilable conflict between the two texts arises. It is a fundamental tenet of law that absolute contradictions between laws cannot be presumed; they must be established by a systematic analysis of the texts involved to identify any unequivocal incompatibility. Such conflict or incompatibility does not exist with regard to Article 3.1(b) of the SCM Agreement. The Agreement on Agriculture specifies no right or obligation that would, *by necessity*, derogate the obligation contained in Article 3.1(b) of the SCM Agreement. The Appellate Body and panels have

[62] US 30 September Further Submission, para. 171.

[63] Appellate Body Report, *EC – Hormones*, WT/DS26/AB/R, para. 128; Appellate Body Report, *EC – Bananas*, WT/DS27/AB/R, paras. 157-158; Appellate Body Report, *EC – Sardines*, WT/DS231/AB/R, paras. 201, 208.

rightly cautioned against interpretations that would exempt disciplines from entire sections of WTO agreements in the absence of a clear and unambiguous carve-out of rights and obligations.[64]

45. Furthermore, the United States' interpretation, which would (permanently) carve out all agricultural products from the prohibition of Article 3.1(b), is contrary to the object and purpose of Article 3 of the SCM Agreement. Negotiators expressed their intent that local content subsidies are a special class of trade-distorting subsidies. Because of their particularly trade-distortive nature, negotiators dispensed with the requirement of showing any adverse effects and made them prohibited subsidies. Given the special prohibited nature of such subsidies – coupled with the ability of negotiators to carve such subsidies out explicitly from the operation of the SCM Agreement – it would be expected that any exception from the disciplines would be clear and unambiguous.

46. The answer to the second question is "no". As Brazil's earlier submissions have articulated, Article 13(b) is not the only basis for Brazil's argument that the Agreement on Agriculture does not carve out agricultural local content subsidies from the Article 3.1(b) prohibition of local content subsidies.[65] As Brazil has argued, there is no inherent conflict between requiring the notification and scheduling of payments to processors of agricultural goods benefiting domestic producers under Annex 3, paragraph 7 of the Agreement on Agriculture and the prohibition on payments to processors of agricultural goods that are contingent upon the use of domestic over imported goods.[66] Nevertheless, the absence of any reference to Article 3 of the SCM Agreement in Article 13(b) of the Agreement on Agriculture (while a similar reference exists for export subsidies) is consistent with Brazil's other arguments that local content subsidies for agricultural goods are prohibited subsidies.

47. The US interpretation eliminating any prohibitions on agricultural local content subsidies creates a sharp distinction in the way that the other group of normally prohibited subsidies – subsidies contingent upon export – are treated under the Agreement on Agriculture. The Agreement on Agriculture provides many instances in which export subsidies for an individual agricultural product may be challenged as prohibited subsidies under the Agreement on Agriculture. These include prohibitions on export subsidies for unscheduled products, prohibitions on subsidies given to products where support is beyond the scheduled reduction commitments, and prohibitions on subsidies that lead to circumvention of export subsidy reduction commitments. By contrast, under the US interpretation of local content subsidies, there will never be an instance in which local content subsidies for an individual agricultural product would ever be prohibited.

48. It would be expected that such radically different treatment of local content subsidies would be spelled out clearly in the Agreement on Agriculture. Yet, the only link the United States can find to justify its total exclusion of local content prohibited subsidies is the provision in Annex 3, paragraph 7 to include local content subsidies – along with the multitude of other types of domestic subsidies that are *not* prohibited subsidies – in the support to be counted for total AMS. All that Annex 3, paragraph 7 stipulates is that AMS calculations shall include measures that "benefit the producers of the basic agricultural products". Such language contains nothing that conflicts with the obligation established in Article 3.1(b) of the SCM Agreement. Brazil notes that measures that "benefit the producers of the basic agricultural products" may or may not be "contingent upon the use of domestic over imported good". In both situations these subsidies must be included in AMS calculations. However, when challenged under the DSU, those subsidies that require local content

[66] Brazil's 22 August Rebuttal Submission, paras. 137-140 (setting out examples where no such conflict would exist).

will be found to violate Article 3.1(b) of the SCM Agreement, and the subsidizing Member will be urged to withdraw such measures.

G. SPECIFICITY/CROP INSURANCE

**129. In the event that the Panel does not consider that the alleged prohibited subsidies fall within the provisions of Article 3 and are therefore, pursuant to Article 2.3, "deemed to be specific", are there any other grounds on which Brazil would rely in order to support the view that such measures are "specific" within the meaning of Article 2 of the *SCM Agreement* (see, for example, fn 16 of Brazil's further submission)? BRA**

Brazil's Answer:

49. Brazil brought prohibited subsidy claims against the Step 2 export and domestic payments, as well as against the CCC export credit guarantee programmes GSM 102, GSM 103 and SCGP. Concerning the latter, only GSM 102 is relevant for Brazil's serious prejudice claims and, thus, the questions of specificity within the meaning of Article 2 of the SCM Agreement only needs to be addressed for that subsidy.

50. Step 2 export and domestic payments are *de jure* specific subsidies because they are only available for exporters and domestic users of upland cotton.[67] Exporters or domestic users of extra-long staple cotton, any other crop or any other product are not eligible to receive Step 2 payments. Consequently, the United States has notified Step 2 payments as cotton-specific non-green box domestic support.[68] Thus, Step 2 payments are specific within the meaning of Article 2.1 of the SCM Agreement in much the same way as marketing loan payments or cottonseed payments.

51. Brazil notes that the Panel's question raises a hypothetical situation that is highly unlikely given the clear export contingency of the GSM 102 export credit guarantee programme. Unlike the crop insurance programme, GSM 102 export credit guarantees are available for exports of most US agricultural commodities.[69] However, GSM 102 support is provided only to enterprises exporting agricultural products and, thus, for the reasons set forth in Brazil's answer to Question 131(a), these subsidies are both *de jure* and *de facto* specific. [70]

**130. Does Brazil agree that the US insurance premium subsidy is available in respect of all agricultural products? Please cite relevant portions of the record. BRA**

Brazil's Answer:

52. Brazil does not agree that the US crop insurance premium subsidy is available in respect of all agricultural products. At the outset, Brazil would like to clarify that the US crop insurance programme encompasses two different types of subsidies. First, the US Federal Crop Insurance Corporation pays *farmers* a portion of the premiums that they have to pay for obtaining crop insurance.[71] Second, the Federal Crop Insurance Corporation covers losses under crop insurance

[67] Exhibit Bra-29 (Section 1207(a) of the 2002 FSRI Act) and Exhibit Bra-28 (Section 136(a) of the 1996 FAIR Act).

[68] *See e.g.* Exhibit Bra-47 (G/AG/N/USA/43, p. 20). Brazil disagrees with the classification of Step 2 export payments as "domestic support." Brazil also considers Step 2 domestic payments to be prohibited local content subsidies within the meaning of Article 3.1(b) of the SCM Agreement and Article III:4 of GATT 1994.

[69] *See* Brazil's Comment to Question 142.

[70] *See* Brazil's Answer to Question 131.

policies that exceed the amount of premiums collected, thus providing free *reinsurance for private insurance companies* offering crop insurance.[72]

53. Brazil has demonstrated that crop insurance policies that are eligible for subsidy payments – both premium and reinsurance subsidies – are not available in respect of all agricultural products. The United States claims that crop insurance subsidies are and will in the future be available to livestock and dairy producers.[73] This assertion is incorrect. First, it is entirely irrelevant if crop insurance will be available to livestock and dairy producers in the future. The question that faces the Panel is whether the US crop insurance subsidies in MY 1999-2002 are specific, not whether they may at some point in the future become less specific. Brazil demonstrated that except for a very narrow pilot programme that began in MY 2002, there were no livestock "crop" insurance policies during MY 1999-2002.

54. Second, Brazil has demonstrated that crop insurance is currently – in MY 2003 – only available to livestock producers in a limited number of US states and counties.[74] The Adjusted Gross Revenue policy cited by the United States[75] covers only "incidental amounts of income from animals and animal products and aquaculture reared in a controlled environment," which must not exceed "35 per cent of expected allowable income".[76] In addition, this policy is only available for producers in a limited number of counties in 18 US states.[77] Even making the entirely unrealistic assumption that *all* US livestock in those pilot counties would be eligible for adjusted gross revenue coverage, that production[78] would only represent 7.58 per cent of the value of total US livestock production.[79] In addition, Brazil has demonstrated that the total value of US livestock and dairy production represents 52 per cent of the value of total US agriculture.[80] Thus, even taking into account the pilot counties for the adjusted gross revenue coverage, at least 48 per cent of the value of US agriculture is excluded from crop insurance subsidy benefits.

55. Third, the 2000 ARP Act itself explicitly limits its application to, *inter alia*, US crops, and does not cover insurance for the production of dairy, beef, poultry, pork and other livestock.[81]

56. In sum, the US crop insurance subsidies are not available to all US agricultural production.

---

[72] Exhibit Bra-30 (Section 508(k) of the Federal Crop Insurance Act). For the reinsurance agreement standards *see* Exhibit Bra-39 (7 CFR 400.161 et seq.).

[73] US 30 September Further Submission, para. 15.

[74] Brazil's 7 October Oral Statement, para. 7.

[75] Brazil notes that this policy is the only one that is cited by the United States in support of its allegation that crop insurance would be available to all US agricultural products. Brazil is not aware of any other policy that would enable and in particular enabled US dairy or livestock producers during MY 1999-2002 to benefit from crop insurance subsidies.

[76] Exhibit Bra-272 ("Fact Sheet: Adjusted Gross Revenue," Risk Management Agency, USDA, February 2003, p. 1).

[77] Exhibit Bra-272 ("Fact Sheet: Adjusted Gross Revenue," Risk Management Agency, USDA, February 2003, p. 1,3).

[78] The record shows that most farms are small, and that many small farms specialize in beef production. *See* Bra-285 ("Agriculture Fact Book 2001-2002, Chapter 3 – American Farms, Figures 3.1 and 3.8). Therefore, these farms could not be eligible under the pilot programme because more than 35 per cent of their revenue is generated from the production of livestock. This suggests that even the figure of 7.58 per cent of total US livestock production is a significant overestimate.

[79] Exhibit Bra-271 (Analysis of the Market Value of Livestock in Adjusted Gross Revenue Insurance Pilot States and Counties).

[80] Brazil's 22 August Rebuttal Submission, para. 59 and Exhibit Bra-177 ("ERS Briefing Room: Farm Income and Costs: Farm Income Forecasts").

[81] Exhibit Bra-30 (Section 518 of the Federal Crop Insurance Act) contains a list of the "agricultural commodities" covered by insurance policies that are subsidized under the Federal Crop Insurance Act.

**131. How should the concept of specificity – and, in particular, the concept of specificity to "an enterprise or industry or group of enterprises or industries" -- in Article 2 of the *SCM Agreement* apply to subsidies in respect of agricultural commodities? Please answer the following questions, citing the principles in Article 2 of the *SCM Agreement*: BRA, US**

**(a) is a subsidy in respect of all agricultural, but not other, products specific?**

**(b) is a subsidy in respect of all agricultural crops (i.e. but not to other agricultural commodities, such as livestock) specific?**

**(c) is a subsidy in respect of certain identified agricultural products specific?**

**(d) is a subsidy in respect of upland cotton, but not other products, specific?**

**(e) is a subsidy in respect of a certain proportion of the value of total US commodities (or total US agricultural commodities) specific?**

**(f) is a subsidy in respect of a certain proportion of total US farmland specific?**

Brazil's Answer:

57. The short answer to Questions 131(a) – (f) is "yes."

58. Brazil's Further Submission sets forth a detailed analysis of the legal requirements for *de facto* and *de jure* specificity (paras. 34-40), demonstrating the broad agreement between the official US interpretation of Article 2 of the SCM Agreement in the Statement of Administrative Action ("SAA") and the position of Brazil. Brazil also provided a detailed application of those requirements for each of the relevant subsidies (paras. 41-70). Brazil offers the following additional comments below:

59. With respect to Question 131(a), a US subsidy that is made available to all enterprises in the industry producing agricultural commodities is specific. As Brazil and the United States agree, the purpose of the specificity requirements is to "function as an initial screening mechanism to winnow out only those foreign *subsidies which truly are broadly available and widely used throughout an economy*".[82] The United States' SAA notes that "all governments, including the United States, intervene in their economies to one extent or another, and to regard all such interventions as countervailable would produce absurd results". Among such "absurd results" would be countervailing "public highways and bridges, as well as a tax credit for expenditures on capital investment even if available to all industries and sectors".[83] After providing these examples, the SAA states that "the specificity test was not intended to function as a loophole through which narrowly focused subsidies provided to or used by discrete segments of an economy could escape the purview of the CVD law".[84]

60. The US subsidies at issue in this case – including crop insurance – are *de jure* limited under Article 2.1(a) because they "explicitly limit access to a subsidy to certain enterprises", *i.e.*, those producing, using, or exporting either crops, certain crops, or one crop.[85] The US subsidies are also *de facto* specific under Article 2.1(c) because they are used by a limited number of enterprises in relation to all enterprises and industries making up the US economy. Only the group of enterprises

[82] Exhibit Bra-148 ("Statement of Administrative Action," p. 929).
[83] Exhibit Bra-148 ("Statement of Administrative Action," p. 929-30).
[84] Exhibit Bra-148 ("Statement of Administrative Action," p. 930).
[85] Brazil's 9 September Further Submission, paras. 34-70.

producing agricultural crops is entitled to receive or actually use these subsidies. All other enterprises and all other industries are excluded from the right to receive and, in fact, do not use such subsidies.

61. The broad diversification of the US economy is a relevant fact for the Panel to consider for *de facto* specificity under Article 2.1(c) ("account shall be taken of the extent of diversification of economic activities within the jurisdiction of the granting authority".). The US SAA indicates that the US Department of Commerce should take "account of the number of industries in the economy in question" in "determining whether the number of industries using a subsidy is small or large".[86] The US industry growing and producing agricultural products, or even the sub-industry of US producers who grow crops, are in the words of the US SAA, "a discrete segment" of the US economy. The value of all US agricultural production of all commodities is only 0.8 per cent of total US GDP.[87] Article 2.1(c) requires a Panel to undertake a "case by case" approach to diversification, and Brazil believes the approach presented here and endorsed by the US SAA is an appropriate application of the provision. In the case of the United States, there is a multitude of US industries that do not use the US subsidies at issue in this case. By contrast, in the case of Benin, the agricultural industry represents 38 per cent of its GDP.[88] For a country like Benin, subsidies to the entire agriculture sector would most likely not be considered to be specific because they are widely available to a large portion of the producers within the economy. No such facts exist for the cotton subsidies at issue in this dispute.

62. Brazil sees no basis in the text of Article 2 of the SCM Agreement for a different specificity test to be applied to subsidies for the purpose of Part V (countervailing measures) and Part III (actionable subsidies) of the SCM Agreement. Nor does Brazil see any basis to apply a different test of specificity for agricultural and other types of goods and industries – no such distinction exists in Article 2 of the SCM Agreement. For example, would a subsidy provided only to the US automotive parts industry (which includes thousands of enterprises) be specific while a subsidy provided to thousands of enterprises producing agricultural crops *not* be specific? There cannot be much doubt that the US automotive parts industry is a discrete segment of the US economy, and a discrete "industry". Brazil (and the US SAA) is of the view that in both these instances, the subsidy would be specific. All of the US subsidies challenged by Brazil are narrowly focused on, at most, a *portion* of the industry producing agricultural products.

63. With respect to Question 131(b), a subsidy that is provided to enterprises producing all agricultural *crops* is specific. Because the applicable industry is the one producing all agricultural commodities, a subsidy to only enterprises producing crops but not to enterprises producing *other* agricultural commodities is specific. Brazil notes the entirely different approach the United States now asserts in this case, regarding crop insurance, and the official interpretation offered in the SAA.[89] While the Panel, of course, is not bound by the unilateral interpretation of the United States in the SAA, Brazil believes that the SAA, in this instance, correctly described the intent of the drafters regarding specificity. The producers of US crops are discrete enterprises within a US industry. None of these subsidies is provided to enterprises producing other types of agricultural products that make up approximately 50 per cent of the value of the US agricultural commodities.[90] In the case of crop insurance, it is useful to recall that many of the small US farming enterprises – representing 92 per cent of US farms – produce livestock, including beef.[91]

[88] Exhibit Bra-294 ("The World Fact Book – Benin," CIA, p.6)

[89] The "SAA thus contains the view of the Administration, submitted by the President to Congress and receiving its imprimatur, concerning both interpretation and application and containing commitments, to be followed by future Administration, on which domestic as well as international actors can rely." Panel Report, *US – Section 301*, WT/DS152/R, para. 7.111.

[90] *See* Brazil's Answer to Question 130.

[91] Exhibit Bra-285 (Agriculture Fact Book 2001-2002, Chapter 3 – American Farms, Figures 3.1 and 3.8).

64. In deciding the question, the Panel should also take into account the significant implications of accepting the US arguments that any subsidy provided to all agricultural producers of all agricultural commodities would be non-specific. This interpretation would create a new class of trade-distorting agricultural subsidies that are non-actionable. The United States has always notified its crop insurance subsidies as amber box subsidies, *i.e.*, presumptively trade distorting. And USDA economists have found that even lower subsidies provided by the pre-2000 ARP Act increased US upland cotton acreage by 1.2 per cent and US upland cotton exports by 2 per cent.[92] Professor Sumner found that the higher subsidies provided by the 2002 ARP Act increased US upland cotton acreage by 3.3 per cent, US exports by 3.8 per cent, and decreased world A-Index prices by 1.3 per cent on average for each year between MY 2000-2002.[93]

65. The US specificity interpretation would permit, for example, a Member to provide a revenue guarantee to every enterprise producing any agricultural commodity to pay for the total cost of production plus a reasonable profit margin of 10 per cent. The US interpretation would permit Members to make direct payments to every farming enterprise that are tied to a constructed average price index for all agricultural products (not individual prices such as the CCP) and a farmer's current total production. A Member could also provide free inputs for the production of all agricultural commodities to every enterprise producing any agricultural product without that subsidy being actionable under Articles 5 and 6 of the SCM Agreement. In short, if the criteria is, as the United States argues, that the subsidy only need be provided to all farming enterprises, then *any* type of trade distorting non-green box domestic subsidy meeting that universal application criteria would escape discipline under the SCM Agreement.

66. The USinterpretation would create a gaping hole in the disciplines of the Agreement on Agriculture and the SCM Agreement. Such an interpretation is clearly inconsistent with the object and purpose of the Agreement on Agriculture, which is to "correct[] and prevent[] restrictions and distortions in world agricultural markets". It is inconsistent with the SCM Agreement's object and purpose of disciplining trade-distorting actionable subsidies. And it is completely inconsistent with the interpretation including in the United States' SAA.

67. With respect to Questions 131(c) and (d), for the reasons set forth above and in Brazil's earlier submissions, a subsidy that is mandated to be provided to only certain enterprises in respect of a handful of identified agricultural products (such as the 10 "programme" crops of the direct and counter-cyclical payment programme) but not provided to most other enterprises within the agricultural industry producing crops or agricultural commodities, is specific under Article 2.1(a) of the SCM Agreement. Similarly, there is *de facto* specificity because these same subsidies covered by the Panel's questions (c) and (d) are only used by certain enterprises of the overall industry producing agricultural commodities (which is the case for all the US subsidies except crop insurance and GSM 102).[94]

68. Regarding Question 131(e), if a subsidy is paid only to enterprises that produce or manufacture products representing a certain *portion* of the value of the products of a single industry (such as the US industry producing agricultural commodities), then the subsidy would be specific. Evaluating specificity based on the "value" of products produced by a single industry is a useful tool for measuring the extent to which the subsidy is provided to discrete enterprises within an industry, or within an economy. When many enterprises in the most highly revenue generating segments of an industry do not receive a subsidy – such as the absence of crop insurance for livestock including beef, poultry and pork, among others – then the subsidy is specific because it is only used by a certain number of enterprises within the industry.

[92] Brazil's 22 August Rebuttal Submission, paras. 63-64.
[93] Brazil's 9 September Further Submission, Annex I, Table 1.5d.
[94] Brazil's 9 September Further Submission, paras. 41-61.

69. Finally, with respect to Question 131(f), another tool for evaluating the specificity of a subsidy is the amount of total US farmland that receives the subsidy. The use of "farmland" is a rough proxy for the number of enterprises producing agricultural products within the meaning of Article 2.1. For example, only 38 per cent of US farmland is used for the growing of crops (including hay) that are eligible for the payment of crop insurance.[95] By contrast, 62 per cent of US farmland is used for the production of livestock that, with only a few exceptions, is not covered by US crop insurance. When used in conjunction with the "value" data discussed in Question 131(e) above, this acreage data confirms the fact that a number of enterprises within the industry producing agricultural commodities do *not* receive the crop insurance subsidy. Brazil notes that the United States has not contested the use of similar acreage data to demonstrate the specificity of other US subsidies.[96]

H. EXPORT CREDIT GUARANTEES

**137. Please elaborate the meaning of "net losses" as is used in paragraph 70 of Brazil's 7 October oral statement. BRA**

Brazil's Answer:

70. The term "net losses" was, in the context of an oral statement, merely a shorthand reference to the elements of item (j) – the provision of the CCC guarantee programmes at "premium rates which are inadequate to cover the long-term operating costs and losses of the programmes".

71. To prove that the CCC guarantee programmes suffered "net losses" (or in other words meet the elements of item (j)), Brazil referred, in paragraph 70, to the comparison of cohort-specific subsidy figures from the "guaranteed loan subsidy" line of the US budget with cohort-specific reestimates from Table 8 of the Federal Credit Supplement[97], summed over the period 1992-2002 to determine the performance of the CCC programmes over the long term.

72. Whether starting with the cohort-specific subsidy figure from the budget year column of the US budget or with the cohort-specific subsidy figure from the prior year column of the US budget, the result of this exercise is a positive subsidy number.[98] The CCC arrives at the very same result in its 2002 financial statements. Specifically, the 2002 financial statements provide a cumulative subsidy figure for *all* post-1991 CCC guarantees, taking account of all adjustments for defaults, fees and reestimates undertaken for all cohorts in all years through 2002. This exercise results in a cumulative

[95] Exhibit Bra-143 (Agricultural Statistics 2003, National Agricultural Statistics Service, USDA. Table IX-6; *See also* Summary of Business Application, Risk Management Agency. USDA. Accessed 21/10/03, http://www3.rma.usda.gov/apps/sob/ Based on the 1997 census (the most recent year), the total land in farms is 968,338,000 acres; the total cropland used for crops was 348,701,000 acres; idle cropland and grassland pasture was 580,165,000 acres; the number of acres insured on rangeland, forage seed, forage production, alfalfa seed (*i.e.*, crops that could be grown on grassland pasture) was 12,575,000 acres. If cropland not used for crops was included, then the total amount of acreage not producing insured commodities would be 58.61 per cent and the total amount of acreage used to produce insured (or potentially insured) commodities under the 2002 ARP Act would be 41.39 per cent. Brazil notes that this does not include any reference to the recent pilot programs discussed elsewhere. However, the percentages would not change to any great extent if such acreage were included, given the 35 per cent limit on livestock imposed by the crop insurance program.

[96] *See* Brazil's 9 September Further Submission, paras. 43-61 (discussion of specificity regarding PFC, MLA, DP, and CCP subsidies).

[97] Table 8 of the 2004 Federal Credit Supplement is included at Exhibit Bra-182.

[98] Brazil has offered calculations using the cohort-specific subsidy estimate from the budget year column of the US budget (para. 115 of Brazil's 22 August Rebuttal Submission), and using the cohort-specific subsidy estimate from the prior year column of the US budget (Exhibit Bra-193).

positive subsidy figure of $411 million for the period 1992-2002.[99] The Panel will recall that under the Federal Credit Reform Act, when "payments from" the government exceed "payments to" the government on a net present value basis, a positive subsidy results, meaning that CCC is "los[ing] money".[100]

73. Brazil has explained that the FCRA cost formula is one way to determine the performance of the CCC export credit guarantee programmes relative to the elements of item (j). Application of the formula demonstrates that over the period 1992-2002, CCC guarantees under the GSM 102, GSM 103 and SCGP programmes were provided "at premium rates which are inadequate to cover the long-term operating costs and losses of the programmes."

74. The United States objects to the appropriateness of the FCRA formula as a proxy for the analysis required by item (j).[101] The United States' objection is based on the fact that re-estimates are still being undertaken for all CCC guarantee cohorts during the period 1992-2002. Brazil has therefore also offered a number of other methods to confirm that operating costs and losses for the CCC guarantee programmes outpace premiums collected during the period 1992-2002[102], or in other words, that the CCC guarantee programmes suffered "net losses" over that long-term period.

**138. Please comment on Brazil's views stated in paragraph 70 of its 7 October oral statement. US**

Brazil's Comment:

75. Brazil notes an inadvertent error in paragraph 70 of its 7 October Oral Statement. Exhibit Bra-193 does indeed compare cohort-specific reestimates to cohort-specific subsidy figures from the prior year column of the US budget. However, the comparison of cohort-specific reestimates to cohort-specific subsidy figures from the budget year column of the US budget is reflected in the table at paragraph 115 of Brazil's 22 August Rebuttal Submission, rather than in Exhibit Bra-192.

76. In Exhibit Bra-192, Brazil subtracted downward reestimates from and added upward reestimates to the original subsidy figure included in the budget year column of the "guaranteed loan subsidy" line of the annual US budget.

**139. In the context of export credit guarantees, is the Panel correct in understanding that Brazil's claims of inconsistency with the *Agriculture Agreement* involve GSM 102, GSM 103 and SCGP, but that it limits its "serious prejudice" allegations in respect of export credit guarantee programmes to the GSM 102 programme, and does not challenge GSM 103 and SCGP in this respect? If so,**

**(a) could Brazil please explain why it did so, and confirm that all the data relied upon in its further submissions (e.g. in Table 13) relate to the GSM 102 programme rather than to GSM 102, GSM 103 and SCGP (and, if the data needs to be adjusted to take account of a narrower "serious prejudice" focus, supply GSM-102-relevant data)? BRA**

[99] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, "Commodity Credit Corporation's Financial Statements for Fiscal Year 2002", Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 19).

[100] Exhibit Bra-121 (US General Accounting Office, Report to Congressional Committees, "Credit Reform: US Needs Better Method for Estimating Cost of Foreign Loans and Guarantees," GAO/NSIAD/GGD-95-31, December 1994, p. 20)). For the FCRA formula, *see* Exhibit Bra-117 (2 U.S.C. § 661a(5)(c)).

[101] US 22 August Rebuttal Submission, para. 162.

[102] Brazil's 11 August Answers to Panel Questions, paras. 163-168; Brazil's 22 August Rebuttal Submission, para. 109.

77. The Panel is correct in understanding that Brazil's serious prejudice claims involve only GSM 102. All tables and figures that make reference to export credit guarantees in the context of Brazil's serious prejudice claims represent data on GSM 102 only. The reason that Brazil's serious prejudice claims do not cover GSM 103 and SCGP is that either no cotton allocations were made under the programme (GSM 103 for most of the marketing years covered by the period of investigation) or that only negligible amounts of cotton were exported under the programme (SCGP and – if exports took place – GSM 103).[103] Almost all US upland cotton exports that benefited from a CCC export credit guarantee were covered by the GSM 102 programme. Thus, the only CCC export credit guarantee programme that significantly contributed to the upland cotton-related serious prejudice suffered by Brazil was the GSM 102 programme. Consequently, Brazil has excluded GSM 103 and SCGP from its serious prejudice claims.

78. However, Brazil has included GSM 102, GSM 103 and SCGP in its export subsidy claims under the Agreement on Agriculture and the SCM Agreement. All three CCC export credit guarantee programmes constitute export subsidies within the meaning of Articles 10.1, 8 and 1(e) of the Agreement on Agriculture and Articles 1 and 3.1(a) of the SCM Agreement, and fulfil the criteria of item (j) of the Illustrative List of Export Subsidies attached as Annex I to the SCM Agreement.

**(b) for the purposes of Article 13(c)(ii) of the *Agreement on Agriculture*, is it necessary for the Panel to examine only GSM 102 or should the Panel's examination include also GSM 103 and SCGP? Why or why not? BRA**

79. The Panel needs to examine all three programmes under Article 13(c)(ii) of the Agreement on Agriculture. This provision exempts export subsidies from actions based on Article XVI of GATT 1994 and Articles 3, 5 and 6 of the SCM Agreement. Brazil has brought claims under Article XVI of GATT and Articles 5 and 6 of the SCM Agreement against CCC's GSM 102 export credit guarantee programme. Thus, to properly address these claims, the Panel needs to determine whether the GSM 102 programme fully conforms to the provisions of Part V of the Agreement on Agriculture, within the meaning of Article 13(c)(ii) of that Agreement.

80. In addition, Brazil has brought claims under Article 3.1(a) of the SCM Agreement against CCC's GSM 102, GSM 103 and SCGP export credit guarantee programmes. To properly address these claims, the Panel needs to determine whether the GSM 102, GSM 103 and SCGP programmes fully conform to the provisions of Part V of the Agreement on Agriculture, within the meaning of Article 13(c)(ii) of that agreement.

81. To demonstrate that CCC's GSM 102, GSM 103 and SCGP programmes do not fully conform to the provisions of Part V of the Agreement on Agriculture, Brazil has established that GSM 102, GSM 103 and SCGP constitute export subsidies and violate Articles 10.1 and 8 of the Agreement on Agriculture by circumventing or threatening to circumvent US export subsidy reduction commitments. The programmes, thus, do not conform fully to the provisions of Part V of the Agreement on Agriculture.

**140. Could Brazil explain how, if at all, it has treated export credit guarantees for the purpose of Table 1 of its further submission? BRA**

82. Brazil has not included GSM 102 for the purpose of Table 1 of its Further Submission. While Brazil has demonstrated that GSM 102 export credit guarantees constitute export subsidies within the meaning of the Agreement on Agriculture and the SCM Agreement[104], Brazil is not in a position to quantify the benefit to the recipients that has arisen from the application of the GSM 102 export credit

[103] Exhibit Bra-73 (Summary of Export Credit Guarantee Programs FY 1999-2003).
[104] Brazil's 22 August Rebuttal Submission, para. 102-110

guarantee programme to exports of US upland cotton between MY 1999-2002. Brazil has no data – nor has the United States provided any – that would enable it to calculate the benefit involved in the GSM 102 transactions.[105]

83. However, the National Cotton Council, which represents the industry benefiting from the GSM 102 programme, has provided what appears to be a reasonable estimate of the benefits to US upland cotton producers, users and exporters. These benefits are significant enough to generate an additional 500,000 bales of US upland cotton exports per year and to raise domestic US prices by 3 cents per pound.[106]

84. Having proven the export subsidy character of the GSM 102 programme, as well as having proven the production and export-enhancing as well as A-Index-suppressing effects of the programme[107], Brazil has met its burden of proof under Articles 5 and 6.3 of the SCM Agreement and GATT Article XVI to establish that the GSM 102 programme causes serious prejudice to the interests of Brazil.

**141. The Panel notes the US argument, *inter alia* in its further submission, that the export credit guarantee programmes are "self-sustaining". Recalling that item (j) of the Illustrative List of Export Subsidies in Annex I of the *SCM Agreement* refers to "premium rates", could the US expand upon how it takes into account the premium rates for the export credit guarantee programmes in its analysis. US**

Brazil's Comment:

85. As Brazil has argued elsewhere, the United States cannot make a showing that the CCC guarantee programmes do not constitute export subsidies by appealing to an *a contrario* interpretation of item (j), since item (j) does not admit of an *a contrario* defense.[108]

86. Even if item (j) does admit of an *a contrario* defense, proving that the CCC programmes are "self-sustaining" is not enough. Were an *a contrario* defense possible, it would require the United States to demonstrate that over a period constituting the long term, "premium rates" are adequate to cover operating costs and losses, which include but are not limited to "claims or defaults". In contrast, the United States has argued that it is sufficient to show that "claims or defaults" do not exceed "revenue from whatever source it may be derived".[109] "Revenue from whatever source it may be derived" gives credit to the United States for revenue that is not recognized as relevant for the purposes of item (j), and "claims or defaults" ignores "operating costs and losses" that are relevant for the purposes of item (j).[110]

87. As a factual matter, Brazil quite evidently does not agree that the premium rates for the CCC programmes meet their long-term operating costs and losses. Brazil has presented voluminous quantitative data demonstrating that long-term operating costs and losses incurred by the CCC programmes outpace premiums collected. Brazil has also provided statements from the USDA Inspector General[111] and the US General Accounting Office[112] establishing that CCC's failure to

[105] However, Brazil has established that GSM 102 guarantees confer benefits *per se*, since there is no comparable commercial instrument available in the marketplace.

[111] Exhibit Bra-153 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, Audit Report No. 06401-14-FM (June 2001), p. 31 ("[T]he fees CCC charges for its GSM-102 and GSM-103

account for country risk or the credit rating of the borrower in setting guarantee fees means that CCC is charging "premium rates" that do not allow it to cover its operating costs and losses over the long-term.

**142. The US has pointed out that there are many limitations on granting export credit guarantees and that there is no requirement to issue any particular guarantee (US further submission, paras 153-156). Can the Commodity Credit Corporation decline to grant an export credit guarantee even in cases where the programme conditions are met? US**

Brazil's Comment:

88. No, the CCC cannot decline to grant an export credit guarantee even in cases where the programme conditions are met. The CCC cannot "stem[], or otherwise control[], the flow of" CCC export credit guarantees.[113] The CCC export credit guarantee programmes therefore threaten to lead to (and in fact have led to) circumvention of the United States' export subsidy reduction commitments, within the meaning of Article 10.1 of the Agreement on Agriculture.

89. Under the Budget Enforcement Act of 1990, the US Office of Management and Budget classifies the CCC export credit guarantee programmes as "mandatory".[114] Mandatory programmes like the CCC export credit guarantee programmes are exempt from the requirement in US law that a programme receive new Congressional budget authority before it undertakes new loan guarantee commitments.[115] As the Congressional Budget Office has noted, support *via* mandatory programmes like the CCC export credit guarantee programmes "must be available to all eligible borrowers", without regard to appropriations limits.[116] The Congressional Research Service has similarly stated that "[e]ligibility for mandatory programmes is written into law, and *any individual or entity that meets the eligibility requirements is entitled to a payment as authorized by the law*".[117]

90. The fact that the CCC can deny guarantees to individuals who do not meet the eligibility criteria does not, of course, affect the conclusion that CCC cannot "stem[], or otherwise control[], the flow of" CCC export credit guarantees.[118] The United States' FSC measure had eligibility criteria, but

---

export credit guarantee programmes have not been changed in 7 years and may not be reflecting current costs".). Exhibit Bra-154 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC (February 2002), p. 49 ("[T]he fees CCC charged for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed for many years and may not be reflecting current costs".).

[118] Appellate Body Report, *US – FSC*, WT/DS108/AB/R, para. 149.

the Appellate Body still concluded that nothing in the measure "stem[ed], or otherwise control[led], the flow of" FSC benefits, leading to a threat of circumvention of the United States' export subsidy reduction commitments.[119]

91. The entitlement that qualified applicants have to CCC guarantees is not curtailed by the requirement in US law that CCC not make available guarantees to countries that cannot adequately service debt.[120] That CCC has the authority to deny guarantees on this basis is not relevant, for at least three reasons.

92. First, under the United States' FSC measure, US authorities were permitted to undertake a factual enquiry into whether the foreign-source income of the foreign corporation was "effectively connected with the conduct of a trade or business within the United States".[121] This authority, and the possibility that the factual enquiry could limit the amount of income that would qualify for the FSC exemption, did not prevent the Appellate Body from concluding that nothing in the FSC measure "stem[ed], or otherwise control[led], the flow of" FSC benefits, leading to a threat of circumvention of the United States' export subsidy reduction commitments.[122] Similarly, the authority that CCC has to undertake an enquiry into whether particular countries are creditworthy, and the possibility that this enquiry could end up reducing the amount of CCC guarantees, does not prevent a conclusion that nothing "stem[s], or otherwise control[s], the flow of" CCC guarantees. (Brazil notes that, in any event, a conclusion by CCC that a particular country is not creditworthy would not necessarily reduce the threat of circumvention, since nothing prevents CCC from simply reassigning the country's allocation to a country that is creditworthy.)

93. Second, as Brazil has previously noted, the US General Accounting Office ("GAO") concluded that the requirement that CCC not make available guarantees to countries that cannot adequately service debt does not remotely curtail CCC's extension of its guarantees. According to the GAO, "the statute does not place any limit on the amount of guarantees that can be provided each year to high-risk countries in aggregate or individually".[123] Thus, the theoretical possibility to halt support to non-creditworthy countries does not "stem[], or otherwise control[]," the flow of CCC guarantees.[124]

94. Third, CCC is not concerned enough about creditworthiness to vary its fees based on the country risk involved.[125] Nor does US law require the CCC to take account of the creditworthiness of *individual guarantee recipients* in the fee charged. In fact, CCC fees expressly do not take account of the credit rating of an individual borrower.[126] Thus, even if CCC finds a country to be creditworthy, it is not compensated for particularly poor individual credit risks.

95. Nor is the entitlement that qualified applicants have to CCC guarantees curtailed by CCC's ability to adopt product- and country-specific allocations for its export credit guarantee programmes. Although CCC adopts initial allocations at the outset of a fiscal year, it generously increases those allocations as needed. In its announcement of initial allocations for fiscal year 2004, for example, which extends $2.8 billion in allocations for CCC guarantees, USDA stated that CCC will subsequently make additional allocations throughout the year that will bring total 2004 allocations to

[126] Brazil's 22 August Comments on US Answers, paras. 109, 112.

more than $6 billion.[127] Browsing the archived list of USDA press releases announcing supplemental allocations extended throughout fiscal year 2003,[128] for example, demonstrates that this is exactly what CCC does – it increases allocations as needed. As noted above, CCC is not required to receive new Congressional budget authority before it undertakes these additional allocations. In fact, Congress requires CCC to make available *at least* $5.5 billion in guarantees – it does not put a ceiling on the amount to be granted.[129] The allocation process does not "stem[], or otherwise control[]", the flow of CCC export credit guarantees.[130] In fact, it enables CCC to increase the guarantees it can provide.

96. Nor does CCC's ability to adopt product-specific allocations for its export credit guarantee programmes mitigate the significant threat, under Article 10.1 of the Agreement on Agriculture, that the United States will surpass its agricultural export subsidy reduction commitments by virtue of the CCC export credit guarantee programmes. This threat implicates both unscheduled and scheduled agricultural commodities.

97. For unscheduled products, the ability to adopt allocations is irrelevant. Since CCC export credit guarantees are *available* for unscheduled products[131], the threat of circumvention of the US reduction commitments is tangible, and the United States is in violation of Article 10.1. As Brazil has previously noted, the Appellate Body held that for unscheduled products, it is inconsistent with Article 10.1 to provide *any* export subsidies.[132] Moreover, the record demonstrates that the threat has materialized, since CCC guarantees have been extended to unscheduled products during, for example, 1999-2003.[133]

98. For scheduled products, the process of adopting product-specific allocations for CCC export credit guarantee programmes does not mitigate the threat of circumvention – or does not "stem[], or otherwise control[]", the flow of CCC export credit guarantees – for at least three reasons.[134]

99. First, as the list of allocations included in the programme activity report for fiscal year 2003 demonstrates[135], most allocations are only made on a country-specific basis, and not on a product-specific basis. In fact, less than 8 per cent of the allocations listed on the 2003 programme activity

[127] Exhibit Bra-296 ("USDA Announces $2.8 Billion in Export Credit Guarantees," FAS Press Release, 30 September 2003).

report are product-specific.[136] The press release announcing initial allocations for 2004 contains no product-specific allocations. These allocations do not "stem[], or otherwise control[], the flow of" CCC export credit guarantees in a way that would curb the threat that they will be used to surpass the United States' export subsidy reduction commitments for scheduled products.[137]

100. Second, the allocations are made on a *monetary* basis, which provides virtually no assurance that the United States will not surpass its *quantitative* export subsidy reduction commitments. This might not happen for all scheduled products in all years, but the threat that it will happen is tangible. Rice provides a good example. Based on the monetary amounts of exporter applications received for the CCC programmes, US export data, and average world prices, CCC guarantees to support US rice exports caused the United States to surpass its quantity export subsidy reduction commitments in fiscal years 2001, 2002 and 2003.[138] (Even if monetary allocations were relevant, nothing limits the amount of funds that can be allocated. The CCC programmes operate without the constraints of the appropriations process, and Congress requires that CCC make available a *minimum* of $5.5 billion in export credit guarantees.)

101. Third, the United States' schedule demonstrates that the CCC export credit guarantees are not the only subsidies available to support exports of scheduled commodities. Combining CCC guarantees with these other export subsidies augments the threat that the United States will exceed its export subsidy reduction commitments.

102. In summary, the CCC cannot "stem[], or otherwise control[], the flow of" CCC export credit guarantees.[139] None of the factors mentioned by the United States stem the flow of those guarantees, which CCC cannot decline to grant in cases where the programme conditions are met. The CCC export credit guarantee programmes therefore threaten to lead to (and in fact have led to) circumvention of the United States' export subsidy commitments, within the meaning of Article 10.1 of the Agriculture Agreement.

103. With respect to its claims under the SCM Agreement, Brazil notes that even if the CCC had the discretion not to grant export credit guarantees in cases where the programme conditions are met, it would not affect Brazil's claim that the guarantees confer benefits *per se*. As Brazil has discussed elsewhere, since CCC export credit guarantees from the GSM 102, GSM 103 and SCGP programmes are unique financial instruments for agricultural commodity transactions that are not available on the commercial market (certainly not for terms longer than the marketing cycles of the eligible commodities), each time they are granted, they confer benefits within the meaning of Article 1.1(b) of the SCM Agreement.

**143. Brazil agrees with National Cotton Council estimates of the effects of the GSM 102 programmes (Brazil's further submission, para. 190) but it also cites a different conclusion by Prof. Sumner (paragraph 192). Brazil cites other estimates by Prof. Sumner throughout its further submission. Does Brazil adopt Prof. Sumner's conclusions and estimates as part of its submission? BRA**

104. Brazil considers both the National Cotton Council's and Professor Sumner's estimates as independent parts of the record that demonstrate the serious prejudice caused by the GSM 102 programme to the interests of Brazil. The NCC has a staff of expert economists (including the former

[136] Exhibit Bra-299 ("Summary of FY 2003 Export Credit Guarantee Programme Activity", USDA, covering GSM 102, GSM 103 and SCGP (Total GSM 102, GSM 103 and SCGP allocations for fiscal year 2003 are listed as $6.025 billion, with product-specific allocations as follows: $370 million of GSM 102 guarantees to Korea; $85 million of GSM 102 guarantees to Pakistan; and, $10 million of GSM 102 guarantees to Tunisia).

[137] Appellate Body Report, *US – FSC*, WT/DS108/AB/R, para. 149.

[138] Exhibit Bra-300 (Calculation on US Rice Exports Benefiting from GSM 102, GSM 103 and SCGP).

[139] Appellate Body Report, *US – FSC*, WT/DS108/AB/R, para. 149.

director of the FAPRI cotton model) and has testified to Congress that the effects of the GSM 102 programme increase annual US cotton exports by 500,000 bales and have a 3-cent per pound price effect.[140] Brazil has no reason to doubt the accuracy and reliability of the sworn NCC testimony to the US Congress.

105. Professor Sumner has based his analysis of the effects of the GSM 102 export credit guarantee programme on the earlier work by the National Cotton Council. Professor Sumner has modelled the impact of the GSM 102 export credit guarantee programme as a shift out of the demand curve for US upland cotton by 500,000 bales.[141] Brazil believes that the resulting lower estimates of the effects of the GSM 102 programme offered by Professor Sumner are yet another illustration of the conservative (and reasonable) nature of his model.

106. In response to the Panel's Question, Professor Sumner has rerun the model analyzing the results of a fixed 500,000 bales export effect rather than a shift out of the demand curve by that amount. His original results showed an average annual 305,000 bales export-increasing effect for MY 1999-2002.[142] But the assumption of a fixed 500,000 bale export-increasing effect from the GSM 102 programme results in an average world price effect between MY 1999-2002 of 0.928 cents per pound (or 1.80 per cent) compared to 0.57 cents per pound (or 1.12 per cent) estimated under the previous assumption.[143] For the period MY 2003-2007 the average world price effect would be 1.07 cents per pound or 1.93 per cent compared to the 0.53 cents per pound or the 0.96 per cent estimated previously.[144]

107. Brazil has submitted the analysis of Professor Sumner along with results from other economists and other evidence throughout its submissions. The Panel should consider the complete record in analysing the collective effects of the US subsidies. *Both* the NCC's as well as Professor Sumner's studies are positive evidence of the export-enhancing and price-suppressing effects of the GSM 102 export credit guarantee programme. Both the NCC's testimony as well as Professor Sumner's original as well as revised analysis establishes that GSM 102 causes serious prejudice to the interests of Brazil, within the meaning of Articles 5(c), 6.3(c) and 6.3(d) of the SCM Agreement, and within the meaning of Articles XVI:1 and 3 of GATT 1994.

I. ACTIONABLE SUBSIDIES

**145. The Panel notes that different remedies are available in respect of prohibited and actionable subsidies under Articles 4.7 and 7.8 of the *SCM Agreement*. If the Panel were to conclude that a subsidy was prohibited and were to make a recommendation under Article 4.7 of the *SCM Agreement* to withdraw the subsidy without delay, can the Panel:**

**(a) also conclude that the same subsidy had resulted in adverse effects to the interests of another Member? If so, what would be the value of such a conclusion in terms of the settlement of the matter before the Panel? BRA, US**

[140] Exhibit Bra-41 ("The Future of Federal Farm Commodity Programmes (Cotton)", Hearing before the House of Representatives Committee on Agriculture, 15 February 2001, p. 12).

[141] Brazil's 9 September Further Submission, Annex I, para. 59. For reasons internal to the FAPRI model, Professor Sumner did not include the 3 cents per pound price effect estimated by the NCC in the shift out of the demand curve, thus generating more conservative results. In addition, the implicit supply and demand elasticities used by the NCC imply larger price impacts than those in the FAPRI model used by Professor Sumner, again leading to more conservative results.

[142] *See* Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of Export Credit (fixed exports)").

[143] Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of Export Credit (fixed exports)).

[144] Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of Export Credit (fixed exports)).

Brazil's Answer:

108. Regarding the first question, the Panel can conclude that prohibited subsidies have resulted in adverse effects to the interests of another Member. Article 5(c) of the SCM Agreement provides that no Member should cause serious prejudice through the use of *any* subsidy. That includes subsidies that are prohibited under Article 3. Nothing in the text of Articles 4.7 and 7.8 of the SCM Agreement suggests that a complaining party must make a choice between prohibited and actionable subsidy remedies. Brazil has a right to remedies provided by both provisions if the Panel makes the underlying findings that a prohibited subsidy such as Step 2 and export credit guarantees also are actionable subsidies that caused serious prejudice.

109. With respect to the second question, there will be value in the Panel making a recommendation under both Articles 4.7 and 7.8 of the SCM Agreement. A subsidy becomes a *prohibited* subsidy because it is contingent on exports or on the use of domestic over imported goods. If the forbidden contingency is removed, the subsidy may still cause ongoing adverse effects. In addition, there may still be continuing adverse effects from subsidies that were previously contingent on export or local content subsidies. Without a recommendation under Article 7.8, these ongoing as well as continuing adverse effects could not be remedied. Finally, recommendations on both prohibited and actionable subsidy claims may avoid later complications in the event of an appeal of the Panel's final determination.

110. Thus, Brazil urges the panel to make first a recommendation under Article 4.7 of the SCM Agreement that the Step 2, as well as GSM 102, GSM 103 and SCGP export credit guarantee programmes be withdrawn without delay. The Panel should also make a recommendation that the United States remove the adverse effects of the Step 2 and GSM 102 export credit guarantee programmes under Article 7.8 of the SCM Agreement.

**(b) take into account the effects of the interaction of those prohibited subsidies with other, allegedly, actionable subsidies? If so, how is this relevant to the issue of causation under Article 5 of the *SCM Agreement*? BRA, US**

Brazil's Answer:

111. With respect to the first question, the text of Article 5 of the SCM Agreement provides that "[n]o Member should cause, through the use of *any subsidy referred to in paragraphs 1 and 2 of Article 1*, adverse effects". The clear intention is for panels to take into account in assessing adverse effects any and all subsidies that are specific, including those found to be prohibited under Article 3. The only subsidies excluded are those that are not specific. The ban on adverse effects also embraces adverse effects caused by the interaction between all actionable subsidy programmes.

112. Because the Panel is required to examine all actionable subsidies in making its causation determination, it is not appropriate for it to separately analyze the individual effects of each subsidy. Thus, the Panel should look at the interaction of the various types of subsidies at issue and at their *collective* effects. No attribution of the effects to individual subsidies or to prohibited and "other" actionable subsidies is necessary because the remedies of Articles 4.7 and 7.8 of the SCM Agreement are not contradictory.

113. Even if the Panel were to decide that it would be appropriate to examine individual effects of subsidies, Brazil has produced extensive evidence of the link between the serious prejudice caused

and the individual and collective effects of all of the actionable subsidies.[145] If the Panel chooses to examine the individual instead of the collective effects of some of the US subsidies, it can do so based on the evidence produced by Brazil.[146] This evidence establishes causation whether the subsidies are examined individually or collectively. With respect to the interactive effects of the various US subsidies, please see Brazil's Answer to Questions 146.

**146. Brazil acknowledges that there are some interaction effects that may increase or decrease the overall effects of the subsidies (Brazil's further submission, para. 225). How would your analysis under Articles 5(c) and 6.3 of the *SCM Agreement* and Article XVI of *GATT 1994* differ if it excluded, for example, crop insurance subsidies, PFC and/or direct payments? BRA**

Brazil's Answer:

114. The evidence in the record is more than sufficient to establish present and threat of significant price suppression, increasing world market share, and inequitable share of world export trade even if PFC/direct payments and crop insurance subsidies were not deemed to be actionable subsidies.

115. In response to the Panel's question, Brazil asked Professor Sumner to use his model described in Annex I to Brazil's 9 September Further Submission to eliminate the effects of *all subsidies except the PFC/direct payment and crop insurance subsidies*. Professor Sumner's analysis examined the effects of the remaining US subsidies with respect to a number of factors such as planted acreage, production, US price, adjusted world price etc. The complete set of results is set forth in Exhibit Bra-301.[147] Brazil describes the interactive effects of all US subsidies *except* crop insurance and PFC/direct payments on US export and world A-Index prices below.

116. Analyzing the results for the MY 1999-2002 period from Exhibit Bra-301 shows that *but for* the payments from all US subsidy programmes (except the PFC and crop insurance), US exports would have fallen by 36.81 per cent and the world A-Index prices would have increased on average by 11.00 per cent (or 5.73 cents per pound). When crop insurance and PFC/direct payments are included in the original analysis, US exports fall by 41.17 per cent and A-Index world prices would increase by 12.55 per cent (6.5 cents per pound).[148]

117. When the period for MY 2003-2007 is examined, eliminating all subsidies except for crop insurance and direct payments means that, on average, US exports would fall by 37.31 per cent and the A-Index world price would increase by 8.36 per cent (4.63 cents per pound).[149] By comparison, when all US subsidies (including PFC/direct payment and crop insurance) are eliminated, US exports, on average, would decrease by 44.02 per cent and the A-Index price would increase by 10.80 per cent.[150]

[145] Brazil's 9 September Further Submission, Sections 3.3.4.7 (individual effects) and 3.3.4.8 (collective effects). *See also* Brazil's 7 October Oral Statement, paras 31-34 (USDA's analysis of individual effects of marketing loan subsidies for cotton for marketing years 2000 and 2001).

[146] The collective and individual effects of the various US subsidies are analyzed by Professor Sumner at Tables 1.5(a) – (e) of Annex I to Brazil's 9 September Further Submission. *See also* Brazil's 9 September Further Submission, Sections 3.3.4.7 (individual effects) and 3.3.4.8 (collective effects). *See further* Brazil's 7 October Oral Statement, paras 31-34 (USDA's analysis of individual effects of marketing loan subsidies for cotton for marketing years 2000 and 2001).

[147] *See* Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of all domestic support except PFC/direct payments and crop insurance")

[148] Brazil's 9 September Further Submission, Annex I, Table I.5a.

[149] *See* Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of all domestic support except PFC/direct payments and crop insurance")

[150] Brazil's 9 September Further Submission, Annex I, Table I.5a.

118. Brazil notes that most of its evidence does not involve proof regarding PFC/direct payments or crop insurance and would, therefore, not be impacted by the assumption in the Panel's question. In addition, many of the econometric analysis cited by Brazil focus on only some of the subsidies challenged by Brazil. The results of these studies are consistent with the findings of Professor Sumner's analysis set out in Annex I to Brazil's 9 September Further Submission and Exhibit Bra-301. In sum, even ignoring the effects of the crop insurance and PFC / direct payment programmes, the US subsidies cause serious prejudice to the interests of Brazil, within the meaning of Articles 5(c), 6.3(c) and (d) and GATT Articles XVI:1 and 3.

**148. How should the significance of price suppression or depression be assessed under Article 6.3(c) of the *SCM Agreement*? In terms of a meaningful effect? Or another concept? BRA, US**

Brazil's Answer:

119. The significance of price suppression should be assessed by reference to whether it meaningfully affects producers or suppliers of the same product that receives the benefits of the challenged subsidies.[151] Price suppression that does not meaningfully affect suppliers or producers of a product cannot give rise to serious prejudice, since it would not be significant. The text of Article 6.3 does not set a numerical limit on the level of price suppression. What renders price suppression significant or insignificant is whether or not it causes adverse effects to the producers or suppliers of the Member(s) concerned, not whether an arbitrary level of numeric significance is achieved.[152]

120. Contrary to the US arguments, there is not an artificial distinction between whether price suppression is "significant" and whether such levels of suppression meaningfully affect suppliers or producers of the product receiving the benefits of the subsidies. Brazil provided considerable evidence setting forth how its producers suffered adverse effects from the levels of price suppression that can be attributed to US subsidies during MY 1999-2002.[153] A good example of the significance of the levels of price suppression demonstrated by Brazil for MY 2000-2001 is found in the testimony of Christopher Ward. He indicated that a 10-per cent increase in prices for Mato Grosso producers in MY 2000 and MY 2001 would have permitted them to cover their variable costs for MY 2001 and come close to covering variable costs in MY 2000.[154] However, because of the losses they suffered without such revenue increases, many Mato Grosso producers reduced production or were forced out of cotton production – Mato Grosso production fell by 34 per cent between MY 2000-2001.[155]

121. The record shows that the adverse effects suffered by Brazilian producers have also been suffered by producers in Africa.[156] Nicolas Minot testified for Benin at the hearing on 8 October. His econometric analysis focused on the effect of lower upland cotton prices on poverty among Benin cotton farmers. Based on his economic analysis, a ten per cent decrease in upland cotton prices drove

approximately 83,500 Benin upland cotton farmers below the poverty line.[157] The evidence that African producers have suffered adverse effects by reason of the effects of the US subsidies confirms and supports the evidence presented by Brazil that its producers are suffering adverse effects as well.

122. But even if the Panel decides to adopt some sort of numerical standard not reflected in the text of Article 6.3(c), Brazil has also set forth evidence showing that the levels of price suppression found by a number of different economists are "significant".[158] In assessing whether the various levels of price suppression found by USDA and other economists are "significant," the Panel should take into account the fact that upland cotton is a primary commodity traded in huge volumes and produced and consumed in a large number of countries. Under these circumstances, any measurable and identifiable effect on the *world* price from the subsidies provided by a single Member is important. In this case, the Panel is not faced with a difficult decision because during MY 1999-2002 – and even during MY 1997-1998 – the record shows that the absolute numerical levels of price suppression caused by some or all of the US subsidies were significant, ranging from 4 to 26.3 per cent of the world price, and 10 to 33.6 per cent of the US price.[159]

**153. Would the conditions in Article 6.3(d) of the *SCM Agreement* be satisfied in respect of time periods other than the one specified? What relevance, if any, would this have for Brazil's claims? BRA**

Brazil's Answer:

123. Brazil has demonstrated that the conditions of Article 6.3(d) of the SCM Agreement are fulfilled for MY 2001, 2002 and 2003.[160] The record indicates that the conditions of Article 6.3(d) of the SCM Agreement would also have been fulfilled for MY 1999 and 2000. In addition, the increase in the US share of the world upland cotton market follows a consistent trend. This consistent trend exists whether the Panel analyzes the trend over the period MY 1996-present (described by USDA as constituting a significant change in US farm policy[161]) or over the period MY 1986-present (since the introduction of the marketing loan programme for upland cotton[162]).

124. The US world market share in MY 2000 was 24.7 per cent, an increase over the previous three-year average (MY 1997-1999) of 23.2 per cent.[163] Similarly, the US market share in MY 1999 was 24.1 per cent, an increase over the previous three-year average (MY 1997-1998) of 23.4 per cent.[164]

125. Further, if the "time period" for assessing a "consistent trend" was changed from 1996-2003 to 1985-2003, the results would not be different. The following figure demonstrates that the increase in the US world market share also follows a consistent trend since MY 1986.[165]

---

[157] Benin's 8 October Oral Statement (Statement of Nicolas Minot, para. 24-25) (estimating that a 40 per cent reduction in price caused 334,000 people to fall below the poverty line, and indicating that smaller reductions in the cotton price cause roughly proportional changes in income, as shown in Table 3 of his paper attached to Benin's 1 October Further Third Party Submission).

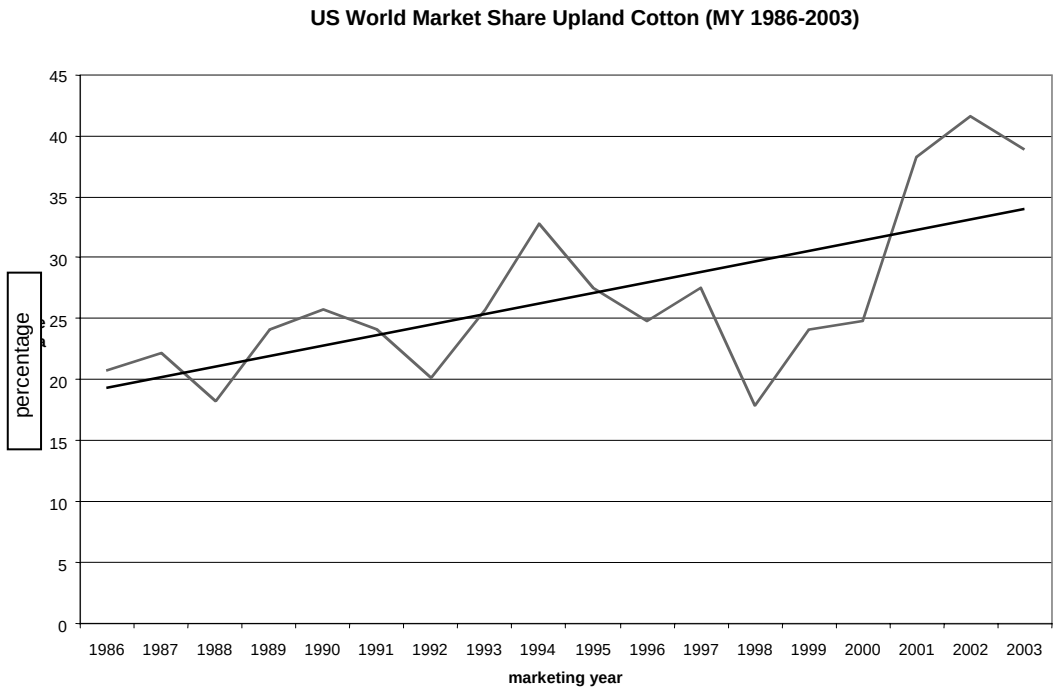
[163] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).

[164] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).

[165] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).



126. The trend line beginning in MY 1986 in the graph above shows an overall consistent increase of US export market share over an 18-year period. This steady long-term increase coincides with the introduction of the marketing loan programme in MY 1986. Another highly trade distortive subsidy, the Step 2 payments, was introduced in MY 1990. The combination of these two subsidies, along with the other trade-distortive subsidies, played an important role in the progressive increase in US world market share over the long-term period covered by the MY 1986-2003 graph above. Thus, looking at all the trends collectively provides corroborating evidence that the large increases in the US world market share from MY 1998 to the present are caused, in significant part, by the US subsidies, in violation of Articles 5(c) and 6.3(d) of the SCM Agreement.

127. Brazil notes that MY 1998 was an unusual year with a relatively low US world market share as a direct result of a 20-per cent abandonment of upland crop acreage due to weather-related issues.[166] *But for* those weather-related problems, the US world market share would have been higher in MY 1998.

128. Finally, Brazil wishes to correct a typographical error in its calculation of the US world market share for MY 1997. The correct market share (as reflected in Figure 26 of Brazil's 9 September Further Submission) is 27.6 per cent, rather than 19.8 per cent,[167] as was incorrectly noted in Exhibit Bra-206. Brazil notes that this typographical error did not affect the calculations of the increase in the US world market share.[168] Correcting for this error, Brazil resubmits the corrected figures:

[166] *See* US 30 September Further Submission, para. 19.

[167] The error results from a typographical error in the line of the "total world exports", which were 26.7 million bales in MY 1997 and not 36.7 million bales, as erroneously included in the calculation.

[168] Brazil notes that Figure 26 of Brazil's 9 September Further Submission is unaffected by this data error and shows a very similar trend in the US world market share in cotton.

Figure 25 (para. 270)[169]

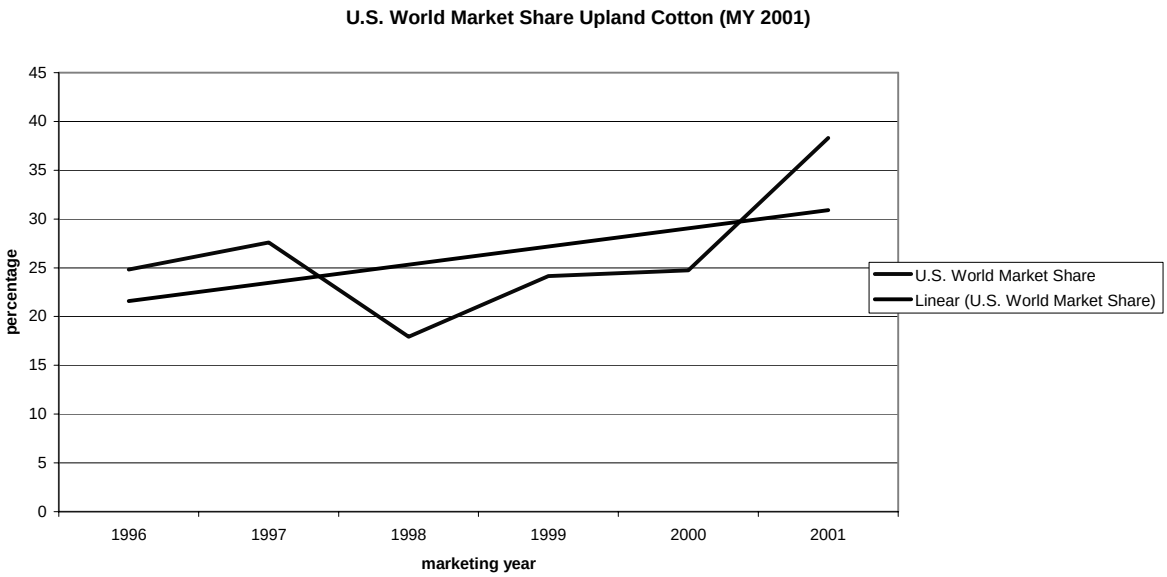


Figure 37 (para. 402)[170]

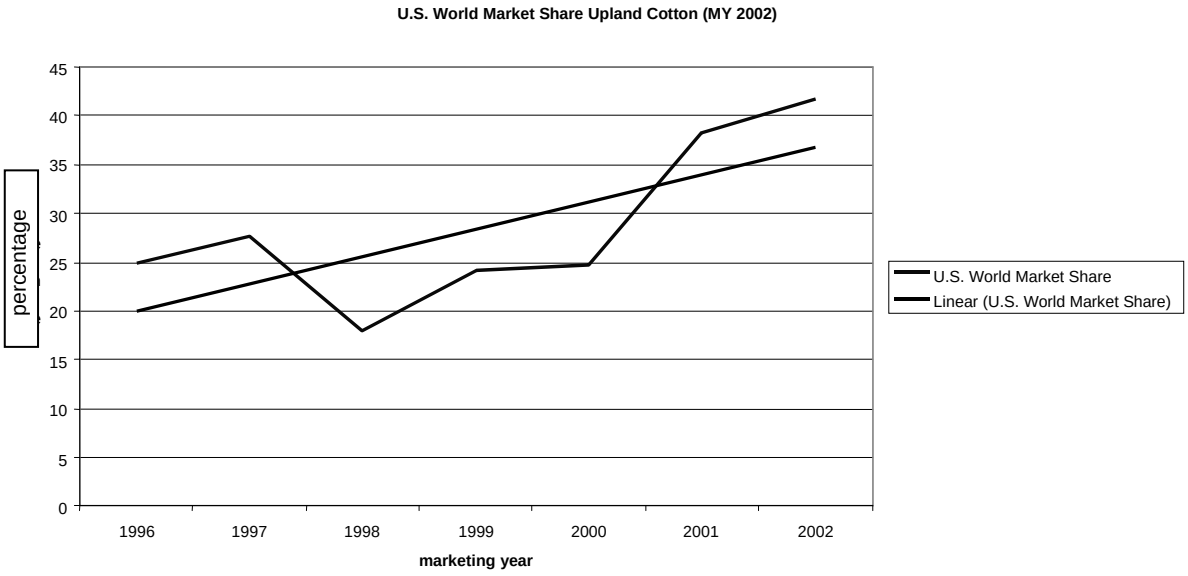
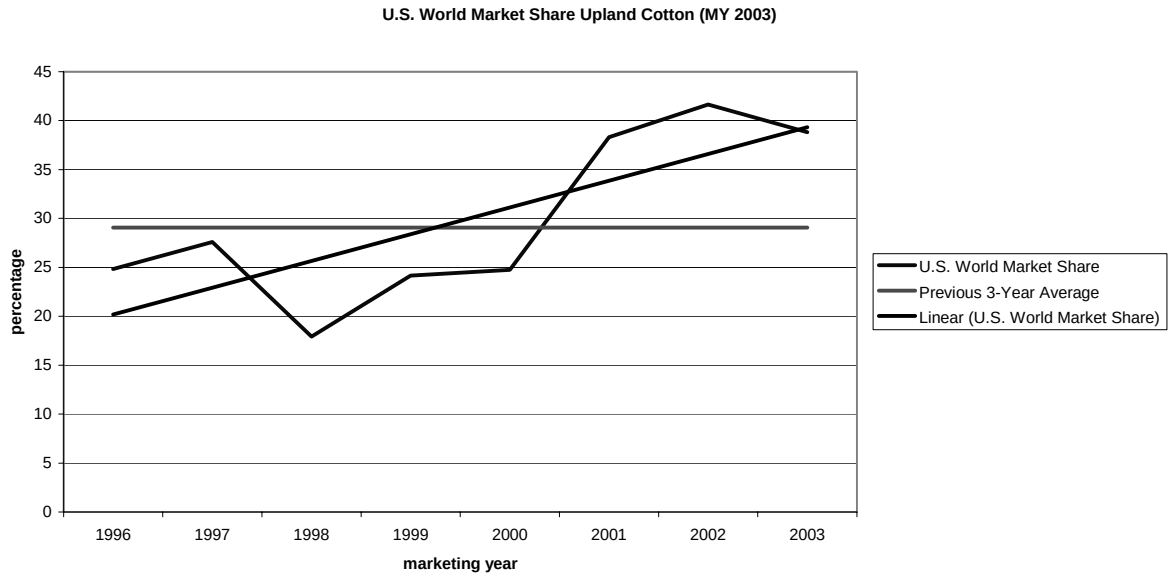


[169] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).
[170] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).

Figure 38 (para. 405)[171]



129. As the Panel can see, all three graphs show a trend line that matches the actual curve even better than the trend line presented by Brazil in its 9 September graphs. Also, all trend lines show that there is a dramatically increasing US world market share in upland cotton, in violation of Article 6.3(d) of the SCM Agreement.

**161. Would a finding of serious prejudice under Article 5(c) of the *SCM Agreement* be determinative for a finding under Article XVI:1 of the GATT 1994? Why or why not? What, if any, is the role of footnote 13 of the *SCM Agreement* in this context? BRA, US**

Brazil's Answer:

130. A finding of serious prejudice based on the effects described in SCM Article 6.3(a), (b), (c) or (d) would be determinative for a finding under GATT Article XVI:1. GATT Article XVI:1 concerns measures that are (i) subsidies, and which (ii) cause or threaten serious prejudice to the interests of any other Member. Footnote 13 of the SCM Agreement provides that "[t]he term 'serious prejudice to the interests of another Member' is used in this Agreement in the same sense as it is used in paragraph 1 of Article XVI of GATT 1994, and includes threat of serious prejudice". Footnote 13 clarifies that the instances that constitute serious prejudice within the meaning of the SCM Agreement, including Article 5(c), constitute at the same time serious prejudice within the meaning of GATT Article XVI:1. In addition, if the Panel determines that a particular measure is a "subsidy" under Articles 1 and 2 of the SCM Agreement, that measure would constitute *ipso facto* a subsidy for the purposes of GATT Article XVI:1. In sum, Articles 5(c) and 6.3 of the SCM Agreement operationalize and clarify the meaning of serious prejudice as contained in GATT Article XVI:1.[172]

**163. Are US cotton producers able to cover the fixed and variable costs without subsidies? Please provide substantiating evidence. Of what relevance is this, if any, to Brazil's actionable subsidy claims ? US, BRA**

[171] Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).

[172] This interpretation of the relationship between Articles 5(c) and 6.3 of the SCM Agreement and GATT Article XVI:1 is without prejudice to the continued relevance of GATT Article XVI:3, as discussed in Brazil's answers to Question 185.

Brazil's Answer:

131. Brazil has established in paragraphs 117-123 of its 9 September Further Submission that between MY 1997-2002, US upland cotton producers on average were not able to cover their total cost of production, *i.e.*, the sum of fixed and variable costs.[173] The gap between the total cost of production and the revenue generated from both upland cotton lint and cottonseed increased steadily from 2.66 cents per pound in MY 1997 to 39 cents per pound in MY 2001 before falling slightly to 34.38 cents per pound in MY 2002.[174] On a percentage basis, the average total costs to produce a pound of upland cotton in the United States between MY 1999-2002 were 77 per cent higher than the average market prices received by US farmers.[175]

132. Similarly, the Institute for Agriculture and Trade Policy in Minneapolis found in a study entitled "United States Dumping on World Agricultural Markets" that based on USDA cost of production data, the United States exported its upland cotton below its total cost of production in each year between MY 1990-2001. The study found that US upland cotton was exported between 9 and 57 per cent below the total cost of production.[176] This evidence on export prices is entirely consistent with Brazil's analysis of the gap between total cost of production and farm prices.[177]

133. Further, Brazil has used USDA data and the FAPRI 2003 baseline projections on prices and costs of production to analyze the likely gap between total costs of production and market revenues.[178] Based on this information, the gap between total cost of production and market returns to producers of upland cotton will be between 24.85 cents per pound in MY 2003 and 21.85 cents per pound in MY 2007.[179]

134. Thus, US producers were not able to meet their total cost of production since MY 1997, and based on USDA and FAPRI baselines, they will not be able to meet their total cost of production through MY 2007. This means that US upland cotton producers would not have met their cost of production for 11 consecutive years absent large US Government subsidies. The average gap between the total cost of production and market return in those eleven years will be 22.85 cents per pound.[180] The only possible conclusion is that many US producers and much US production could not exist without US subsidies, as confirmed by the National Cotton Council.[181]

135. The consistently large cost-revenue gap, among other factors, establishes the link between US subsidies and increased and maintained high levels of US production and exports. Given the high cost of production that significantly exceeds market revenues, absent the US subsidies, many US

[173] *See* also Brazil's Answer to Question 125 (2) (c).

[174] Exhibit Bra-205 (Costs and Returns of US Upland Cotton Producers).

[175] *See* Exhibit Bra-205 (Costs and Revenues of US Upland Cotton Producers). The number represents the gap between the cost of production of cotton lint and the price received by producers for cotton lint. It does not take into account cottonseed revenue that would slightly narrow the gap.

[176] Exhibit Bra-212 ("United States Dumping on World Agricultural Markets," Institute for Agriculture and Trade Policy, p. 21).

[177] Farm prices are somewhat lower than export prices.

[178] Brazil's 9 September Further Submission, paras. 353-359.

[179] Exhibit Bra-205 (Costs and Returns of US Upland Cotton Producers).

[180] In such a situation it is materially irrelevant whether US producers met their variable cost of production. Meeting at least the variable cost of production may be a short-term option for farmers to stay in business. However, over the long-run, farmers need to cover their total cost of production. Not covering total cost of production for eleven consecutive years would certainly force any producer in any industry out of business.

[181] Exhibit Bra-3 (Roger Thurow / Scott Kilman, "US Subsidies Create Cotton Glut That Hurts Foreign Cotton Farms," The Wall Street Journal, 26 June 2002, p. A1) quoting Kenneth Hood, the then Chairman of the National Cotton Council as saying "cotton farmers . . . can't exist without subsidies."

producers would have to cut upland cotton production, and much upland cotton acreage would no longer be planted to upland cotton. This result is intuitively clear and is confirmed by evidence of significant production cut-backs by Mato Grosso producers (34 per cent) who are sensitive to changes in prices, as described in Christopher Ward's statement of 7 October.[182] It is also confirmed by the results of many economists examining the effects of eliminating US subsidies. They found that eliminating the US subsidies that cover the US producer cost-revenue gap would result in lower US production, leading to lower US exports and higher US and world prices.[183]

136. The Panel has also asked for US cost data on variable and fixed costs. Brazil provides below the most recent USDA data covering the period MY 1997-2002.[184] These data demonstrate that the "gross value of the US production" did not permit US upland cotton producers to cover their total costs of production. In MY 2001, the gross value of the production did not even permit them to cover their variable costs of production. In MY 2002, their revenue only covered slightly more than their variable costs. Not reflected in the chart below is the fact that US subsidies made up all (or almost all) the difference between the "gross value of the US production" and the "total costs listed" between MY 1997-2002.

US cotton production costs and returns per planted acre, excluding direct Government payments, 1997-2002 1/

| Item | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 |

J. CAUSATION

**165. Please comment (and submit substantiating evidence) on the US assertion that the FAPRI model has been designed and developed for prospective analysis, and is not suitable for retrospective counterfactual analysis. What is the reliability of past FAPRI-produced analyses when compared with actual data for the period covered by them? Is there any other instrument that can be used to try to identify the effect of subsidies already granted, or of their removal? BRA, US**

Brazil's Answer:

137. Concerning the first question, there is nothing inherently different in using a calibrated simulation model (the category of models into which the FAPRI and many other models fall) to investigate (i) questions of the future effects on prices and quantities of a potential change in policy or, instead, (ii) questions of how the recent pattern of prices and quantities would have been different if a different set of policies would have been in place. Calibrated simulation models, including the FAPRI model, are routinely used for *both* kinds of questions. The applications are identical. In one case, the comparison for the results from the counter-factual policy option is to an unobserved future baseline. In the other case, the comparison for the results from the counter-factual policy option is retrospective to past actual events.

138. The FAPRI policy simulation framework is an elaborate set of supply and demand equations (along with associated stock equations and equilibrium conditions that set quantity supplied equal to quantity demanded). The framework includes, as a component, a set of "baseline" projections of agricultural prices and quantities for future periods that are based on explicit assumptions about policy, climate, technological change, macroeconomic conditions, etc. In many applications, the relevant questions investigated by the model are of the following form: if some specific policy were different in the future, how would this affect the future outcomes for farm commodity prices and quantities. For example, this is the form of question that is often posed in the context of options for changing US farm subsidies in the future. Because they have baseline projection components, the FAPRI framework and a few others are well suited for these future-oriented questions. But the use of such models to analyze the recent past is also common whenever that is a relevant question.

139. As with other calibrated simulation models, the FAPRI model itself is also used routinely for both projections *and* retrospective counterfactual analysis. One recent publication that applied retrospective counterfactual analysis concerned world peanut (groundnut) policy. That study adapted the basic FAPRI framework, much as it was adapted to apply to the current case for upland cotton, to consider international peanut policy questions. The model is calibrated to three recent years – 1999/2000, 2000/2001 and 2001/2002 – and examines a peanut trade liberalization scenario.[185]

140. A second recent retrospective counterfactual application was to the US sugar programme in a project conducted for the US General Accounting Office. In that analysis, a version of the FAPRI domestic sugar model was combined with the CARD international sugar model (much as Professor Sumner has done for upland cotton, as reported in Annex I to Brazil's 9 September Further Submission). The model was calibrated to 1999 data, and results considered the effects of policy reform relative to the 1999 crop year actual outcomes.[186]

141. In addition, Brazil notes that USDA has frequently used calibrated simulation models to perform retrospective, counterfactual analysis. For example, USDA economists calibrated the USDA "SWOPSIM" model, which was used extensively to analyze trade policy options in the 1980s and 1990s, to 1989 data and solved it for commodity prices and quantities that would have obtained in that year under alternative trade liberalization scenarios.[187]

142. The USDA "FAPSIM" model, which is quite similar to the FAPRI model, is a calibrated simulation model that is also used for retrospective counterfactual analysis and for considering policy options relative to projections. According to J. Michael Price of the USDA Economic Research Service, who was one of the developers of the model and currently maintains and operates the model, it is calibrated to historical data each year as well as to the official USDA baseline. That model is used for responding to questions about future policy options *and* to retrospective counterfactual questions. Indeed, one of the first published applications of the "FAPSIM" model was a retrospective counterfactual analysis of US grain storage policy.[188]

143. One of the most recent applications of the USDA "FAPSIM" model was to respond to requests for both alternative projections and retrospective counterfactual analysis from the *Commission on the Application of Payment Limitations for Agriculture*. These results, which have been discussed in previous submissions by Brazil, used the FAPSIM policy framework.[189]

144. According to the Commission Report (chaired by the Chief USDA Economist):

> "Westcott and Price analyzed the effects of eliminating marketing loans on production and prices of major crops over the period from 1998 through 2005. The

[189] *See* Brazil's 7 October Oral Statement, paras. 31-34.

> baseline used for the analysis was the USDA 2000 baseline, which did not anticipate the sharp decline in cotton price for 2001 crop year."[190]
>
> . . .
>
> "The Commission requested that the above study be updated to take into account the sharp decline in cotton prices for the 2001 crop (Westcott). The updated analysis indicated that elimination of marketing loan benefits for the 2001 crop would have lowered cotton acreage by 2.5 to 3.0 million acres or 15-20 per cent and reduced rice acreage by 300,000 acres or 10 per cent."[191]

145. Finally, there are literally hundreds of other academic and government studies using a variety of models calibrated on retrospective data that analyze policy questions. All computable general equilibrium models use this approach, and most academic partial equilibrium simulation models do so as well.

146. Concerning the second question, it is difficult to determine the reliability of the analysis of *potential* (*i.e.*, future) policy outcomes because – by definition – the baseline approach will not mirror exactly the actual conditions. This is why baseline projections use long-term data to even out inevitable fluctuations in commodity market developments. Similarly, the *but for* analysis of a retrospective study attempts to simulate what would have (but did not actually) occur with different policy assumptions. However, the retrospective analysis has the benefit of using actual market data and not projected benchmarks. It is, of course, possible to critique selected portions of the FAPRI baseline projections if they are treated as forecasts of the future values for prices and quantities. Against this benchmark, the FAPRI projections – like all others – will sometimes miss future movements in commodity markets.

147. One measure of the reliability of the FAPRI baseline is that the FAPRI model continues to be relied upon regularly by a variety of US government and US industry organizations to guide decisions on important policy questions. USDA even provided the FAPRI economists with their highest award based on the 2002 baseline analysis.[192] In addition, FAPRI economists over the years have performed checks to ensure that the FAPRI model is as reliable as possible. For example, observed (actual) planted acreage has generally responded in the directions the model projects when the loan rates and other driving factors are relatively constant. In addition, FAPRI constantly examines the internal consistency of the model and its economic logic when compared to actual market events and conditions and makes appropriate adjustments, as necessary.

148. Concerning the third question, there are a number of other potential simulation modelling frameworks that can be used as instruments to respond to retrospective counterfactual policy questions. The USDA FAPSIM model is one such framework. It was used, for example, in the Westcott/Price analysis of the effect of removing all marketing loan payments for MY 2000 and MY 2001.[193] However, the FAPSIM model does not have a full international cotton model as used in the

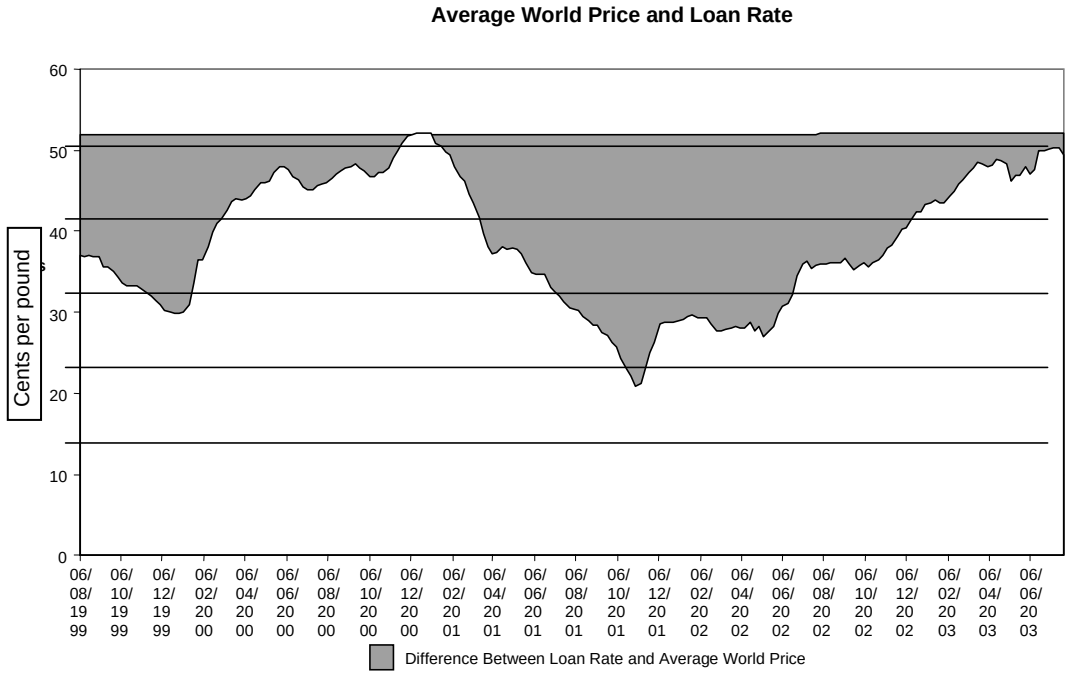
FAPRI/CARD framework, and thus would be less appropriate for dealing with the world price aspects of this case. In general, for specific questions about how quantities and prices of upland cotton would have been different but for US upland cotton subsidies, the appropriate models with which Brazil is familiar would all follow the same basic simulation framework as the FAPRI model.

**167. How does Brazil react to Exhibit US-44? BRA**

Brazil's Answer:

149. The United States claims that Exhibit US-44 demonstrates the "disconnect between the decline in cotton prices … and the incentive offered by US marketing loans."[194] But all that Exhibit US-44 does is to show monthly A-Index prices for upland cotton. These prices, as with other primary agricultural commodities, move up and down with large swings. This exhibit provides no insight into the link between US producer's decisions to keep planting upland cotton as upland cotton prices (including A-Index prices) move up and down. Further, the quantity of subsidies provided by the US marketing loan is a function of the difference between the loan rate (currently 52 cents per pound) and the adjusted world price (AWP) for upland cotton – not the A-Index price.[195] As the Panel can see from the chart provided in response to Question 181, the AWP is consistently and considerably below the A-Index.

150. A relevant graph to examine the causal link between US subsidies and US production is one with a horizontal line representing the marketing loan rate, and which compares that line against the AWP, which is the basis for the payment of marketing loans. This is illustrated in the graph below:[196]



151. This graph shows first what the Exhibit US-44 neglected to illustrate – that except for a short period in MY 2000, the AWP was *below* the loan rate throughout *all* of MY 1999-2002, and that marketing loan payments corresponding to the difference between the AWP and the loan rate were

[194] US 7 October Oral Statement, para. 23.
[195] *See* Brazil's Answer to Question 180.
[196] The data is based on the data collected for Brazil's Answer of Question 181, *see* Exhibit Bra-311.

made. All of the dark area below the 52 cents line represents marketing loan subsidies paid to US upland cotton producers. This illustrates US producers' indifference to market prices. To paraphrase the United States, the line of 52 cents per pound illustrates a "disconnect," but it is not one between the A-Index price and US subsidies. Rather, this graph illustrates the disconnect between the AWP (and more importantly, the US price received by upland cotton producers) and the acreage and production response of US producers: even when prices go to record lows, US producers' revenue is insulated from the decline. This revenue not only kept them in production, but it allowed them to *increase* production during MY 1999-2001. And more remarkably, it kept many of the producers planting 14.2 million acres of cotton when the AWP was near record lows in the period from February-June 2002. These low prices during the crucial planting decision period are clearly reflected in the figure above.[197] It was this period that USDA economists Westcott and Price examined and found that but for the marketing loan payments in MY 2001, US upland cotton production would be 2.5-3 million bales less than it actually was.

152. Thus, this graph helps explain why there is such a limited response from high-cost US upland cotton producers to changes in upland cotton prices. Of course, the graph above does not represent the full amount of revenue supplied by all US subsidies. Other programme features and other programmes provide additional subsidies that cause the effective per unit revenue guarantee to be much higher than the loan rate.

153. If the purpose of Exhibit US-44 was to demonstrate the absence of a link between US upland cotton production (and price suppression) and US marketing loan payments, then it flies in the face of the findings of USDA's own economists. Brazil has referenced the testimony of USDA's chief economist, among many other USDA economists, who have candidly acknowledged the enormous production and price effects that US marketing loan subsidies have on stimulating and maintaining large amounts of US upland cotton production.[198]

**170. Brazil quotes a report that states that a 10 per cent increase in soybean prices reduces upland cotton acreage by only 0.25 per cent (Brazil's 7 October oral statement, para. 27). Could Brazil indicate if this analysis is done on a short-run basis or a long-run basis? BRA**

Brazil's Answer:

154. The authors of the USDA study cited by Brazil – USDA economists Westcott and Meyer – use a "modified version of the estimated elasticities from Lin et al.,"[199] which Westcott/Meyer refer to as a technical improvement. The original study by Lin et al. appears to estimate short to medium-run elasticities. Lin et al. use what they describe as "new supply response elasticities . . . in short-term, acreage forecasting applications".[200] For the estimation of the elasticities themselves, Lin et al. use two models that are solved by regression analysis of the effect of expected relative price changes between crops and the resulting acreage effects in the two following years.[201]

[197] *See* Brazil's 7 October Oral Statement, paras. 32-33.

[198] Brazil's 9 September Further Submission, paras. 148-161. *See further* Brazil's 7 October Oral Statement, paras 31-34.

[199] Exhibit Bra-275 ("US Cotton Supply Response Under the 2002 Farm Act," Westcott and Meyer, USDA, 21 February 2003, p. 9). Brazil is not in a position to specify in which sense the estimated elasticities are modified.

[200] Exhibit Bra-306 ("Supply Response under the 1996 Farm Act and Implications for the US Field Crops Sector," Lin et al., USDA, July 2000, p. 2).

[201] Exhibit Bra-306 ("Supply Response under the 1996 Farm Act and Implications for the US Field Crops Sector," Lin et al., USDA, July 2000, p. 9-16).

155. Lin et al. present their results in Table 21 of their study.[202] It appears that the resulting estimates of the acreage price elasticities are short or medium-term elasticities (acreage reaction one to three years in the future), and that the adaptations by Westcott and Meyer are also short to medium-term elasticities.[203]

**172. Please estimate the price effect, in cents per pound, of the growth in the US retail market which it is said has directly contributed to strengthening world cotton prices. US**

Brazil's Comment:

156. Brazil emphasizes that its claims under Article 6.3(c) of the SCM Agreement revolve around the present and threatened suppression of prices. Thus, whether world upland cotton prices are strengthening or weakening is irrelevant to the question whether those prices would have been higher (at any price level) *but for* the US subsidies.

**176. With reference to Figure 4 of Brazil's Further Submission, how does Brazil explain the apparent decrease in prices in 2001 and the increase of the A-Index in recent months, despite the continued use of US subsidies on upland cotton? BRA**

Brazil's Answer:

157. Brazil has consistently argued that over the period of investigation (MY 1999-2002), the US subsidies caused price suppression that was significant when A-Index prices declined and when A-Index prices increased both during and near the end of the period of investigation in mid-2003.[204] As Brazil explained at the meeting on 7 October 2003, A-Index prices rise and fall for a variety of supply and demand reasons.[205] *One* of the reasons that prices fell as low as they did in MY 1999-2001 and did not rise as far as they should have in MY 2002 was due to the US subsidies. This is best illustrated in Figure 14, set out in Brazil's 9 September Further Submission and reproduced below:

[202] Exhibit Bra-306 ("Supply Response under the 1996 Farm Act and Implications for the US Field Crops Sector," Lin et al., USDA, July 2000, p. 60).

[203] Due to the adaptations, the elasticities reported by Westcott and Meyer are not identical to those reported by Lin et al.

[204] Brazil's 9 September Further Submission, paras. 83-89 (discussing definition of "price suppression"); paras. 92-93 (discussing "causation").

[205] Brazil's 7 October Oral Statement, paras. 18-28.

Figure 14[206]

158. This figure represents Professor Sumner's findings, but a similar figure could be reproduced to reflect other levels of price suppression – including the 33.6 per cent suppression of US prices found by USDA's own economists for MY 2001,[207] as well as the ICAC and other international organizations' findings of price suppression caused by US subsidies for upland cotton.[208] Professor Sumner's findings indicate that during MY 1999-2002, there were a number of global supply and demand factors (including $12.9 billion in US subsidies) that caused upland cotton prices to fall and remain at low levels compared to historical prices throughout the period of investigation. The upper line on the graph reflects the contribution of the $12.9 billion in US subsidies to keeping A-Index prices suppressed. The area below the upper line and above the darker area reflects the amount of price suppression. In other words, regardless of whether market prices rise or fall, there is always a price-suppressive effect.

159. With respect to the Panel's specific question regarding the effects of US subsidies in the latter half of MY 2002, the record shows that US and A-Index prices rose in MY 2002 for a number of supply [and] demand factors – many of which also impacted the market during the fall of prices in MY 1999-2001. The most important supply factor was the *decline* in production of 1.71 million tons in MY 2001-2002 by non-US producers such as the African Franc zone, Southern Africa, East Asia, South Asia, and the former Soviet Union countries.[209] The evidence suggests that many of these producers could not maintain existing levels of production at lower prices that existed in MY 2001 and MY 2002. For example, Christopher Ward testified that even though Brazilian Mato Grosso producers had extremely high yields and low costs, they were forced by low prices to cut their production by 34 per cent in 2001 and by 25 per cent in 2002, compared with 2000 production levels.[210] Similarly, Mr. Ibrahim Malloum, President of CottonChad, testified that lower prices in MY

[206] A-Index prices with and without subsidies are based the baseline and the change from the baseline as reflected in the results of Professor Sumner's simulation model. *See* Brazil's 9 September Further Submission, Annex I, Table I.5a.

[207] Brazil's 7 October Oral Statement, para. 32-33.

[208] *See* Brazil's 9 September Further Submission, paras. 148-162 (discussing price suppressing effects of marketing loan payments including Figure 11 at paragraph 160), para. 190 (NCC estimates of 3 cent per pound price suppressing effect from only the GSM 102 program), paras. 200-213 (various international studies), paras. 214-232 (Professor Sumner's analysis). *See also* Brazil's 7 October Oral Statement, paras 31-34 (discussion of Westcott/Price studies of price suppressing effects of marketing loans in MY 2000 and MY 2001).

[209] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 28-29).

[210] Exhibit Bra-283 (Statement of Christopher Ward – 7 October 2003, para. 6).

2001-02 meant that Chadian production fell because producers could not afford inputs such as fertilizer.[211]

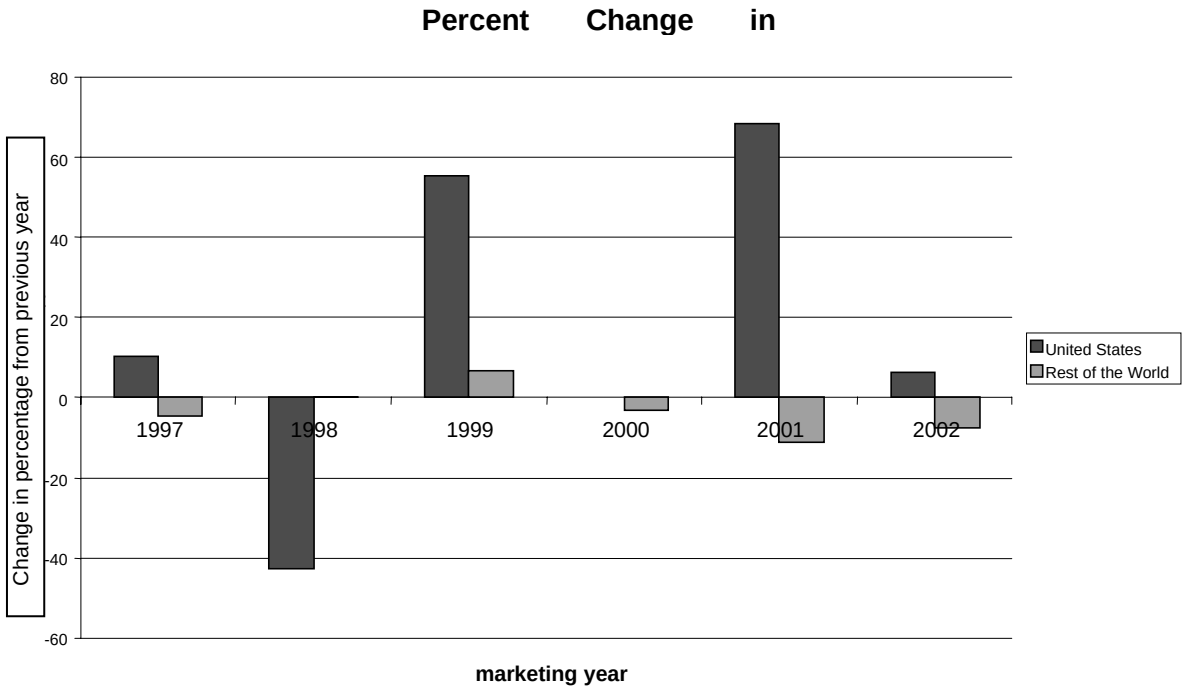
160. For US producers at the time of planting for the MY 2002 crop – between January-April 2002 – the AWP and US price received by US producers were near record lows.[212] Faced with an annual 39 cents per pound differential between total costs and such prices in MY 2001, US cotton producers still planted 14.2 million acres of upland cotton for MY 2002.[213] The resulting US production in MY 2002 was 16.73 million bales (or 3.64 million metric tons). This is an extraordinary amount of acreage and production given the huge gap between US producers' costs and expected *market* revenue. It is estimated that without US subsidies, US production in MY 2002 would have been approximately 1.92 million metric tons, or 1.72 million metric tons less than what US upland cotton farmers actually produced.[214] The effects of this additional 1.72 million metric tons of subsidy-generated production can be judged from the effects of an *actual* decline in world supply of 2.365 million metric tons[215], which contributed to an *increase* in A-Index prices of 33 per cent between MY 2001 and MY 2002.[216] If an *additional* 1.72 million metric tons of US production were taken out of world supply, prices would have been even higher. Professor Sumner has indicated that A-Index prices in MY 2002 would have increased by 17.70 per cent absent the US subsidies.[217] Thus, the effect of the US subsidies in MY 2002 – even as prices increased – was to suppress prices.

**178. The Panel notes Exhibit US-63. Could the US please provide a conceptually analogous graph concerning US export sales during the same period? US**

Brazil's Comment:

161. Brazil offers a conceptually analogous figure to Exhibit US-63 concerning US and rest-of-the-world export sales. The figure below shows the relative changes in US and non-US exports as compared to the previous year for the period MY 1997-2002, based on data covering the period MY 1996-2002.[218]

[211] Chad's 8 October Oral Statement (Statement of Ibrahim Malloum, para. 7).
[212] *See* Brazil's Answer to Question 167.
[213] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).
[214] Brazil's 9 September Further Submission, Annex I, Table I.5a applying the percentage change.
[215] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 4).
[216] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 106).
[217] Brazil's 9 September Further Submission, Annex I, Table I.5a.
[218] Exhibit Bra-307 (Change in US and World Exports in Percent). The exhibit also contains the underlying data for the figure with the sources being described in more detail in Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) claim).



162. The figure demonstrates that US exports increased in every year except for MY 1998, during which the United States claims it suffered a major crop failure. In addition, US exports increased in all years, except for MY 1998, more than exports from non-US producers, which since MY 2000 even *decreased* continuously. The figure demonstrates that the United States gains world market share, with its own exports increasing since MY 1999, at the expense of non-US exports, which have fallen since MY 2000.

163. In sum, this figure supports Brazil's claim of serious prejudice under Articles 5(c) and 6.3(d) of the SCM Agreement. It also supports Brazil's claim of serious prejudice under Articles XVI:1 and 3 of GATT 1994 because the USshare of world export trade increased, in significant part, by the US subsidies at the expense of other lower-cost producers.

**179 Could Brazil comment on the argument that decoupled payments and other subsidies to upland cotton are largely being capitalized into land values and that removing these subsidies would reduce the cost of production of upland cotton producers (US 7 October oral statement, para. 48). What would be the net effect of these adjustments? BRA**

Brazil's Answer:

164. A February 2003 study by ERS economists estimated that "decoupled" payments lead to an increase of about 8 per cent in US farmland values.[219] A more comprehensive ERS 2001 report estimating the regional effects of all subsidies (not just decoupled subsidies) on land values found that land values increased by 16 per cent in the regions where upland cotton is grown. This is shown in the following chart:[220]

[219] Exhibit Bra-308 ("Decoupled Payments: Household Income Transfers in Contemporary US Agriculture," ERS Agricultural Economic Report No. 822).

[220] Exhibit Bra-309 (Barnard C., Nehring, R., Ryan, J., Collender, R. "Higher Cropland Value from Farm Programme Payments: Who Gains?" Economic Research Service. USDA Agricultural Outlook November 2001, p. 29).

**ERS/USDA Estimated Cropland Value Attributable to Commodity Programme Payments**

| Region | Total Value of Land Harvested in 8 Programme Crops | Estimated Value Attributable to Commodity Programme Payments | Per cent of Value Attributable to Commodity Programme Payments |
|---|---|---|---|
| Prairie Gateway | 41.70 | 9.40 | 23.00 |
| Mississippi Portal | 17.30 | 2.70 | 16.00 |
| Fruitful Rim | 21.60 | 2.20 | 10.00 |
| Southern Seaboard | 18.20 | 1.80 | 10.00 |
| Eastern Uplands | 4.60 | 0.50 | 10.00 |
| **Total** | **103.40** | **16.60** | **16.05** |

165. Brazil notes that neither of these studies provides an estimate of the percentage of each dollar of "decoupled" or total subsidy payments that are capitalized into land *values*. However, an August 2003 study by ERS economists indicates that PFC payments in MY 1997 resulted in an increase of land rents by 34-41 cents of per PFC dollar.[221] Thus, contrary to the premise of the Panel's question, this evidence suggests that PFC payments are somewhat, but not "largely capitalized" into land rents.

166. There would be only a minimal impact on total costs of production for upland cotton farmers from the removal of both "decoupled" and total US subsidies. For the allegedly "de-coupled" payments referred to in the February 2003 ERS study, the impact of an 8 per cent reduction in land values translates into a decrease in total costs of US upland cotton producers by less than one per cent (0.75 per cent).[222] If the effects on increased land values from all subsidies are taken into account (using the 2001 ERS regional study), then US upland cotton producers' costs would have declined between MY 1999-2002 by only 1.49 per cent.[223] In response to the Panel's question, the net effect of these tiny adjustments throughout MY 1999-2002 on the very wide cost-revenue gap and the other costs of production analysis conducted by Brazil in its various submissions is obviously minimal.

167. Finally, the United States at paragraph 48 of its 7 October Oral Statement criticized Professor Sumner's analysis for allegedly not factoring into his estimates the effect of direct payments being capitalized into increased land rents. The US criticism is misplaced. Professor Sumner's model used very low estimates of production incentives for every dollar of PFC payments (only 15 per cent) and direct payments (only 25 per cent).[224] By taking a very conservative approach for these direct payments, Professor Sumner's analysis more than allows for the effects these payments have in increasing land values. This can be illustrated by using the 34-41 per cent results of the August 2003 land rent study referred to above. The results of this study suggest that 66-59 cents of each PFC dollar are *not* reflected in increased rents. This leaves more than enough residue from each PFC and direct payment dollar to account for the only 15-25 per cent production effects for PFC/direct payments found by Professor Sumner.[225]

**180. Please describe the precise formula as to how USDA determines the "adjusted world price" using the Liverpool A-Index, the NY futures price and any other relevant price indicators. Please submit substantiating evidence. BRA, US**

[221] Exhibit Bra-310 ("The Incidence of Government Program Payments on Agricultural Land Rents: The Challenges of Identification", Roberts, Kirwan, and Hopkins, August 2003, American Journal of Agricultural Economics, p. 767.).
[222] Exhibit Bra-7 (ERS Data: Commodity Costs and Returns).
[223] Exhibit Bra-7 (ERS Data: Commodity Costs and Returns).
[224] Brazil's 9 September Further Submission, Annex I, para. 48.
[225] Brazil's 9 September Further Submission, Annex I, para. 48.

Brazil's Answer:

168. Brazil looks forward to receiving a detailed description of the complicated calculation of the adjusted world price from the United States in reply to this question. Brazil has set forth a brief description of the calculation of the adjusted world price in paragraph 73 of its 24 June First Submission, and will elaborate to the best of its understanding.

169. The details of the complicated calculation method for the adjusted world price are laid down in 7 CFR 1427.25.[226] The weekly *Cotton Outlook* published by Cotlook Ltd. provides a somewhat simpler description of the process. Exhibit Bra-51 includes the Cotton Outlook description of the "US Pricing Mechanism", including the calculation of the adjusted world price for the week of 31 January 2002.[227]

170. The descriptions shows that the adjusted world price is calculated based on the A-Index from which a total adjustment factor is subtracted, thus:

> The Adjusted World Price (AWP) is calculated from CIF North Europe quotations, adjusted for shipping, location and quality differentials. The Shipping Differential is derived from the average over the preceding 52 weeks, or as many of that number of weeks for which quotations are available, of the difference, calculated from Thursday's values only, between the average of the Memphis and California/Arizona CIF North Europe quotations, and the Middling 1-3/32" (31-35) domestic spot market average. However, the Shipping Differential in any week may not fall below, or rise above 115 per cent, of an assessed actual transportation cost (now 12.9 cent). A further discount, the Course Count Adjustment, is applied by reference to the amount by which the World Quality difference exceeds the appropriate Loan Quality Difference. It applies to cotton of any grade stapling 1-1/32" or shorter, and to selected lower grades in longer staples.[228]

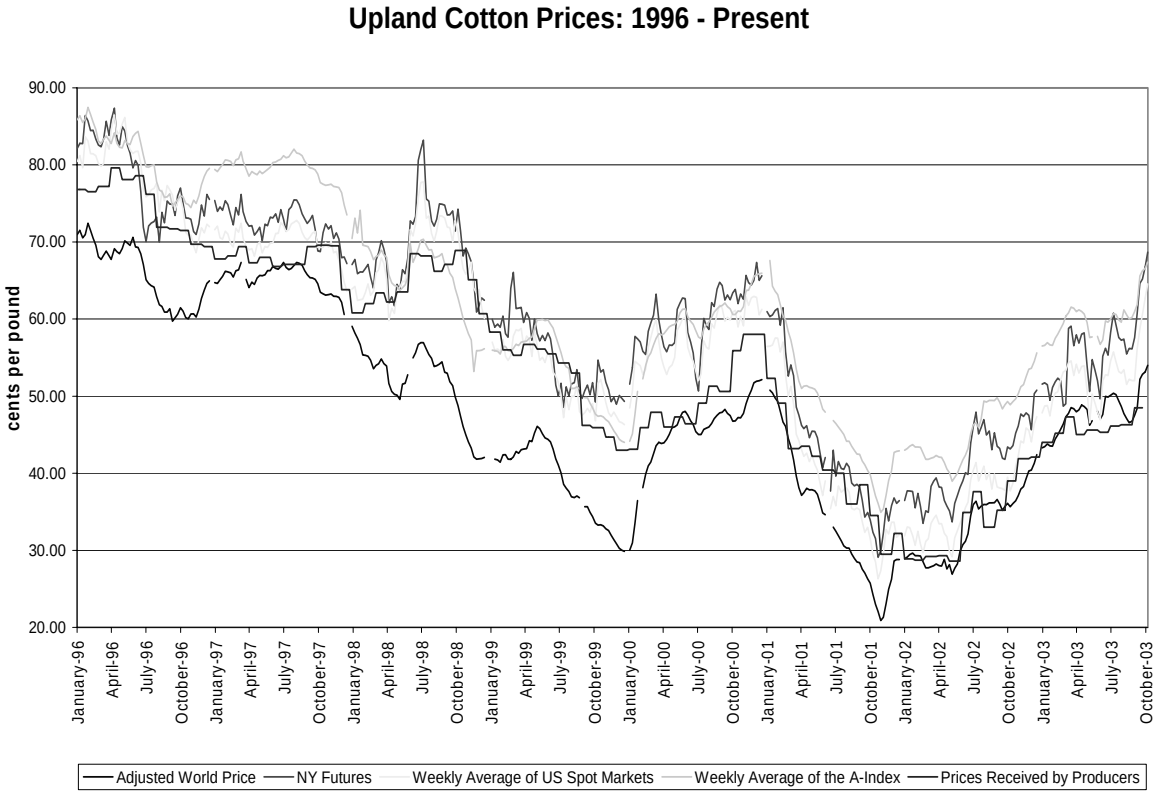
171. Brazil also notes that under certain conditions, the Secretary of Agriculture is entitled to reduce the adjusted world price below the result of this calculation – the so-called Step 1 adjustment. In such circumstances, the adjusted world price would be reduced by a maximum of the difference between the A-Index and the average of the cheapest US Middling 1-3/32" CIF North Europe quotes – thus, the amount by which the US price quotes exceed the average of the five cheapest price quotes worldwide. Such a downward adjustment would increase the amount of marketing loan payments that US upland cotton farmers receive and help close the cost-revenue gap that US producers face.

**181. Please provide a side-by-side chart of the weekly US adjusted world price, the Liverpool A-Index, the NY futures price, and spot market prices from 1996-present. What, if anything, does this reveal? BRA, US**

Brazil's Answer:

172. In Brazil Bra-311, Brazil provides a side-by-side chart of the weekly US AWP, the A-Index, the nearby New York futures price, the average US spot market price and prices received by US producers from January 1996 to the present. The figure below shows the respective price developments over this period. Exhibit Bra-311 also contains a colour copy of this chart.[229]

[226] Exhibit Bra-36 (7 CFR 1427.25).
[227] Exhibit Bra-51 (Cotton Outlook, 1 February 2002, p. 16).
[228] Exhibit Bra-51 (Cotton Outlook, 1 February 2002, p. 16) (emphasis in original).
[229] The data has been obtained from the Cotton Outlook published by Cotlook, Ltd. in Liverpool.



173. The figure demonstrates that the A-Index price is consistently 12-14 cents per pound higher than the adjusted world price ("AWP"), which constitutes the basis for the US marketing loan payments. The average difference between both prices over the 1996-present period is 13.76 cents per pound. As expected, both prices move in parallel. Further, both prices follow the price trends that originate from the New York futures market or at least move in parallel to those prices. There is also a close linkage between the average US spot market price and the New York futures and A-Index prices.

174. The figure further demonstrates that the New York futures prices and the average US spot market prices are usually more volatile than the A-Index and AWP prices. Thus, any rapid increases or decreases in the New York futures prices will not necessarily be reflected to the same extent in AWP or prices received by US producers – the prices of which marketing loan and counter-cyclical payments, respectively, are triggered. They may just be a temporary phenomenon.

175. In sum, the price movements support Brazil's argument that New York futures, US and international prices for upland cotton are closely linked, and that price movements and trends originating from the US market are closely tracked by prices on the world markets.[230]

176. That US and international – and indeed Brazilian – prices closely track each other demonstrates that production and price effects from the US subsidies on the US market are transmitted to the international upland cotton market and to third country markets such as the Brazilian market or markets where Brazil exports its upland cotton. The Panel will remember that the A-Index is composed of price quotes from 16 different upland cotton export markets around the world.[231] Thus, if USDA studies like those undertaken by Westcott and Price establish price-suppressing effects of the US subsidies for the US market, those effects will also occur on the

[230] *See* Section 3.3.4.9 of Brazil's 9 September Further Submission, para. 233-250.
[231] Brazil's 9 September Further Submission, Annex II, para. 24.

international and third country markets. The parallelism in the price movements establishes the link between price suppression in the US and international markets and other third country markets.

**182. Please explain why the US can be taken to be price *leaders*, or price *setters*, (and not just takers) when US producers receive large subsidy payment to support the difference between *world prices* and their own costs? BRA**

Brazil's Answer:

177. The Panel's question focuses first on "US producers" who receive large subsidies. One of the premises of this question is that US producers receive subsidies that account for the difference between *world* prices and their own costs. This is not entirely correct. US producers receive what the USDA refers to as "Average price received by US producers". During the MY 1999-2002 period, this US producer price was on average 9.2 cents per pound, or 17.6 per cent, *below* the world A-Index price.[232] Other than the first month of marketing year 1999, the A-Index price was always higher than the US price received by US producers between MY 1999-2002. The lower prices paid to US producers are partly explained by the transportation costs of upland cotton from the United States to foreign markets, where most US upland cotton is marketed. However, as the Panel's question suggests, the total revenue received by US producers includes marketing loan payments that are a function of the set loan rate (52 cents in MY 2002) and the adjusted world price that itself is determined in part by reference to the A-Index prices.

178. During MY 1999-2002, individual US producers of upland cotton did not "set" or "lead" A-Index prices. Most US producers were isolated from the effects of market price during MY 1999-2002. As the Panel's questions implies, on average, US producers were generally able to cover their costs based on a combination of market revenue and the large subsidies they received during MY 1999-2002.[233] The guaranteed subsidies and price support at high price levels ensured a revenue stream that left them largely indifferent to market prices throughout the entire period of investigation.

179. The Panel's question further asks how the United States could be a "price setter" in the world upland cotton market. Individual US *exporters* of US upland cotton do not "set" or "control" the price of upland cotton. In a world-wide market such as the upland cotton market, no single private trader has the market power (in an anti-trust sense) to "set" the world price. As Andrew Macdonald testified, prices of upland cotton are *discovered* hourly and daily by traders in the futures, spot, and forward delivery markets based on key supply and demand factors.[234] Nor has Brazil argued that the US *leads* prices down by initiating a price war, as may occur with industrial products.

180. What Brazil has argued is that the United States is a leading *driver* of the world upland cotton market to the extent it suppresses the price of upland cotton. The United States can do this because of its large guaranteed production and direct subsidies that inject a near permanent stream of large US production and supplies into the world market. US export subsidies drive the world market in the sense that they stimulate the demand for high-cost US upland cotton at the expense of other world producers. Further, its size (by far the largest exporter and second largest producer), its transparency, which in turn plays a major role in the price discovery in the New York futures market, and the ability of US exporters to use the Step 2 and GSM 102 tools to market US upland cotton, allow it to suppress world prices.[235] Only by taking these price-suppressing factors into account could it be said that the United States "leads" world prices.

[232] *See* Brazil's Answer to Question 181 for data on the A-Index prices and the prices received by US producers.

[233] *See* Brazil's Answer to Questions 125 (2) (c) and 163.

[234] Brazil's 9 September Further Submission, Annex II, paras 11-13, 15-25 and 38-42.

[235] Brazil's 9 September Further Submission, paras. 134-145; Annex II, paras. 38-42 and Chad's 8 October Oral Statement (Statement of Ibrahim Malloum), para. 13-14.

181. For example, the large size of the US production, which represents approximately 20 per cent of total world supply annually, is a key factor in driving and influencing world prices.[236] Shifts in US production caused by good or bad US weather influence total world supply and create an impact on world prices.[237] In much the same way as US weather plays a role in the discovery of world prices (by reducing US and, thus, world stocks), continued high levels of US production generated by US subsidies suppressed world prices throughout the period of investigation by increasing world supplies.

182. Further, the dominant (over 40 per cent) export market share of the United States coupled with the Step 2 and GSM 102 export subsidies creates a further suppressing effect on world prices.[238] These export subsidies allow US exporters to price their upland cotton below the prices of most other world producers because Step 2 gives them (not US producers) the difference between the lowest US price and the A-Index price (the average five lowest prices in the world market).[239] These subsidies, along with the domestic production and direct payment subsidies, have permitted exporters of high-cost US upland cotton to increase US world market share even as prices plunged throughout MY 1999-2001. Thus, while individual US exporters may not have "set" or "led" prices, the US subsidies allowed these exporters to continue marketing high-cost US cotton at *whatever* market price was determined by global supply and demand conditions.

K. ARTICLE XVI OF GATT 1994

**183. Why does Brazil believe that the appropriate "previous representative period" is the term of the previous Farm Bill, MY1996-2002? (Brazil's further submission, para. 282) BRA**

Brazil's Answer:

183. The Panel's question has stimulated a re-evaluation by Brazil of the appropriate "previous representative period" in relation to Article XVI:3. Brazil agrees with the US arguments made in the *EEC – Wheat Flour* GATT dispute that the appropriate "previous representative period" in Article XVI:3 should be one in which trade patterns have not been distorted by subsidies. In that dispute, the United States correctly argued:

> …that the three most recent calendar years could not be used as the representative period in the case since, given the distortion of trade patterns resulting from the heavy use of export subsidies by the EEC, it did not constitute a period during which "normal market conditions existed." There was ample GATT precedent for selecting a period when subsidization was not unduly affecting the market shares. During the 1995 Review Session it was agreed that in determining what is an equitable share of world trade, the CONTRACTING PARTIES should not lose sight of the "fact that

[236] Brazil's 9 September Further Submission, para. 135.

[237] Consider the following market reports: Exhibit Bra- 312 (Cotton Outlook, 4 October 2002, p. 3 ("Current developments on the production side – though perhaps not the consumption side – would seem to be constructive for prices. Yield potential in several parts of the world appears to be diminishing as a result of unfavourable weather – including storm systems affecting open cotton in parts of the United States.")); Exhibit Bra-312 (Cotton Outlook , 27 September 2002, p.3 ("Tropical Storm Isidore drove New York futures to higher levels earlier this week, on the grounds that its predicted path would bring heavy rainfall across a huge swathe of the south eastern United States and the Memphis Territory, and thus damage yield and quality prospects… [D]espite the adverse weather, the US will continue to need to make inroads into what remains a significant exportable surplus." )); and Exhibit Bra-312 (Cotton Outlook, 7 June 2002, p. 3 "Many eyes are directed towards developments in West Texas, where rain appears to have fallen too heavily in places where it is less needed and insufficiently in the dryland areas where soil moisture is lacking.")).

[238] *See* Brazil's 9 September Further Submission, paras. 139-142.

[239] Chad's 8 October Oral Statement (Statement of Ibrahim Malloum), para. 14; Brazil's 9 September Further Submission, Annex II, paras. 31, 49-53.

> the export subsidies in existence during the selected representative period may have influenced the share of the trade obtained by the various exporting countries." (GATT, BISD 3rd Supplement, paragraph 19, page 226). Then, in 1960, the CONTRACTING PARTIES adopted a Panel Report which dealt with notification of subsidies, in which it was agreed that an analysis of the effect of a subsidy should include statistics "… for a previous representative year, which were possible and meaningful, should be the latest period preceding the introduction of the subsidy or preceding the last major change in the subsidy." (GATT, BISD 9th Supplement, Annex II(b)(ii), page 194)…. Thus, *it was necessary to examine a period of which preceded the adoption of the EEC's subsidy system in order to assure that the trade distorting effect which the EEC system had already had on world markets was minimized as a factor in judging "equitable share."* [240]

184. There has been no period since the 1930s when US producers of upland cotton were not subsidized.[241] Since the 1980s in particular, US upland cotton producers have been guaranteed very high levels of government payments by a variety of subsidies, including the marketing loan programme that began in MY 1986. The revenue guarantee that these subsidies provide has locked in large amounts of apparently permanent high-cost US upland cotton production and exports. These distortions exist even in those years in which actual quantities of payments under the programmes are minimal due to higher prices. This is because the subsidies provided to high-cost producers in years of low prices mean they stay in business to continue to produce upland cotton also at times when subsidies fall due to increased prices. The relatively small planted acreage and production response by US producers to market prices over many years reflects the effects of this guaranteed US government revenue.

185. In view of the US arguments in *EEC – Wheat Flour* and the long-term distortions in the US production and exports caused by US subsidies, one appropriate "representative period" would be a simulated period in which no subsidies were provided. The Panel would examine the question: what would be a Member's share of world trade if it received no subsidies? This question, of course, is a function first of the amount of acreage and production, and ultimately exports attributed to the subsidies. The Panel is fortunate to have the benefit of very recent 2003 analysis by USDA economists Westcott and Price, who estimated that up to 3 million US acres of upland cotton production would have not been planted in MY 2001 if no marketing loan payments were made that year. These 3 million acres represent 19.36 per cent of US upland cotton acreage in MY 2001.[242] A reduction by this amount would imply a reduction in US production of 3.79 million bales for MY 2001.[243] Consequently, US exports would also fall by about 3.79 million bales, representing 34.74 per cent of US exports in MY 2001.[244] The implied export effects from the Westcott/Price study are very similar to those found by Professor Sumner, who estimated the export-increasing effects of the marketing loan programme in the comparable period to be 29.67 per cent and the effects of all US subsidies to increase US exports by 48.16 per cent.[245]

186. The record provides an example of what the US share of world export trade in upland cotton would be in a marketing year in which production and exports fell by amounts similar to those estimated by Professor Sumner and Westcott/Price. In MY 1998, 20 per cent of US upland cotton

acreage was abandoned and US harvested acreage fell by 2.8 million acres compared to MY 1997.[246] US production fell by 4.77 million bales and US exports fell by 3 million bales. As a result, US world market share declined from 27.6 per cent in MY 1997 to 17.9 per cent in MY 1998.[247] This considerable decrease in the US share of world export trade provides an approximation for the Panel to assess what the equitable US share would be *but for* the US subsidies in MY 2001-2003. Thus, MY 1998 is a useful representative period for the Panel to examine (in conjunction with Professor Sumner's and USDA economists Westcott/Price's analysis).

187. An alternative representative period that the Panel could use for assessing the *inequitable* nature of the US share of world export trade in upland cotton is the period MY 1994-96, during which the average level of US subsidies fell to "only" $495 million per year.[248] The development of the US world market share in MY 1994-1996 compared to MY 2001-2003 is shown in the graph below:[249]

188. During the period 1994-1996, US producers were generally able to cover their total costs of production largely from market revenue. In these conditions, US world market share averaged 28.4 per cent.[250] Yet, in conditions where market revenue plunged, costs of production and the cost-revenue gap increased. Average MY 1999-2002 US subsidies were six times greater than the period MY 1994-96, and US world market share increased to between 38 and 41.6 per cent in MY 2001-2002. These record high levels of world market share were purchased with large increases in both the quantity and level of guaranteed subsidies in MY 2001-2003 – huge marketing loan payments as well as increases in revenue support of 10 cents a pound resulting from the 2002 FSRI Act.[251] Thus, even though the period MY 1994-1996 was still heavily influenced by the revenue guarantees provided by the numerous US upland cotton subsidy programmes, this period could be a representative period for the Panel to examine for the purposes of making its "inequitable" share of world export trade findings.

**184. Why does Brazil believe that an "equitable share" is one which factors out all subsidies? To the extent that domestic support and export subsidies are permitted by the *Agreement on Agriculture*, why should they not be accepted as being normal conditions in analyzing an equitable market share? (See Brazil's further submission, paras 288-289) BRA**

Brazil's Answer:

189. Brazil believes, for the reasons articulated by the United States in the *EEC - Wheat Flour* dispute quoted in Brazil's Answer to Question 183, that the appropriate representative period for evaluating the *inequitable* share of share of world export trade is one in which no (or at most very few) trade-distorting subsidies were provided. Selecting an *earlier* representative period where the market share is not tainted with subsidies allows an assessment of whether a *later* market share *is* tainted by subsidies. As the United States argued well in *EEC – Wheat Flour*, the *inequitable* nature of a world market share can best be judged in comparison to what an *equitable*, *i.e.*, non-heavily subsidized world market share would be. This is consistent with Brazil's arguments in paragraphs 288-289 of its 9 September Further Submission that a non-subsidized world market share of 17 per cent is, by definition, an *equitable* share for the purpose of Article XVI:3. By contrast, a heavily subsidized and subsidy-increased world market share of 41.6 per cent in MY 2002 is *inequitable.*[252]

190. With respect to the second question, Brazil notes that although agricultural domestic and – to a certain extent - export subsidies are not prohibited, GATT Article XVI places clear limits to such subsidization. Section A determines, for example, that subsidies must be notified when the operate "directly or indirectly to increase exports of any product from, to reduce imports of any product into, its territory". More specifically, it established that the subsidizing Member must avoid causing serious prejudice to the interest of other Members. Therefore, even purely domestic subsidies should only be granted in a manner that does not affect the equilibrium of world trade that would be achieved in their absence.

191. The GATT Article XVI obligations – especially those of the second sentence of paragraph 3 – are primarily focused on the effects of subsidies that operate to increase exports. Paragraph 2 places particular emphasis on the fact that such subsidies "may cause undue disturbance" to the "normal commercial interests" of other Members. Large subsidies stimulating exports cannot be understood not to cause "undue disturbance" that affect the "normal commercial interest" of other Members. Otherwise, GATT Article XVI:3 would be stripped of any meaning. If, the starting point to an analysis of an equitable share grandfathers subsidies that were being previously granted, such analysis would start from an inequitable situation of equilibrium.

192. The term "equitable" is defined as something that is "characterized by equity or fairness; fair, just."[253] "Equitable" does not relate to something that is "legal" or "permitted." Something that is permitted may well be not equitable. The fact that certain subsidies are "permitted" does not grandfather their effects and transforms them into "normal conditions in analyzing an equitable market share," as put by the Panel in this question. The text of GATT Article XVI:3 requires that the test of "equitable" market share be primarily and intrinsically linked with the concept of fairness. Therefore, an "equitable" analysis of a fair equilibrium of market shares cannot be one that starts by accepting as legitimate – or as "normal conditions" – the effects of widespread and expensive subsidies that only a few Members can afford, to the expense of developing countries.

193. Brazil does not believe that subsidies representing 95 per cent of the value of a widely-traded commodity product like upland cotton can ever be considered to have been provided under "normal conditions". Nor can a dramatic increase in absolute levels of subsidies coupled with the increase in

[252] *See* Brazil's 9 September Further Submission, para. 288.
[253] The New Shorter Oxford English Dictionary, 1993 edition, p. 843.

the subsidization rate (and in absolute subsidy payments) during the period MY 1999-2002 over a previous representative period be considered to be "normal conditions". Further, when a more than doubling of world market share by a WTO Member coincides with record low world prices, record *gaps* between total costs and market revenue and record amounts of that Member's subsidies, the subsidies cannot be considered to have been provided in "normal conditions".

**185. Please respond to the following questions concerning the relationship between Article XVI:3 of the GATT 1994, the disciplines on export subsidies and domestic support in the *Agreement on Agriculture* and the disciplines on prohibited export subsidies and actionable subsidies in Articles 3, 5(c) and 6.3(d) of the *SCM Agreement*. BRA, US**

**(a) Are agricultural domestic support programmes challengeable under Article XVI:3 of the GATT 1994? How, if at all, is the title of Section B of Article XVI ("Additional provisions on *export subsidies*" (emphasis added)) relevant? How, if at all, are Articles 13 and 21.1, or any other provisions of the *Agreement on Agriculture,* relevant?**

Brazil's Answer:

194. With respect to the first question, the answer is that any domestic support programme that grants "directly or indirectly" "*any form of subsidy* which operates to increase the export of any primary product" is covered by the second sentence of Article XVI:3. All of the domestic support subsidies challenged by Brazil in this case operate to increase US exports. Professor Sumner found that each of the challenged US subsidies he examined had the effect of increasing US exports.[254]

195. Because Article XVI, including Article XVI:3, deals with serious prejudice to the interests of another Member, the direct context for interpreting its provisions is found in Article 5 of the SCM Agreement. Article 5 makes no distinction between subsidies contingent upon export and domestic support subsidies. It provides that "[n]o Member should cause, *through the use of any subsidy referred to in paragraphs 1 and 2 of Article 1,* adverse effects to the interests of other Members". Articles 1 and 2 of the SCM Agreement in turn make no distinction between export and domestic support subsidies.

196. The United States argues that the only subsidies governed by Article XVI:3 are export subsidies.[255] This argument misreads Article XVI:3. Although the first sentence of Article XVI:3 refers to "subsidies *on* the export of primary products," the second sentence provides:

> "If, *however*, a contracting party *grants directly or indirectly any form of subsidy which operates to increase the export* of any primary product from its territory . . ."

The word "however" is important, as it signifies that the second sentence contradicts the first and does not follow from it. Similarly, the use of the phrase "on the export of primary products" in the first sentence of Article XVI:3 is quite different from the phrase "which operates to increase the export of" in the second sentence of Article XVI:3. The notion of "on the export" is analogous to the export contingency set out in Article 3.1(a) of the SCM Agreement. However, the phrase "which operates to increase the export of" does not contain an export contingency requirement. Rather, it focuses on *effects* – whether the subsidies have the effect of increasing exports. Thus, read in light of the SCM Agreement, the second sentence of Article XVI:3 encompasses a notion of export-related subsidies that is far broader than subsidies that are "contingent upon export performance;" it includes as "export subsidies" those that operate to increase exports.

[254] Brazil's 9 September Further Submission, Annex I, Tables 5a-5g.
[255] US 7 October Oral Statement, para. 61.

197. Indeed, the reading of the second sentence of Article XVI:3 as meaning "subsidies contingent upon the export of products" would render Article XVI:3 a nullity. This is because under the US interpretation, any form of subsidy covered by the second sentence of Article XVI:3 would already be deemed prohibited as an export subsidy under Article 3.1(a). Given Article 13 of the Agreement on Agriculture, GATT Article XVI:3 is clearly intended to continue to provide rights and obligations for Members. Further, Article XVI is not a prohibited subsidy provision – it is an *actionable* subsidy provision. The subsidies and the provisions of Article XVI that are not superceded by the provisions of the SCM Agreement or the Agreement on Agriculture[256] must be read consistent with the *actionable* subsidy provisions of Article 5 of the SCM Agreement. Article 5 makes no distinction between subsidies that are contingent upon export and those that are not.

198. With respect to the Panel's second question, the title of Section B is not determinative. In light of the use of the phrase "any form of subsidy" in the second sentence of Article XVI:3, the title of Section B is properly read as encompassing any subsidies that have any effect on a Member's exports – whether they be "export subsidies" contingent upon export or whether they are "export subsidies" having the effect of increasing exports. Finally, Brazil notes that the US argument that places primary reliance on the title of Section B to interpret the second sentence of Article XVI: 3 is also questionable given the fact that Article XVI:5 is also covered by the title of Section B – and it deals with all types of subsidies covered by Article XVI.

199. With respect to the Panel's reference to Article 21 of the Agreement on Agriculture, Brazil does not believe that it is particularly relevant. As the Appellate Body noted in the *EC – Bananas* case, Article 21 of the Agreement on Agriculture provides that the provisions of GATT 1994 and the other multilateral trade agreements on trade in goods "*shall apply* subject to the provisions of this Agreement".[257] The drafters of the WTO Agreement did not intend agricultural trade to be a GATT-free zone – quite the opposite. They simply provided transitional provisions in Article 13 of the Agreement on Agriculture to moderate the application of some GATT provisions, strictly on a temporary basis. [258]

200. Article 13 of the Agreement on Agriculture is not that relevant in providing guidance regarding whether domestic support measures are included within the meaning of "any type of subsidy" under Article XVI:3, second sentence. Article 13(b)(ii) exempts non-green box domestic support only from actions based on paragraph 1 of GATT Article XVI, and does not directly exempt Article XVI:3. However, Article XVI:1 and 3 must be read together in order to assert a claim of serious prejudice.[259]

201. Article 13(c)(ii) of the Agreement on Agriculture provides that during the "implementation period", export subsidies that conform fully to Part V, as reflected in a Member's Schedule, are exempt from "actions" based on Article XVI. By implication, such export subsidies *are* subject to actions under Article XVI after the expiry of the peace clause and will be subject to such actions as of the time that the Panel issues its ruling. The same applies for green box domestic support under Article 13(a)(ii). Those subsidies are also exempt from actions under GATT Article XVI, including Article XVI:3. But these subsidies can be challenged under Article XVI:3 following the termination of the peace clause.

**(b) Are the requirements of Article XVI:3 of the GATT 1994 reflected in, developed by or subsumed by the requirements in Article 6.3(d) of the *SCM Agreement,* or in any other**

[256] *See US- FSC*, WT/DS108/AB/R, para 117 *quoted* in Question 185(a).
[257] Appellate Body Report, *EC – Bananas*, WT/DS27/AB/R, para. 155.
[258] Appellate Body Report, *EC – Bananas*, WT/DS27/AB/R, para. 155.
[259] Brazil's 7 October Oral Statement, para. 59 (arguing that Articles XVI:1 and 3 are directly linked).

**provisions of the covered agreements? Of what relevance, if any, is the Appellate Body Report in *US-FSC*, para. 117[260] here?**

**Brazil's Answer:**

202. Brazil agrees that Article 6.3(d) reflects one of the situations that would also fall under GATT Article XVI:3. An increase in the world market share compared to the previous three-year average through the effects of subsidies would be consistent with a finding of an inequitable share of world trade under GATT Article XVI:3. However, an increase over the previous three-year average is not a necessary prerequisite for a finding of a violation of GATT Article XVI:3. For example, a Member's share of world export trade may be inequitable even if that share has not increased over the average of the past three years. Similarly, a Member's increase in exports may be inequitable even if an increase in exports has not followed a consistent trend, as required under Article 6.3(d).

203. GATT Article XVI:3 is concerned with whether a particular level of a Members' share of world export trade is equitable, whereas Article 6.3(d) of the SCM Agreement only addresses an *increase* in the share. Article 6.3(d) creates a presumption that an increase in a Member's world market share over its previous three-year average that follows a consistent trend over a period when subsidies have been granted nullifies and impairs other Member's rights. No such presumption exists for Article XVI:3 – the nullification and impairment must be demonstrated by showing that the share

[260] WT/DS108/AB/R, para 117:

> "… the provisions of the *SCM Agreement* do not provide explicit assistance as to the relationship between the export subsidy provisions of the *SCM Agreement* and Article XVI:4 of the GATT 1994. In the absence of any such specific textual guidance, we must determine the relationship between Articles 1.1(a)(1) and 3.1(a) of the *SCM Agreement* and Article XVI:4 of the GATT 1994 on the basis of the texts of the relevant provisions as a whole. It is clear from even a cursory examination of Article XVI:4 of the GATT 1994 that it differs very substantially from the subsidy provisions of the *SCM Agreement*, and, in particular, from the export subsidy provisions of both the *SCM Agreement* and the *Agreement on Agriculture*. First of all, the *SCM Agreement* contains an express definition of the term "subsidy" which is not contained in Article XVI:4. In fact, as we have observed previously, the *SCM Agreement* contains a broad package of new export subsidy disciplines that "go well beyond merely applying and interpreting Articles VI, XVI and XXIII of the GATT 1947". Next, Article XVI:4 prohibits export subsidies only when they result in the export sale of a product at a price lower than the "comparable price charged for the like product to buyers in the domestic market." In contrast, the *SCM Agreement* establishes a much broader prohibition against *any* subsidy which is "contingent upon export performance". To say the least, the rule contained in Article 3.1(a) of the *SCM Agreement* that all subsidies which are "contingent upon export performance" are prohibited is significantly different from a rule that prohibits only those subsidies which result in a lower price for the exported product than the comparable price for that product when sold in the domestic market. Thus, whether or not a measure is an export subsidy under Article XVI:4 of the GATT 1947 provides no guidance in determining whether that measure is a prohibited export subsidy under Article 3.1(a) of the *SCM Agreement*. Also, and significantly, Article XVI:4 of the GATT 1994 does not apply to "primary products", which include agricultural products. Unquestionably, the explicit export subsidy disciplines, relating to agricultural products, contained in Articles 3, 8, 9 and 10 of the *Agreement on Agriculture* must clearly take precedence over the *exemption* of primary products from export subsidy disciplines in Article XVI:4 of the GATT 1994."

of world export trade is *inequitable*. While a particular situation may – as in this dispute – fall under both provisions, the focus and proof required for both provisions can be different.

204. Thus, Article 6.3(d) of the SCM Agreement subjects a specific subset of the situations covered by GATT Article XVI:3 to the remedy provided in Article 7.8 of the SCM Agreement. But it does not cover *all* of the situations covered by GATT Article XVI:3. This marks the crucial distinction between the provisions on export subsidies in the SCM Agreement that "take precedence" over those in GATT[261] and the provisions on actionable subsidies in both agreements that are complementary.

205. With respect to the Appellate Body's holding in paragraph 117 of *US – FSC*, the provisions on export subsidies in Articles 3 and 4 of the SCM Agreement represent the results of years of negotiations that have pushed the level of obligation in this area well beyond Article XVI:4. The conclusion that the Appellate Body drew in that instance was that "whether or not a measure is an export subsidy under Article XVI:4 of the GATT 1947 provides no guidance in determining whether that measure is a prohibited export subsidy under Article 3.1(a) of the SCM Agreement." Brazil agrees that the provisions of Article XVI:2-4 that deal with subsidies contingent upon export performance are superceded by the respective export subsidy provision contained in the Agreement on Agriculture and in the SCM Agreement.

206. However, as Brazil has argued in response to Question 185(a), the second sentence of GATT Article XVI:3 is not a provision limited to subsidies contingent upon export performance. Rather, its disciplines apply to *any* form of subsidy that operates to increase the exports of a Member. Thus, it is not superceded by the export subsidy provisions of the Agreement on Agriculture and the SCM Agreement. Rather, it provides rights and obligations concerning any form of a subsidy independent of the right and obligations set forth in Article 3 of the SCM Agreement.[262]

**(c) Of what relevance, if any, is the fact that the definition of "subsidy" in Article 1 of the *SCM Agreement* and the prohibition on subsidies contingent upon export in Article 3.1(a) were introduced in the Uruguay Round, but did not exist at the time that the GATT 1947 was negotiated?**

Brazil's Answer:

207. The short answer is "not at all." What is important for the Panel to consider is the entire package of Uruguay Round agreements, including the GATT 1994 and the contemporaneous SCM Agreement, not what was in GATT 1947.

208. Every agreement attached to the WTO Agreement is contemporaneous with every other attached agreement. The GATT 1947 no longer binds WTO Members; what is binding is the GATT 1994. The SCM Agreement and the GATT 1994 must be read together, and each provides "context" for interpreting the other, in the sense of Article 31(2) of the Vienna Convention on the Law of Treaties. As the Appellate Body noted in *Argentina – Footwear*[263], and as is now well established, the WTO Agreement is a single undertaking. All WTO obligations are, therefore, generally cumulative, and Members must comply with all of them simultaneously: "It is important to understand that the WTO Agreement is *one* treaty."[264] Thus, in as far as GATT Article XIX and the Agreement on Safeguards apply cumulatively, GATT Article XVI and the SCM Agreement apply cumulatively.

Brazil refers the Panel to its Answer to Question 185(a) for a further discussion of the issues relevant to Question 185(c).

N. CLARIFICATIONS

**189. Please indicate whether the correct figure in paragraph 37 of Brazil's 7 October oral statement is 38.1 per cent or 38.3 per cent? BRA**

Brazil's Answer:

209. Brazil confirms that the correct figure in paragraph 37 of Brazil's 7 October Oral Statement is 38.3 per cent, *i.e.*, that the US world market share in MY 2001 was 38.3 per cent.[265]

**190. Please confirm that the figure "17.5" in paragraph 43 of Brazil's 7 October oral statement, is "percentage point". BRA**

Brazil's Answer:

210. Brazil confirms that the figure "17.5" in paragraph 43 of Brazil's 7 October Oral Statement refers to an increase by 17.5 percentage points in the world market share. Brazil further notes that – as explained in note 468 to Figure 26 of its 9 September Further Submission – the world market share refers to the world market share in the international cotton market, including the upland cotton and extra-long staple cotton market, as data on upland cotton only is not available to Brazil. However, given the small size of the extra-long staple market as compared to the upland cotton market, this only minimally distorts the data.[266]

**191. Could Brazil clarify its statement in para. 12 of its 9 September further submission: "Alternatively crop insurance is not specific because the 2000 ARP Act denies benefits to commodities representing more than half of the value of US agriculture. Further US crops represent only 0.8 per cent of total US GDP." (emphasis added) BRA**

Brazil's Answer:

211. Brazil thanks the Panel for bringing to its attention the error in paragraph 12 of its 9 September Further Submission. As clarified in paragraphs 67-69 of the same submission, Brazil meant to state that "[a]lternatively, crop insurance *is specific* because the 2000 ARP Act denies benefits to commodities representing more that half of the value of US agriculture" (emphasis added).

[265] Exhibit Bra-206 (Data on Article 6.3(d) claim).
[266] *Compare* Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 2-7).

# ANNEX I-6

## ANSWERS OF THE UNITED STATES TO QUESTIONS FROM THE PANEL TO THE PARTIES FOLLOWING THE SECOND SESSION OF THE FIRST SUBSTANTIVE PANEL MEETING

27 October 2003

### A. REQUEST FOR PRELIMINARY RULINGS

**122. Does Brazil allege that cottonseed payments, interest subsidies and storage payments are included in the subsidies that cause serious prejudice? Do they appear in the economic calculations? BRA**

**123. Does Brazil's request for the establishment of the Panel name the statute authorizing cottonseed payments for the 1999 crop? BRA**

### B. EXEMPTION FROM ACTIONS

**124. According to its revised timetable, the Panel will issue its report to the parties after the end of the 2003 calendar year. Does this have any impact on "exempt[ion] from actions" under Article 13(b)(ii) and 13(c)(ii) of the Agreement on Agriculture? BRA, US**

1. The scheduled issuance of the Panel's report after the end of the 2003 calendar year has no impact on the applicability of Article 13(a)(ii), (b)(ii) and (c)(ii) of the Agreement on Agriculture to the US measures in this dispute. There is no question, and Brazil has not contested, that Article 13 was in effect at the time of the Panel's establishment, and the Panel's terms of reference set on that date are to examine the matter raised in Brazil's panel request in light of the covered agreements, which include the Agreement on Agriculture.

2. As a separate matter not presented by this dispute, the United States notes that the commitments of the United States with respect to cotton are specified by *marketing* year, not calendar year. Therefore, the end of the 2003 calendar year would in any case not be relevant to the question of when the provisions of Article 13 cease to have effect with respect to US support measures for upland cotton.[1]

### C. IDENTIFICATION OF THE SUBSIDIZED PRODUCT

**125.**

**(1) In view of requirements in the FAIR Act of 1996 and the FSRI Act of 2002 that contract acreage remain in agricultural or conservation uses and which impose penalties if the producer grows fruits or vegetables, how likely is it that the producer with upland cotton base acreage will not use his or her land to produce programme crops or covered commodities? US**

[1] *See* Agreement on Agriculture Article 1(i) ("'[Y]ear' in paragraph (f) above and in relation to the specific commitments of a Member refers to the calendar, financial or marketing year specified in the Schedule relating to that Member.")

3. With respect to contract acreage on a farm, the 2002 Act generally allows any commodity or crop to be planted on base acres on a farm for which direct payments are made, with limitations for certain commodities (fruits, vegetables (other than lentils, mung beans, and dry peas), and wild rice). With some exceptions, planting of those limited commodities on base acres is prohibited and could lead to reduced or eliminated direct payments.[2] Otherwise, a producer (or landowner) is permitted to make any other use of the land so long as the land on the farm in a quantity equal to base acreage is used for an agricultural or conserving use.[3] Thus, the direct payment recipient has the flexibility to plant and harvest any other commodity or crop on the land representing their upland cotton base acreage; indeed, direct payment recipients may plant nothing at all and still receive payment. (We note that the foregoing description of the "planting flexibility" under the 2002 Act is relevant only to base acres on a farm for which direct payments are made; other acres on the farm need not comply with any of the contract requirements set out in Sections 1105 and 1106 of the 2002 Act.)

4. The data demonstrate that planting and harvesting decisions by US producers result in US upland cotton area varying significantly. In marketing year 2003, for example, US farmers planted 13,748,000 acres, a decline of 11.3 per cent from the recent high reached in marketing year 2001.[4] As indicated in the US closing statement at the second session of the first panel meeting, US harvested acreage largely increases and decreases in line with the rest of the world.[5] In marketing year 2001, US area harvested increased by almost the exact same percentage as did the rest of the world. In marketing year 2002, the per cent decline in harvested acreage in the United States was *greater* than that observed in the rest of the world. Thus, regardless of whether US farmers who plant upland cotton may also be holders of upland cotton base acres, and contrary to Brazil's assertions, US farmers respond to market signals by planting or harvesting upland cotton much as producers in the rest of the world do.

**(2) Brazil has submitted that "The record suggests that historic producers are current producers." It points to factors including the specialization of upland cotton producers, the need to recoup expensive investments in cotton-specific equipment, and the geographic focus and climatic requirements of upland cotton production in the "cotton belt". (Brazil's rebuttal submission, footnote 98, on page 24)**

**(a) Regarding the specialization of upland cotton producers and the geographic focus of upland cotton production, how does Brazil take account of the fact that cotton is produced in 17 of the 50 states of the United States and that average cotton area is approximately 38% of a cotton farm's acres? (This information is taken from the US's response to question 67bis, footnote 35). BRA**

**(b) Regarding the geographic focus of upland cotton production, how many other crops can upland cotton producers viably grow in the cotton belt, other than fruits and vegetables? US**

5. Based on planted acreage data as reported by National Agricultural Statistics Service[6], US upland cotton is produced in several diverse regions across the Cottonbelt, generally known as the Southeast, Delta, Southwest, and West regions. Across the regions (as well as within a given region), producers are faced with differing physical growing environments as well as economic factors that help determine the viability of upland cotton or some other alternative crop in any given year. Over

[3] 2002 Act, § 1105(a)(1)(D) (Exhibit US-1).

[4] US Department of Agriculture, National Agricultural Statistics Service, *Acreage*. Cr Pr 2-5 (6-03). June 30, 2003. Available at: http://usda.mannlib.cornell.edu/reports/nassr/field/pcp-bba/acrg0603.pdf

[5] *See* US Closing Statement at the Second Session of the First Panel Meeting, paras. 5-6; Exhibit US-63.

[6] See Exhibit Q125(2)(b).

the last several years, producers have reduced plantings of upland cotton and increased plantings to alternatives. A list of the full range of alternative crops that are viable in these areas would be extensive. Below we present a regional breakdown of some principal alternative crops to upland cotton as well as historical plantings since 1996 of these crops compared with upland cotton.

6. Upland cotton producers in the Southeast region (Alabama, Florida, Georgia, North Carolina, South Carolina, and Virginia) have corn and soybeans as principal alternative crops. Peanuts are also an alternative, though mainly in Georgia. Between 1996 and 2003, area planted to upland cotton, corn, and soybeans in the Southeast averaged about 8.6 million acres, ranging from 8.2 to 9.1 million acres. During this same period, upland cotton area ranged from 3.0 to 3.6 million acres. Since 2001, upland cotton has been reduced in favour of corn and soybeans in this region.

7. Upland producers in the Delta region (Arkansas, Louisiana, Mississippi, Missouri, and Tennessee) also have corn and soybeans as an alternative and, to a lesser extent, rice in some areas. Between 1996 and 2003, area planted to these 4 crops averaged 22.9 million acres, ranging from 22.2 to 23.8 million. At the same time, upland cotton area ranged from 3.2 to 4.6 million acres. Like the Southeast region, the Delta area planted to upland has declined since 2001 in favour of corn and soybeans.

8. The Southwest region (Texas, Oklahoma, and Kansas) has the most diverse growing environment of the 4 regions. In the northern part of the region – where most of upland cotton is grown – principal alternatives to upland cotton may include wheat and sorghum. In the southern part, however, corn, soybeans, and sorghum are generally an alternative to upland cotton. The Southwest region planted an average of 26.3 million acres to these 5 crops between 1996 and 2003.[7] Area ranged from 24.5 to 27.9 million acres during this period. Meanwhile, upland cotton area ranged from 5.7 to 6.7 million acres. Since 2000, upland area in the Southwest has fallen in favour of sorghum, wheat, and corn.

9. In the West region (California, Arizona, and New Mexico), upland producers have a variety of alternatives, including corn, extra-long staple (ELS) cotton, alfalfa, and wheat. Between 1996 and 2003, area planted to these 5 crops averaged 4.3 million acres in the region, ranging from 4.0 to 4.6 million. At the same time, upland cotton area has ranged from 0.7 to 1.4 million acres. The last several years, however, have seen upland area decline in favour of one or more of the alternative crops.

**(c) Regarding the high cost of upland cotton production, can Brazil show that farms who planted upland cotton could only have covered their costs by receiving upland cotton, rice or peanut payments in every year from 1999 through 2002? BRA**

**(d) Regarding the need to recoup investments in cotton-specific equipment, is it important to planting decisions that upland cotton producers cannot run any other crop through their cotton-pickers? How does this affect the likelihood that they will grow other crops? US**

10. **The National Agricultural Statistics Service (NASS) reported that in 2002, farmers paid an average of $225,000 for a cotton picker**.[8] Farmers may respond to machinery costs through the contracting-out of harvesting operations and rental or leasing of cotton-picking machinery.

[7]To be conservative, we have excluded Kansas wheat and sorghum acreage from the totals presented due to the state's large production of these crops and relatively small production of cotton.

[8] US Department of Agriculture, National Agricultural Statistics Service, *Agricultural Prices 2002 Summary*. Pr 1-3 (03)a July 2003. Available at: http://usda.mannlib.cornell.edu/reports/nassr/price/zap-bb/agpran03.pdf

11. In the short run, investment costs may slow acreage adjustments to market prices. This does not mean, however, that cotton producers do not respond to changes in market prices. Research by Lin et al. suggest that cotton producers may, in fact, be more responsive to own price changes (that is, the response of cotton acreage to changes in cotton prices as opposed to changes in prices of competing crops) **than other competing crops** are.[9] In the long run, fixed assets like cotton pickers are less of a constraint to entry, and thus one would expect the acreage response to changes in price to be larger.

**Acreage own-price elasticity for major field crops**

| Crop | National acreage price elasticity |
|---|---|
| Wheat | 0.34 |
| Corn | 0.293 |
| Sorghum | 0.55 |
| Barley | 0.282 |
| Oats | 0.442 |
| Soybeans | 0.269 |
| Cotton | 0.466 |

Source: Lin *et al*., Appendix table 21 (Exhibit US-64).

**(3) In calculating the amount of PFC, MLA, direct and counter-cyclical payments that went on upland cotton, Brazil made an adjustment for the ratio of current acreage to base acreage (see its answer to question 67, footnotes 2, 3, 4 and 5). Is this an appropriate adjustment for the particular factors referred to above? Why or why not? BRA, US**

12. Brazil's adjustment is not appropriate. It does not explicitly take into account any of the factors referred to above. Instead, Brazil's belated adjustment is simply based on the assumption that all of the planted cotton acreage was by producers who had cotton base acreage exactly equal to their planted acreage. This assumption is inaccurate and causes Brazil's figures to be in error. For some producers, cotton planted acres exceed their historical base, and some cotton acres are planted by producers who have no cotton base. As noted in the US further submission, important changes such as lowered costs from pest eradication and adoption of biotechnology have lowered costs and brought new areas and farmers into cotton production. Brazil's adjustment takes no account of these changes.

13. More fundamentally, the relevant point is that any producers who have upland cotton base will receive direct and counter-cyclical payments regardless of whether they plant upland cotton. Thus, the decision to plant upland cotton will be based on expected economic returns of cotton and competing crops – not the level of direct and counter-cyclical payments that are decoupled from the decision to produce upland cotton. And the fact that these are decoupled payments means that the amount of the payment could not in any event be allocated only to cotton production.

**(4) Dr. Glauber has alleged that there are statistical problems in comparing planted acres to programme acres because of abandonment of crops and also because planted acres are only survey estimates, not reported figures (See Exhibit US-24, the first full paragraph in P2). Would it be more appropriate to divide harvested acreage by base acreage? What margin of error is there between the survey estimates and reported figures? BRA, US**

14. Exhibit US-24 outlines the statistical problems associated with dividing complying base acres by planted acres. The discussion addressed complying base acres under the Acreage Reduction Programme of 1990 Farm Bill and did not address programme payment acres as defined under the

[9] **Lin, W., *et al.*. *Supply Response Under the 1996 Farm Act and Implications for the US Field Crops Sector.* US Department of Agriculture, Economic Research Service, Technical Bulletin No. 1888**, Appendix table 21 (Exhibit US-64).

1996 Farm Bill. Dividing harvested acreage by base acreage could potentially overstate the difference if there is significant acreage abandonment after producers reported their payment acres to the Farm Service Agency. Also, there remains a problem with the comparison since harvested acres are survey-based while base acres are reported numbers.

15. In the June *Acreage* report, the National Agricultural Statistics Service reports reliability estimates for selected crops. The **reliability of acreage estimates is computed by expressing the deviations between the planted acreage estimates and the final estimates as a per cent of the final estimates and averaging the squared percentage deviations for the 1983-2002 twenty-year period; the square root of this average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current estimates relative to the final estimates assuming that factors affecting this year's estimate are not different from those influencing the past 20 years. For example, the "Root Mean Square Error" for the upland cotton planted estimate is 2.4 per cent. This means that chances are 2 out of 3 that the current cotton acreage will not be above or below the final estimate by more than 2.4 per cent. NASS reports that the 90 per cent confidence interval for the upland cotton estimate is 4.1 per cent. This means that chances are 9 out of 10 (90 per cent confidence level) that the difference will not exceed 4.1 per cent**.[10]

**(5) Do the acreage reports under section 1105(c) of the FSRI Act of 2002 indicate or assist in determining the number or proportion of acres of upland cotton planted on upland cotton base acres? Was there an acreage reporting requirement for upland cotton during MY1996 through 2002? BRA, US**

16. The acreage reports filed under Section 1105(c) of the 2002 Act by farms receiving direct and counter-cyclical payments indicate what crops are planted on a farm. A farm is an administrative construct that consists of tracts of land that are operated as one unit. The farm may be operated by more than one producer, and a producer may produce crops on more than one farm. The acreage report does not indicate the quantity of base acres on the farm. Because the acreage reports are filed after the planting season but before the harvest, the reports do not contain information on the quantity of production on each farm.

17. Based on a very preliminary review of a sampling of marketing year 2002 acreage reports, the United States estimates that roughly 53 per cent of farms that were eligible for direct and counter-cyclical payments for upland cotton base acreage also planted at least one acre of upland cotton in 2002. That is, approximately 47 per cent of farms receiving direct and counter-cyclical payments in 2002 for upland cotton base acreage planted no upland cotton at all.

18. Over the period 1996 through 2002, there was no statutory requirement for acreage reports by recipients of decoupled payments or marketing loan payments. By regulation, producers who signed up for disaster assistance or who received marketing loan benefits (including loan deficiency payments) were asked to file planting acreage reports. Reports for producers receiving disaster assistance were to cover all acreage on the farm while reports for producers receiving marketing loan benefits were to cover only acreage for the crop receiving benefits. As a result, acreage reports over the period of the 1996 Act are incomplete.

**(6) Please prepare a chart showing upland cotton base acreage, planted acreage and harvested acreage for MY1996 through 2002. Does the planted acreage fluctuate within a broad band? If not, does this indicate any stability in decisions to plant the same acres to upland cotton? BRA, US**

[10] US Department of Agriculture. National Agricultural Statistics Service. *Acreage.* CrPr 2-5 (6-03). 30 June 2003. Pp 38-39.

19. The following chart shows upland cotton base acreage, planted acreage and harvested acreage for marketing years 1996 through 2002:

**US upland cotton area (thousand acres)**

| Crop year | Base acreage 1/ | Planted acreage 2/ | Harvested acreage 2/ |
|---|---|---|---|
| 1996 | 16128 | 14395 | 12632 |
| 1997 | 16213 | 13648 | 13157 |
| 1998 | 16412 | 13064 | 10449 |
| 1999 | 16377 | 14584 | 13138 |
| 2000 | 16268 | 15347 | 12884 |
| 2001 | 16239 | 15499 | 13560 |
| 2002 | 16217 (est.) | 13714 | 12184 |

1/ US Department of Agriculture, Farm Service Agency
2/ US Department of Agriculture, National Agricultural Statistics Service, selected Acreage reports

20. Over the period 1996-2002, US upland cotton planted acres ranged considerably, from 13,064,000 acres to 15,499,000 acres. Year-over-year, planted and harvested acreage can rise or fall significantly. For example, from marketing year 2001 to marketing year 2002, planted acreage fell by 1.785 million acres or 11.5 per cent; harvested acreage fell by 1.376 million acres or 10.1 per cent. As was pointed out in the US closing statement at the second session of the first substantive meeting of the Panel and in Exhibit US-63, year-over-year changes in US harvested cotton acreage have been similar to year-over-year changes for harvested cotton acreage outside of the United States. These data do not provide any information on whether the same or different acres are planted to upland cotton.

21. As noted above in the US answer to Question 125(5), based on a preliminary review of a sampling of marketing year 2002 acreage reports, it would appear that nearly half of farms receiving direct and counter-cyclical payments in 2002 for upland cotton base acreage planted no upland cotton at all. That so many farms that produced upland cotton during the historical base period of 1993-1995 or 1998-2001 no longer plant even a single acre of upland cotton suggests that there has been a large exit of past cotton producers and a large entry of new producers or a large expansion by other historical cotton producers.

**(7) Brazil states that one third of all US farms with eligible acreage decided to update their base acreage under the direct payments and counter-cyclical payments programmes using their MY1998-2001 acreage. What is the proportion of the current base acreage for upland cotton resulting from such updating? Is the observed updating of base acreage consistent with Brazil's argument that it is only profitable to grow upland cotton on base acreage (and peanut and rice base acreage)? BRA**

**(8) How could one take account of upland cotton producers who receive PFC, MLA, direct and counter-cyclical payments for other covered commodity base acreage? BRA, US**

22. Under Brazil's approach, one would need to take account of upland cotton producers receiving decoupled payments only for base acreage for other covered commodities. This follows from Brazil's explanation that "only the portion of upland cotton [decoupled] payments that actually benefits acres planted to upland cotton can be considered support to upland cotton".[11] Thus, under Brazil's approach, one would need to deduct any production (or acreage) attributable to such producers from the acreage figures Brazil has used to adjust the amount of decoupled payments on upland cotton base acreage.

[11] Brazil's Answer to Question 67 from the Panel, fn. 2-5.

**(9) Assuming that Brazil's payment figures were to amount to a prima facie case, please answer the following questions: US**

**(a) How would the United States calculate or estimate the proportion of upland cotton producers who receive subsidy payments for upland cotton base acreage?**

**(b) Should any adjustment estimates be made for any factors besides those listed by Brazil?**

**(c) What adjustment estimate would it be appropriate to make?**

**(d) How could one take account of upland cotton producers who receive decoupled payments for other programme crop base acreage?**

**(e) Could the US specifically indicate what, in its view, are the flaws in the approach summarized in paras. 6-7 of Brazil's closing oral statement on 9 October (i.e. the use of the ration of 0.87 to adjust the amount of total upland cotton direct and CCPs for the MY to obtain the amount of subsidies received by upland cotton producers)? Can the US suggest an alternative approach that would yield reliable results in its view?**

23. Putting Peace Clause and green box issues to one side, the United States believes that the issue of what payments may be attributed to upland cotton production is fundamentally part of Brazil's burden to present evidence substantiating the amount of the subsidy that it is challenging. However, the United States would note that this issue is not a matter of "the proportion of upland cotton producers who receive subsidy payments for upland cotton base acreage." Rather, the issue is, first, what is the quantity of decoupled payments received by upland cotton producers; second, how are those payments allocated across the total value of each farm's agricultural production; and third, how much and in what amount are US cotton exports subsidized by these payments.

24. Brazil has conceded that decoupled payments made with respect to upland cotton base acreage are not "tied to the production or sale" of upland cotton, by adjusting such payments by 0.87.[12] That is, Brazil recognizes that, even on its theory, at least 0.13 of these payments "can[not] be considered support to upland cotton" because at least that fraction of upland cotton base acres were not planted to upland cotton in marketing year 2002. Because these payments are not "tied to the production or sale" of upland cotton, as suggested by Annex IV of the Subsidies Agreement, they must be allocated across the total value of production of each recipient. Brazil has not denied the applicability of the allocation methodology set out in Annex IV, but neither has Brazil provided any evidence relating to the total value of production of decoupled payment recipients.[13]

25. Brazil claims that its "suggested methodology is based on the conclusion that all upland cotton producers received these payments".[14] In fact, Brazil's methodology is based on the further assumptions that (1) every acre of upland cotton in marketing year 2002 was planted by a holder of upland cotton base acreage and (2) no such base acreage holder planted more upland cotton than his or her base acres.[15] Brazil has provided no evidence to support these assumptions, which is no

[12] In addition to issues relating to the "adjustment," the United States disagrees with the total amount of decoupled payments paid with respect to upland cotton base acreage that Brazil calculates and uses as the base for its adjusted payment amounts. *See* US Answer to Additional Question 67*bis* from the Panel, para. 28, fn. 37, 38.

[13] As noted in the Panel's Question 125(2)(a), average cotton area is approximately 38 per cent of a cotton farm's acres. Thus, a substantial portion of the average cotton farm's agricultural production will be derived from production of other crops.

[14] Brazil's Closing Statement at the Second Session of the First Panel Meeting, para. 8.

[15] Using figures for marketing year 2002 planted acreage and base acreage, Brazil claims, "Out of the 16.2 million upland cotton base acres, 2.1 million were not planted to upland cotton in MY2002." Brazil's Closing Statement at the Second Session of the First Panel Meeting, para. 6. However, given the planting and

surprise since the evidence is to the contrary. For example, the fluctuations in upland cotton planted and harvested area in recent years and the fact that one-third of all US farms with eligible acreage decided to update their base acreage using their MY1998-2001 acreage, imply substantial new entrants or new acreage that were not included in the base period figures under the 1996 Act. In fact, as noted above in the US answer to Question 125(5), based on a preliminary review of marketing year 2002 acreage reports, the United States estimates that nearly half of all farms receiving direct and counter-cyclical payments in 2002 for upland cotton base acreage planted no upland cotton at all.

26. We also note that there are substantial requirements with which a payment recipient must comply (see US answer to Question 162), such as highly erodable cropland conservation requirements and wetland conservation requirements.

D. "LIKE PRODUCT"

**126. Does the US agree that the product at issue is upland cotton lint and that Brazilian upland cotton lint is "like" US upland cotton lint within the meaning of Article 6.3(c) of the SCM Agreement in that it is a separate like product that is identical or has characteristics similar to the upland cotton lint from the United States? (e.g. Brazil's further submission, para. 81) US**

27. For purposes of this dispute, the United States is not arguing that all US cotton is "unlike" Brazilian cotton. There are some grades of cotton that both produce. Such grades would have similar characteristics although, as noted by Mr. Ward at the second session of the first panel meeting, Brazilian lint has been sold in the past at a substantial discount to the New York futures price. That discount has been declining over time as Brazil, a relatively new supplier internationally, works to establish a reputation for quality and reliability.

**E. "SUBSIDIES"**

**127. The Panel notes that the US contests that export credit guarantees constitute "subsidies". The Panel recalls that the US agrees that Step 2 payments are "subsidies" and wishes to have confirmation that it is correct in understanding that the US does not disagree that the following are "subsidies" for the purposes of Article 1 of the SCM Agreement: marketing loan/loan deficiency payments, PFC, direct payments, market loss assistance and CCP payments, crop insurance payments, cottonseed payments, storage payments and interest subsidy (without prejudice to the Panel's rulings on the US requests for preliminary rulings on the latter two payments). US**

28. With respect to marketing loan payments, the United States agrees that these product-specific amber box payments that are made to producers of upland cotton for the production of upland cotton are subsidies within the meaning of Article 1 of the Subsidies Agreement.

29. With respect to crop insurance payments, through which the United States pays a portion of the crop insurance premium for producers, the United States agrees that these amber box payments are subsidies within the meaning of Article 1 of the Subsidies Agreement. We note, however, that these payments are not product-specific because they are not made to upland cotton producers for the production of upland cotton. Rather, they are non-product-specific support made to "producers in general" (that is, generally). Further, these crop insurance payments are not specific within the meaning of Article 2 of the Subsidies Agreement because they are available with respect to all

---

base acreage numbers, the most Brazil can logically claim is that "*at least* 2.1 million [base acres] were not planted to upland cotton in MY2002". That is, if in 2002 new producers without base acres planted upland cotton or if some historical producers planted more than their base acres, then some portion of the 14.1 million planted acres in MY2002 were not planted "on" upland cotton base acres.

agricultural products for which policies are offered by private companies. Therefore, pursuant to Article 1.2, this "subsidy" is not subject to the provisions of Part III of the Subsidies Agreement.

30. With respect to cottonseed payments, we recall that these payments are not within the terms of reference of the Panel.[16] With respect to "other payments" for upland cotton notified by the United States to the WTO – that is, storage payments and interest subsidy – the United States also recalls that these payments are not within the Panel's terms of reference.[17] Without prejudice to the US request for preliminary rulings on these three types of payments, the United States considers that these product-specific amber box payments are subsidies within the meaning of Article 1.

31. With respect to green box production flexibility contract payments under the 1996 Act and direct payments under the 2002 Act, the United States does not consider that Brazil has demonstrated what is the amount of the subsidy attributable to upland cotton producers pursuant to Article 1. Article 1 requires that a financial contribution by a government or public body or income or price support confers a benefit. The subsidies Brazil challenges are subsidies to producers, users, and/or exporters of upland cotton. However, Brazil has not identified the portion of the production flexibility contract payments that is properly attributable to upland cotton producers as opposed to other recipients of this subsidy. In fact, Brazil concedes that the entire amount of these payments does not confer a benefit on upland cotton producers by reducing the amount of production flexibility contract payments and direct payments on upland cotton base acres by the proportion 14/16. However, Brazil has provided no evidence of the amount of these decoupled payments received by producers that currently produce cotton. Nor has Brazil demonstrated how much or to what extent US cotton exports are subsidized.

32. With respect to *ad hoc* market loss assistance and counter-cyclical payments under the 2002 Act, the United States also does not consider that Brazil has demonstrated what is the amount of the subsidy attributable to upland cotton producers pursuant to Article 1. Specifically, as with production flexibility contract payments and direct payments, Brazil has not identified the portion of the subsidy that is properly attributable to producers of upland cotton as opposed to other recipients of this subsidy. Brazil has not identified the benefit to upland cotton producers conferred by these payments. Rather, Brazil merely assumes that for every upland cotton harvested acre, upland cotton producers had a corresponding upland cotton base acre. However, Brazil has provided no evidence of the amount of these decoupled payments received by producers that currently produce cotton.

## F. PROHIBITED SUBSIDIES

**128. Could the US respond to Brazil's assertions relating to the meaning and effect of the introductory phrase of Article 3 ("Except as provided in the Agreement on Agriculture....")? Would the meaning/effect change if Article 13 of the Agreement on Agriculture did not exist? BRA, US**

33. It is not entirely clear to the United States to which assertions of Brazil the Panel refers in its question. Moreover, the United States does not believe Brazil has purported to ascribe a specific meaning to that particular phrase. Indeed, with respect to Article 3.1(b), Brazil's arguments would effectively delete the introductory phrase in its entirety.[18]

## G. SPECIFICITY / CROP INSURANCE

**129. In the event that the Panel does not consider that the alleged prohibited subsidies fall within the provisions of Article 3 and are therefore, pursuant to Article 2.3, "deemed to be**

[17] *See* US Further Submission, paras. 6-7.
[18] See Answer of the United States to Panel Question 144, *infra*.

**specific", are there any other grounds on which Brazil would rely in order to support the view that such measures are "specific" within the meaning of Article 2 of the SCM Agreement (see, for example, fn 16 of Brazil's further submission)? BRA**

**130. Does Brazil agree that the US insurance premium subsidy is available in respect of all agricultural products? Please cite relevant portions of the record. BRA**

**131. How should the concept of specificity - and, in particular, the concept of specificity to "an enterprise or industry or group of enterprises or industries" -- in Article 2 of the SCM Agreement apply to subsidies in respect of agricultural commodities? Please answer the following questions, citing the principles in Article 2 of the SCM Agreement: BRA, US**

**(a) is a subsidy in respect of all agricultural, but not other, products specific?**

34. The United States does not regard a domestic subsidy as being specific solely because the subsidy is limited to the agricultural sector. As previously noted, this proposition is codified in the US countervailing duty regulations, at 19 C.F.R. § 351.502(d). Thus, the United States is of the view that the agricultural sector is too broad and too diverse to constitute a single "enterprise or industry or group of enterprises or industries".

**(b) is a subsidy in respect of all agricultural crops (i.e. but not to other agricultural commodities, such as livestock) specific?**

35. It is difficult to opine on this question in the abstract. However, this fact pattern does not apply to the US insurance premium subsidies, which are also available in respect of livestock.

**(c) is a subsidy in respect of certain identified agricultural products specific?**

36. It is difficult to opine on this question in the abstract. However, this fact pattern does not apply to the US insurance premium subsidies since the premium subsidy is a single subsidy programme available in respect of all products (while policies issued by private parties are in certain instances available in respect of certain identified products).

**(d) is a subsidy in respect of upland cotton, but not other products, specific?**

37. The United States assumes that this would require that the subsidy be limited to certain entities or the upland cotton industry and so would be specific. This fact pattern, however, does not apply to the US insurance premium subsidies since the premium subsidy is a single subsidy programme available with respect to all products (while policies issued by private parties are in certain instances available in respect of certain identified products).

**(e) is a subsidy in respect of a certain proportion of the value of total US commodities (or total US agricultural commodities) specific?**

38. In principle, a subsidy that is limited to a sufficiently small proportion of US commodities would be "limited", and, thus, "specific" within the meaning of Article 2.1(c). However, the Subsidies Agreement does not establish any quantitative standards for determining when a subsidy is so limited, and a proposal to establish such standards was rejected during the Uruguay Round. Therefore, the determination must be made on the basis of the facts of the particular case. This is the approach taken by the US Department of Commerce for purposes of the US countervailing duty law.

**(f) is a subsidy in respect of a certain proportion of total US farmland specific?**

39. This question is not presented in this dispute, but the United States would note that "land" is neither an "enterprise" nor an "industry", and so the proportion of farmland as such would not be appear to be relevant to the analysis under Article 2 of the Subsidies Agreement. The issue also does not appear to fall within the scope of Article 2.2, which deals with regional specificity – that is, "total US farmland" does not correspond to a "designated geographical region".

**132. Please state the amount and percentage of upland cotton acreage covered by each crop insurance programme and/or policy under the ARP Act of 2000. US**

40. There is one crop insurance programme, through which the United States provides premium subsidies on crop insurance policies that are offered by private insurance companies under the authority of the Federal Crop Insurance Act. There is no specific crop insurance programme or policies for cotton authorized under the Agricultural Risk Protection Act of 2000. Within this crop insurance programme, there are different plans of insurance that offer different types of coverage, such as production plans of insurance or revenue plans of insurance. All such plans of insurance are reinsured by FCIC and a premium subsidy paid by the US Government, is available. The amount and percentage of upland cotton acreage covered by each plan of insurance is shown in Exhibit US-65.

**133. Concerning Brazil's arguments in its oral statement, para. 7, can the US indicate if any producers of livestock outside a pilot programme are covered by the crop insurance programme? US**

41. Yes, producers of livestock outside of pilot programmes are covered by the crop insurance programme. In addition, there are policies being developed pursuant to pilot programmes in order to expand the scope of insurance products offered by private insurers to livestock producers. Thus, US crop insurance payments on premiums are made to a broad range of agricultural producers across the agricultural sector, including many livestock producers.

42. Livestock producers are eligible for several forms of "crop insurance" benefits under the provisions of the same operational statute that provides for benefits for "crops". Under the Federal Crop Insurance Act (7 USC 1501-1524), the Federal Crop Insurance Corporation (FCIC), an entity within the US Department of Agriculture, can approve insurance products if there is "sufficient actuarial data" to justify it to producers of "agricultural commodities".[19] *See* 7 USC 1508(a). The Act defines "agricultural commodity" to include a lengthy list of commodities, including such non-plant commodities as "finfish" and "mollusks". The definition also includes any "other agricultural commodity", except stored grain (the crop that produced the grain would be eligible for coverage), as determined by the Board of Directors of FCIC.

43. Thus, FCIC has the authority to offer insurance for livestock under its regular insurance programmes. The FCIC has approved products providing income protection to producers with livestock on t heir farm as contemplated in the statute. In addition, with the enactment of the Agricultural Risk Protection Act of 2000 (ARPA) (Pub. Law 106-224), Congress specifically mandated that FCIC offer pilot programmes for livestock. See 7 USC 1523.

44. The Adjusted Gross Revenue (AGR) product provides protection against low revenue due to unavoidable natural disasters and market fluctuations that occur during the insurance year. Covered farm revenue consists of income from all agricultural commodities, including amounts of income from animals and animal products and aquaculture reared in a controlled environment. To be eligible to purchase an AGR policy, the producer can earn no more than 35 per cent of expected allowable income from animals and animal products. Because the amount of livestock is considered incidental,

[19] *See* 7 US Code § 1508.

the expenditures are not counted against the funding limitations for livestock contained in 7 USC 1523 (which have never been reached).

45. The 35 per cent limit does not apply in the so-called "AGR-lite" programme, which was developed by, and originally available only in, Pennsylvania , the state that developed the policy. However, beginning with the 2004 crop year, an "AGR-lite" product will be expanded to counties in Connecticut, Delaware, Maine, Vermont, Massachusetts, New Hampshire, New Jersey and Rhode Island, and selected counties in West Virginia, New York, and Maryland, as approved by RMA. In all, the AGR-lite programme will now cover about 300 counties. That expansion of AGR-Lite was announced in an 18 August 2003, press release, available on the RMA website.

46. There are at least four kinds of products specifically for livestock available to livestock producers, and they are described at the website of the Risk Management Agency (RMA) (www.rma.usda.gov). There are two different policies that are available for swine producers. The first is Livestock Risk Protect (LRP- Swine). Originally that product was available only in Iowa. RMA recently announced that the policy may be offered to swine producers in 10 additional states: Illinois, Indiana, Kansas, Minnesota, Nebraska, Nevada, Oklahoma, Texas, Utah and Wyoming. The other policy available to swine producers is Livestock Gross Margin (LGM), which is available in Iowa. For cattle, there are two specialized policies available. Livestock producers may purchase a LRP-Feeder Cattle policy in Colorado, Iowa, Kansas, Nebraska, Nevada, Oklahoma, South Dakota, Texas, Utah, and Wyoming. Finally, there are "LRP-Fed Cattle" policies in Illinois, Iowa and Nebraska.

**134. Please state the annual amount of premiums paid or contributions made by US upland cotton farmers relating to each of the crop insurance programmes and/or policies supported by the US Risk Management Agency and the Federal Crop Insurance Corporation in each year from 1992 through 2002. US**

47. Please see Exhibit US-66.

**135. Please state the annual amount of insurance indemnity payments made by the US government; or insurance companies participating in crop insurance programmes and/or policies under the ARP Act of 2000 to upland cotton farmers in each year from 1992 through 2002. US**

48. Please see Exhibit US-67.

**136. Is the US arguing that crop insurance subsidies corresponding to "over 90 per cent of insured cotton area" (US 7 October oral statement, para. 46) in MY1999 through 2002 are consistent with paragraph 8(a) of Annex 2 of the Agreement on Agriculture? Is it correct that in the past these subsidies were nonetheless notified to the Committee on Agriculture as non-product specific AMS (see, for example, G/AG/N/USA/43 in Exhibit BRA-47)? US**

49. The United States has notified crop insurance payments to the Committee on Agriculture as non-product specific support. This is consistent with the US position that crop insurance subsidies are generally available subsidies to the agricultural sector as a whole.[20] In the US oral statement of 7 October 2003, it is pointed out that over 90 per cent of the cotton area currently under the programme is insured at coverage levels of 70 per cent or less of expected yield (or revenue). Over all commodities, almost 70 per cent of total insured area is insured at 70 per cent or less of expected yield or revenue. Thus, associated subsidies would be consistent with paragraph 8(a) of Annex 2 of the Agreement on Agriculture – that is, payments for relief from natural disasters that Members have

[20] US Comments on Brazil's Rebuttal Submission, paras. 34-42; US Rebuttal Submission, paras. 93-98; US Further Submission of September 30, 2003, paras. 14-15.

agreed have no or at most minimal trade-distorting effects or effects on production. The point is made to stress that such subsidies that satisfy green box criteria are likely non-production distorting, contrary to the assertions made by Brazil.

## H. EXPORT CREDIT GUARANTEES

**137. Please elaborate the meaning of "net losses" as is used in paragraph 70 of Brazil's 7 October oral statement. BRA**

**138. Please comment on Brazil's views stated in paragraph 70 of its 7 October oral statement. US**

50. In specific response to Brazil's views stated in that paragraph, the United States invites the attention of the Panel to paragraphs 157-162 of the 22 August US Rebuttal Submission, the table accompanying paragraph 161 of that submission, and paragraphs 144-150 of 30 September Further Submission of the United States. Paragraph 70 of Brazil's 7 October oral statement is simply a recapitulation of arguments it had previously advanced.

51. As noted in paragraph 144 of the US Further Submission, current data for each of the cohorts for 1992, 1993, 1994, 1995, 1996, and 1999 indicates a profit.[21] As stated in OMB Circular No. A-11: "The subsidy cost is the estimated present value of the cash flows . . . resulting from a direct loan or loan guarantee . . . . A positive net present value means that the Government is extending a subsidy to borrowers; *a negative present value means that the credit programme generates a 'profit' (excluding administrative costs) to the Government."*[22]

**139. In the context of export credit guarantees, is the Panel correct in understanding that Brazil's claims of inconsistency with the Agriculture Agreement involve GSM 102, GSM 103 and SCGP, but that it limits its "serious prejudice" allegations in respect of export credit guarantee programmes to the GSM 102 programme, and does not challenge GSM 103 and SCGP in this respect? If so,**

**(a) could Brazil please explain why it did so, and confirm that all the data relied upon in its further submissions (e.g. in Table 13) relate to the GSM 102 programme rather than to GSM 102, GSM 103 and SCGP (and, if the data needs to be adjusted to take account of a narrower "serious prejudice" focus, supply GSM-102-relevant data)? BRA**

**(b) for the purposes of Article 13(c)(ii) of the Agreement on Agriculture, is it necessary for the Panel to examine only GSM 102 or should the Panel's examination include also GSM 103 and SCGP? Why or why not? BRA**

**140. Could Brazil explain how, if at all, it has treated export credit guarantees for the purpose of Table 1 of its further submission? BRA**

**141. The Panel notes the US argument, inter alia in its further submission, that the export credit guarantee programmes are "self-sustaining". Recalling that item (j) of the Illustrative List of Export Subsidies in Annex I of the SCM Agreement refers to "premium rates", could the US expand upon how it takes into account the premium rates for the export credit guarantee programmes in its analysis. US**

[21] *See also* US Rebuttal Submission, para. 161 (chart of Subsidy Estimates and Reestimates by Cohort); US Further Submission, fns. 82 and 96.

[22] OMB Circular No. A-11, section 185.2, pp. 185-3 and 185-4 (italics added) (Exhibit Bra-116).

52. Item (j) of the Illustrative List of Export Subsidies in Annex I of the SCM Agreement is concerned with whether premium rates are inadequate to cover the long-term operating costs and losses of the programmes. **A rate is applied against a transaction amount to generate revenue to cover any costs and losses. In the context of the export credit guarantee programmes, the premium rate is applied against the volume of a particular transaction to generate revenue. The mere rate as an abstract number cannot generate revenue. Consequently, premium rates as applied to the volume of transactions is necessarily the principal source of programme revenue. In addition, recoveries – whether direct or through rescheduling – are an additional source of revenue. Revenue from all these sources are applied against its operating costs (e.g., administrative expenses) and losses from its claims experience. Alternatively, such recoveries may be viewed not as revenue but as a reduction of loss arising from claims experience. For example, a full recovery of an amount already paid as a claim yields a net loss of zero. Arithmetically, this would yield the same result as treating the recovery as revenue, offsetting the equivalent amount of prior loss.**

53. As the United States noted in footnote 81 of its 30 September Further Submission, Brazil has erroneously argued that item (j) compels consideration only of premiums on the revenue side of the ledger for purposes of covering long-term operating costs and losses. In Brazil's Comment on the US answer to Panel question 77 (para. 94), Brazil states that "item (j) limits the revenue to be used to offset operating costs and losses to 'premium rates'". To the contrary, item (j) envisions an examination of whether premium rates are inadequate to cover long-term operating costs and losses. It does not say that all other revenue must be excluded from the calculation of whether a loss has occurred. Brazil would argue that if the United States paid a claim on day 1 and recouped in full on day 2 the amount it had paid, it could not include such recovery in a determination of whether the programme satisfied item (j). Such a draconian result is economically illogical and certainly not compelled by the text. As noted above, whether the recovery is viewed as revenue or as a subtraction from loss, the net result would be the same, but it must be included in any evaluation of whether premium rates cover long-term operating costs and losses.

54. As the United States further noted in its response to Panel question 77 (11 August Answers to Panel Questions, para. 145), item (j) applies to three different types of programmes: export credits, export credit guarantees, and insurance. In the case of export credit guarantees and insurance, the provider will occasionally incur claims. To the extent such claims or defaults exceed revenue from whatever source it may be derived, the net result would be a loss arising from operations. In an accounting sense such result would constitute an 'operating loss.'.

55. Revenues derived from fees paid in connection with the export credit guarantee programmes form an integral part of the estimate and re-estimate process that currently indicate profitability for each of the cohorts in 1992, 1993, 1994, 1995, 1996, and 1999.[23] The application of the rates in this regard to the analysis is properly extended to 1992, as this is the first fiscal year of applicability of government-wide accounting for federal credit programmes under the Credit Reform Act of 1990. This period also conforms with the period that Brazil recognizes as appropriate for analysis under item (j).[24] As a result of such profitability, the programmes are self-sustaining.

**142. The US has pointed out that there are many limitations on granting export credit guarantees and that there is no requirement to issue any particular guarantee (US further**

[23] *See* Answer of the United States to Panel Question 138, *supra*. *See also* US Rebuttal Submission, para. 161 (chart of subsidy estimates and reestimates by cohort); US Further Submission, fns. 82 and 96.

[24] See First Submission of Brazil (24 June 2003), para. 282: "[A] ten-year period . . . fulfils the criterion of being 'long-term' within the meaning of item (j)." In contrast, no such long-term analysis is possible with respect to the Supplier Credit Guarantee Programme, the regulations for which were first promulgated only on 1 July 1996, with transactions commencing during fiscal year 1997.

**submission, paras 153-156). Can the Commodity Credit Corporation decline to grant an export credit guarantee even in cases where the programme conditions are met? US**

56. A proper response to this question requires one to define by what is meant by "programme conditions". The arguments of Brazil would appear to create a tautological circularity: if one assumes that none of the various discretionary programmatic and budgetary bases that would permit the Commodity Credit Corporation not to issue a particular export credit guarantee are in effect, then can the CCC decline to grant that particular guarantee? Under those circumstances the question itself dictates that the answer must be "no". The United States submits, however, that assuming away all of the real-world bases that would permit CCC to decline issuance of a guarantee is not a proper basis for analysis.

57. The fact remains, as the United States has pointed out, that numerous bases exist for denial of a guarantee.[25] Brazil has argued, however, that "CCC does not enjoy the discretion to refuse to issue a guarantee to an eligible individual".[26] This is simply not true. Perhaps a practical example would further illustrate the point. As the United States mentioned during the first substantive meeting of the Panel, CCC internally maintains limits on the amount of its exposure to obligations of particular foreign banks.[27] Although a qualified applicant might apply for an export credit guarantee for an eligible good to an eligible destination (each of those elements themselves constituting potential bases for denying an application), notwithstanding the eligibility of the applicant, good, and destination, if the foreign-bank obligor envisioned in the transaction would exceed the applicable *internally established* exposure limit if it consummated the transaction, CCC could and would deny the application for the guarantee. Thus, while it is true that the CCC does not engage in any *arbitrary* or standard-less denials, the point is that no exporter seeking to engage in a particular export transaction can be certain of obtaining a credit because of CCC decisions relating to the conditions for issuance of export credit guarantees.

**143. Brazil agrees with National Cotton Council estimates of the effects of the GSM 102 programmes (Brazil's further submission, para. 190) but it also cites a different conclusion by Prof. Sumner (paragraph 192). Brazil cites other estimates by Prof. Sumner throughout its further submission. Does Brazil adopt Prof. Sumner's conclusions and estimates as part of its submission? BRA**

## I. STEP 2 PAYMENTS

**144. Is the Panel correct in understanding that the US does not dispute that Step 2 (domestic) payments are contingent upon import substitution, and that it argues that such measures are permitted due to the operation of the provisions of the Agreement on Agriculture? How is that relevant to a claim under Articles 5 and 6 of the SCM Agreement? US**

58. The United States acknowledges that to receive a payment under the Step 2 programme a domestic user must open a bale of domestically produced baled upland cotton. As the United States noted in its Further Submission of 30 September 2003[28], the introductory clause of Article 3.1 of the Subsidies Agreement, "Except as provided in the Agreement on Agriculture", applies to both Articles 3.1(a) and 3.1(b). Brazil's arguments would delete the application of the introductory clause to Article 3.1(b). As the exception's applicability to Article 3.1(b) must be given meaning, the United States has noted that the Agreement on Agriculture does permit domestic content subsidies in favour

[25] See, e.g., US Further Submission (30 September), paras. 153-156
[26] Second Oral Statement of Brazil (7 October), para. 67.
[27] See http://www.fsa.usda.gov/ccc/banks_foreign_rqts.htm.
[28] Paras. 165-176.

of agricultural producers, albeit paid to processors, if such subsidies are provided consistently with the Member's domestic support reduction commitments.[29] The European Communities concur.[30]

59. As the United States has previously indicated to the Panel[31], the United States reports all Step 2 payments as product-specific domestic support to cotton. As the United States is entitled to the protection of the Peace Clause under Article 13(b)(ii) of the Agreement on Agriculture, the United States is exempt from action under Articles 5 and 6 of the Subsidies Agreement. By their express terms, Articles 5 and 6 do "not apply to subsidies maintained on agricultural products as provided in Article 13 of the Agreement on Agriculture".

60. The question of "import substitution" is otherwise irrelevant to Brazil's claims under Articles 5(c) and 6, which focus on the effect of the particular subsidy without regard to the origin requirements of the subsidy. In contrast, Article 3.1(b) focuses on whether a subsidy is contingent upon use of domestic over imported goods to determine whether a particular subsidy is a prohibited subsidy irrespective of its effect.

## J. ACTIONABLE SUBSIDIES

**145. The Panel notes that different remedies are available in respect of prohibited and actionable subsidies under Articles 4.7 and 7.8 of the SCM Agreement. If the Panel were to conclude that a subsidy was prohibited and were to make a recommendation under Article 4.7 of the SCM Agreement to withdraw the subsidy without delay, can the Panel:**

**(a) also conclude that the same subsidy had resulted in adverse effects to the interests of another Member? If so, what would be the value of such a conclusion in terms of the settlement of the matter before the Panel? BRA, US**

**(b) take into account the effects of the interaction of those prohibited subsidies with other, allegedly, actionable subsidies? If so, how is this relevant to the issue of causation under Article 5 of the SCM Agreement? BRA, US**

61. As a practical matter, there may be limited value in a particular dispute from making a finding that a particular subsidy is both a prohibited subsidy and causes adverse effects. If a subsidy is prohibited, then the remedy required to be recommended under Article 4.7 is to withdraw the subsidy without delay. A finding at the same time that a subsidy causes serious prejudice, if done cumulatively with an analysis of other subsidies, would mean that it would leave unclear the question of whether the other, non-prohibited subsidies cause adverse effects. That may diminish the value (in terms of resolving the dispute) of any finding concerning those other subsidies.

62. On the other hand, if the Panel were to make a separate "adverse effects" analysis for each of the non-prohibited subsidies, there would be no reason to so analyze any prohibited subsidy. First, an adverse effects analysis of a prohibited subsidy could not affect a panel's findings with respect to each non-prohibited subsidy. Second, since under Article 4 the panel would have recommended withdrawal of the prohibited subsidy, compliance with Article 4 would also comply with a recommendation under Article 7. Therefore, having made a recommendation under Article 4 with respect to a subsidy, there would be no utility to also making a recommendation under Article 7.

---

[30] Answers of the European Communities to Panel Question 40, paras. 72-78; First Oral Statement of the European Communities, paras. 31-37.

[31] See, e.g., First Written Submission of the United States, para. 129; G/AG/N/USA/43, at 20 (Supporting Table DS:6) (Exhibit Bra-47)

**146. Brazil acknowledges that there are some interaction effects that may increase or decrease the overall effects of the subsidies (Brazil's further submission, para. 225). How would your analysis under Articles 5(c) and 6.3 of the SCM Agreement and Article XVI of GATT 1994 differ if it excluded, for example, crop insurance subsidies, PFC and/or direct payments? BRA**

**147. Does the US agree that subsidies provided under the marketing loan programme, counter-cyclical payments and market loss assistance are or were more than minimally trade-distorting? If so, please elaborate on the type of effects which are more than minimally trade-distorting within the meaning of Annex 2 of the Agreement on Agriculture but less than adverse effects within the meaning of Article 5 of the SCM Agreement. US**

63. The issues of whether a measure is more than minimally trade-distorting and whether a measure has adverse effects require two different analyses. While it may be a necessary condition that a subsidy has trade- or production-distorting effects in order to find that it causes adverse effects, it is not a sufficient condition. The question under an adverse effects analysis is one of the effect on a particular Member's "interests" – for example, whether injury to the domestic industry of another Member, nullification or impairment, or serious prejudice to the interests of another Member. Therefore, the mere showing that a subsidy can distort trade or production does not necessarily mean it has, for example, seriously prejudiced a particular Member's interests.

64. Marketing loan payments, counter-cyclical payments, and market loss assistance payments provide different types of support that can be expected to have different effects. As noted in the US answer to Question 127, the United States notifies marketing loan payments as product-specific amber box support. These payments are linked to production of upland cotton in favour of the producers of upland cotton – a producer must have harvested cotton to receive the payment. Therefore, the United States considers that marketing loan payments could not satisfy the general and policy-specific criteria set out in Annex 2 of the Agreement on Agriculture and therefore could not be deemed to have met the fundamental requirement of that Annex.

65. That a particular support measure does not conform to the general and policy-specific criteria of Annex 2 is relevant to the type of support it is deemed to be, which has meaning for a Member's compliance with its reduction commitments. That a particular measure is not green box, however, would not suffice to demonstrate that a measure has "adverse effects" within the meaning of Articles 5 and 6 of the Subsidies Agreement. A finding that a subsidy has caused adverse effects is a fact-intensive analysis. In the case of a claim of serious prejudice, for example, one of the four effects set out in Article 6.3 must be demonstrated (such as significant price suppression or depression by the subsidized product in the same market as the non-subsidized product is found) and the effects caused by the subsidy must rise to the level of "serious prejudice." Such a fact-intensive analysis must take into account, *inter alia*, the nature and amount of the subsidy, market conditions, and other factors affecting production, consumption, and prices.

66. Therefore, a conclusion that a measure does not provide green box support and therefore would not be deemed to have no or at most minimal trade-distorting effects or effects on production cannot take the place of the fact-intensive examination required to show causation under the WTO Agreements. For example, marketing loan payments provide a revenue floor of 52 cents per pound for US upland cotton producers. The effect of this subsidy would depend in large part on the producer's expected market revenue at the time of planting – that is, whether this expected revenue was above or below 52 cents per pound. Thus, the effect of this subsidy would be quite different from a subsidy that merely provided an unchanging per unit payment (e.g., 10 cents per pound), even if as a result of prices that actually develop over the course of a marketing year the per-unit payments under these two measures turn out to be the same. As another example, a measure that provided, in the aggregate, $1 of support linked to production of upland cotton could not satisfy the general and

policy-specific criteria of Annex 2 of the Agreement on Agriculture[32], but it would be difficult to conceive that the effect of $1 in subsidies could be "significant price suppression [or] price depression" or "an increase in the world market share of the subsidizing Member" given the large number of market participants (including cotton producers worldwide), highly developed cotton markets, and volume and value of cotton trade.

67. With respect to counter-cyclical payments under the 2002 Act, the United States recalls that according to Brazil's interpretation of the first sentence of Annex 2 as a stand-alone requirement, if a measure has no more than minimal trade-distorting effects or effects on production, it follows that such a measure must be deemed green box. As the United States has demonstrated, the economic literature on decoupled payments (counter-cyclical payments are decoupled from production although linked to current prices) suggests that the effects on production of such income transfers are no more than minimal.[33] Therefore, although the United States would not contend that counter-cyclical payments conform fully to the policy-specific criteria in Annex 2, there is not only no evidence that such payments have more than minimal trade-distorting effects or effect on production, but the evidence suggests the contrary. In such a case, the effect of a payment that does not have more than minimal effects on production would not appear to be "significant price suppression [or] depression" or an "increase in the world market share of the subsidizing Member", much less "serious prejudice".

68. The expired market loss assistance payments were ad hoc payments made during the 1999, 2000, and 2001 marketing years to holders of base acreage. These payments were not linked to production – that is, a recipient need not have produced upland cotton or any crop at all in order to receive the payment.[34] However, because these payments were explicitly made in reaction to low commodity prices, the United States considered that these payments would not conform fully to the criteria in Annex 2 of the Agreement on Agriculture and therefore notified these payments as non-product-specific amber box support. As noted above with respect to the 2002 counter-cyclical payments, however, the economic literature on payments decoupled from production suggests that the effects on production of income transfers such as the market loss assistance payments are no more than minimal.[35] Therefore, the evidence suggests that the effect of such payments could not be "significant price suppression [or] depression" or an "increase in the world market share of the subsidizing Member" resulting in "serious prejudice".

**148. How should the significance of price suppression or depression be assessed under Article 6.3(c) of the SCM Agreement? In terms of a meaningful effect? Or another concept? BRA, US**

69. As the United States has previously noted[36], in Article 6.3(c) the term "significant" modifies the phrase "price suppression or depression", suggesting that it is the level of price suppression or depression itself that must be "important, notable" or "consequential".[37] As Brazil agrees[38], important

[32] For example, the measure would not qualify as decoupled income support because, by requiring that recipients have produced upland cotton, the amount of the payment would be "related to, or based on, the type or volume of production . . . undertaken by the producer in any year after the base period". *See* Agreement on Agriculture, Annex 2, para. 6(b).

[33] *See, e.g.*, US Rebuttal Submission, paras. 59-64.

[34] Supplemental legislation authorizing each of these payments was passed several months after planting for the crop year in question had occurred. Even if producers had some expectations of payment at planting time, they were eligible to receive such a payment regardless of what crop they planted. Indeed, they could choose not to plant and still be eligible for the payment. This would argue that market loss assistance payments, like production flexibility contract payments, direct payments, and counter-cyclical payments, are decoupled from planting decisions.

[35] *See, e.g.*, US Rebuttal Submission, paras. 59-64.

[36] US Opening Statement at the Second para. 58.

[37] US Further Submission, para. 83.

[38] *See* Brazil's Further Submission, para. 88 ("This interpretation of price suppression and price depression is consistent with the *relevant context of Article 6.3(c), which includes Article 15.2 of the SCM*

context for interpreting this phrase can be found in Article 15.2 of the Subsidies Agreement, which sets out for countervailing duty purposes the same effects found in Article 6.3.[39] This text confirms that the relevant analysis is whether the level of price suppression or depression itself is "significant":

> With regard to the effect of subsidized imports on prices, the investigating authorities shall consider whether there has been a significant price undercutting by the subsidized imports as compared with the price of a like product of the importing Member, or whether the effect of such imports is otherwise *to depress prices to a significant degree or to prevent price increases*, which otherwise would have occurred, *to a significant degree*.[40]

Thus, Article 15.2 provides contextual support for reading the term "significant price suppression [or] depression" in Article 6.3(c) according to the ordinary meaning of its terms – that is, it is the degree of price suppression or depression itself that must be "significant".

70. As suggested by this analysis, it is not the effect on the producers of the complaining Member that must be "significant". In determining whether the alleged price suppression or depression is "important" or "notable", it will of course be relevant to look at that suppression or depression in the context of the prices that have been affected – that is, at the *degree* of suppression or depression. One absolute level of suppression or depression could be significant in the context of prices for one product but not for another and meaning must be given to the phrase "in the same market".

**149. What is the meaning of "may" in the chapeau of Article 6.3(c) in the context of Brazil's assertion that there is no need to conduct a distinct analysis of "serious prejudice" under Article 5(c) after having made a finding under 6.3(c) or (d)? (Brazil's further submission, paras 437 ff). How, if at all, are Articles 6.2 and 6.8 relevant in this context? What context should the Panel use for assessing serious prejudice under Article 5(c) of the SCM Agreement if the Panel takes the view that Article 6.3(c) and (d) are permissive conditions for a determination of serious prejudice? US**

71. The chapeau of Article 6.3 states that "[s]erious prejudice in the sense of paragraph (c) of Article 5 may arise in any case where one or more of the following apply". The Article then goes on to detail four effects that "may" result in serious prejudice arising. Brazil's reading would re-write the chapeau of Article 6.3, changing the permissive "may" into the obligatory "shall". The ordinary meaning of "may" is "to express possibility, opportunity, or permission".[41] Therefore, the ordinary meaning of the chapeau of Article 6.3 would be that there is a "possibility" or "opportunity" for serious prejudice in the sense of Article 5(c) to arise where one or more of the effects listed in Article 6.3 is found.

72. Article 6.2 clarifies that a prerequisite for a finding of serious prejudice is that at least one of the four effects in Article 6.3 must be demonstrated. That is, Article 6.2 precludes a panel from finding serious prejudice ("serious prejudice shall not be found") if a subsidizing Member demonstrates that the subsidy has not had any of the effects listed in Article 6.3. This provided a subsidizing Member with a means to overcome the presumption created through the operation of

---

*Agreement*. That provision discusses standards for the determination of injury in countervailing duty cases and provides that the investigating authorities should consider whether the effect of imports is 'to depress prices' or 'to prevent price increases, which otherwise would have occurred . . .'[.]") (emphasis added).

[39] Effects on prices form one part of a determination of injury for countervailing duty purposes. Pursuant to Article 15.1, such a determination of injury involves an objective examination of (a) the volume of subsidized imports and the effect of the subsidized imports on prices in the domestic market for like products and (b) the consequent impact of these imports on the domestic producers of such products.

[40] Subsidies Agreement, Article 15.2 (italics added).

[41] *The Random House Dictionary of the English Language, Unabridged Edition* at 886 (1983).

Article 6.1 while that provision was still in effect. However, Article 6.1 demonstrates that Members knew how to create a presumption of serious prejudice: they did so by explicitly stating that, in certain cases, "[s]erious prejudice . . . *shall be deemed to exist*" (italics added). Article 6.2, while providing a means to rebut that presumption, does not by its terms establish that serious prejudice "shall be deemed to exist" if one of the effects in Article 6.3 exists.

73. Article 6.4 lends further contextual support to the interpretation that the use of the term "may" in the chapeau of Article 6.3 signifies that the effects listed in Article 6.3 are permissive conditions for a determination of serious prejudice. Article 6.4 states that "displacement or impeding of exports shall include any case in which, subject to the provisions of paragraph 7, it has been demonstrated that there has been a change in the relative shares of the market to the disadvantage of the non-subsidized like product". Thus, given certain situations further explained in Article 6.4, displacement or impeding of exports "shall" exist. However, Article 6.3 does not state that, given those situations, displacement or impeding of exports *resulting in serious prejudice* shall exist. That is, the situations in Article 6.4 which must result in a finding of displacement or impeding of export do not, by the terms of the Article, also result in a finding of serious prejudice.

74. Article 6.5 similarly defines a situation in which "price undercutting" under Article 6.3(c) "shall" be found but does not also mandate a finding of serious prejudice. Had Members intended (as Brazil contends) that a finding under Article 6.3 would necessarily suffice to demonstrate serious prejudice, one also would have expected Articles 6.4 and 6.5 to mandate a finding of serious prejudice where a finding of one of the effects under Article 6.3 is mandated.

75. Article 6.8 provides further contextual support for reading Article 6.3 as setting out certain permissive conditions that could result in a panel finding that serious prejudice to the interests of a Member exist. Article 6.8 states that, "in the absence of circumstances referred to in paragraph 7", which merely preclude a panel from finding displacement or impediment resulting in serious prejudice, "the existence of serious prejudice *should be* determined on the basis of the information submitted to or obtained by the panel" (italics added). Again, this provision does not mandate a finding of serious prejudice should one or more of the effects set out in Article 6.3 be demonstrated. Rather, it emphasizes that "the existence of serious prejudice" (rather than the existence of one of the effects in Article 6.3) "should be determined" by the panel based on the information before it. Thus, while a panel may be *precluded* from making a finding of serious prejudice (where, for example, a complaining party has only alleged displacement or impediment under Article 6.3, but one of the conditions in Article 6.7 exist), there is no currently effective provision under which a panel is *compelled* to find serious prejudice.

**150. Is the list in Article 6.3 of the SCM Agreement exhaustive, or could serious prejudice arise in circumstances other than those listed in paragraphs (a) through (d)? US**

76. Article 6.3 sets out four circumstances in which the effects of subsidies "may" give rise to a finding of serious prejudice. Article 6.2 establishes that "serious prejudice shall not be found" if a subsidizing Member demonstrates that a challenged subsidy has not resulted in any of those four effects. Therefore, Articles 6.3 and 6.2 indicate that serious prejudice may not be deemed to have arisen without at least one of the four effects listed in Article 6.3 having been demonstrated.

**151. Where in the text of Article 6.3(d) of the SCM Agreement is there a basis to take into account that 1998 may be a "misleading" year for the purposes of comparison? For example, unlike the text of Article XVI:3 of the GATT 1994, there does not seem to be a general reference to "special factors". US**

77. Article 6.3(d) requires that a complaining party demonstrate that the effect of a challenged subsidy is an increase in the world market share in a particular subsidized primary product or commodity as compared to the average share it had during the previous period of three years and this

increase follows a consistent trend over a period when subsidies have been granted. Where the evidence offered by a complaining party relies in large part on abnormal production and trade data evidently caused by factors unrelated to the challenged subsidy (in the case of the United States in 1998, severe drought and record abandonment of planted acres), use of that data cannot satisfy the complaining party's burden of demonstrating causation – that is, the "effect of the subsidy".

78. Article 6.3(d) sets out a fairly mechanical two-part test: first, there must be an increase in world market share as compared to the average over the preceding period of three years. Thus, assuming *arguendo* that Brazil could challenge expired marketing year 2001 support measures, this test would compare the world market share of US upland cotton in that year to the average over the preceding three years. Brazil, however, has misinterpreted Article 6.3(d) and examined the US world *export* share.

79. The second part of the test is that any such increase over the average of the preceding three-year period "follows a consistent trend over a period when subsidies have been granted". The marketing year 2001 payments challenged by Brazil were first introduced for the 1996 marketing year by the 1996 Act. Thus, Brazil must demonstrate that the alleged increase in world market share follows a "consistent trend" between marketing years 1996-2001. In fact, there is no consistent trend showing an increasing US world market share over this period; that world market share has been inconsistent but showing a tendency to decline over that period. As demonstrated in Exhibit US-47, US world market share surpassed 20 per cent in both marketing years 1996 and 1997 but has not thereafter.

80. Finally, as the United States has noted in its further submission, Brazil has limited its claim under Article 6.3(d) to alleged effects in marketing year 2001.[42] Thus, there can be no finding that challenged US subsidies under the 2002 Act presently cause serious prejudice within the meaning of Article 6.3(d). As the United States has previously noted, moreover, payments with respect to marketing year 2001 expired with the granting of support in respect of the 2002 marketing year's production, which began on 1 August 2002 – that is, seven months before this Panel's terms of reference were established. The result is that Brazil is asking the Panel to make findings and a recommendation with respect to subsidies that had been replaced at the time of panel establishment and that no longer exist to be withdrawn even were a recommendation to be made.

**152. If the US is correct in asserting that the Article 13(b)(ii) Agreement on Agriculture analysis is a year-by-year analysis, how would this affect the Panel's examination of Brazil's claims of serious prejudice, including the three year period and the trend period in Article 6.3(d) of the SCM Agreement? US**

81. Article 13(b)(ii) exempts from action measures that, *inter alia*, conform fully to the provisions of Article 6 of the Agreement on Agriculture. Chief among those provisions is the obligation that a Member remain within its Annual and Final Bound Commitment Levels for its Aggregate Measurement of Support, a commitment that is expressed by year. Therefore, while a Member may breach the Peace Clause in a given year by exceeding its bound commitment level, that Member may in the following year not breach the Peace Clause if its domestic support measures once again do not exceed its commitment levels. Thus, to gauge whether domestic support measures have breached the Peace Clause requires a year-by-year analysis.[43]

[42] US Further Submission, para. 100.

[43] Brazil agrees that the Peace Clause requires a year-by-year comparison. Brazil insists, however, that once a Member has breached the Peace Clause once, that Member can never thereafter regain Peace Clause protection. There is nothing in the text of the Peace Clause that supports Brazil's view on this point – nor, as a result, has Brazil pointed to any supporting text.

82. The year-by-year analysis under the Peace Clause does not affect how the Panel would undertake a serious prejudice analysis; it affects only the Panel's analysis of which of the US measures that Brazil has challenged may be the subject of the serious prejudice analysis. In the event, Brazil has only claimed that the effect of US subsidies in marketing year 2001 was inconsistent with Article 6.3(d). Therefore, the Panel's task is first to analyze whether US domestic support measures in marketing year 2001 breached the Peace Clause. If so, then the Panel would be able to undertake a serious prejudice analysis – and that second analysis is distinct from the first one. The United States has demonstrated that US measures in marketing year 2001 do not grant product-specific support to upland cotton in excess of that decided during the 1992 marketing year, whether measured according to the level of support granted by those measures or a price-gap AMS calculation.

83. With respect to the two-part test of the three-year average and consistent trend over a period when subsidies have been granted, the Peace Clause would have no impact on these tests. That is, assuming *arguendo* that marketing year 2001 measures were not exempt from action, the fact that the Peace Clause exempts from action measures for other marketing years would not preclude the Panel from examining data and evidence from those years as part of its serious prejudice analysis of the 2001 measures. The payments made in those other marketing years (that is, the marketing year 1999 measures and the marketing year 2000 measures) would be exempt from action; evidence relating to those years would not be sheltered from examination by the Panel in its serious prejudice analysis of the 2001 measures.

**153. Would the conditions in Article 6.3(d) of the SCM Agreement be satisfied in respect of time periods other than the one specified? What relevance, if any, would this have for Brazil's claims? BRA**

**154. Does the US agree that upland cotton is a "primary product or commodity" within the meaning of Article 6.3(d) of the SCM Agreement? (ref. Brazil's further submission, para. 262) and within the meaning of Article XVI:3 of the GATT 1994? US**

84. Yes.

**155. Please respond to Brazil's identification of the seven-year period beginning with MY1996 (following the passage of the FAIR Act of 1996) as the "most representative period" for the purposes of Article 6.3(d)? (ref. Brazil further submission, para. 269) US**

85. Brazil has challenged only those US subsidies that allegedly had the effect of increasing US world market share in marketing year 2001 – that is, marketing year 2001 payments. The second part of the test under Article 6.3(d) is that any increase in world market share that is the effect of the challenged subsidy over the average of the preceding three-year period "follows a consistent trend over a period when subsidies have been granted". The marketing year 2001 payments were granted under the 1996 Act. Therefore, the "period when subsidies have been granted" for purposes of an analysis of the effect of marketing year 2001 support would be the marketing year 1996-2001 period.

86. The United States believes that marketing year 2001 support cannot cause present serious prejudice because these payments expired when marketing year 2002 payments began to be made. Nonetheless, if marketing year 2001 payments are the challenged measures for purposes of Brazil's Article 6.3(d) claim, there is no basis to include marketing year 2002 within the period when subsidies have been granted. (We also note that Brazil identifies a seven-year period beginning with marketing year 1996 but presents data only for the six-year period through marketing year 2001.)

**156. Does the US agree that "...footnote 17 [of the SCM Agreement] does not carve out upland cotton from the scope of Article 6.3(d) of the SCM Agreement"? (ref. Brazil further submission, para. 275). US**

87. The United States is not aware of any "other multilaterally agreed specific rules apply to the trade in the product or commodity in question" within the meaning of footnote 17 to Article 6.3(d) of the Subsidies Agreement.

**157. Does the reference to "trade" in footnote 17 of the SCM Agreement have any impact on the interpretation of "world market share" in Article 6.3(d)) If so, what is it? US**

88. The use of the term "trade" in footnote 17 provides useful context in interpreting the phrase "world market share" in Article 6.3(d). Specifically, Article 6.3(d) speaks of an increase in a Member's "world market share", not an increase in a Member's "world trade share". By using the term "market" and not "trade", Article 6.3(d) establishes that its scope is *not* limited to cross-border movements of a primary product or commodity. That is, the "world market" for a primary product or commodity encompasses all the markets in the entire "world", including the market of the allegedly subsidizing Member. Had Members desired instead to restrict the analysis under Article 6.3(d) to cross-border shipments, they could have used the phrase "world trade share" or, in Brazil's preferred formulation, "world export share", or even (as in GATT 1994 Article XVI:3) "world export trade". They did not. Finally, we note that, rather than elaborating on the test under Article 6.3(d), footnote 17 was intended to describe those products or commodities *not* covered by Article 6.3(d) and therefore could use the term "trade".

**158. Please respond to Brazil's assertion that "...the absence of any payment, production or expenditure limitations in the US marketing loan programme is analogous to the EC sugar regime that was challenged in EC - Sugar Exports II (Brazil) and EC - Sugar Exports I (Australia)." (ref. Brazil further submission, para. 317) US**

89. The EC sugar export regime challenged by Australia and Brazil under the GATT 1947 was manifestly different than the US marketing loan programme, primarily in that the challenged programme was an export subsidy providing export refunds on exportable surpluses of sugar. The *Sugar Exports* panel concluded that in the particular market situation prevailing in 1978 and 1979, the EC system had caused serious prejudice to Brazil's interests because it had been applied in a manner which contributed to depress sugar prices. The panel also concluded that the lack of "pre-established effective limitations" on those export refunds and the application of that refund system "constituted a permanent source of uncertainty in world sugar markets and therefore constituted a threat of serious prejudice. The panel's finding on serious prejudice was made carefully, circumscribed by "the particular market situation prevailing in 1978 and 1979". However, the panel's finding on threat of serious prejudice was made without any explanation and apparently without argument by the parties. Therefore, it is difficult to see how the Panel could draw useful guidance from this finding by that panel or draw conclusions on relevant types of payments.

**159. The EC, in its oral statement (paras 9 and 10), disagrees with the US interpretation of the terms "same market". Can the US comment on the EC's view? US**

90. The United States still has difficulty with the EC view. The United States cannot understand how the "world" can be one "market" for purposes of Article 6.3(c), which by its nature calls for a comparison of the prices of the goods of one Member when competing in a market with the goods of another Member. Goods are not sold to the "world" – they are sold in the market of a particular country.

91. The EC on the other hand evidently considers that it is at least possible that the world could function as one market and therefore constitute a "same market" for purposes of analyzing whether

the "effect of the subsidy" is "significant price suppression [or] depression" of the price of a non-subsidized product in the same market. For the reasons set forth in the US further submission, the United States considers that such an interpretation would render the "in the same market" language inutile because the subsidized and non-subsidized products could never be found in the same geographic market and still be considered to be in the same "world market". Furthermore, under the EC's approach, a Member could be selling at a price well above another Member's price in the same country, and yet be found to be depressing prices on the "world market" due to a comparison between sales prices of the Member in one country compared to sales prices of the other Member in a different country.

92. However, the EC itself concedes that a "world market" could only be deemed to exist if there were not significant barriers to trade in the product at issue, such as customs duties, technical barriers to trade, etc. The EC's own explanation suggests that such a "world market" is unlikely to exist because of significant barriers to trade somewhere in the world. Thus, even under the EC's approach, it is not the case that there is a "world market" for upland cotton.

**160. Without prejudice to the meaning of "world market share" as used in Article 6.3(d) of the SCM Agreement, can you confirm the world export share statistics provided in Exhibit BRA-206? US**

93. The table below reflects most recent updates for 2002-03 and 2003-04. We caution that, as noted in the footnotes in the table, the data are drawn from different sources and data sets. Also, we have corrected data in BRA-206 for 1997-98 for total world exports, world upland exports, and US export share.

**World cotton exports (million bales)**

| Year | US upland exports (1) | Total world exports (2) | ELS world exports (3) | World upland exports (4) | US Share of World Exports (5) |
|---|---|---|---|---|---|
| 1996-97 | 6.399 | 26.929 | 1.017 | 25.912 | 24.70% |
| 1997-98 | 7.06 | 26.838 | 1.106 | 25.732 | 27.44% |
| 1998-99 | 4.01 | 23.668 | 1.085 | 22.583 | 17.76% |
| 1999-00 | 6.303 | 27.326 | 1.193 | 26.133 | 24.12% |
| 2000-01 | 6.303 | 26.589 | 1.127 | 25.462 | 24.75% |
| 2001-02 | 10.603 | 29.052 | 1.325 | 27.727 | 38.24% |
| 2002-03 | 11.266 | 30.629 | 1.989 | 28.640 | 39.34% |
| Average: 98/99 - 00/01 | 5.539 | 25.861 | 1.135 | 24.726 | 22.40% |
| 99/00 - 01/02 | 7.736 | 27.656 | 1.215 | 26.441 | 29.26% |
| 00/01 - 02/03 | 9.391 | 28.757 | 1.480 | 27.276 | 34.43% |

**161. Would a finding of serious prejudice under Article 5(c) of the SCM Agreement be determinative for a finding under Article XVI:1 of the GATT 1994? Why or why not? What, if any, is the role of footnote 13 of the SCM Agreement in this context? BRA, US**

94. Article 5(c) establishes that one of the adverse effects that a subsidizing Member should not cause to the interests of other Members is "serious prejudice", and footnote 13 to that Article states that the term "'serious prejudice to the interests of another Member' is used in the same sense as it is used in paragraph 1 of Article XVI of GATT 1994". Therefore, "serious prejudice" under Subsidies Agreement Article 5(c) and GATT 1994 Article XVI:1 must be read to have the same meaning. As Article 5(c), and Article 6 which explains it, are the more detailed provisions on "serious prejudice" and contain a more effective remedy than the consultation envisioned under GATT 1994 Article XVI:1, the Panel's analysis should begin with the Subsidies Agreement provisions. Were the Panel to agree that Brazil has not established that the effect of the challenged subsidy is "serious prejudice" within the meaning of the Subsidies Agreement, it would be difficult to see how the Panel could then determine that "serious prejudice" exists within the meaning of GATT 1994 Article XVI:1 since the term is used "in the same sense" in these provisions.

**162. Can the US confirm that marketing loan/LDP, step 2 and counter-cyclical payments are mandatory if the price conditions are fulfilled? US**

95. The statutory authority for marketing loan payments, step 2 payments, and counter-cyclical payments does not provide the Secretary with the authority to arbitrarily decline to make these payments to qualified recipients. However, certain conditions must be met before these payments will be made: price conditions must be met, the producer must meet all conditions for payment, including compliance with "sodbuster" and "swampbuster" provisions and any planting restrictions, the Commodity Credit Corporation (CCC) must not have exhausted its statutory borrowing authority, and Congress must not have cut back on the programme, by an appropriations bill or otherwise.

96. As the question notes, different price conditions apply to each of these payments. For example, in the case of marketing loan payments, the adjusted world price (as calculated by the Department of Agriculture) must be below 52 cents per pound. Recently, the adjusted world price has been above 52 cents per pound and thus no marketing loan payments have been made to qualified recipients.

97. There is no preset limit on the total amount of payments that can be made under each of these programmes although for counter-cyclical payments a maximum total outlay can be calculated using the base acres, base yields, and maximum payment rate for each commodity produced during the historical base period. In addition, for certain recipients, per-person payment limits may apply. We also note that under Section 1601(e) of the 2002 Act, the Secretary has the authority (so-called "circuit breaker" authority) to make adjustments to farm programmes because of WTO domestic support reduction commitments. Presumably, this authority could result in refusals to make certain payments.

98. Conditions for receiving counter-cyclical and marketing loan payments are numerous. The programme contract for counter-cyclical payments is required by section 1105 of the 2002 Act. That section provides explicitly that the producers must agree: (A) to comply with the requirements dealing with the highly erodible cropland conservation found at 16 USC 3811 *et seq*.; (B) comply with the wetland conservation requirements found at 16 USC 3821 *et seq*.; (C) comply with the planting flexibility requirement of Section 1106 of the 2002 Act; (D) use the land representing the base acres for an agricultural or conserving use but not for a non-agricultural, commercial, or industrial use, as determined by the Secretary; and (E) control noxious weeds and otherwise maintain the land in accordance with sound agricultural practices as determined by the Secretary of Agriculture, if the agricultural or conserving use involves the noncultivation of any portion of the land as permitted under the specification just set out in (D). For marketing loans, the loan agreement and loan

regulations, contained in 7 CFR part 1421, specify various conditions that must be met and followed by the producer. Under 16 USC 3811 *et seq*., the wetland and conservation provisions cited above are made applicable to all commodity benefits, including loans.

**163. Are US cotton producers able to cover the fixed and variable costs without subsidies? Please provide substantiating evidence. Of what relevance is this, if any, to Brazil's actionable subsidy claims ? US, BRA**

99. The United States notes that even using cost data that reflects 1997 cost structures[44], US producers appear to have been able to cover variable costs through the sale of cotton at harvest time in every year but marketing years 2001 and (more narrowly) 2002. In this, US producers were no different than Brazil's farmer witness, Christopher Ward, who stated: "But even with these high yields and the excellent quality of our land, we were not able to fully recover all of our variable costs of production during the 2000/01 and 2001/02 seasons[,]" a position evidently shared by most producers in Mato Grosso, Brazil's leading cotton-producing state.[45]

100. Furthermore, even in years in which US producers may not have been able to cover fixed and variable costs, it does not follow that it is subsidies that covered these costs. Again, Mr. Ward explained that in marketing years 2000 and 2001, "Nor were we able to meet our total costs which include the additional fixed costs." Therefore, producers can cover costs from revenue sources other than subsidies. That harvest prices at times fall below costs does not necessarily mean that subsidies have had the effect of maintaining production.

**US upland cotton operating costs compared to harvest cotton price**

| Year | Cotton price at harvest ($/lb) | Average operating cost ($/lb) |
|---|---|---|
| 1998 | 0.64 | 0.481 |
| 1999 | 0.47 | 0.418 |
| 2000 | 0.57 | 0.473 |
| 2001 | 0.35 | 0.447 |
| 2002 | 0.42 | 0.453 |

## K. CAUSATION

**164. When the US points, in its oral statement of 7 October, to the alleged "bias" of Prof. Sumner's model, is it arguing that US subsidies are irrelevant to the movement in prices and production (acreage) of upland cotton? US**

101. The United States recognizes that subsidies can potentially affect production and prices of upland cotton. The question is one of the nature of the subsidy examined and the degree of any predicted effect, which could range from significant to negligible. The criticisms of Dr. Sumner's model outlined in the US oral statement of October 7, 2002 take issue with many of the underlying

[44] Recall that the Department of Agriculture conducted a survey of cotton farmers in 1997. For any cost data published by the Department since that time, the 1997 data has merely been updated by applying the producer price index to 'update' input costs. *See* US Closing Statement at the Second Session of the First Panel Meeting, paras. 10-11.

[45] Statement of Mr. Christopher Ward at the Second Session of the First Panel Meeting, para. 6 (emphasis added). Mr. Ward goes on to state: "Based on my discussions with many producers relating to Mato Grosso cotton production and revenue, *I know that most other producers in State of Mato Grosso were in the same situation as we were during the 1999-2000 period." (Id* (emphasis added)

assumptions in the model, particularly in regards to how decoupled payments were modelled and the choice of baselines used by Dr. Sumner, which have led to results that have exaggerated the impact of US subsidies on world cotton markets.

**165. Please comment (and submit substantiating evidence) on the US assertion that the FAPRI model has been designed and developed for prospective analysis, and is not suitable for retrospective counterfactual analysis. What is the reliability of past FAPRI-produced analyses when compared with actual data for the period covered by them? Is there any other instrument that can be used to try to identify the effect of subsidies already granted, or of their removal? BRA, US**

102. FAPRI uses its models for prospective analyses; that is, they analyze the future effects of proposed programme changes against a baseline that assumes current programmes are in place. Recent examples of FAPRI analyses include the effects of stricter payment limitations on US farmers[46], an analysis of the European Union's 2003 CAP Reform Agreement[47], and the effects on the US dairy industry of removing current Federal regulations.[48] These analyses are forward-looking examinations of the effects of policy changes.[49]

103. Econometric modelling systems similar to the ones maintained by FAPRI and USDA are designed for prospective analyses of alternative policy assumptions. The foundation for forward-looking analyses is the baseline projections, which are conditioned on specific assumptions for exogenous variables, i.e., those that are independent of the modelling system. The baseline model is also conditioned to incorporate the current structure of specific commodity markets through equation specifications, elasticity estimates, and structural shift and dummy variables. As a result, the baseline models will not be appropriately structured to analyze changes over a historical period. For example, models calibrated for the current structure of the US textile industry may not be appropriate to assess the structure present in the late 1990's due to the tremendous changes that have occurred. Another difficulty of using the system over a historical period is the degree of external shocks that impact the model. In prospective analysis, assessing the impacts of alternative policies occurs absent of extreme shocks from independent variables.

---

[47] FAPRI. *Analysis of the 2003 CAP Reform Agreement.* FAPRI Staff Report #2-03, 9 September 2003. 16 pp. Available at: http://www.fapri.missouri.edu/FAPRI_Publications.htm

[48] FAPRI. *The Effects on the United States Dairy Industry of Removing Current Federal Regulations.* FAPRI-UMC Report #03-03. April 2003. 14 pp. Available at http://www.fapri.missouri.edu/ FAPRI_Publications.htm

[49] FAPRI recognizes the forward-looking nature of its analyses and the limitations of those baselines quite clearly:

> Each year, FAPRI prepares a set of baseline projections that provide information about the outlook for agricultural markets, farm programme spending, farm income, and a variety of other indicators. The baseline then serves as the point of comparison for analyses of alternative policy options....
>
> The baseline is not a forecast of what will happen, but rather a projection of what could happen under a particular set of assumptions. Current global policies are held in place, even when there is reason to suspect changes are likely....
>
> In reality, these assumptions are certain to be violated and actual market outcomes will differ from the deterministic baseline projections presented in the supply-demand tables....

FAPRI 2003 US Baseline Briefing Book, Foreward, page 1. FAPRI-UMC Technical Data Report 04-03 (March 2003) (www.fapri.missouri.edu).

104. As mentioned by Dr. Sumner in Annex I to Brazil's submission of 30 September, baseline models such as the one utilized by FAPRI or USDA are not forecasting models. They are used to analyse proposed policy changes.[50] The attached table shows the forecast accuracy for year ahead price forecasts by FAPRI.

**FAPRI farm price projections for upland cotton compared to actual prices, MY1999-2003 ($/lb)**

| FAPRI published baseline | Marketing year | FAPRI projected price | Actual price 1/ | Difference 2/ |
|---|---|---|---|---|
| January 1998 | 1999/00 | 0.689 | 0.45 | -0.239 |
| January 1999 | 2000/01 | 0.531 | 0.498 | -0.033 |
| January 2000 | 2001/02 | 0.479 | 0.298 | -0.181 |
| January 2001 | 2002/03 | 0.554 | 0.43 | -0.124 |
| January 2002 | 2003/04 | 0.385 | 0.463 3/ | 0.078 |

*Source: FAPRI, USDA World Agricultural Supply and Demand Estimates*
1/ Marketing year average farm price reported by USDA.
2/ Actual farm price minus forecast price
3/ Average cotton farm price for August 2003. USDA is prohibited from publishing cotton price forecasts.

105. One potential approach to using a baseline model to estimate the effects of subsidies during a historical period would be to use an *ex post* prospective analysis. Under an *ex post* analysis, instead of using the current baseline for measurement, one would use a past baseline to make year-ahead projections of the effects of subsidies on the cotton market. For example, to analyze the effects of subsidies on the 1998/99 marketing year, one could use the January 1998 FAPRI baseline model to project the effects of removing subsidies and compare them to baseline levels for the 1998/99 marketing year. To analyze the 1999/00 marketing year, one would update the baseline to the January 1999 baseline and so on, until the current baseline. This would provide baseline comparisons that would reflect the estimated effects of the programmes at the time of planting in each year.

**166. The US states that "futures prices demonstrate that market participants predict increasing upland prices over the course of the marketing year" (US 7 October oral statement, para. 62). Please elaborate on this argument including citing specific futures prices. US**

106. Exhibit US-68 shows average daily closing prices for the December 2003 cotton futures contract. Daily futures prices for December 2003 and May 2004 delivery have increased by as much as 35 per cent from January 2003 levels.

107. Futures prices reflect a price that a buyer is willing to pay to secure a supply at a given price and protect against the possibility of prices rising even higher. Thus, where futures contract prices are higher than current market prices, the futures prices suggest that cotton buyers are concerned about

[50] For example, the US Department of Agriculture explains:
The projections are a conditional scenario with no shocks and are based on specific assumptions regarding the macroeconomy, agricultural policy, the weather, and international developments. In particular, the baseline incorporates provisions of the Farm Security and Rural Investment Act of 2002 (2002 Farm Act) and assumes that current farm legislation remains in effect through the projections period. The projections are not intended to be a Departmental forecast of what the future will be, but instead a description of what would be expected to happen under a continuation of the 2002 Farm Act, with very specific external circumstances. Thus, the baseline provides a point of departure for discussion of alternative farm sector outcomes that could result under different domestic or international assumptions."
USDA Agricultural Baseline Projections to 2012. Office of the Chief Economist, US Department of Agriculture.

the possibility of cotton prices rising still higher and are willing to lock in a purchase price that carries a premium over current prices.

108. In fact, current futures prices reveal that market participants anticipate upland cotton prices rising over the current 2003 marketing year.

| New York Cotton Exchange, Closing Futures Prices MY03<br>Friday, 24 October 2003[51] | |
|---|---|
| December 2003 contract | 82.11 cents per pound |
| March 2004 contract | 84.34 cents per pound |
| May 2004 contract | 84.50 cents per pound |
| July 2004 contract | 84.64 cents per pound |

That is, a producer may sell cotton futures for December delivery at 82.11 cents per pound, but for deliver later in marketing year 2003 the price rises to greater than 84 cents per pound. To update the information provided by the United States to the Panel in its further submission[52], these futures prices indicate that the market expects cotton prices to remain well above their 20-year average of 67.86 cents per pound (1983-2002) within the current 2003 marketing year and well above what Brazil calculates as the 1980-98 A-index average (74 cents per pound) – that is, the average for the period *before* Brazil alleges serious prejudice through significant price suppression or depression.[53] Thus, given expected cotton prices reflected in futures contracts, Brazil has not demonstrated any clearly foreseen and imminent likelihood of serious prejudice. Quite the contrary: in marketing year 2003, upland cotton producers expect high and increasing prices.

**167. How does Brazil react to Exhibit US-44? BRA**

**168. Please confirm that the production figures cited in Exhibit US-47 are for upland cotton only and do not include textiles. US**

109. Yes, the production figures cited in Exhibit US-47 are for upland cotton production only. They do not include the raw cotton equivalent of textile production.

**169. Can the US confirm the accuracy of the facts and figures cited in the four bullet points in paragraph 12 of Brazil's 7 October oral statement? US**

110. From paragraph 12 of Brazil's 7 October oral statement:

> *Between MY 1999-2001, prices received by US upland cotton farmers fell by 34 per cent, yet US production increased by 20.3 per cent. . . . .*
>
> **Fact check**: We can confirm the price and production figures given and would note again Brazil's selective use of marketing year 2001 as the end-point for its comparison. As Brazil complains of effects over marketing years 1999-2002, it would appear that Brazil has simply chosen to use MY2001 figures to inflate the figures it presents.
>
> *Between MY 1999-2002, the average US upland cotton farmer would have lost 24.3 cents per pound for every pound of cotton produced if revenue were based only on market revenue. The US response to this huge gap between market prices and costs was to increase*

[51] Current futures contract prices are available at: http://www.nybot.com/cotton/ (click on "Futures").
[52] *See, e.g.*, US Further Submission, para. 118.
[53] Brazil's Further Submission, para. 114, figure 6.

*production leading to an increase of US exports by 78.7 per cent and to an increase in the US world market share from 24.1 per cent to 41.6 per cent. . . . .*

**Fact check**: Based on Economic Research Service (ERS) estimates provided in Exhibit US-69, the market value of upland cotton (including the value of cottonseed) averaged $325.06 per acre over MY 1999-2002. Operating costs averaged $261.35 per acre over MY 1999-2002. The value of upland cotton production less operating costs averaged $63.71 per acre. Based on an average upland cotton yield of 577 pounds per planted acre, upland cotton producers received 11.05 cents per pound above their operating costs.

We can confirm the export figure but note that the US share of "world exports" rose from 24.1 per cent in 1999/00 to 39.34 per cent in 2002/03. (See US response to Question 160). In addition, we note that US world market share over the marketing year 1999-2002 period fell from 18.6% in MY1999 to 16.9% in MY2000, rose to 19.8% in MY2001, and fell again to 19.6% in MY2002.[54]

*Between MY 1999-2001, the US dollar appreciated approximately 15 per cent against the currencies of other worldwide cotton producers. . . . US exports increased by 68 per cent. . . . .*

**Fact check**: ERS calculates a commodity-weighted exchange rate index for upland cotton based on the real exchange rates of importing countries, weighted by the share of US cotton exports.[55] Based on this index, the dollar appreciated by 6.2 per cent from 1999 to 2001. ERS also calculates a commodity weighted exchange rate index based on the currencies of other cotton producers and their share in world cotton trade. Based on this index, the dollar appreciated by 11 per cent from 1999 to 2001.

**Fact check**: We can confirm the US upland cotton export figure and again note Brazil's use of marketing year 2001 for its comparison.

*US costs of production are much higher than those of most other exporters of upland cotton, yet the US export market share increased from 24.1 per cent to 41.6 per cent between MY 1999-2002.*

**Fact check**: In paras. 284 and 285 of its Further Submission of 9 September 2003, Brazil uses data from the International Cotton Advisory Committee (ICAC) to compare costs of production across countries, which represents the most complete published comparisons of costs of cotton production for major cotton producing countries. Nevertheless, even when good survey data are available for one country, using cost of production data to draw valid economic conclusions is fraught with difficulties. In fact, the ICAC specifically discourages this kind of cross-country comparison: "***Because of a number of limitations, it is not advisable to compare the costs of production among several countries at the same time***".[56]

**Fact check**: Over the period 1999/00 to 2002/03, the US share of world exports rose from 24.1 per cent to 39.34 per cent. (See US response to Question 160).

**170. Brazil quotes a report that states that a 10% increase in soybean prices reduces upland cotton acreage by only 0.25% (Brazil's 7 October oral statement, para. 27). Could Brazil indicate if this analysis is done on a short-run basis or a long-run basis? BRA**

[54] *See* Exhibit US-47.
[55] *See* Exhibit US-69.
[56] Raffiq Chaudhry, International Cotton Advisory Committee, "Cost of Producing Raw Cotton" Presented at the III Brazilian Cotton Congress, Brazil, 31August 2001 (emphasis added).

**171. In paragraphs 22 and 23 of its further submission, we understand that the US is, in short, claiming that increased total supply (i.e. including polyester) drove prices down. On the other hand, we note that, according to the figures in the chart in paragraph 22 of the same submission, the world production of cotton during this period has basically been steady. Do all polyester fibres as represented by these figures compete directly with cotton? That is to say, do these figures for polyester fibres include, for example, those that are used for textiles that technically cannot be substituted by cotton? US**

111. The figures in the chart in paragraph 22 represent world polyester textile production. Polyester competes with cotton either directly in the fibre market or indirectly through apparel and other intermediate products.

**172. Please estimate the price effect, in cents per pound, of the growth in the US retail market which it is said has directly contributed to strengthening world cotton prices. US**

112. As was presented in the table in paragraph 27 of the Further Submission of the United States of 30 September 2003, US retail purchases of raw cotton fibre increased from 12.3 million bales in 1990 to 20.9 million bales in 2002, an increase of 8.6 million bales. This increase accounted for the entire increase in world retail purchases of raw cotton fibre over the same period and reflects an increase at the world level of 10 per cent. Based on the average demand elasticity of -0.25 used by Dr. Sumner in his analysis (see Annex 1 of Brazil's Further Submission to the Panel, para 23), an equivalent price decline of 40 per cent would be necessary to generate a 10 per cent increase in demand of cotton, all else held equal. Of course, this omits other factors such as supply response of world cotton producers and competition of manmade fibres. Nonetheless, it is clear that the growth in retail purchases of cotton fibres in the United States has strengthened world prices.

**173. The US asserts that "burgeoning US textile imports … shifted the disposition of US cotton production from domestic mills to export markets" (US further submission, para. 20). A similar description appears in paragraph 33, together with the explanation that "the share of world cotton consumption supplied by US cotton has been roughly the same since 1991/92". Why have sales of US cotton for export increased and sales of cotton imported into the US increased? US**

113. The role and impact of rapidly growing US textile and apparel imports is fundamental in explaining the shift in the use of US cotton production from domestic mills to foreign mills. As noted at paragraphs 20 and 33 of the US further submission, the US textile and apparel industry has suffered from declining competitiveness compared with off-shore producers for many years, reflecting many factors, including higher wage costs, a strong US dollar, etc. As domestic mills have shut down in the United States, and production has moved overseas, domestic demand for US cotton by domestic mills has declined sharply.

114. But US consumer demand for cotton products has not declined. That demand has increasingly been met by lower-priced imports of cotton textiles and apparel. As can be seen in the table following paragraph 34 of the US further submission, US imports of cotton textiles (in cotton equivalents) have more than tripled since 1990. It is important to note that the import, export, and consumption data in that table are expressed in bales of cotton-equivalent. In other words, the data are not "sales of cotton imports", but rather represent the amount of cotton imbedded in the particular products.[57]

[57] These estimates of the "cotton equivalent" of textile imports are done by USDA's Economic Research Service, based an a set of internationally-accepted conversion factors. See Cotton and Wool Situation and Outlook Yearbook. Market and Trade Economics Division, Economic Research Service. US Department of Agriculture, November 2002, CWS-2002.

115. US cotton is grown to be used to make cotton textiles and apparel. The point of the US submission is to explain how the location of where US cotton is manufactured into products has shifted. US and world consumers continue to purchase cotton products. But increasingly US consumers purchase those cotton products, made from exported US cotton, from overseas manufacturers as US manufacturers are less able to compete. That is the structural transformation that paras. 33-34 and the accompanying table seeks to present and explains at least in part some of the changes in US exports.

**174. How, if at all, did the Asian financial crisis affect the United States' world market share? Did it disproportionately affect the US as compared to other exporters? US**

116. The Asian financial crisis disrupted cotton consumption (spinning) in the major consuming countries of Thailand, Indonesia, and the Republic of Korea in 1997/98, reducing their mill use 9 per cent from the preceding year. In addition, the decline in world economic growth induced by the crisis reduced total world cotton consumption 3.4 per cent in 1998/99 from the pre-crisis level in 1996/97. Subsequently, however, the depreciation of currencies in these three countries boosted their cotton consumption due to expanding textile exports. World cotton consumption rose 11 per cent between 1996/97 and 2002/03, while consumption in Thailand, Indonesia, and Korea collectively rose 16 per cent. During this same period, US spinners lost market share to textile imports, due in large part to currency effects, and US domestic mill use fell 35 per cent.

117. US export share in these markets is influenced by total supply availability, qualities produced, and price. For example, US export share of the three countries' consumption fell by more than half in 1998/99, due to the drought-devastated US crop. Export share has since returned to the pre-crisis level of about 30 per cent and, with higher consumption, this added about 400,000 bales to US exports between 1996/97 and 2002/03. Since the combined total consumption increase for Thailand, Indonesia, and Korea was about 800,000 bales, this indicates that other exporters also increased exports by about 400,000 bales. As US mill use of cotton declined while exports increased, US world market share was left relatively unchanged (with a slight downward bent) by the Asian financial crisis.

**175. With reference to paragraphs 57-58 and the related table on page 21 of the US further submission, could you please clarify the arguments regarding the ratio of the soybean futures to the cotton futures prices since in the table the inverse ratio is used? US**

118. Attached is a corrected version of the table. The ratio of cotton futures price to soybean futures prices is positively correlated with movement in planted cotton area.

**Expected cotton and soybean prices and planted cotton acreage**

| Year | December cotton futures (cents/lb) | November soybean futures ($/bushel) | Ratio of cotton futures to soybean futures | Planted cotton acres (million acres) |
|---|---|---|---|---|
| 1996 | 78.58 | 7.23 | 10.87 | 14.4 |
| 1997 | 76.82 | 6.97 | 11.02 | 13.6 |
| 1998 | 72.13 | 6.64 | 10.86 | 13.1 |
| 1999 | 60.32 | 5.11 | 11.8 | 14.6 |
| 2000 | 61.31 | 5.32 | 11.52 | 15.3 |
| 2001 | 58.63 | 4.67 | 12.55 | 15.5 |
| 2002 | 42.18 | 4.50 | 9.37 | 13.7 |
| 2003 | 59.6 | 5.26 | 11.33 | 13.5 |

**176. With reference to Figure 4 of Brazil's Further Submission, how does Brazil explain the apparent decrease in prices in 2001 and the increase of the A-Index in recent months, despite the continued use of US subsidies on upland cotton? BRA**

**177. Could the United States further elaborate on paragraph 50 of its 7 October oral statement? US**

119. Lin et al. estimated that the own-price elasticity of cotton acreage under the FAIR Act was 0.466.[58] This is identical to the 2003 net-return elasticity reported by Dr. Sumner. However, it is incorrect to equate a price elasticity to net-return elasticity given the linear specification utilized by Dr. Sumner. The implied price elasticity from Dr. Sumner's model would be approximately 50 per cent larger than the net-return elasticity. Larger elasticities imply greater acreage shifts to change in policies or prices.

120. The relationship between the price elasticity and a net revenue elasticity can be shown as follows. Given a linear specification as described by Dr. Sumner, then cotton area (CA) can be expressed:

(1) $CA = a0 + a1*CNR + a2*Z,$
where CNR is Expected Cotton Net Returns and Z is a vector of other variables including returns from competing crops.

The elasticity with respect to CNR is found by differentiating the equation with respect to CNR. The derivative is the coefficient a1. The elasticity, eNR, is expressed as follows:

(2) $eNR = a1 * CNR / CA.$

With CNR a function of the cotton price P, the elasticity with respect to P can be determined by taking the derivative of the equation with respect to price P. Based on equation (1) from page 13 of Annex I, the derivative with respect to price P is a1*Y, where Y is expected yield.

It follows that the price elasticity is $eP = a1 * Y * P / CA$. One can then conclude that $eNR/eP = ENR / (Y*P)$.

The relationship between eNR and eP can be found by looking at the relationship between CNR and Y*P. Specifically, $eP = ((Y * P) / CNR) * eNR$.

In recent years, the ratio of $(Y * P) / CNR$ has been approximately 1.5, implying that $eP = 1.5 * eNR = 1.5 * 0.466 = 0.699$.

**178. The Panel notes Exhibit US-63. Could the US please provide a conceptually analogous graph concerning US export sales during the same period? US**

121. Exhibit US-70 shows in table and graph form the per cent change over the previous year for upland cotton exports by the United States and the rest of the world. In addition, the United States provides in Exhibit US-71 a table and graph demonstrating the absolute levels of US exports and domestic consumption. As the figures show, over the last seven years domestic consumption has declined by almost the same amount by which exports have increased, leaving US world market share largely unchanged.

[58] **Lin, W., P.C. Westcott, R. Skinner, S. Sanford, and D.G. De La Torre Ugarte. *Supply Response Under the 1996 Farm Act and Implications for the US Field Crops Sector.* US Department of Agriculture, Economic Research Service, Technical Bulletin No. 1888**, Appendix table 21.

**179. Could Brazil comment on the argument that decoupled payments and other subsidies to upland cotton are largely being capitalized into land values and that removing these subsidies would reduce the cost of production of upland cotton producers (US 7 October oral statement, para. 48). What would be the net effect of these adjustments? BRA**

**180. Please describe the precise formula as to how USDA determines the "adjusted world price" using the Liverpool A-Index, the NY futures price and any other relevant price indicators. Please submit substantiating evidence. BRA, US**

122. The Adjusted World Price (AWP) is equal to the Northern Europe (NE) price (the 5-day average of the 5 lowest-priced growths for Middling 1-3/32 inch cotton, cost, insurance and freight [CIF] northern Europe), adjusted to US base quality and average location. The AWP for individual qualities is determined using the schedule of loan premiums and discounts and location differentials. A "coarse count adjustment" (CCA) may be applicable for cotton with a staple length of 1-1/32 inches or shorter and for certain lower grades with a staple length of 1-1/16 inches and longer. The AWP and CCA are announced each Thursday.[59]

123. A Step 1 adjustment to the AWP may be made when the 5-day average of the lowest US growth quote for Middling 1-3/32 inch cotton, CIF United States-northern Europe (USNE) price, exceeds the NE price and the AWP is less than 115 per cent of the loan level. The Secretary of Agriculture may lower the AWP up to the difference between the USNE price and the NE price. A Step 1 adjustment has never been made, although the conditions have been met many times.

**181. Please provide a side-by-side chart of the weekly US adjusted world price, the Liverpool A-Index, the NY futures price, and spot market prices from 1996-present. What, if anything, does this reveal? BRA, US**

124. Exhibit Q181 sets out weekly price movements for the Adjusted World Price, the Liverpool A Index, the nearby New York cotton futures price and the spot market price from January 1996 to present.

**182. Please explain why the US can be taken to be price leaders, or price setters, (and not just takers) when US producers receive large subsidy payment to support the difference between world prices and their own costs? BRA**

## L. ARTICLE XVI OF GATT 1994

**183. Why does Brazil believe that the appropriate "previous representative period" is the term of the previous Farm Bill, MY1996-2002? (Brazil's further submission, para. 282) BRA**

**184. Why does Brazil believe that an "equitable share" is one which factors out all subsidies? To the extent that domestic support and export subsidies are permitted by the Agreement on Agriculture, why should they not be accepted as being normal conditions in analyzing an equitable market share? (See Brazil's further submission, paras 288-289) BRA**

**185. Please respond to the following questions concerning the relationship between Article XVI:3 of the GATT 1994, the disciplines on export subsidies and domestic support in the Agreement on Agriculture and the disciplines on prohibited export subsidies and actionable subsidies in Articles 3, 5(c) and 6.3(d) of the SCM Agreement. BRA, US**

**(a) Are agricultural domestic support programmes challengeable under Article XVI:3 of the GATT 1994? How, if at all, is the title of Section B of Article XVI ("Additional**

[59] *See* Exhibit US-72.

**provisions on *export subsidies*" (emphasis added)) relevant? How, if at all, are Articles 13 and 21.1, or any other provisions of the Agreement on Agriculture, relevant?**

125. As indicated in the US opening statement at the recent panel meeting[60], GATT 1994 Article XVI:3 applies only to export subsidies. Paragraph 3 is found in Part B of Article XVI, entitled "Additional Provisions on Export Subsidies", as opposed to Part A, which is entitled "Subsidies in General". Paragraph 2 (also in Part B) states that "[c]ontracting parties recognize that the granting of a *subsidy on the export* of any product may have harmful effects for other contracting parties" (emphasis added). Paragraph 3 begins with the word "[a]ccordingly", the ordinary meaning of which is "[i]n accordance with the logical premises; correspondingly"[61], and follows with "contracting parties should seek to avoid the use of *subsidies on the export* of primary products" (emphasis added). That is, "in accordance with" the recognition in paragraph 2 that export subsidies may have harmful effects, paragraph 3 address the use of "subsidies on the export of primary products". The second sentence of paragraph 3 follows this hortatory statement with the obligation not to apply subsidies "which operate[] to increase the export of any primary product" in a manner that "results in a contracting party having more than an equitable share of world export trade in that product". Paragraph 4 "[f]urther" addresses export subsidies for "any product other than a primary product". Thus, the text and context of paragraph 3 indicate that this provision is addressed to export subsidies and not domestic support programmes.

126. The Peace Clause provides further context supporting this interpretation. Article 13(c)(ii) exempts export subsidies that conform fully with Part V of the Agreement on Agriculture from, *inter alia*, "actions based on Article XVI of GATT 1994" – that is, including Article XVI:3 on export subsidies. Article 13(b)(ii), on the other hand, exempts conforming domestic support measures from, *inter alia*, "actions based on paragraph 1 of Article XVI of GATT 1994" but does not mention Article XVI:3. Thus, Article 13 lends contextual support to the notion that Article XVI:3 applies to export subsidies on primary products or commodities but does *not* apply to domestic subsidies on such products.

**(b) Are the requirements of Article XVI:3 of the GATT 1994 reflected in, developed by or subsumed by the requirements in Article 6.3(d) of the SCM Agreement, or in any other provisions of the covered agreements? Of what relevance, if any, is the Appellate Body Report in US-FSC, para. 117 here?**

127. Article 6.3(d) of the Subsidies Agreement does not, by its terms, interpret or replace GATT 1994 Article XVI:3. In fact, the range of measures potentially actionable under Article 6.3 is broader than the export subsidies subject to GATT 1994 Article XVI:3. In addition, the analysis under these two provisions is different. Article 6.3(d) is concerned with whether the effect of a subsidy is to increase the world market share of the subsidizing Member; GATT 1994 Article XVI:3 is concerned with whether export subsidies result in a Member having "more than an equitable share in world export trade" in a particular product. However, an important similarity between these two provisions is the scope of products covered by their respective disciplines. GATT 1994 Article XVI:3 is concerned with export subsidies on primary products; Article 6.3(d) is concerned with any subsidy on "a particular subsidized primary product or commodity". This similar product coverage resulted because Members desired to provide more operationally effective subsidies disciplines with respect to these products but had found the "more than equitable share" language of GATT 1994 Article XVI:3 to be unworkable. For further discussion, please see the US response to Question 186 from the Panel.

**(c) Of what relevance, if any, is the fact that the definition of "subsidy" in Article 1 of the SCM Agreement and the prohibition on subsidies contingent upon export in**

[60] US Opening Statement at the Second Session of the First Panel Meeting, para. 60.
[61] *The New Shorter Oxford English Dictionary*, vol. 1, at 15 (1993 ed.) (third definition).

**Article 3.1(a) were introduced in the Uruguay Round, but did not exist at the time that the GATT 1947 was negotiated?**

128. The United States notes the Appellate Body's discussion of relevant differences between the provisions of the Subsidies Agreement and those of GATT 1994 in *United States – FSC*.

**186. Could the United States please expand upon its statement that "[t]hese are the types of considerations that led to the negotiation of the Subsidies Agreement...." (US further submission, para. 109)? Is there any relevant material, including, for example, drafting history that might support this statement? US**

129. Dissatisfaction with the difficulties in applying the "more than equitable share" standard of GATT 1994 Article XVI:3 was an important motivation for the negotiation of stronger and more operational disciplines in the WTO Subsidies Agreement. In two separate challenges in 1979 and 1980 to the sugar export subsidy programme of the European Communities by Australia and Brazil, panels were unable to find that the export refunds provided by the Communities resulted in a "more than equitable share" of world export trade.[62] Similarly, in the 1983 US challenge to export subsidies on wheat flour by the European Communities (quoted in the US further submission), "[t]he [p]anel found that it was unable to conclude as to whether the increased [EC] share [of world exports of wheat flour] has resulted in the EEC 'having more than an equitable share' in terms of Article 10 [of the Subsidies Code], in light of the highly artificial levels and conditions of trade in wheat flour, the complexity of developments in the markets, including the interplay of a number of special factors, the relative importance of which it was impossible to assess, and, most importantly, the difficulties inherent in the concept of 'more than equitable share'".[63]

130. Significantly, the latter two of these panel reports explicitly considered the 1979 Tokyo Round Subsidies Code and its interpretive gloss on the "more than equitable share language". Article 10.2 of the 1979 Subsidies Code (of which both Brazil and the United States were signatories) stated, in pertinent part:

> For purposes of Article XVI:3 of the General Agreement and paragraph 1 above:
>
> (a) "more than an equitable share of world export trade" shall include any case in which the effect of an export subsidy granted by a signatory is to displace the exports of another signatory bearing in mind the developments on world markets;
>
> (b) with regard to new markets traditional patterns of supply of the product concerned to the world market, region or country, in which the new market is situated shall be taken into account in determining 'equitable share of world export trade'[.]

That is, the 1979 Subsidies Code represented an effort to make operational the discipline provided in GATT 1994 Article XVI:3 by giving additional meaning to the phrase "more than an equitable share of world export trade". Despite that effort, however, the panel considering the Brazilian challenge to EC sugar export subsidies and the panel considering the US challenge to EC wheat flour export subsidies remained unable to find any inconsistency with GATT 1994 Article XVI:3 (in the words of

[62] *European Communities – Refunds on Exports of Sugar*, L/4833, 26S/290 (adopted 6 November 1979) (complaint by Australia); *European Communities – Refunds on Exports of Sugar*, L/5011, 27S/69 (adopted 10 November 1980).

[63] *European Economic Community – Subsidies on Export of Wheat Flour*, SCM/42, para. 5.3 (unadopted 21 March 1983).

the Wheat Flour panel) "in light of . . . , most importantly, the difficulties inherent in the concept of 'more than equitable share'".

131. Thus, there was a recognition in the Uruguay Round subsidies negotiations that the effort in the 1979 Subsidies Code to make GATT 1994 Article XVI:3 more operationally effective had not succeeded. For example, a reference paper on GATT subsidies rules and the existing status of discussion of these rules prepared by the GATT Secretariat for the Negotiating Group on Subsidies and Countervailing Measures states:

> The most pronounced difficulties have occurred in connection with the concept of "more than an equitable share" embodied in Article XVI:3 of the GATT. The Agreement on Subsidies and Countervailing Measures (Article 10) attempted to bring precision to Article XVI:3 but it has not always been found to give clear guidance on its interpretation. Consequently a number of disputes involving the concept of "more than an equitable share" have not found a satisfactory solution and in some cases have provoked retaliatory subsidization. The case-by-case application of this concept has revealed its imprecisions and the fact that it largely refers to notions which escape objective criteria. There is, for example, sufficient imprecision in this concept to allow countries using export subsidies to argue that these subsidies do not result in obtaining more than equitable share. On the other hand it is not always possible to provide causality between the subsidy and the increase share. Furthermore, it is impossible to derive a general line of case law from the decisions of panels, some of which have given divergent interpretations.[64]

132. A checklist of issues for the negotiations based on Contracting Parties' written submissions and oral statements prepared by the Secretariat demonstrates that Contracting Parties were well aware of these difficulties and the need to move away from the "more than an equitable share" concept:

> There is a need for review, with a view to improving GATT disciplines, of the provisions of Article XVI:2 and 3. Notably there is a need to build on the recognition embodied in Article XVI:2 and the exhortation in the first sentence of XVI:3 in the direction of improving the conditions of competition on world markets for primary products currently covered by the equitable share criterion in the second sentence of Article XVI:3.
>
> The review should examine the application of the "more than an equitable share" rule for primary products. This rule has serious conceptual flaws and in practice has failed to provide clear guidance as to the permissible scope of primary product subsidization. . . . .
>
> The Negotiating Group should consider negotiating a similar prohibition to that of Article 9 of the Code on the use of export subsidies for forest, fishery and farm products.
>
> The prohibition on export subsidies for products other than basic or primary products under Article XVI:4 and Article 9 of the Code should be extended to agricultural, forestry and fishery products, in other words to all basic or primary products.
>
> A major objective of these negotiations should be to extend the existing prohibition on export subsidies to cover all products, primary as well as non-primary.

[64] *Subsidies and Countervailing Measures: Note by the Secretariat*, MTN.GNG/NG10/W/4, at 79 (28 April 1987) (Section VI.3).

> There are serious deficiencies in Article XVI:3 of the GATT and in Article 10 of the Code, notably the fundamental problems connected with the 'more than equitable share' concept. However, these problems arise from the basic fact that current disciplines for primary products are significantly weaker than those which apply to manufactured goods. They cannot be resolved merely by making minor adjustments to rules which are intrinsically defective. The only genuine, long-term solution is an effective prohibition on all export subsidies. Accordingly at this stage of the negotiating process, there is little value in trying to improve the "more than equitable share" rule, which is only relevant so long as there is no general prohibition on export subsidies.[65]

133. Reflecting the desire of Members to move away from the "more than an equitable share" concept which had repeatedly been found by panels to be incapable of application, the WTO Subsidies Agreement does not provide any further definition or interpretation of GATT 1994 Article XVI:3. Instead, it contains the general prohibition on export subsidies in Article 3 and rules on adverse effects, including serious prejudice.

## M. THREAT CLAIMS

**187. Please provide USDA's projections of marketing loan/LDP payments, direct payments and counter-cyclical payments to be made during MY2003 through 2007 based on the most recent USDA baseline projection. US**

134. The following table shows projections for cotton marketing loan/LDP payments, direct payment and counter-cyclical payments for crop years 2003 through 2008, as published in the FY2004 Mid-Session Review on 15 July 2003. We note that projected outlays for marketing year 2003 are likely to be significantly overstated given the increase in prices and futures prices over the course of this marketing year. For example, no marketing loan payments are currently being made because the adjusted world price is above the marketing loan rate.

**Projected outlays (million dollars)**

| Item | 2003 | 2004 | 2005 | 2006 | 2007 | 2008 |
|---|---|---|---|---|---|---|
| Direct payments | 587 | 587 | 587 | 587 | 587 | 587 |
| Counter-cyclical payments | 929 | 602 | 521 | 521 | 521 | 521 |
| Loan deficiency payments | 420 | 298 | 193 | 137 | 137 | 82 |
| Marketing loan gains | 22 | 13 | 8 | 6 | 6 | 3 |
| Certificate gains 1/ | 196 | 114 | 75 | 55 | 52 | 29 |

1/ Includes value of non-cash marketing loan transactions.

**188. Can the United States comment on the FAPRI projections for cotton provided in Exhibit BRA-202? US**

135. The FAPRI projections presented by Brazil in Exhibit BRA-203 reflect the January 2003 FAPRI projections. These projections were published by Iowa State University in January 2003.[66] The same projections were published by FAPRI at the University of Missouri in March 2003 and were referenced by the United States in Exhibit US-52.

[65] *Checklist of Issues for Negotiations: Note by the Secretariat*, MTN.GNG/NG10/W/9/Rev.4, at 26-28 (12 December 1988).

[66] Food and Agricultural Policy Research Institute. *FAPRI 2003: US and World Agricultural Outlook.* Iowa State University Staff Report 1-03. January 2003.

136. Of significance is the difference between the January 2003 baseline and the preliminary baseline of November 2002 utilized by Dr. Sumner in his analysis. Under the January 2003 baseline, the Adjusted World Price (AWP) forecasts for 2002/03 to 2007/08 are considerably higher than the forecasts made in the preliminary November 2002 baseline. Because loan deficiency payments and marketing loan gains are calculated based on the difference between the loan rate and the AWP, this means that expected marketing loan subsidies under the November 2002 baseline are far higher than expected marketing loan subsidies under the January 2003 baseline. Thus, the effects of eliminating marketing loans would tend to be biased upwards using the preliminary November 2002 baseline.

**Differences in the Adjusted World Price forecast between the November 2002 and January 2003 FAPRI baseline ($/lb)**

| | 2002/03 | 2003/04 | 2004/05 | 2005/06 | 2006/07 | 2007/08 |
|---|---|---|---|---|---|---|
| November 2002 baseline 1/ | 0.3597 | 0.3722 | 0.3983 | 0.4194 | 0.436 | 0.4548 |
| January 2003 baseline 2/ | 0.448 | 0.454 | 0.46 | 0.46 | 0.467 | 0.48 |
| Difference | 0.0883 | 0.0818 | 0.0617 | 0.0406 | 0.031 | 0.0252 |

1/ As presented by Dr. Sumner in Annex I and oral statement of 7 October 2003.
2/ As reported in Exhibit BRA-203 and Exhibit US-52

## N. CLARIFICATIONS

**189. Please indicate whether the correct figure in paragraph 37 of Brazil's 7 October oral statement is 38.1% or 38.3%? BRA**

**190. Please confirm that the figure "17.5" in paragraph 43 of Brazil's 7 October oral statement, is "percentage point". BRA**

**191. Could Brazil clarify its statement in para. 12 of its 9 September further submission: "Alternatively crop insurance is not specific because the 2000 ARP Act denies benefits to commodities representing more than half of the value of US agriculture. Further US crops represent only 0.8 per cent of total US GDP." (emphasis added) BRA**

## List of Exhibits

**UNITED STATES – SUBSIDIES ON UPLAND COTTON**

Questions from the Panel to the parties –
second substantive Panel meeting

## I. Terms of Reference

**192. Regarding the interest subsidies and storage payments listed by the United States in its response to the Panel's Question No. 67:**

**(a) Please provide a copy of the regulations under which they are currently provided and under which they were provided during the marketing years 1996-2002;**

**(b) Please indicate whether there are any such payments which are not provided to implement the repayment rate for upland cotton within the marketing loan programme. USA**

**193. Are interest subsidies and storage payments already included in the amounts shown in your submissions to date for payments under the marketing loan programme? Has there been any double-counting? BRA**

Brazil's Answer:

1. The answer to both questions is "no." Brazil reported interest subsidies and storage payments separately and thus did not double count them.[1] To the extent that the United States confirms that both of these payments are connected in some way to the storage of bales of cotton involved in the marketing loan programme, then they would appropriately be included within the overall marketing loan numbers. In that case, the Panel should increase the amount of payments attributable to marketing loan payments by including interest and storage payments related to bales of cotton in the marketing loan programme.

**194. Does the United States maintain its position stated in response to the Panel's Question No. 67 that "it would not be appropriate for the Panel to examine payments made after the date of panel establishment"? If so, please explain why. Can Brazil comment on this statement? BRA, USA**

Brazil's Answer:

2. Brazil reserves its right to further comment on the US answer provides some initial thoughts.

3. Brazil reiterates its arguments that the Panel must examine data relating to payments made after the date of establishment.[2] In addition, the Panel is not prevented from examining payment data that originates after the date of the Panel's establishment because these payments are identified in Brazil's panel request and, therefore, are within the Panel's terms of reference.

4. The measures covered by Brazil's request for the establishment of the Panel are very broad and encompass, *inter alia*, any type of payment made under the 2002 FSRI Act and the 2000 ARP Act.[3] In addition, the panel request covers, *inter alia*, a time period of a "marketing year" for 2002 for

[1] *See e.g.* Brazil's 9 September Further Submission, Table 1.
[2] Brazil's 22 August Rebuttal Submission, paras. 88-96; Brazil's 22 July Oral Statement, paras. 40-44.
[3] WT/DS267/7, p. 2.

upland cotton for the period 1 August 2002 through 31 July 2003. The panel request further covers 2002 FSRI Act and 2000 ARP Act payments *to be made* during marketing years MY 2003-2007. In addition, the identified measures guarantee the right of eligible US producers, users and exporters to receive future payments.[4] Given the comprehensive scope and timing coverage of the request for the establishment of a Panel and the mandatory nature of the payments,[5] the Panel's terms of reference encompass all payments made under the 2002 FSRI Act for the period marketing year 2002.

5. As has been firmly established in WTO jurisprudence, any "measure" identified in the panel request pursuant to DSU Article 6.2, is within terms of reference of the panel.[6] As noted above, Brazil identified all relevant "measures" in its request for the establishment in the Panel. Further, in the *Chile – Agricultural Products (Price Band)* case, the Appellate Body held that a panel request which includes reference to "amendments" is sufficient to bring later enacted significant changes to legislation within the Panel's terms of reference.[7] While Brazil's panel request also included "amendments," this case does not even raise the *Chile – Agricultural Products (Price Band)* issues because Brazil's panel request identified the measures that have not changed or been amended since 18 March 2003. Further, to the extent that "payments" made since 18 March 2003 are evidence, the Appellate Body and panels have repeatedly found that evidence generated after the establishment of the panel can be used by panel's in their objective assessment of the facts under DSU Article 11.[8]

## II. Economic Data

**195. Does the United States wish to revise its response to the Panel's Question No. 67*bis*, in particular, its statement that "the United States ... does not maintain information on the amount of expenditures made under the cited programmes to US upland cotton producers"? Did the United States make enquiries of the FSA in the course of preparing its original answer? USA**

**196. Please provide the latest data for the 2002 marketing year on payments under the marketing loan, direct payments, counter-cyclical payments, user marketing certificate (step 2) programmes and export credit guarantee programmes. BRA, USA**

Brazil's Answer:

6. With its letter of 18 December 2003, the United States has finally confirmed – after asserting the contrary repeatedly to Brazil and then to the Panel – that it has collected complete planted acreage, contract base acreage, contract yields, and even payment data that would allow it to calculate with relative precision the amount of direct and counter-cyclical payments made to current producers of

[4] Brazil's 9 September Further Submission, para. 423.

[5] US 27 October Answers to Questions, paras. 95-97.

[6] Panel Report, *Japan – Agricultural Products*, WT/DS76/R, para. 8.4; Panel Report, *Indonesia – Automobiles*, WT/DS54/R, paras. 14.3-14.4.

[7] Appellate Body Report, *Chile – Agricultural Products (Price Band)*, WT/DS207/AB/R, para. 135.

[8] Panel Report, *India – Quantitative Restrictions*, WT/DS90/R, para. 5.161-5.163 ("In this case the parties and the IMF have supplied information concerning the evolution of India's balance of payments and reserve situation until June 1998. To the extent that such information is relevant to our determination of the consistency of India's balance of payments measures with GATT rules as of the date of establishment of the Panel [18 November 1997], we take it into account."); Appellate Body Report, *EC – Hormones*, WT/DS26/AB/R, paras. 133-4 ("The deliberate disregard of, or refusal to consider, the evidence submitted to a panel is incompatible with the panel's duty to make an objective assessment of the facts. … A claim that a panel disregarded or distorted the evidence submitted to it is, in effect, a claim that the panel, to a greater or lesser degree, denied the party submitting the evidence fundamental fairness, or what in many jurisdictions is known as due process of law or natural justice."); Panel Report, *Japan – Apples*, WT/DS245/R, para. 8.49; GATT Panel Report, *Korea – Beef*, BISD 36S/268, paras. 122-123.

upland cotton in MY 2002. Therefore, Brazil looks forward to the United States answering this question in full on 22 December.

7. Unfortunately, Brazil cannot calculate direct payment and counter-cyclical payment figures because the United States refused to produce on 18 December the information requested by Brazil and the Panel. In particular, the United States refused to provide farm-specific identifying numbers, thus rendering any matching of farm-level information on contract payments with information on farm-specific plantings impossible. Only this unique farm number (or a substitute number protecting the alleged confidentiality of farmers) would allow any matching of planting and payment data critical for the calculation of the amount of contract payments that constitute support to upland cotton.[9] The United States asserts newfound "confidentiality" concerns even though it provided identical information on rice to a private US citizen making a simple FOIA request. But even these confidentiality concerns could not possibly apply to aggregate matched figures that the United States could easily calculate with the data the United States admits it has collected. On 12 January 2004, Brazil will provide a more detailed analysis of the US failure to cooperate in this proceeding by continuing to refuse to provide Brazil and the Panel with the requested information.

8. In view of the US failure to produce the requested information that would allow Brazil and the Panel to calculate easily the amount of direct and counter-cyclical payments (as well as PFC and market loss assistance payments for MY 1999-2001), Brazil must present below revised figures using its so-called "14/16$^{th}$" methodology.[10] The figures represent the best information available and are corroborated by circumstantial evidence. Moreover, in view of the US refusal to produce the actual information regarding direct payment and counter-cyclical payments, the Panel could reasonably infer that the *actual* amounts are greater than those estimated by Brazil.

[9] Brazil pointed this out more than a month ago when it stated in its 18 November Further Rebuttal Submission, that "CCC-509 *does* indicate the quantity of base acreage fir each programme crop on the farm. Since both CCC-509 and FSA-578 require identification of the *identical* 'farm' by a unique farm serial number, the base acreage from CCC-509 can be matched with the planted acreage in FSA-578. What the United States has failed to do is 'connect the dots,' *i.e.*, match the information in the two forms." (Brazil's 18 November Further Rebuttal Submission, para. 44, emphasis in original, footnotes omitted).

[10] In view of the new information provided by the United States in Exhibit US-95, Brazil has adjusted the total amount of contract payments by a ratio of 13.714 million acres of actual upland cotton plantings in MY 2002 to 18.858 million acres of total upland cotton base.

| PROGRAMME | PREVIOUS AMOUNT OF PAYMENTS[11] | NEW AMOUNT OF PAYMENTS |
|---|---|---|
| **MARKETING LOAN GAINS AND LDPS** | **$918 MILLION** | **$832.8 MILLION[12]** |
| **CROP INSURANCE** | **$194.1 MILLION** | **$194.1 MILLION[*]** **(+ $104.2 MILLION[13])** **($298.3 MILLION)** |
| **STEP 2** | **$217 MILLION** | **$217 MILLION[*]** |
| **DIRECT PAYMENTS** | **$485.1 MILLION** | **$454.5 MILLION[14]** |
| **COUNTER-CYCLICAL PAYMENTS** | **$998.6 MILLION** | **$935.6 MILLION[15]** |
| **COTTONSEED PAYMENTS** | **$50 MILLION** | **$50 MILLION[*]** |
| **OTHER PAYMENTS** | **$65 MILLION** | **$65 MILLION[*]** |
| TOTAL PAYMENTS | $2,927.8 MILLION | $2,749 MILLION ($2,853.2 MILLION) |

[*] Brazil has no new information on the amount of these payments

9. Concerning the export credit guarantee programmes, Brazil estimates the amount of payments using the "guaranteed loan subsidy" estimate FY 2003 (which largely overlaps with MY 2002) results in a subsidy amount of $17 million.[16] In sum, the latest data available to Brazil continues to demonstrate that US support to upland cotton in MY 2002 far exceeds the support decided in MY 1992.

**197. Please provide actual data for 2002/2003 for US exports, US consumption and per cent of world consumption to replace the projected data in Exhibit US-47. If available, please provide projected data for 2003/2004 to replace the forecast data. USA**

**198. Please comment on the respective merits of the price-gap calculations of MY1992 deficiency payments in US comments of 27 August, footnote 14 ($867 million), and Brazil's response to the Panel's Question No. 67 ($812 million). BRA, USA**

[11] Taken from Table 1 of Brazil's 9 September Further Rebuttal Submission.

[12] Exhibit Bra-373 (Loan Deficiency Payment and Price Support Activity as of 12/3/2003).

[13] Brazil notes that the United States also paid $104.2 million in fulfilment of its reinsurance obligations towards the insurance companies providing the insurance policies to upland cotton producers. These payments also constitute support to upland cotton, but Brazil had so far not included them in its calculation of the total support to upland cotton. This amount results from a MY 2002 loss ratio of 1.26, *i.e.*, the 26 per cent of the $400,666,618 in indemnity payments were not covered by the Federal Crop Insurance Corporation or producer premium payments. These $104.2 million were paid by the Federal Crop Insurance Corporation (*See* Exhibit Bra-374 ("Crop Year Statistics MY 2002" – Federal Crop Insurance Corporation).

[14] This calculation is based on total direct payments for upland cotton base of $625 million (US 27 August Comments, Table at para. 28 reporting PFC payments for MY 2002 of $452 million and additional direct payments of $173 million). This figure has been adjusted by the ratio of MY 2002 plantings (13.714 million acres) and MY 2002 direct payment base acreage (18.858 million acres) (*See* Exhibit US-95).

[15] Brazil has used the direct payment of $454.5 million and adjusted it by the ratio of the direct payment rate of 6.67 cent per pound basis and the CCP payment rate for MY 2002 of 13.76 cents per pound.

[16] Brazil refers the Panel to Exhibits Bra-333 (Cotton: World Markets and Trade, USDA, October 2003, Table 3) for the amount of cotton exports that were covered by export credit guarantees during the fiscal years that overlap with MY 2002 (FY 2002 and FY 2003). Since the overlap is largely with fiscal year 2003, Brazil has used the share of cotton export credit guarantees ($349.63 million) of the total guarantees made available ($5,953 million) under GSM 102 and GSM 103 in that year to calculated the amount of payments as estimated by the FCRA formula. The original subsidy estimate for FY 2003 (taken from the 2004 budget) is $294 million. The share attributable to cotton export credit guarantees would be $17 million.

Brazil's Answer:

10. Brazil has no reason to disagree with the US calculations which appear based on information exclusively within the control of the United States.

**199. What is the composition of the A-Index? We do note footnote 19 and, for example, Exhibit BRA-11, but please explain more in detail how this index is calculated. BRA**

Brazil's Answer:

11. Brazil refers the Panel to the statement made by Andrew Macdonald in Annex II of Brazil's 9 September Further Submission that provides considerable detail about the calculation and formation of the A-Index.[17] Further information is set forth in Exhibit Bra-375.[18] The A-Index, along with the B-Index, are two important indices that summarize the price developments of the physical market in various countries around the world. Both indices are published by Cotlook, Inc., a private company, and reflect an average price.[19] As an index, it is not a trading or negotiable price, but a composite of quotations from the major producing origins around the world, much like a poll.

12. The A-Index is published weekly by the Cotton Outlook and calculated daily based on daily cotton price quotes converted on the basis of delivery to Northern European ports. The A-Index is generated based on Cotlook receiving daily information as regards quotations for upland cotton referring to 16 different origins. The quotes are for an upland cotton described as quality Middling Grade with a 1 3/32" staple length. The 16 quoted prices that are eligible for inclusion in the A-Index include prices for Brazilian Middling 1 3/32" upland cotton as well as prices for US Memphis and California/Arizona Middling 1 3/32" upland cotton.[20] The A-Index value of the day represents the average of the five cheapest quotes out of the 16 quotes that are considered for the index calculation. The price quotes are derived from a variety of physical markets, merchants and trade information, which is gathered telephonically and analyzed for consistency and logic.[21]

13. Andrew Macdonald testified that growers, consumers and traders perceive the A- (and B-Index), along with the New York futures prices as reflecting the "world" market price for cotton.[22]

**200. Concerning the chart on page 37 of Brazil's further rebuttal submission, why did Brazil use a futures price at planting time? Is this a relevant measure for assessing acreage response? BRA**

Brazil's Answer:

14. Brazil presented the nearby futures chart in its 18 November Further Rebuttal Submission[23] to rebut US arguments that US producers allegedly respond to market price signals in making their

[17] Brazil's 9 September Further Submission, Annex II, paras. 22-25.
[18] Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC).
[19] Brazil's 9 September Further Submission, Annex II, paras. 22-25.
[20] The other quotes being Mexican Middling 1 3/32", Paraguayan Middling 1 3/32", Izmir/Ant St White 1 3/32", Syrian Middling 1 3/32", Greek Middling 1 3/32", Spanish Middling 1 3/32", Uzbekistan Middling 1 3/32", Pakistan Punjab SG 1503 1 3/32", Indian H-4/Meach-1 1 3/32", Chinese Type 329, Tanzanian AR Type 2, African "Franc Zone" Middling 1 3/32" and Australian Middling 1 3/32".

[23] Brazil's 18 November Further Rebuttal Submission, paras. 81-82.

planting decisions.[24] Because the United States' 18 November Further Rebuttal Submission focused on the December Futures price in February as the relevant contract month to gauge producer's revenue expectations, Brazil presented a similar chart in its 2 December Oral Statement based on average December futures prices in January-March planting period.[25] Using December futures prices (like the nearby futures chart) confirms USDA's economists – and the world's leading cotton trader's[26] – conclusions that US subsidies make cotton producers largely unresponsive to market price signals.[27]

**201. Is data available to show the proportion of US upland cotton production sold under futures contracts, and the prices under those contracts, at different times during the marketing year? If so, please provide summarized versions to the Panel. How does a futures sale impact the producer's entitlement to marketing loan programme payments? BRA, USA**

Brazil's Answer:

15. Brazil has reviewed the questions very carefully and regrets that it does not have a clear understanding of the meanings of the terms used. Therefore, Brazil provides alternative answers depending on the possible intent of the questions/terms used. Brazil regrets if it has misinterpreted the terms in the questions and would welcome the opportunity to provide additional comments if the Panel should so desire.

16. The first question focuses on data relating to "cotton production sold under *futures contracts.*" The term "futures contracts" could have several meanings in the context of this dispute. First, if the phrase "production sold under futures contracts" means the amount of US production sold on a forward delivery basis, the answer is that Brazil has no access to any such data. However, Brazil notes that all US upland cotton that is exported is for "future delivery" because it takes time to actually ship cotton from the United States, and some contracts are more "future" than other contracts. Theoretically, it would be possible to take the volume of US upland cotton exported each week and assume that it was sold at the average A-Index price that week. However, this would only be an estimate and would not necessarily reflect the price received by the US producers, or the prices received by the exporter. Prices received by US producers are tabulated by USDA and are before the Panel.[28] Average A-Index prices are also evidence before the Panel and are found in Exhibit Bra-311. If this is the information sought by the Panel, Brazil would be pleased to provide an estimate.

17. If the phrase "production sold under futures contracts" means contracts for future delivery where the contract for sale contains a pricing clause pegged to the New York futures price at the time of delivery, then the answer to the first question is "no," *i.e.*, there is no data that would provide the amount of production sold through such contracts. The record contains evidence that Brazilian and Chad producers and purchasers of upland cotton use such clauses in their contracts.[29] Brazil has no access to information concerning the amount of US upland cotton sold through such contracts.

18. Finally, if the phrase "cotton production sold under futures contracts" means the amount of US upland cotton that is sold through the New York cotton futures exchange, the answer is "very

[28] *See e.g.* Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5) and various issues of USDA's Cotton and Wool Outlook, Table 6.

[29] Brazil's 9 September Further Submission, Annex II, para. 16; Chad's 8 October Oral Statement, para. 9 (Statement by Ibrahim Malloum).

little." As Andrew Macdonald has indicated, the purpose of the futures market is not for the buying or selling of physical cotton.[30] Rather, it is used for hedging position for growers and the upland cotton industry while the speculators in the market provide the day-to-day liquidity.[31] Physical delivery is theoretically possible in order to give reality to the market, *i.e.*, it is always possible to take or give delivery of cotton at the expiration of the contract. This ensures that the futures truly reflect the market and vice versa. However, the volume normally delivered is very small compared to the total volume traded during the life of a contract. This is because traders with long (or buy) futures contracts and traders with short (or sell) futures contracts "close out" or "settle" the contracts by offsetting trades at the end of the contract period and, thus, no physical cotton is delivered.[32]

19. With respect to the final question of whether a "futures sale impacts the producer's entitlement to marketing loan programme payments," the answer is "no." A producer is entitled to receive a marketing loan payment independent from any futures price or selling price that the producer may receive. A producer receives a marketing loan benefit if – after having taken out a marketing loan – he sells the upland cotton, *i.e.*, loses the beneficial interest to the upland cotton, or foregoes the right to a marketing loan in favour of a LDP payment, which is paid upon ginning of the raw cotton.[33] The process of marketing and selling the upland cotton in the United States or for export through forward contracts to supply upland cotton in the future, or contracts which set the price based on future New York futures market prices does not impact in any way the amount the US producer receives in marketing loan payments. The amount of marketing loan payment solely depends on the difference between the loan rate and the adjusted world price. Whether the actual selling price is below or above the loan rate, or below or above the adjusted world price, has no impact on the amount of the marketing loan benefit. The fact that producers may sell at prices above the adjusted world price means that they generate a combined revenue from the market and the marketing loan programme that exceeds 52 cents per pound.

**202. Concerning paragraph 7 of the US oral statement, are the expected cash prices shown for February only? Can the US provide the prices for January and March of each year as well? USA**

**203. Please provide information concerning the organization, mandate, credentials and standing of FAPRI. BRA**

Brazil's Answer:

20. The Food and Agricultural Policy Research Institute (FAPRI) was established in 1984 by a grant of Congress and continues to be financed largely by the US Congress. FAPRI is a unique dual-university programme by the Center for Agricultural and Rural Development (CARD) at Iowa State University[34] and the Center for National Food and Agricultural Policy at the University of Missouri (Columbia),[35] with researchers at the University of Missouri focusing mainly on the domestic / US side of agriculture and researchers at Iowa State University focusing mainly on international agricultural issues. FAPRI uses comprehensive data and computer modeling systems to analyze the

[30] Brazil's 9 September Further Submission, Annex II, para. 17.
[31] Brazil's 9 September Further Submission, Annex II, paras. 14-15.
[32] The information in this paragraph was provided by Andrew Macdonald to counsel for Brazil during the week of 12 December.
[33] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 1-2).
[34] Exhibit Bra-376 ("About FAPRI," Center for Agricultural and Rural Development, Iowa State University).
[35] Exhibit Bra-377 ("About FAPRI," Food and Agricultural Policy Research Institute at the University of Missouri).

complex economic interrelationships of the food and agriculture industry.[36] FAPRI's mission is to provide objective qualitative and quantitative analyses of alternative US and international agricultural policies.

21. FAPRI is considered the leading US agricultural policy research institute and ever since the 1985 farm bill[37] has conducted analyses of alternative policies that have helped shape US farm legislation. In July 2002, FAPRI received the USDA Secretary's Honor Award, the highest award bestowed by the US Department of Agriculture, for its analysis of various farm bill proposals that led to the 2002 FSRI Act.[38] Professor Bruce Babcock described the award as follows:

> This award recognizes the outstanding research effort by FAPRI at [Iowa State University] and [the University of] Missouri in analyzing policy proposals during the 2002 farm bill debate. This group has dedicated itself to being the world's best at conducting agricultural policy analysis.[39]
>
> …
>
> World economic integration makes it increasingly vital that we understand the impacts of US policy decisions on US and world markets, producers and consumers. Increasing numbers of policy proposals and their complexity requires that we continually update our analytical capabilities and our market intelligence.[40]

22. FARPI is the leading research institution that fulfills this task in the United States. FAPRI prepares baseline projections each year for the US agricultural sector and international commodity markets. The multi-year projections are published as FAPRI Outlooks,[41] which provide a starting point for evaluating and comparing scenarios involving macroeconomic, policy, weather, and technology variables.[42] These projections are intended for use by farmers, government agencies and officials, agribusinesses, and others who do medium-range and long-term planning.[43]

23. FAPRI describes its objectives as follows:

- To prepare baseline projections for the US agricultural sector and international commodity markets. These multi-year projections are available in print and on the Web.
- To examine the major commodity markets and analyze alternative policies and external factors for implications on production, utilization, farm and retail prices, farm income, trade, and government costs.
- To help determine effective risk management tools for crop and livestock producers, and to analyze how government policy affects risk management strategies.

[36] Exhibit Bra-378 ("About FAPRI," Food and Agricultural Policy Research Institute).
[37] Exhibit Bra-379 (CARD Report, 40th Anniversary Commemorative Issue, Part 2, p. 1-2.)
[38] Exhibit Bra-380 ("Food and Agriculture Policy Research Institute Receives USDA's Highest Honor," CARD Press Release, 9 July 2002).
[39] Exhibit Bra-380 ("Food and Agriculture Policy Research Institute Receives USDA's Highest Honor," CARD Press Release, 9 July 2002).
[40] Exhibit Bra-380 ("Food and Agriculture Policy Research Institute Receives USDA's Highest Honor," CARD Press Release, 9 July 2002).
[41] *See* http://www.fapri.iastate.edu/outlook2003.
[42] *See* http://www.fapri.iastate.edu/publications for all of FAPRI's publications.

- To brief staff members of the US Senate and House Agriculture Committees on projections for US and world agricultural markets.

- To disseminate research results through printed reports, staff presentations, and on the Web.[44]

24. In sum, FAPRI is the most influential organization in the United States analyzing farm policy and its effects on US and world commodity markets, *i.e.*, that has the highest reputation and experience in answering the kind of "but for" questions faced by this Panel. This is a fact implicitly recognized by Dr. Glauber who indicated on 2 December in responding to the Panel's oral questions that the United States was not contesting FAPRI's work or analysis but rather took issue with Professor's Sumner's modifications to and use of the FAPRI baseline.

**204. Which support to upland cotton is not captured in the EWG data referred to in Brazil's 18 November further rebuttal submission? BRA**

Brazil's Answer:

25. While Brazil believes that the EWG data is a useful indicator of the amount of support provided to producers of upland cotton, the EWG data undercounts the amount of support in several basic ways. First, the database *undercounts* the amount of marketing loan payments reflected in FSA's "LDP / Loan / Market Gain Activity" Summary Report by $572 million for MY 2000 through MY 2002.[45] The EWG database also undercounts the amount of contract payments by $61 million in MY 2000 and MY 2001.[46] This means that there are very likely additional farms and recipients of upland cotton contract payments that also received marketing loan payments, but that are not tracked by EWG data.

26. Second, as described more fully in Christopher Campbell's statement in Exhibit Bra-316, the database also undercounts the percentage of contract payments to farms growing upland cotton, because marketing loan certificates are often purchased by partnerships, with the partnership receiving the payment from USDA.[47] There can be multiple partners in these partnerships that eventually get a portion of the marketing loan certificate payment. These partners are not recorded in the EWG data as receiving marketing loan payment – thus as upland cotton producers – but they *are*, in fact, producers of upland cotton that will most likely receive contract payments.

27. Third, current producers of upland cotton also received contract payments from base acreage other than upland cotton. The EWG database does not readily permit the allocation of these payments without the application of a complex methodology requiring a number of assumptions. Only farm-specific data exclusively controlled by the United States, which it continues to refuse to provide to Brazil and the Panel, would permit such a calculation.

28. The EWG data, however, provides corroborating evidence that Brazil's "$14^{th}/16^{th}$" methodology is a reasonable approximation of the amount of contract payments that are support to upland cotton. In view of the continued refusal of the United States to provide the requested information on contract payments and acreage matched by farm, the Panel should infer that Brazil's methodology of calculating these payments undercounts the actual amount of contract payments that constitute support to upland cotton.

[46] *Compare* Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 6) with Exhibit Bra-317 (EWG Database: Tables of Results, Table 2).

[47] Exhibit Bra-316 (Statement of Christopher Campbell, para. 13).

**205. Does the United States accept or agree with the EWG data submitted by Brazil? If not, please explain your reasons. USA**

**206. Please explain how the graph in paragraph 40 of the US further rebuttal submission was derived. In so doing, please clarify whether the figures are on a cents per pound basis or some other basis. What averaging method was used? Can you prepare individual charts showing average US and Brazilian cotton prices for each of those third country markets? USA**

**207. Please indicate whether any of the measures challenged in this dispute *obliges* cotton farmers to harvest their crop in order to receive the benefit of the programme (subsidy). USA**

**208. Please provide data for the marketing years 1992 and 1999-2002 of the "quantity of production to receive the applied administered price" (*Agreement on Agriculture*, Annex 3, paragraph 8) for purposes of a price-gap calculation of support through the marketing loan programme. USA**

**209. It is understood that the data in the graph in paragraph 5 of the US oral statement are as at harvest time, while the data in the graph in paragraph 39 of Brazil's oral statement are as at planting time. Please explain why the trend of US acreage increase/decrease differs between these two graphs. BRA, USA**

Brazil's Answer:

29. The trend between those two graphs differs because they provide a different measure for US upland cotton acreage. The graph at paragraph 5 of the US 2 December Oral Statement shows *harvested* acreage, while the graph at paragraph 39 of Brazil's Oral Statement shows *planted* acreage. The figures differ because not all planted US upland cotton is harvested. The rate of abandonment that describes the difference between planted acres and harvested acres is significant in the United States. During MY 1996-2002 it varied between 3.6 per cent in MY 1997 and 20 per cent in MY 1998. The average for the period was 12.2 per cent.[48]

30. Brazil notes that US upland cotton farmers naturally reflect their planting decisions in planted – not harvested – acreage. To analyze whether the planting decisions of upland cotton farmers in the United Sates are "congruent" to farmers in other parts of the world, it would be best to compare planted acreage figures. Harvested acreage figures are a function of weather effects that may cause the abandonment of a significant portion of planted acreage. This is relatively common in the arid cotton producing areas of the US Southwest and less common in the irrigated regions of the US West or in the high rainfall regions of the South. Brazil also refers the Panel to its response to Question 210.

**210. Are worldwide planted acreage figures available? BRA, USA**

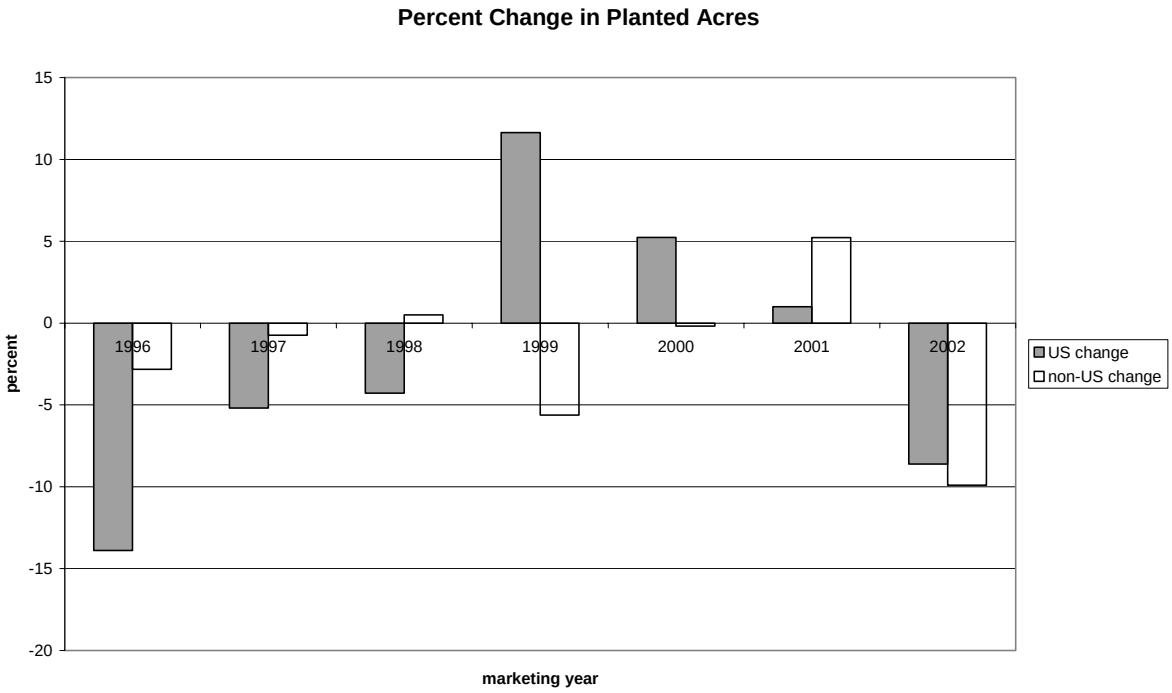
Brazil's Answer:

31. To the best of Brazil's knowledge, there are no planted acreage figures available on a worldwide basis. However, the fact that these figures do not or may not exist does not render the US harvested acreage graph valid for the purpose of evaluating the responsiveness of the US farmer to world prices.

[48] Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

32. Nonetheless, variations in harvested acreage could be a reasonable proxy for variations in planted acreage for the world outside the United States. The reason is that the relationship between planted acreage and harvested acreage on a worldwide basis can be assumed to be relatively stable, *i.e.*, weather-related problems likely lead to the abandonment of about the same percentage of planted acreage at the aggregate level each year. Upland cotton is grown in many regions and worse than normal weather conditions in one region will be offset by better than normal weather in other regions. But this is not the case when only an individual country such as the United States is analyzed because individual countries have more variable weather. This is particularly true for the United States with the considerable variance in abandonment in the Southwest. Thus, for the United States, planted acreage is the appropriate measure of production decisions. By contrast, on the worldwide level, high abandonment in one region would be compensated or balanced out by low abandonment in other regions. On average, these differing trends would cancels each other out and worldwide harvested acreage would remain relatively stable over from year to year.

33. The following graph shows percentage changes in US planted acreage and percentage changes in non-US (harvested) acreage:[49]



As expected, the graph demonstrates that the decision-making process of US producers is quite different than that of non-US producers. US planted acreage moved in *opposite* directions to world harvested acreage between MY 1998-2000. In MY 1996, 1997 and 2001, US planted acreage changes to a far greater extent than non-US planted acreage.[50] Given those significant differences, for any valid statistical analysis, this graph could not possibly be used to support a claim that planting decisions in the US were analogous to those made worldwide. In fact, taken together with the other evidence that US producers are not sensitive to market signals,[51] this graph confirms that US producers are insulated from market forces and act independently of competitors' behavior.

[49] The US planted acreage is taken from Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4) and Non-US acreage is taken from Exhibit US-63.

[50] The non-US planted acreage is approximated by using non-US harvested acreage. As discussed above, with a stable rate of abandonment, changes in harvested acreage equal changes in planted acreage.

[51] Brazil's 18 November Further Rebuttal Submission, Section 3.4 with further references.

34. The United States relies on its "harvested acreage" chart to argue that "US producers have increased and decreased acreage commensurately with producers in the rest of the world" relying on data for MY 1996-2002.[52] But even using this inappropriate harvested acreage chart, the same disconnect between US producers and other world producers can be seen. Only in two out of seven years is there a similar movement in the harvested acreage of the US and the rest of the world. In the other five years, the movement either goes in the opposite direction or the magnitude of the acreage movement is much smaller or greater respectively.

35. These distinctly different reactions by US and non-US farmers are consistent with the fact that non-US farmers must actually deal with market signals. The significant production declines by Mato Grosso producers in MY 2000 and 2001 in the face of record low prices (even though they are among the world's highest yield and lowest cost producers) illustrate this point well.[53] In addition, the fact that US farmers' planted acreage did not significantly decline in MY 1999-2002 is totally inconsistent with the considerable exchange rate increases of the US dollar during the same period.

36. Finally, even in MY 2002 when US acreage movements were relatively consistent with the rest of the world, the effect of the US subsidies significantly dampened the decrease in US acreage. As Professor has demonstrated, the US planted acreage in MY 2002 would have been 7.5 million acres *without* US subsidies not the 13.7 million acres actually planted.[54] Thus, the effect of the US subsidies is better estimated by examining the amount (or level) of US planted acres, rather than percentage changes in which the graph moves. Were it not for the US subsidies, the US downward trend in MY 2002 would have been much sharper, as a large number of inefficient cotton producers would have chosen not to plant or would have switched crops.

**211. Brazil presents a graph in paragraph 59 of its further rebuttal submission indicating the increasing cumulative loss incurred by cotton producers. Please comment on the argument that US cotton producers could not continue operating without subsidies. In particular:**

**(a) to what extent does the use of 1997 survey technological coefficients with annually updated values affect the results?**

**(b) to what extent do producers base planting decisions on their ability to cover operating costs but not whole farm costs? USA**

**212. Brazil states in paragraph 37 of its oral statement that studies of Westcott and Price found that the effect of the programme on cotton is to add an additional 1 to 1.5 million acres during marketing years 1999-2001 and to suppress US prices by 5 cents per pound. Does the US reject these findings? Why or why not? USA**

**213. What differences, if any, can be observed in the results of econometric models in the literature which use lagged prices and those which use futures prices to analyse the effect of prices on planting decisions? BRA, USA**

[52] US 2 December Oral Statement, para. 5. This data is different from the one contained in the above graph, as it is based on US harvested acreage data rather then planted acreage.

[53] *See* Exhibit Bra-283 (Statement by Christopher Ward – 7 October 2003).

[54] Brazil has applied the percentage change as estimated by Professor Sumner in Brazil's 9 September Further Submission, Annex I, Table I.5a.

Brazil's Answer:[55]

37. Econometric simulation models of the sort used by Professor Sumner, USDA and other independent economic analysts have not used futures markets in their projections or counterfactual analysis. Instead, analysts have used either lagged prices and revenues or some variant of lagged or actual realized prices or revenues as the representation of grower expectations. Thus, there are no comparisons that one could make in this regard.

38. As previously noted, "it is impossible to know what precisely individual farmers expect"[56] because price expectations of farmers are "fundamentally unobservable."[57] It is important to note that USDA economists Westcott and Price, like Professor Sumner, have used and relied on the same retrospective analysis of the effects of marketing loans using so-called "lagged prices" – not futures prices. The United States notes that the use of a futures price analysis for MY 2002 is not possible for "multi-commodity modeling frameworks for extended time projection."[58] The United States accepts that FAPRI, USDA and the US Congressional Budget Office use lagged prices rather than futures prices as proxies for price expectations.[59] And Dr. Glauber indicated during the second Panel meeting on 3 December that the United States accepts the FAPRI modeling system as a valid means to analyze the questions faced by this Panel.

39. The statistical estimation literature in agricultural economics has used a variety of proxies for anticipated prices and revenue for the upcoming season. These include rational expectations in which many sources of information available to decision makers are combined and the expectations are consistent with the conditional forecasts of the model. Such models have strong theoretical grounding but have been impractical in most estimation situations.

40. No systematic survey has been undertaken of the very large statistical literature estimating supply functions to study how estimates differ based on assumed models of the formation of expectations.[60] In a recent study for rice, McDonald and Sumner[61] found that most published articles for rice (another US programme crop with complex government programmes) used a variant of lagged information to project prices and future revenue per acre. None of the rice estimates used futures markets.

41. Across a wide variety of commodities, no systematic differences are noticeable in estimated supply or acreage response depending on how expectations of prices and other revenue terms are represented in the model. That is, there is no evidence that the estimated acre response elasticity are systematically lower or higher using futures markets to represent the price that then enters the projected relative net revenue function used for estimation.

42. Finally, if the United States were right (which it is not) that futures prices are a better indicator of farmers' price expectations, then Professor Sumner's results are *not wrong*, but

[55] The information and analysis in this answer was provided by Professor Sumner.

[56] Brazil's 9 September Further Submission, Annex I, para. 18.

[57] Exhibit Bra-279 (Statement of Professor Sumner – 7 October 2003, para. 9). *See also* Exhibit Bra-361 (Cotton Pricing Guide, July 2001) containing guidance for farmers to take planting and marketing decisions.

[58] US 7 October Oral Statement, para. 34.

[59] US 7 October Oral Statement, para. 34.

[60] Exhibit Bra-306 (Lin, William, Paul C. Westcott, Robert Skinner, Scott Sanford, and Daniel G. De La Torre Ugarte. *Supply Response Under the 1996 Farm Act and Implications for the US Field Crops Sector*, TB-1888, US Department of Agriculture, Economic Research Service, July 2000) provides a survey of the literature and cites mostly studies that use a variant of lagged prices. Lin et al. use both lagged prices and futures markets to represent expectations.

[61] Exhibit Bra-381 (Jeffrey D. McDonald and Daniel A. Sumner. "The Influence of Commodity Programmes on Acreage Response to Market Price: With an Illustration concerning Rice Policy in the United States." *American Journal of Agricultural Economics*, (85) 4 (November 2003): 857-871).

*conservative*. This is, because, as a matter of statistical theory, the more precise the proxy for expected price or revenue, the larger the coefficient of supply response. For example, in regression estimations, when an explanatory variable is measured with error, the regression coefficient tends to be biased toward zero, thus undercounting the significance of the variable. When there is less error in measurement (*i.e.*, the imperfectly measured proxy variable becomes more accurate) the regression coefficient tends to be larger.[62] In the present context, this means that if futures market prices were better proxies for farmers' expectations, the estimated coefficient of the price or revenue effect on acreage (the acreage response elasticity) would be larger. It follows that the estimated acreage response elasticity would be too low in the FAPRI model. US acreage would respond stronger to changes in relative cotton revenue than estimated in the FAPRI models. In the context of the Professor Sumner's simulation analysis, that would mean larger US supply response to expected price and revenue changes, and thus higher supply and export response to government programme benefits. In sum, Professor Sumner's results, which are based on FAPRI elasticity estimates, would not be wrong, but would underestimate the amount of additional acreage, production and exports from US policy incentives.

## III. Domestic Support

**214. Please provide a copy of regulations regarding the marketing loan programme and loan deficiency payments published at 58 Federal Register 15755, dated 24 March 1993. What does this regulation indicate about the target price? USA**

**215. Please expand or comment on the statement at paragraph 91 of the US further rebuttal submission that the counter-cyclical target price ceases to be paid when the farm price rises above 65.73 cents per pound. In this scenario, should the Panel disregard Direct Payments? BRA, USA**

Brazil's Answer:

43. It is correct that the CCP payments cease when average US farm prices for the marketing year received by US farmers rise above 65.73 cents per pound. But this has only happened four times since the 1930s and the last time was seven years ago in MY 1996. In MY 2002, the average price received by US farmers was 40.50 cents per pound.[63] Through November 2003, MY 2003 average price received by US farmers was 58.5 cents per pound.[64] Indeed, the first CCP payment has been made for MY 2003.[65]

44. The impact of the direct payments has been analyzed and quantified by Professor Sumner who found, using the FAPRI November 2002 baseline, that in MY 2002 direct payments added 120,000 acres to US upland cotton production.[66]

45. Even in the highly unlikely event that expected US farm prices were to exceed the CCP target price of 72.4 cents per pound for MY 2004[67] (prices that have occurred only twice in the past 75 years), direct payments would still be made and US producers would still require direct payments

[65] Exhibit Bra-340 ("USDA Announces First Partial 2003-Crop Counter-Cyclical Payments," USDA Press Release, 17 October 2003).

[66] Brazil's 9 September Further Submission, Annex I, Table I.5a.

[67] US farm prices have exceeded 72.4 cents per pound only twice in 75 years – in MY 1995 and in MY 1980. Exhibit Bra-4 ("Fact Sheet Upland Cotton," USDA, January 2003, p. 5).

to cover the total cost of current production. These payments, like the other payments in the package of cotton subsidies, are essential to maintain past, current, and future high levels of US upland cotton production.[68] Thus, they must be taken into account in assessing the production-distorting effects they caused in MY 2002 as well as today in MY 2003.

46. Brazil recalls that even if futures price were to indicate that US farm prices will be at or somewhat above the target price, the programme has a significant impact on planting decisions. At planting time, the producer still is unsure on whether or not the target price will be met during the following marketing year. Given the considerable price fluctuations and the low prices in the MY 1997-2002 period, there is a significant risk that actual prices will be lower than the futures market predicts. The direct and counter-cyclical payments remove the risks of lower prices. The evidence of a long-term lack of any significant US acreage response to higher or lower prices since MY 1996 demonstrates that US producers have and will continue to plant upland cotton because they face no downside revenue risk. Professor Sumner outlined this effect when he responded to a similar question by the Panel at the second meeting with the parties.[69] This reinforces the argument that the Panel cannot disregard these payments in the scenario described in the question.

**216. How many times have upland cotton producers been able to update their base acres since 1984? How do upland cotton producers come to note the possibility of future updating? Please provide examples of relevant material. BRA, USA**

Brazil's Answer:

47. Under the deficiency payment programme as provided by the 1985 and 1990 Farm Acts, farmers were offered the option to update the amount of acreage participating in the programme each year. To do this, they were required to opt *out* of the programme and receive no payments during the period in which they increased the amount of acreage planted to the programme crop. Relatively few upland cotton farmers took advantage of this programme feature because the costs of forgoing payments in the current year generally outweighed the present value of benefits of higher base acres and base yield in the future.

48. In the 1996 FAIR Act, farmers established their production flexibility base acreage by carrying over the would-be deficiency payment base acreage. For example, any producers of upland cotton during the period MY 1991-1995 were entitled to place such acreage into the PFC programme along with any acreage that had been in the conservation programme and was released from that programme in MY 1996.[70] Unlike the 1985 and 1990 Farm Acts, the 1996 FAIR Act did not authorize any acreage or yield updates by individual farmers during later years. In the 1996 FAIR Act, Congress essentially told farmers they should take advantage of planting flexibility and that planting alternative crops would not affect the amount of their payments. However, several years after 1996, as commodity prices began to decline, momentum for an update in the next farm act began to build. Many upland cotton farmers and others argued that their historical acreage and yields no longer reflected the reality of their current production and that they needed additional payments on their increased programme crop acreage. These upland cotton and other programme crop growers

[68] Brazil's 18 November Further Rebuttal Submission, para. 26 citing, *inter alia*, the National Cotton Council.

[69] Exhibit Bra-371 (Simple Example of the Calculations of Marketing Lon Benefits (Probability Distribution).

[70] Any such former deficiency payment base being released from the conservation programme could be added to the PFC base once the land left the conservation programme.

including wheat, feed grains, and rice pressured Congress to include updating of acreage and yield bases in the 2002 Farm Bill.[71]

49. The 2002 FSRI Act provided for the opportunity for all farmers to update their base acreage for purposes of the direct payment programme and to update their base acreage and base yields for purposes of the counter-cyclical payment programme. They could do this without having to temporarily opt out of the programmes, which they needed to do under the deficiency payments programme. The 2002 update and the individual deficiency payment updates during 1985-1995 established the principle that acreage and yield base updates are a part of the farm policy in the United States. Even though no updates are explicitly provided for during the lifespan of the 2002 FSRI Act, farmers may reasonably expect future updates, either as a part of ad hoc legislation or as a part of the regularly scheduled new law in 2007.

50. The pressure for updates will come especially from farmers who were not in a position to take advantage of the 2002 update having switched away from higher per-acre payment crops like upland cotton or rice. For example, farmers who had planted less than their full upland cotton base to upland cotton in the MY 1998 to 2001 period would likely have found the acreage update unattractive. But, since the yield update was only available to farmers who updated acreage, these farmers also missed the opportunities to update yields. These farmers expressed deep disappointment in 2002 that they had used planting flexibility, only to find that they were penalized by not being allowed to update payment yields. These farmers saw the update of 2002 by farmers who had stayed in upland cotton production during MY 1998-2001 as unfair and look to have this redressed in the next revision of the programmes. Many of those (non-updating) farmers are now planting their full upland cotton base (or more) and are maintaining high and expanding inputs to expand their yields in order to be in a position to take advantage of an anticipated base update at the next opportunity. These farmers will add to the political pressure to update base in 2007, if not before.

**217. What is the reason for reducing payments under the PFC and direct payments programmes for planting and harvesting fruit, vegetables and wild rice on certain base acreage? Please comment on the statements by the European Communities that "the reduction in payment for fruit and vegetables, if the EC understands correctly, is in fact designed to avoid unfair competition within the subsidising Member." (EC oral statement at first session, first substantive meeting, paragraph 29) and "To find otherwise would not permit a WTO Member wishing to introduce decoupled payments to take account of important elements of internal competition (…)" (EC response to Panel third party Question No. 5). USA**

**218. Please comment on the testimony of USDA Chief Economist Keith Collins cited in paragraph 36 of Brazil's oral statement regarding the trade-distorting and production-distorting nature of the marketing loan payments. USA**

## IV. Export Credit Guarantees

**219. Under the *Agreement on Agriculture* the general position is that the use of export subsidies, both those listed in Article 9.1 as well as those within the scope of Article 1(e) which are not so listed, may only be used within the limits of the product specific reduction commitments specified in Part IV of Members' Schedules. One might therefore have expected that Article 3.3 of the *Agreement on Agriculture* would have prohibited the use of both listed and non-listed export subsidies in excess of reduction commitment levels in the case of scheduled products and, in the case of non-scheduled products, would have simply prohibited the use of any export subsidy. Instead, the Article 3.3 prohibition is limited in both cases to export**

[71] *See e.g.* Exhibit Bra-41 (Congressional Hearing, "The Future of Federal Farm Commodity Programmes (Cotton)," House of Representatives, 15 February 2001, p. 4, and 24).

**subsidies listed in Article 9.1. What significance, if any, does this contextual aspect have for how Article 10.2 might be interpreted having regard, *inter alia*, to:**

**(a) the fact that export performance-related tax incentives, which like subsidised export credit facilities were considered as a possible candidate for listing as an Article 9.1 export subsidy in the pre-December 1991 Draft Final Act negotiations, have been held (for example, in *United States – Tax Treatment for Foreign Sales Corporations*, WT/DS108) to be subject to the anti-circumvention provisions of Article 10.1; and**

**(b) the treatment of international food aid and non-commercial transactions under Article 10? USA**

**220. What will be the relevance of Articles 9 and 10.1 of the *Agreement of Agriculture* to export credit guarantees when disciplines are internationally agreed? BRA**

Brazil's Answer:

51. The relevance of Articles 9 and 10.1 of the Agreement on Agriculture following the conclusion of the negotiations called for by Article 10.2 of the Agreement necessarily depends on the commitments that are negotiated. Brazil does not know what the outcome of the negotiations will be, or what commitments, if any, parties will undertake. Nor does Brazil know in what way those commitments would be brought into the WTO – automatically, *via* the cross-reference in Article 10.2, or instead *via* amendments to the Agreement on Agriculture or the SCM Agreement, or yet some other means. The nature of the disciplines negotiated and the way in which those disciplines are transposed into the WTO will dictate the effect they will have on Articles 9 and 10.1. With these important reservations about the purely hypothetical nature of this exercise, Brazil will explore a number of possible outcomes and the impact those outcomes would have on Articles 9 and 10.1.

52. One possible outcome is that negotiators will reach agreement on other types of export credits, but that export credit guarantees will not be included. In Brazil's view, this would mean that export credit guarantees would continue not to be among those *per se* export subsidies listed in Article 9.1, and would continue to be subject to Article 10.1, to the extent that they constitute export subsidies and circumvent (or threaten to circumvent) a Member's export subsidy commitments.

53. Another possible outcome is an amendment to Article 9.1 that would add export credit guarantees (or possibly those export credit guarantees issued or programmes maintained on particular terms or conditions) to the list of *per se* export subsidies. Article 10.1 would no longer be applicable, since export credit guarantees would no longer be "[e]xport subsidies not listed in paragraph 1 of Article 9 … ."

54. Yet another possible outcome is agreement to subject export credit guarantees to the same type of notification, consultation and information exchange disciplines agreed in the OECD Arrangement on Officially Supported Export Credits for industrial products ("OECD Arrangement").[72] For example, the OECD Arrangement includes provisions regarding: prior notification of derogations, permitted exceptions, matching of derogations, permitted exceptions, non-conforming non-notified terms, and terms granted by countries that are not parties to the OECD Arrangement. The United States now characterizes such disciplines as "pedestrian."[73] In *Canada – Aircraft II*, however, the United States characterized these provisions and the disciplines they

[72] *See* OECD Arrangement on Guidelines for Officially Supported Export Credits, Chapter IV (Sections 1-5) available at http://www.oecd.org/dataoecd/52/3/2763846.pdf.

[73] US 3 December Closing Statement, para. 3.

provided as central to the "entire logic" of the OECD Arrangement, and as a critical way to prevent "a subsidy 'race to the bottom.'"[74]

55. Under this outcome, export credit guarantees would continue not to be among those *per se* export subsidies listed in Article 9.1, and would continue to be subject to Article 10.1, to the extent that they constitute export subsidies and circumvent (or threaten to circumvent) a Member's export subsidy commitments. Under WTO jurisprudence, the provisions regarding notification, consultation and information exchange would be read cumulatively with Article 10.1, since the obligations imposed would not be mutually exclusive or mutually inconsistent.[75]

56. Another possible outcome would be agreement on alternative benchmarks against which to determine whether export credit guarantees and export credit guarantee programmes would constitute export subsidies. In determining what constitutes an "export subsidy" within the meaning of Article 10.1, the Appellate Body's decisions in *US – FSC*[76] and *Canada – Dairy*[77] currently direct the Panel to refer to contextual guidance included in Articles 1 and 3 of the SCM Agreement and in item (j).[78] Were agreement one day reached on alternative benchmarks following negotiations pursuant to Article 10.2, that agreement might provide relevant context for a panel to determine what constitutes an "export subsidy" for the purposes of Article 10.1. Alternatively, it might serve as "subsequent practice," pursuant to Article 31(3)(b) of the Vienna Convention on the Law of Treaties, indicating the interpretation of the term "export subsidy" that the Members intend for the purposes of Article 10.1.[79]

57. Under this outcome, export credit guarantees would continue not to be among those *per se* export subsidies listed in Article 9.1. Moreover, they would continue to be subject to Article 10.1, to the extent that they constitute export subsidies, and to the extent that they circumvent (or threaten to circumvent) a Member's export subsidy commitments. The difference would be that the interpretation of the term "export subsidy" might be based, among other things, on the context or evidence of "subsequent practice" offered by the newly-negotiated alternative benchmark.

**221. In respect of the table in paragraph 161 of the US August 22 rebuttal submission (concerning the cohort specific treatment of export credit guarantees), the Panel notes the subsequent US agreement (footnotes 82 and 96 in US further submission of 30 September 2003; footnote 160 in US 18 November further rebuttal submission) to Brazil's assertion (footnote 67 in Brazil's 27 August 2003 comments on US rebuttal submission) that the total figure net of re-estimates should be $230,127,023 instead of the figure which originally appeared ($381,345,059).**

---

[74] Panel Report, *Canada – Aircraft II*, WT/DS222/R, Annex C-2, paras. 12-13 (Third Party Submission of the United States, 22 June 2001).

[75] *See e.g.* Appellate Body Report, *Guatemala –Cement*, WT/DS60/AB/R, paras. 66, 73-74; Panel Report, *Indonesia – Automobiles*, WT/DS54, para. 14.28.

[76] Appellate Body Report, *US – FSC*, WT/DS108/AB/R, para. 136-140.

[77] Appellate Body Report, *Canada – Dairy*, WT/DS103/AB/R and WT/DS113/AB/R, para. 87-90.

[78] *See* Brazil's 24 June First Submission, paras. 258-261.

[79] The extent to which alternative benchmarks agreed pursuant to negotiations under Article 10.2 qualify as relevant context for or as "subsequent practice" regarding the interpretation of the term "export subsidy" in Article 10.1 will depend, in part, on the form the agreement takes. If agreement is reached among only the 10 WTO Members that participated in OECD discussions on agricultural export credit disciplines, it will be difficult to argue that the agreement serves as relevant context for interpretation of Article 10.1, which is applicable to 146 Members. Nor would such an agreement constitute evidence of "subsequent practice." *See* Appellate Body Report, *Chile – Agricultural Products (Price Band)*, WT/DS207/AB/R, para. 213 (defining "subsequent practice" as "a 'concordant, common and consistent' sequence of acts or pronouncements which is sufficient to establish a discernible pattern implying the agreement of the parties [to a treaty] regarding its interpretation."). *See also* Appellate Body Report, *Japan – Alcoholic Beverages*, WT/DS8/AB/R, WT/DS10/AB/R, WT/DS11/AB/R, p. 12-17.

**(a) Please submit a corrected table reflecting all of the necessary information to produce this result, to the extent this is possible for the reasons indicated in footnote 96 in US further submission of 30 September 2003.**

**(b) Please clarify whether and how the Panel should treat the figures in Exhibit BRA-182 for the net lifetime re-estimates for each respective cohort.**

**(c) The Panel notes that the CCC 2002 financial statement in Exhibit BRA-158 refers to annual "administrative" expenses of $4 million, and that the US has also referred to this figure in its submissions (e.g. US first written submission, paragraph 175). Please confirm whether the figures in the table in paragraph 161 of the US August 22 rebuttal submission (or a corrected version thereof) includes "administrative expenses", of approximately $4 million per year over the period 1992-2002, and explain why (or why not) this affects the substantive result.**

Brazil's Comment:

58. With respect to the $4 million of administrative expenses for the CCC guarantee programmes, Brazil draws the Panel's attention to Congressional testimony by the administrator of the programmes, General Sales Manager Christopher Goldthwait. This testimony is included on pages 20-21 of Exhibit Bra-87. Mr. Goldthwait's testimony clarifies that premiums charged by the CCC are sufficient to cover these administrative expenses, but not other costs and losses of the programmes.

59. A member of Congress posed the following question to Mr. Goldthwait and August Schumacher, USDA's Under Secretary for Farm and Foreign Agricultural Services:

> Is [the GSM] programme operated at essentially no net costs to the US Government? By that what I mean putting to one side the Iraq and the Poland experiences which you outlined earlier in your response to questions, do we charge fees that reflect the cost of administering the programme *and the risk that is involved, the default, things such as that*, or is this a programme which is subsidized at a fairly significant level by the Federal Government? (emphasis added)

Mr. Goldthwait's response was as follows:

> Yes. The programme is *from the administrative standpoint* at least pretty much self-financing. We do collect fees. The fee structure is relatively modest. We keep the fees low because the legislation has limited us to no more than 1 per cent. But, nonetheless, we collect several million dollars a year in fees, *and that enables us to say that effectively the administrative cost of running the programme are more than covered*. Now, that money does not come directly to us at the USDA, it goes to the general Treasury account, but the amount of the money is more than *enough to cover the administrative costs of the programme*. (emphasis added)

60. Thus, although the question asked whether fees covered "the cost of administering the programme *and* the risk that is involved, the default, things such as that," Mr. Goldthwait, the administrator of the CCC guarantee programmes, responded that fees "at least pretty much" covered only "the administrative cost of running the programme." Mr. Goldthwait could not state that the fees collected also cover "the risk that is involved, the default, things such as that," since, as Brazil has established, fees for the CCC guarantee programmes are not set to (see comment to question 223) and in fact do not cover those risks and defaults.

**(d) Please identify what is considered an "administrative expense" for this purpose.**

**(e) The Panel notes the US statement in paragraph 160 of its answers to Panel questions following the first meeting that all cohorts are still open although the 1994 and 1995 cohorts will close this year. Is this still an accurate statement? If not, please indicate whether any cohorts have since "closed" for the period 1992-2002.**

**(f) The Panel notes the current "high" figures for 1997 and 1998 indicated in the original US chart. Pending their confirmation and/or updating by the US, why does the US assert that a cohort will *necessarily* reach a "profitable" result (for example, the 1994 cohort, which has almost closed still indicates an outstanding amount)? Do "re-estimates" reflect also expectations about a cohort's future performance?**

Brazil's Comment:

61. Brazil reserves the right to comment on the US response, but would like to provide a preliminary comment on the last part of the Panel's question. To a certain extent, reestimates do reflect expectations about a cohort's future performance. Agencies are to undertake two types of reestimates – interest rate and technical reestimates. The Office of Management and Budget ("OMB") defines these two types of reestimates in the following way:

> Two different types of reestimates are made:
>
> - Interest rate reestimates, for differences between interest rate assumptions at the time of formulation (the same assumption is used at the time of obligation or commitment) and the actual interest rate(s) for the year(s) of disbursement; and
>
> - Technical reestimates, for changes in technical assumptions.[80]

62. One purpose of technical reestimates is "to adjust the subsidy estimate for . . . new forecasts about future economic conditions, and other events and improvements in the methods used to estimate future cash flows."[81] The OMB also states that one purpose of technical reestimates is to record "changes in assumptions about future cash flows."[82]

**(g) Why should the Panel "eliminate" the 2001 and 2002 cohorts from its examination, as suggested in paragraph 198 of the US further rebuttal submission?**

**(h) Why should the Panel "eliminate", in addition, the 2000 cohort, as also suggested in paragraph 198 of the US further rebuttal submission for which information is presumably more "complete"?**

**(i) Under the US approach, at what point in time could a Panel ever make an assessment of the programme, if it had to wait for each cohort to be completed before it could be "properly" assessed? Why is it inappropriate for the Panel to**

[80] Exhibit Bra-116 (OMB Circular A-11, p. 185-15).
[81] Exhibit Bra-116 (OMB Circular A-11, p. 185-16).
[82] Exhibit Bra-163 ("Introduction to Federal Credit Budgeting," OMB Annual Training, 24 June 2002, White House Conference Center, p. 32).

**include these "most recent years" in its evaluation, as the US suggests in paragraph 199 of its 18 November further rebuttal submission? USA**

**222. For GSM 102, 103 and SCGP, please provide year-by-year amounts from 1992 to 2003 with respect to: (i) cumulative outstanding guarantees; (ii) claims paid; (iii) recoveries made; (iv) revenue from premiums; (v) other current revenue, including interest earned; (vi) interest charges paid; and (vii) administrative costs of running the programmes. Please indicate any allocation methodologies used to calculate administrative costs. USA**

**223. Are the premium rates applicable to GSM 102, 103 and SCGP subject to regular review as to their adequacy in enabling the operating costs and losses associated with these programmes? If so, what criteria or benchmarks are taken into consideration for this purpose? Secondly, how do the premium rates applied compare with the implicit cost of forfaiting transactions and with premiums for export credit insurance? USA**

Brazil's Comment:

63. Brazil reserves the right to comment on the US response, but would like to provide a preliminary comment on the first part of the Panel's question. First, Brazil notes that premium rates for the three CCC guarantee programmes are not subject to regular review. In audit reports of the CCC's fiscal year 2000 and 2001 financial statements, USDA's Office of the Inspector General confirmed that "the fees CCC charges for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed in 7 years and may not be reflecting current costs."[83] Two changes have been made, in the fee schedule for GSM 102, since November 1994: (i) for a 12-month guarantee with semi-annual repayment intervals, the fee was changed from $0.209 per $100 of coverage to $0.229 per $100 of coverage; and (ii) borrowers are now offered the additional option of 30- and 60-day guarantees, at the same fee charged for 90-day and 4-, 6- and 7-month guarantees.[84]

64. Moreover, the US General Accounting Office ("GAO") analyzed CCC's failure to charge guarantee fees that take account of country risk or the creditworthiness of individual borrowers. The GAO emphasized that CCC's failure to do so means that it lacks the flexibility to cover the costs and losses of the programmes:

> Although GSM-102 recipient countries vary significantly from one another in terms of their risk of defaulting on GSM-102 loans, CCC does not adjust the fee that it charges for credit guarantees to take account of country risk. CCC fees are based upon the length of the credit period and the number of principal payments to be made. For example, for a 3-year GSM-102 loan with semiannual principal payments, CCC charges a fee of 55.6 cents per $100, or 0.56 per cent of the covered amount. For 3-year loans with annual principal payments, the fee is 66.3 cents per $100.[ ] CCC fees that included a risk-based component might not cover all of the country risk, but they could help to offset the cost of loan defaults.[85]

[83] Exhibit Bra-153 (US Department of Agriculture Office of Inspector General Financial and IT Operations Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2000, Audit Report No. 06401-14-FM (June 2001), p. 31). *See also* Exhibit Bra-154 (US Department of Agriculture Office of Inspector General Great Plains Region Audit Report of the Commodity Credit Corporation's Financial Statements for Fiscal Year 2001, Audit Report No. 06401-4-KC (February 2002), p. 49 ("[T]he fees CCC charged for its GSM-102 and GSM-103 export credit guarantee programmes have not been changed for many years and may not be reflecting current costs.").

[84] Brazil's 11 August Answers to Questions, para. 167 (first bullet point).

[85] Exhibit Bra-181 (US General Accounting Office, Report to the Ranking Minority Member, Committee on Agriculture, Nutrition, and Forestry, US Senate, *Former Soviet Union: Creditworthiness of Successor States and US Export Credit Guarantees*, GAO/GGD-95-60 (February 1995), p. 135-136).

As noted above, CCC fees for GSM 102 have not changed materially since the GAO published its report in 1995.[86] Moreover, the United States confirmed in its 11 August Answer to Question 84 (at paragraph 180) that US law prohibits CCC from charging fees in excess of one per cent of the guaranteed dollar value of the transaction.

65. With respect to the second part of the Panel's question, Brazil has demonstrated that forfaits and export credit insurance are not similar financial instruments to CCC export credit guarantees, and therefore that the terms for forfaits and export credit insurance cannot serve as benchmarks against which to determine whether CCC export credit guarantees confer "benefits."[87] Moreover, Brazil has demonstrated that in any event, fees for forfaiting instruments are well above fees for CCC export credit guarantees.[88]

66. Although government support from the US Export-Import Bank does not constitute a market benchmark for the purposes of determining "benefit," Brazil has offered evidence that premiums for CCC guarantees are considerably lower that fees for Ex-Im Bank guarantees.[89] This demonstrates that the terms for CCC guarantees do not even meet *non-market* benchmarks. As noted by the GAO:

> The US Export-Import Bank, which provides credit guarantees to promote a variety of US exports, uses risk-based fees to defray the cost of defaults on its portfolio. Under its system, each borrower/guarantor is rated in one of eight country risk categories. Exposure fees vary based on both the level of assessed risk and the length of time provided for repayment. For example, in the case of repayment over 3 years, a country rated in the lowest risk category is charged a fee of 75 cents per $100, whereas a country in the highest risk category is charged a fee of $5.70 per $100 of coverage. Thus, the bank's fee structure includes a substantial added charge for high country risk. According to the bank, its system is designed to remain as competitive as possible with fees charged by official export credit agencies of other countries.
>
> Under section 211(b)(1)(b) of the 1990 Farm Bill, CCC is currently restricted from charging an origination fee for any GSM-102 credit guarantee in excess of an amount equal to 1 per cent of the amount of credit extended under the transaction.[90] This restriction was initially enacted in 1985 following proposed administration legislation to charge a 5-per cent user fee for exports backed with credit guarantees. Some Members of Congress were concerned that such a fee would adversely affect the competitiveness of GSM-102 exports. Under the 1-per cent restriction, CCC would be considerably limited in the size of the fee that it could charge to take account of country risk should it decide to do so. For example, as previously noted, CCC charges 0.56 per cent for a loan payable in 3 years and with principal payments due annually. The most it could increase the fee would be 0.44 per cent. In contrast, the Export-Import Bank currently charges fees as high as 5.7 per cent for 3-year loans.[91]

**224. Please indicate how the CCC's cost of borrowing was treated in the 2002 financial statement of the CCC, in Exhibit BRA 158. USA**

**225. Please indicate whether there was any instance where the CCC "wrote off" debt and, if so, please indicate the accounting regulation or principle used. If a "written off" debt is subsequently recovered, do the CCC's accounts reflect both the interest cost and interest received in relation to the debt during the time it was "written off"? USA**

**226. If a debt was "written off" more than ten years ago, does it still create a cost to the programme? If so, how is this reflected in the 2002 financial statement of the CCC, in Exhibit BRA 158 (or any other material)? USA**

**227. The United States has indicated that Brazil continues to "mischaracterize" the amount of $411 million in the 2002 financial statement of the CCC, in Exhibit BRA 158, pp. 18 & 19. Can the United States please indicate how it believes this amount – referred to on p. 19 of the Exhibit as "Credit Guarantee Liability-End of Fiscal Year" - should be properly characterized? How, if at all, does it represent CCC operating costs or losses? USA**

Brazil's Comment:

67. On page 4 of the notes to the CCC 2002 financial statements, CCC defines the term "Credit Guarantee Liability" as follows:

> Credit guarantee liabilities represent the estimated net cash outflows (loss) of the guarantees on a net present value basis. To this effect, CCC records a liability and charges an expense to the extent, in management's estimate, CCC will be unable to recover claim payments under the post-Credit Reform Export Credit Guarantee programmes.[92]

Thus, Brazil stands by its characterization of the $411 million figure as a cumulative running tally of the losses for the programmes during the period 1992-2002, and as one way of demonstrating that the CCC guarantee programmes meet the elements of item (j).

**228. What accounting principles should the Panel use in assessing the long-term operating costs and losses of these three programmes? For example, if internal US Government regulations require costs to be treated differently to generally accepted accounting principles, is it incumbent on the Panel to conduct its analysis in accordance with that treatment? BRA, USA**

Brazil's Answer:

68. Item (j), interpreted according to its ordinary meaning, in its context and according to the object and purpose of the SCM and Agriculture Agreements, does not require that the Panel use any particular accounting principles to assess long-term operating costs and losses. Similarly, under item (j), it is not *incumbent* on the Panel to conduct its analysis in accordance with US government accounting principles, whether or not those principles adhere to GAAP. (A Panel may, however, consider it particularly persuasive that the US government' own accounting principles lead to a conclusion that premium rates are inadequate to meet the long-term operating costs and losses of the CCC guarantee programmes.) Nor is it necessary, at this stage of dispute settlement proceedings, for

[92] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 4)).

the Panel to arrive at a determination of the precise amount by which operating costs and losses incurred by the CCC guarantee programmes outpace premiums collected.

69. For these reasons, Brazil has offered a number of different methodologies and sets of evidence that the Panel can use to determine whether premium rates are adequate to meet the long-term operating costs and losses of the CCC guarantee programmes. Each of those methodologies or sets of evidence demonstrates that premium rates are inadequate to meet the long-term operating costs and losses of the CCC guarantee programmes.

70. One methodology is the present value accounting endorsed by the US Congress and the President in the Federal Credit Reform Act ("FCRA"). The FCRA has been translated into accounting standards for US government loan guarantees by the Federal Accounting Standards Advisory Board ("FASAB"). Consistent with the FCRA, the FASAB accounting standards state that "[f]or guaranteed loans outstanding, the present value of estimated net cash outflows of the loan guarantees is recognized as a liability."[93] The FASAB standards (and the FCRA) state that "[t]he amount of the subsidy expense equals the present value of estimated cash outflows over the life of the loans minus the present value of estimated cash inflows, discounted at the interest rate of marketable Treasury securities with a similar maturity term applicable to the period during which the loans are disbursed."[94]

71. As one way to determine whether the long-term operating costs and losses of the programmes outpace premiums collected, Brazil has used the net subsidy expense (including reestimates) calculated using the FCRA and FASAB standards over the period 1992-2002.[95] The CCC has itself adopted this methodology in its 2002 financial statements, when it lists a net subsidy expense of $411 million for all post-1991 CCC guarantees.[96] Using present value accounting, CCC's 2002 financial statements also track enormous uncollectible amounts on pre-1992 and post-1991 guarantees that far outpace premiums collected for the programmes – by $2.3 billion on pre-1992 guarantees, and by $550 million on post-1991 guarantees.[97]

---

[93] Exhibit Bra-118 (Federal Accounting Standards Advisory Board, "Statement of Federal Financial Accounting Standards No. 19, Technical Amendments to Accounting Standards for Direct Loans and Loan Guarantees" in STATEMENT OF FEDERAL FINANCIAL ACCOUNTING STANDARDS NO. 2, March 2001, p. 13 (para. 23)).

[94] Exhibit Bra-118 (Federal Accounting Standards Advisory Board, "Statement of Federal Financial Accounting Standards No. 19, Technical Amendments to Accounting Standards for Direct Loans and Loan Guarantees" in STATEMENT OF FEDERAL FINANCIAL ACCOUNTING STANDARDS NO. 2, March 2001, pgs. 13-14 (para. 24)).

[95] Exhibit Bra-193.

[96] Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, *Commodity Credit Corporation's Financial Statements for Fiscal Year 2002*, Audit Report No. 06401-15-FM (December 2002), Notes to the Financial Statements, p. 19).

[97] *See* Brazil's 11 August Answers to Questions, para. 167 (third and fourth bullet points); Brazil's 18 November Further Rebuttal Submission, para. 250; Notes to Financial Statements contained in Exhibit Bra-158 (US Department of Agriculture, Office of Inspector General, Financial and IT Operations, Audit Report, Commodity Credit Corporation's Financial Statements for Fiscal Year 2002, Audit Report No 06401-15-FM (December 2002), pg. 14). Contrary to the United States' assertion at paragraph 170 of its 22 August Rebuttal Submission, for post-1991 CCC guarantees, the amounts in the "subsidy allowance" column are actually the amounts of receivables associated with post-1991 CCC guarantees that CCC considers uncollectible. Under the FCRA – and as confirmed above in the quote from page 4 of the CCC 2002 financial statements – the subsidy allowance is recorded on a net present value basis, which means that it represents the cost CCC considers it will incur on a guarantee cohort *at the time that cohort is closed*. The amount listed in the "subsidy allowance" column in the receivables table of CCC's 2002 financial statements for post-1991 guarantees is therefore as uncollectible as the amount listed in the "uncollectible" column of the pre-1992 CCC guarantee receivables table.

72. The Panel asks whether, if US government regulations require costs to be treated differently than they would be under generally accepted accounting principles, the Panel must conduct its analysis in accordance with that treatment. As Brazil has already noted, nothing in item (j) would require the Panel to do so. However, Brazil notes that in its 2002 financial statements, the CCC, which relies on present value accounting, states that "[t]he accounting principles and standards applied in preparing the financial statements and described in this note are in accordance with Generally Accepted Accounting Principles (GAAP) for Federal entities."[98]

73. In this dispute, the United States objects to the use of present value accounting to determine the costs of the CCC guarantee programmes, because present value accounting entails the use of "estimates."[99] Apart from the fact that the FCRA does not in fact rely on "estimates" to the extent suggested by the United States,[100] Brazil also notes that in other contexts, the US government is comfortable with this inherent aspect of present value accounting for loan guarantees. Present value accounting has been endorsed by the US Congress and the President in the FCRA, as well as by the FASAB, the Office of Management and Budget,[101] and the General Accounting Office,[102] to name a few. Finally, Brazil notes that the United States is comfortable with the Panel relying on present value accounting and *some* estimated data, as long as the Panel limits itself to data suggesting that CCC guarantees issued in some, carefully-selected years did not lose money.[103] This is not an appropriate means of determining the performance of the "programmes," as is required by item (j).

74. Other methodologies and means of accounting for CCC's long-term operating costs and losses confirm the result reached using present value accounting. First, Brazil has constructed a methodology using actual data on income, costs and losses, which shows net losses for the CCC guarantee programmes of $1.1 billion.[104] Second, defaults of more than $4 billion on CCC guarantees for exports to Iraq and Poland alone similarly demonstrate costs and losses far in excess of total CCC premiums collected.[105] Third, a methodology adopted by the US General Accounting Office concluded that if GSM 102 and GSM 103 continued until 2007, costs would reach $7.6 billion, which exceeds maximum premiums collected by nearly $7.3 billion.[106]

75. In conclusion, item (j) does not require that the Panel use any particular accounting principles in assessing long-term operating costs and losses. Brazil has offered the Panel a number of different methodologies based on a variety of accounting principles. Each methodology confirms that premium rates are inadequate to meet the long-term operating costs and losses of the CCC guarantee programmes.

## V. Serious Prejudice

**229. What is the meaning of the words "may arise in any case where *one or several* of the following apply" (emphasis added) in Article 6.3 of the *SCM Agreement*? Please comment on the possibility that these words indicate that one of the Article 6 subparagraphs may not be sufficient to establish serious prejudice and that serious prejudice should be considered an additional or overriding criterion to the factors specified in the subparagraphs. BRA**

Brazil's Answer:

76. The phrase "*one or several*" must be interpreted in its ordinary meaning. This phrase means that the conditional clause "may arise" is satisfied when *one* of the following applies or when *more than one* of the following apply. The phrase "*one or several*" is equivalent to: "*at least one*." Such a trigger is not conditioned on any other clause. In fact, this is stressed by the words "in any case" just before the phrase *where one or several*. Therefore, serious prejudice may be shown *in any case* where *at least one* of the subparagraphs of Article 6.3 applies.

77. Brazil disagrees with the possibility that the words *one or several* indicate that one of the Article 6.3 subparagraphs may not be sufficient to establish serious prejudice. Had negotiators felt that this should be the case, they certainly would have found a way to say so. This was the case, for example, in Articles 3.2 and 3.4 of the Anti-Dumping Agreement, where after the enumeration of relevant factors, the text states that no "… one or several of these factors" can "give decisive guidance." Identical language is found in the SCM Agreement itself. Article 15.4 *in fine* reads "… nor can one or several of these factors necessarily give decisive guidance." In SCM Article 15.7 negotiators were even more explicit, affirming that "[n]o one of these factors by itself can necessarily give decisive guidance but the totality of the factors considered must lead to the conclusion that … ."

78. The provisions of the Anti-Dumping and SCM Agreement cited above relate to situations where a number of factors could lead to a determination of injury. Article 6.3 of the SCM Agreement is meant to address a similar situation: a list of factors could lead to a determination of serious injury. However, in stark contrast with Articles 3.2 and 3.4 of the Anti-Dumping Agreement and Articles 15.4 and 15.7 of the SCM Agreement, negotiators chose not to include reference to the possibility that, in Article 6.3, "the words *one or several* indicate that one of the Article 6 subparagraphs may not be sufficient to establish serious prejudice." To find so, the Panel would need to read into Article 6.3 the words found in Articles 3.2 and 3.4 of the Anti-Dumping Agreement and Articles 15.4 and 15.7 of the SCM Agreement. The Appellate Body has made clear that panels must not read into a text words that are not there.

79. The phrase "may arise in any case where one or several of the following apply" recognizes that effects of subsidies constituting serious prejudice under one of the identified paragraphs of Article 6.3 may *also* constitute serious prejudice under another of the identified paragraphs of Article 6.3. This case is a good example. US cotton subsidies have both increased the US world market share under Article 6.3(d) as well as suppressed world market prices and prices in third country markets under Article 6.3(c). But the existence of "serious prejudice" in this or other cases does not depend upon whether the effects of the subsidies cause one or four different types of serious prejudice.

80. In its context within Article 6, the phrase "may arise in any case where one or several of the following apply" is necessary because while the facts may demonstrate that the effects of the subsidies *may* create the one, two, three or four enumerated types of serious prejudice, these effects may not be *actionable.* For example, under Article 6.3(d), there may be an increase in the world market share for a commodity product. But it "may" not be actionable because there are specific multilaterally agreed rules for that commodity, within the meaning of footnote 17. Further,

Article 6.7 of the SCM Agreement creates exemptions from serious prejudice findings even if the requirements of Article 6.3 would be fulfilled. These situations include export prohibitions by the complaining Member, *force majeure*, arrangements that limit exports, or the failure to conform to standards and regulatory requirements. Article 6.9 of the SCM Agreement covers another situation in which the "may" language would be applicable. It exempts serious prejudice that exists even where the requirements of Article 6.3 are fulfilled because the subsidies are exempt from action by virtue of the peace clause of Article 13 of the Agreement on Agriculture.

**230. Please comment on Brazil's views on Article 6.3 of the *SCM Agreement* as stated in paragraphs 92-94 of its further submission. USA**

**231. Do you believe that the now-expired Article 6.1 and/or Annex IV of the *SCM Agreement* are relevant context for the Panel's interpretation of Article 6.3? USA**

**232. How, if at all, should the Panel take into account the effects of other factors in its analysis of the effects of US subsidies under Article 6.3? If the Panel should compare the effects of other factors to establish the relative significance of one compared to others, how would this be done? What would be relevant "factors" for this purpose? BRA**

Brazil's Answer:

81. Brazil divides its response to this question into two parts. First, Brazil will discuss Article 6.3(c), and, second, Brazil will discuss Article 6.3(d).

82. Concerning Article 6.3(c), the Panel can and should, to the extent it is relevant to do so, take into account the effects of non-subsidy related factors in its analysis of the price-suppressing effects of US subsidies. The only "other factors" identified by the United States include demand-related factors the United States claims contributed to lower cotton prices in MY 1999-2002 including weak cotton demand, flat retail consumption, falling world incomes, increasing US textile imports, and China's releasing of stocks.[107] The United States further claimed that US production-related factors accounted for increased US production including boll weevil eradication, higher yielding GMO cotton, and lower prices of alternative crops.[108]

83. Brazil addressed all of these "other" factors in earlier submissions and demonstrated that while some of the so-called other factors no doubt influenced prices, many of them either were factually incorrect (*i.e.*, not "other factors") or could not have had the effect claimed by the United States.[109] Brazil further demonstrated that Professor Sumner's analysis took account of all the "other" factors identified by the United States. Professor Sumner stated:

> The baseline is calibrated to reproduce the acreage, production, exports, prices and other variables that actually applied between the marketing years 1999-2001, the period over which data was available at the time the baseline was developed. *By calibrating the baseline to actual data for the recent past, the model incorporates all the factors that have determined the situation of the cotton market during this period.*
>
> The United States has highlighted some of these factors. In their Further Submission they discuss developments in the synthetic fiber market, such as prices of polyester; Chinese stock releases, exchange rate movements, global and US macroeconomic

[108] US 30 September Further Submission, paras. 45-70.
[109] Brazil's 7 October Oral Statement, paras. 18-28; Exhibit Bra-279 (Statement of Professor Sumner – 7 October 2003, paras. 13-14); Brazil's 27October Answers to Question 176, paras. 157-160.

> conditions, and technical changes in cotton production that reduce costs, such as boll weevil eradication and release of genetically modified cotton varieties. Remember, my model is calibrated to reproduce actual cotton market data for the historical period. *Hence, my model incorporates all these historical factors into the baseline from which I analyze the impact of removing cotton subsidies.*[110]

84. The econometric evidence presented by Brazil – including the studies by USDA economists Westcott and Price, Professor Sumner, and Professor Ray of the University of Tennessee, among others – separate out the effects of the US subsidies from the effects of all other supply and demand factors that impact on the upland cotton market. In effect, these studies are designed precisely to answer the question posed by the Panel. The results of these studies sift through the "other factors" to isolate for the effects of the US subsidies. Professor Sumner has conservatively estimated that A-Index prices would on average be 12.6 per cent or 6.5 cents per pound higher without the US subsidizing upland cotton production, use and exports. The other econometric simulation models find that cotton prices are suppressed to a significant degree regardless of whether other factors push upland cotton prices up or down.

85. It bears repeating that Brazil has not claimed in this dispute that the entire decline in upland cotton prices during MY 1999-2002 was due to the effects of US subsidies. Brazil's argument has been all along that *but for* the US subsidies upland cotton prices would be higher by a significant degree, whether prices rise or fall. Thus, for example, the fact that Chinese release of stocks may have lowered world prices in MY 2000-2001 to a certain extent is entirely consistent with Brazil's evidence and its proof. Brazil demonstrated that actual market prices in MY 1999-2002 would have been higher to a significant degree but for the US subsidies.

86. Thus, the Panel can and should take "other factors" into account. But the record shows that there is no legitimate basis to conclude that "other" supply and demand factors collectively (a) accounted for *all* of the declines in prices during the period of investigation or (b) meant that prices went as high as they would have even if no US subsidies had been provided.

87. Brazil's claim under Article 6.3(d) concerns the development of actual world market share data. This world market share is the result of several key factors including US subsidies, weather effects in many countries, and exchange rate effects. However, Brazil has demonstrated that the US subsidies were a major contributing factor behind the increase in the US world market share, which occurred even when prices were falling and the US dollar increased in value. Professor Sumner has conservatively estimated that without the US subsidies, US exports would be on average 41.2 per cent lower during MY 1999-2002.[111] The US upland cotton farmers' long-term cost of production gap between market revenue and total costs of $872 per acre for over 14.38 million acres during MY 1997-2002 (or $12.5 billion) fully supports Professor Sumner's analysis.[112]

88. It follows that the US world market share would be much lower absent the US subsidies. As an example, based on Exhibit Bra-302, Brazil has calculated out the effects of a 41.2 per cent decline in US exports as estimated by Professor Sumner for MY 2002.[113] In this example, US world market shares for MY 1999-2001 remain unchanged.[114] The results are as follows:

---

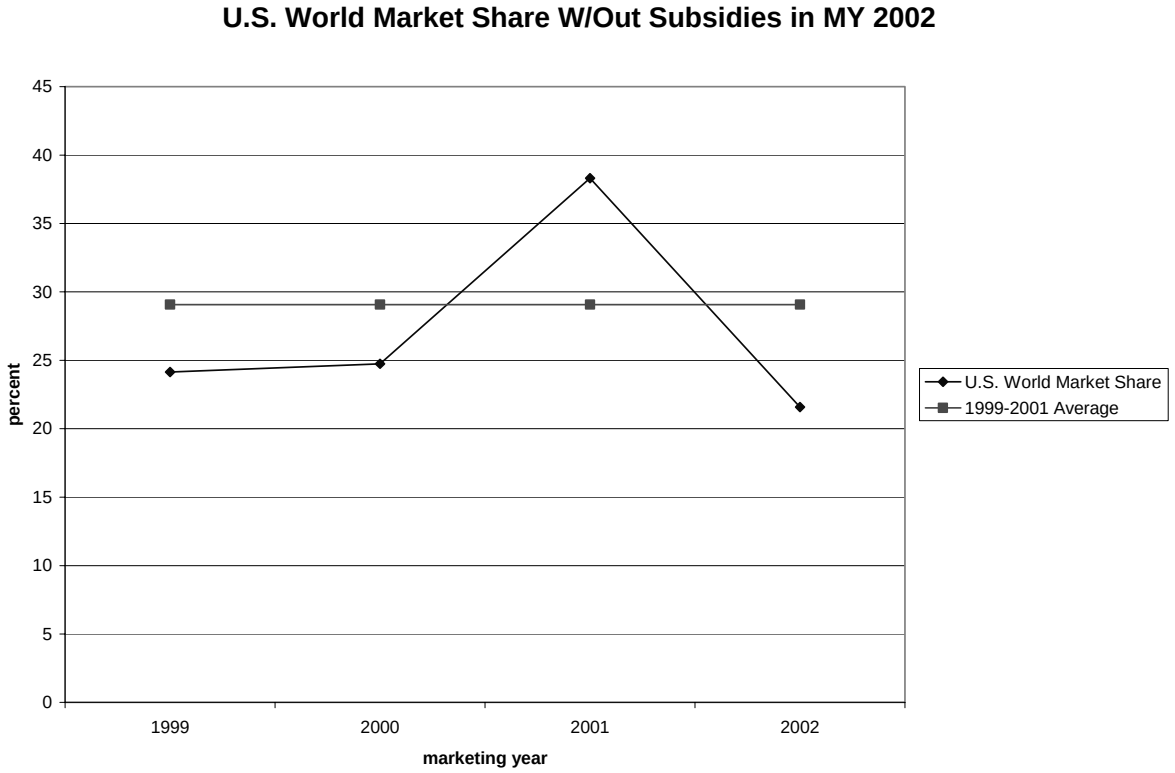
[110] Exhibit Bra-279 (Statement of Professor Sumner – 7 October 2003, paras. 13-14).

[111] Brazil's 9 September Further Submission, Annex I, Table I.5a.

[112] Brazil's 3 December Closing Statement, para. 13.

[113] This calculation assumes that total world trade would not be affected if US subsidies were not provided.

[114] Brazil emphasizes that also for these years there are strong export-enhancing effects of the US subsidies, but has assumed for this exercise that they had no effects on US world market share.



89. This graph shows that in MY 2002, US exports would have fallen and remained below their previous three-year average *without* the US subsidies for that year. In other words, *but for* the 2002 US subsidies, there would have been a reduction in US world market share, not an *increase.*[115] This analysis also demonstrates that while there may have been other factors at work stimulating US exports (such as reduced domestic US demand for upland cotton), these factors were not enough to cause an increase in US world market share over the previous 3 year period as required by Article 6.3(d).

**233. In Brazil's view, what is or are the "same market(s)" for the purposes of Article 6.3(c)? Does Brazil's view of "world market" imply that regardless of which domestic (or other) "market" is examined, price suppression will be identifiable? BRA**

Brazil's Answer:

90. The "same market(s)" for the purposes of Brazil's price suppression claims under Article 6.3(c) are (1) the world market for upland cotton, (2) the Brazilian market, (3) the US market, and (4) 40 third country markets[116] where Brazil exports its cotton. US and Brazilian "like" upland cotton is found in each of these markets.

[115] Brazil's 9 September Further Submission, Annex I, Table I.5a.

[116] Argentina, Belgium, Bangladesh, Bolivia, Cambodia, China, Chile, Colombia, Cuba, Ecuador, France, Germany, Greece, Hong Kong, Indonesia, India, Israel, Italy, Japan, South Korea, Malaysia, Morocco, Netherlands, Pakistan, Peru, Poland, Portugal, Philippines, Singapore, South Africa, Spain, Switzerland, Thailand, Tunisia, Turkey, Taiwan, United Kingdom, Ukraine, Venezuela, Vietnam.

91. The record establishes that there is a "world market" for upland cotton and that the prices for that market are reflected in the New York futures prices and in the A-Index prices.[117] Brazil established that there is a global price discovery mechanism that reflects the "world market price," which is heavily influenced by world market supply and demand factors, including the US subsidies.[118] These "world market prices," in turn, are transmitted to the US market, the Brazilian market, and to the 40 other markets where both Brazilian and US subsidized cottons are marketed as typical commodities.[119]

92. In response to the Panel's question whether the world market prices that Brazil claims are suppressed are also "identifiable" in the "domestic (or other) 'market,'" the answer is "yes." The evidence of the transmission of the global effects to these other markets includes (1) USDA's own data for the US prices received by US producers,[120] (2) USDA volume and value data for US exports to third countries,[121] (3) Brazilian Government volume and value data for Brazilian exports to 40 countries,[122] (4) Brazilian ESALQ Index data regarding internal Brazilian prices,[123] (5) data from various third countries reflecting upland cotton import prices,[124] and (6) data from several third countries reflecting their domestic prices for upland cotton.[125] In addition, Brazil has presented the evidence of Andrew Macdonald and Christopher Ward who testified concerning the importance of the A-Index. Brazil further includes the views of Gerald Estur, the ICAC's chief statistician, as set out below.[126]

93. A-Index world prices are a useful benchmark by which to judge whether prices for upland cotton traded internationally or even within domestic markets are influenced by global world market forces.[127] While the New York futures prices play a major role in influencing markets, the short term volatility of the futures market makes comparison with monthly or annual export prices more difficult. Andrew Macdonald indicated that "the price oscillations of the A and B-Index are much less pronounced than the futures market, but in the longer term they accompany the signs and trends coming from the futures market."[128] Moreover, the US Government uses the A-Index as a key basis for Step 2 and marketing loan payments. Professor Sumner's model adapted from the FAPRI model used actual A-Index prices for the period MY 1999-2001 and the "world price" simulation effects are estimated "A-Index" prices.[129]

94. Organized below is the evidence on pricing data supporting the link between A-Index prices that reflect the global supply and demand influences (including effects of the US subsidies) and prices in "other markets" as posed in the Panel's question. Brazil first presents evidence of US and Brazilian

[128] Brazil's 9 September Further Submission, Annex II (Statement of Andrew Macdonald, para. 23.).

[129] Brazil's 9 September Further Submission, Annex I (Sumner Analysis, para. 70 ("the model uses the Cotlook A-Index price to represent the world price . . . [and] the actual A-Index prices were used for the database for the model for marketing years 1999-2001.").

export prices to 40 different countries, based on official published US and Brazilian Government sources. It then provides (based on availability) information concerning the import prices of all imports from certain of the 40 countries where both Brazil and US upland cotton was exported during MY 1999-2002. Finally, Brazil presents information of internal domestic prices in the United States, Brazil, and China.

**Brazilian and US Export Prices**

95. In response to the Panel's question, Brazil first presents evidence of US and Brazilian export prices to 40 different markets where both Brazilian and US upland cotton was exported at some point during MY 1999-2002. The information and evidence below is based on a compilation from two sources. First, all information on US upland cotton export prices is based on the "US Trade Internet System," a web application run by USDA's Foreign Agricultural Service (FAS).[130] Second, information on Brazilian upland cotton export prices is taken from information published and maintained the Brazilian Ministry of Agriculture on its public web-site.[131] The export "prices" represent the declared contract value of the upland cotton at the US and Brazilian port of export – known as "Free Alongside Ship (FAS)" values.[132]

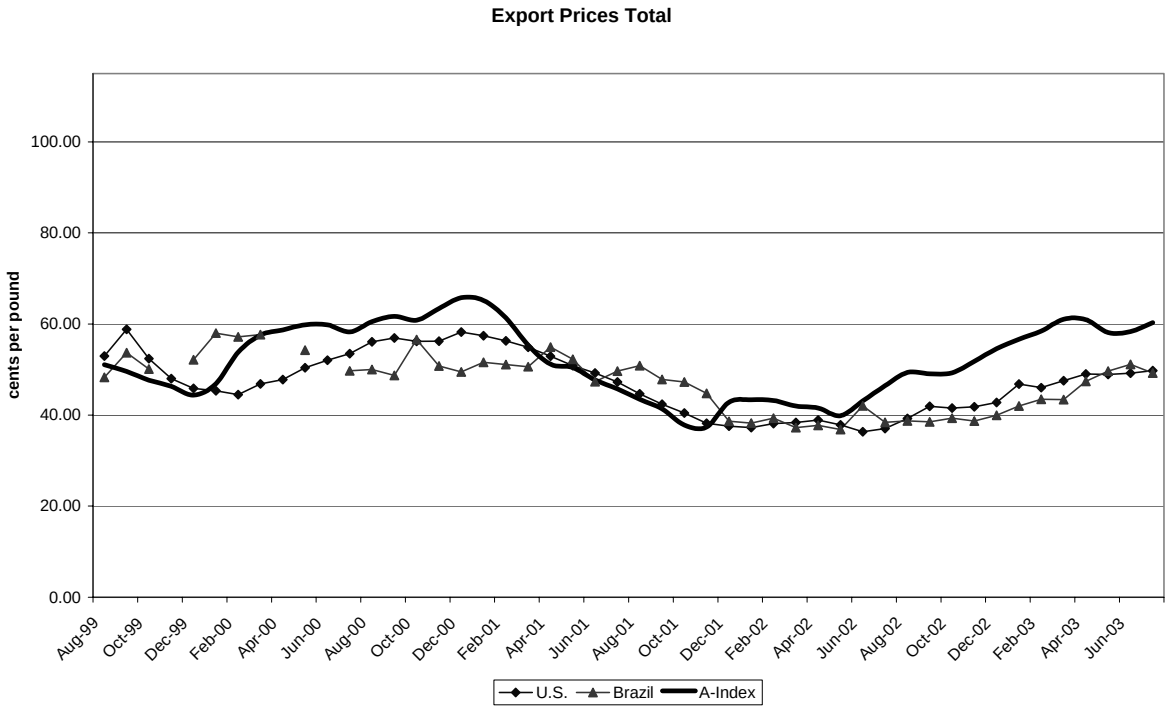
96. The first way to examine the available data is to view it collectively similar to what the United States did in Exhibit US-75. The first graph below examines the cumulative Brazilian and US export prices in MY 1999-2002 covering exports to the 40 markets where Brazil exports its upland cotton as well as US exports to Brazil.[133]

[130] *See* http://www.fas.usda.gov/ustrade/. The four upland cotton HS-10 codes used are 5201001010, 5201001020, 5201001025 and 5201001090. All data originally in tons and dollars, was converted into pounds and cents.

[131] *See* http://alicewebl.desenvolvimento.gov.br; www.mdic.gov.br/indicadores/balanca/balanca.html. See also Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country). All Brazilian data originally provided in kilograms and dollars was converted into pounds and cents.

[132] The FAS value includes all inland freight, insurance and other charges incurred in placing the merchandise alongside the carrier at shipping or insurance costs.

[133] Exhibit Bra-386 (Brazil and US Export Prices by Country). The data for all of the graphs in this subsection of Brazil's answer is contained in Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).

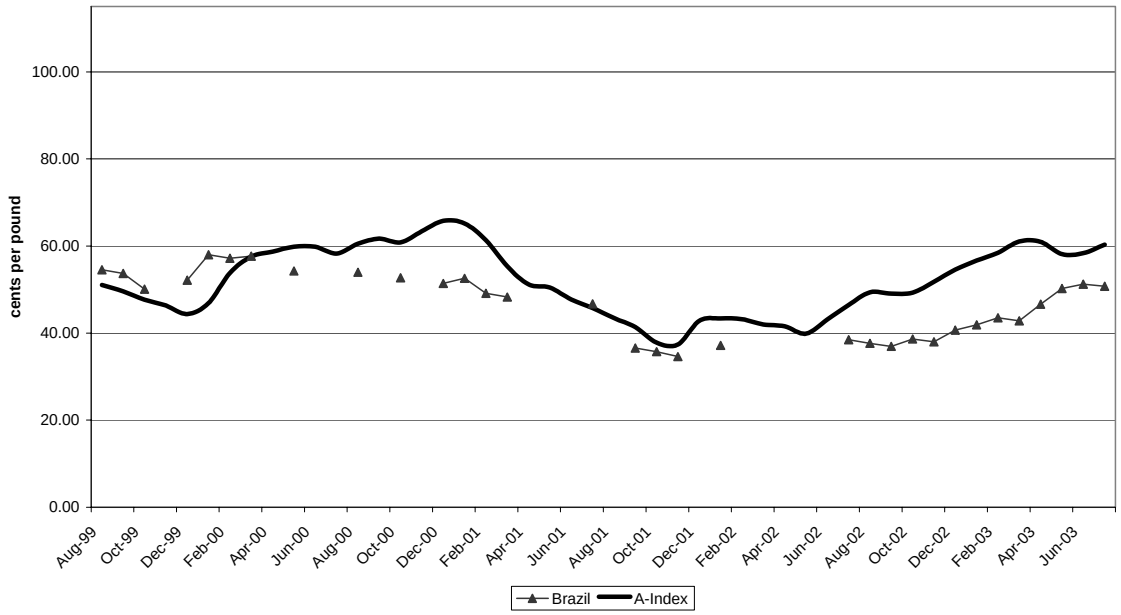


97. The A-Index on the graph is the solid black line. The Panel can see that over the four year period, US and Brazilian export prices closely follow the movements in the A-Index. In addition, as discussed in greater detail in the answer to Question 235, Brazilian prices are at times equal to, slightly greater than US prices or slightly lower than US prices.

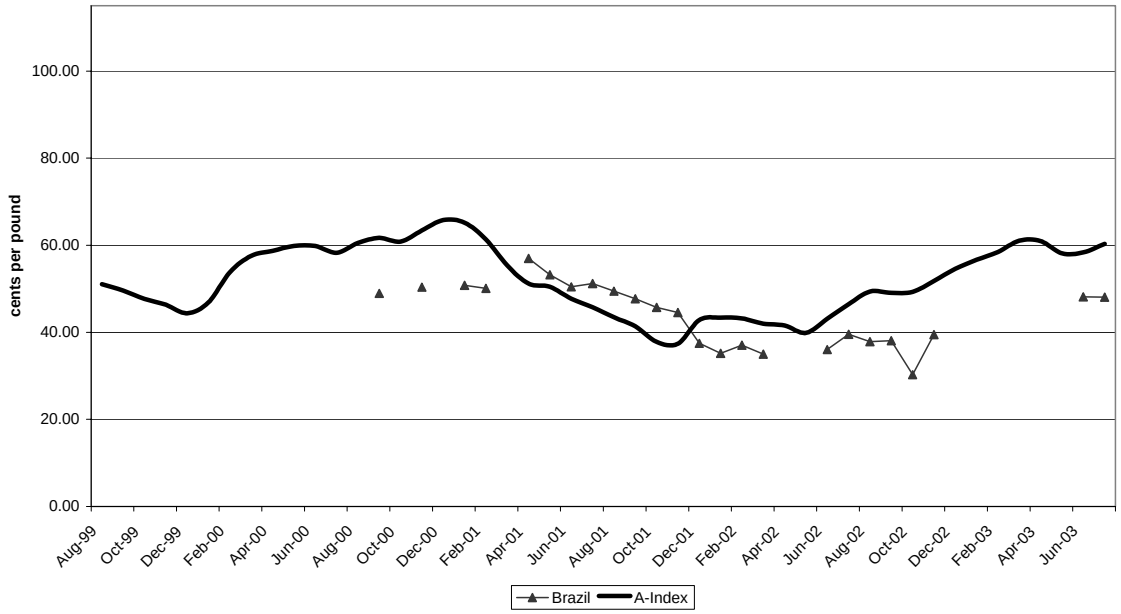
98. The Brazilian export data can be used as a proxy for third country market prices in a handful of countries where there were extensive Brazilian exports. This is illustrated in the cases of three of the larger markets for Brazilian exports – Argentina, India, and Portugal as set out in the graph below:[134]

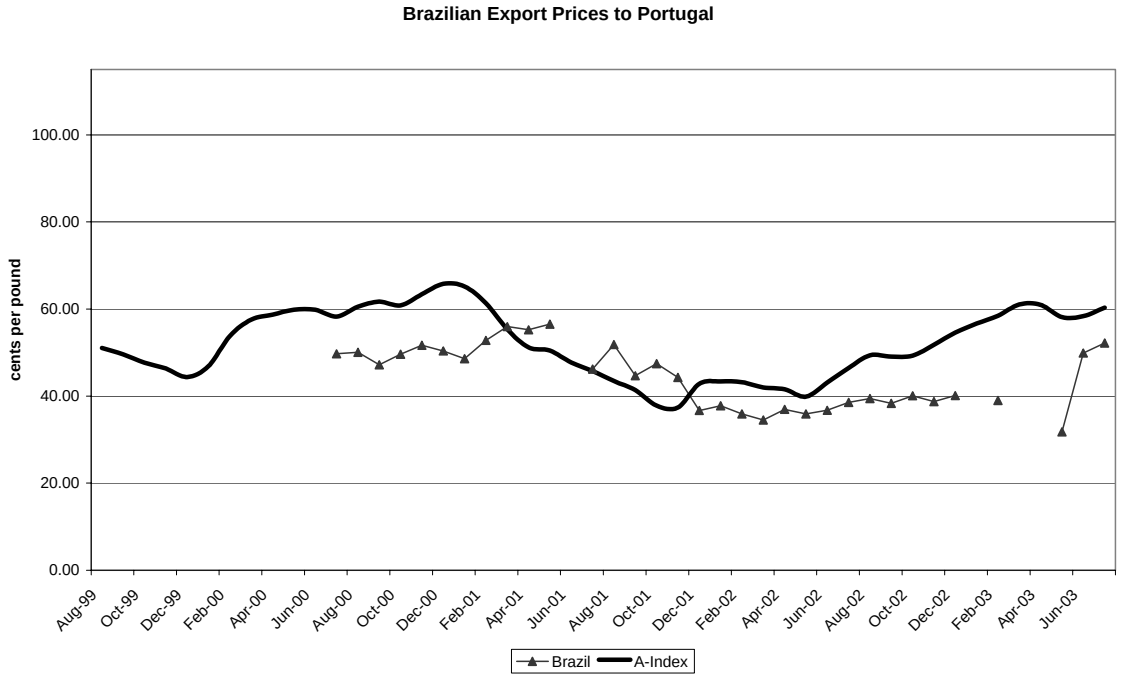
[134] The Panel will find a complete list of graphs showing A-Index prices plotted against Brazilian export prices to all countries to which Brazil exports in Exhibit Bra-387 (Brazil Export Prices v A-Index Prices by Country).

**Brazilian Export Prices to Argentina**



**Brazilian Export Prices to India**

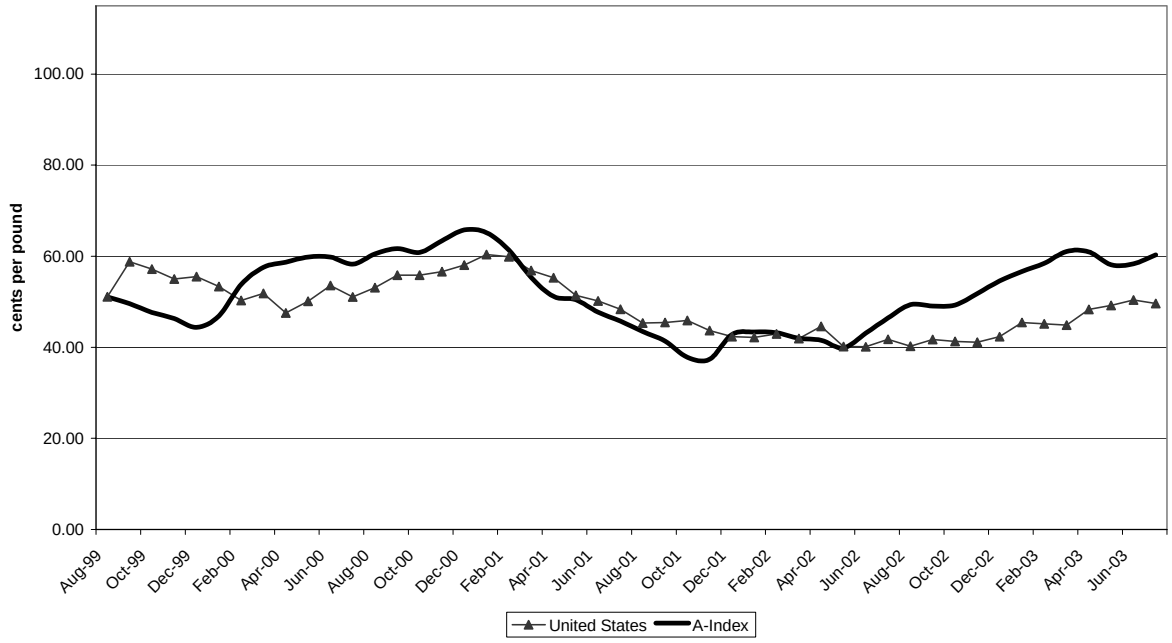




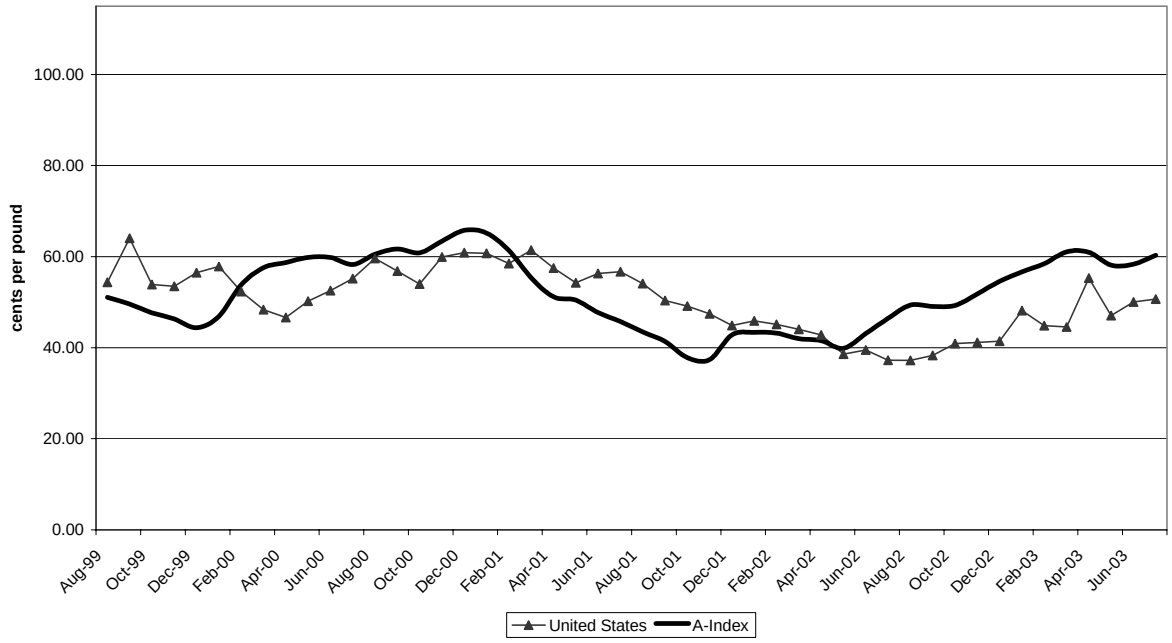
99. Because US exports were so much greater than Brazilian exports, a better way to examine the relationship between A-Index prices and prices in the 40 countries is to examine US export prices, particularly where there were large volumes of US exports. This is illustrated in the graphs below for China, Indonesia, South Korea and the Philippines (as well as other graphs in Exhibit Bra-388):[135]

[135] The Panel will find a complete list of graphs showing A-Index prices plotted against US export prices to all countries to which Brazil exports in Exhibit Bra-388 (US Export Prices v A-Index Prices by Country).

**US Export Prices to Indonesia**



**Export Prices to South Korea**



100. Brazil presents in Exhibit Bra-383 the underlying data on all 40 of the markets where Brazil and the United States export their upland cotton. This underlying data is presented in a variety of different graphs; one set compares Brazilian exports to the A-Index;[136] another compares US exports to the A-Index,[137] and a third combines Brazilian and US export prices.[138]

101. Many of the 40 markets show only very limited amounts of Brazilian exports. Compared to the volume of US exports, Brazilian exports during MY 1999-2002 were relatively small (representing approximately 1 per cent of total world market share).[139] Thus, when the monthly export data is examined on a country-by-country basis, there are very few third country markets where Brazil exported in each of the 48 months in MY 19999-2002, *i.e.*, where there is a complete set of 48 data points. Nevertheless, even the limited data points for each of the 40 countries shows that Brazilian export prices generally tracked A-Index prices.

102. Many of the graphs also reflect fairly widely ranging data point prices, particularly where the import volumes are not very great.[140] By contrast, country markets with very high volumes of imports[141] tend to have much more stable import prices that closely follow the A-Index. This is why the US high-volume import data graphs provide reliable evidence of pricing trends in some of the 40 country markets examined. There are various reasons that explain the widely ranging pricing data points. First, while US and Brazilian cottons may have the same staple length, their quality may differ significantly which, in turn, impacts their respective price.[142] For example, California A-Index cotton is consistently sold at a premium in world markets because its superior quality allows it to be

[136] Exhibit Bra-387 (Brazil Export Prices v A-Index by Country).
[137] Exhibit Bra-388 (US Export Prices v A-Index by Country).
[138] Exhibit Bra-386 (Brazil and US Export Prices by Country).
[139] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 4 and 76).
[140] *See* Exhibit Bra-387 (Brazil Export Prices v A-Index by Country). Examples are Belgium, Pakistan, South Africa.
[141] *See* Exhibit Bra-387 (Brazil Export Prices v A-Index by Country). Examples are Argentina, China, India, Italy, Portugal, Philippines, Thailand.
[142] Brazil's 9 September Further Submission, Annex II (Statement of Andrew Macdonald, paras 9-10).

used in production of finer cotton fabric.[143] During certain period between MY 1999-2002, both Brazil and the United States exported cotton with a high staple length or a particularly good quality to a third country market, resulting in higher prices. This no doubt accounts for much higher US prices compared to Brazilian cotton in some markets such as France, Germany, and Portugal.

103. Second, smaller monthly export sales to a third country market with relatively few imports may result in much higher prices than large volume sales to large importers. Larger consuming countries (with larger consumers) can demand volume price premiums and sellers can export at higher volumes and lower prices based on economies of scale. The country data of the world's largest importers such as China, Hong Kong, Taiwan, and Indonesia, for example, closely match A-Index price trends.[144] But even larger importing countries data reflects an occasional month where prices diverge from the overall trend. This may be due to the fact that smaller shipments were purchased quickly on a spot basis at higher prices.

104. Third, some exports or forward contracts for export sales are fixed-price contracts, which may be executed months before export takes place.[145] For example, a yarn spinner or textile producer in Brazil may contract to purchase 100 tons of US cotton on 1 January 2002 at an import price fixed at 40 cents per pound at that date, but when the cotton is actually exported on 1 June 2002 the A-Index price may be 50 cents. This type of contract with terms fixed at execution rather than on delivery may explain a number of country market graphs where there is a delayed reaction of the country price to declines or increases in the A-Index prices. However, even where there is a delay in response, the longer-term trends in most markets thereafter track the downward or upward climb of A-Index prices.

105. But even with the limitations in the monthly data for individual country markets, the data on the whole strongly supports the conclusion that world prices do influence local export market prices. Any anomalies in smaller importing country markets are notably eliminated by using the weighted average analysis of monthly data from all 40 markets where Brazil and US cotton exports are found. With the vast bulk of US – and most of Brazilian cotton – being exported to large volume markets, the combined analysis shows the close relationship between A-Index prices and both Brazilian and US prices. Indeed, the Chief Statistician of the ICAC, who has extensive experience with individual country and world market pricing data, came to the following conclusions:

> For all importing non-producing countries, domestic prices follow the Cotlook A Index, taking into account appropriate location and quality differentials and the quality differential for the particular type of cotton needed by the spinning industry.
>
> Prices of imported cotton in producing countries also follow the Cotlook A Index, with appropriate location and quality differentials. The international market for raw cotton is relatively open, with rather low imports taxes (averaging less than 5 per cent. The US having one of the highest).

[143] Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC)(California/Arizona cottons "is usually about 2 cents more expensive than Memphis"). *See also* Brazil's 9 September Further Submission, para. 241, figure 17 (showing California A-Index quotes at higher prices than Brazil A-Index cotton which is comparable to Memphis).

[144] *See* Exhibit Bra-387 (Brazil Export Prices v A-Index by Country), Exhibit Bra-388 (US Export Prices v A-Index by Country) and Exhibit Bra-384 (Import Prices from Various Countries).

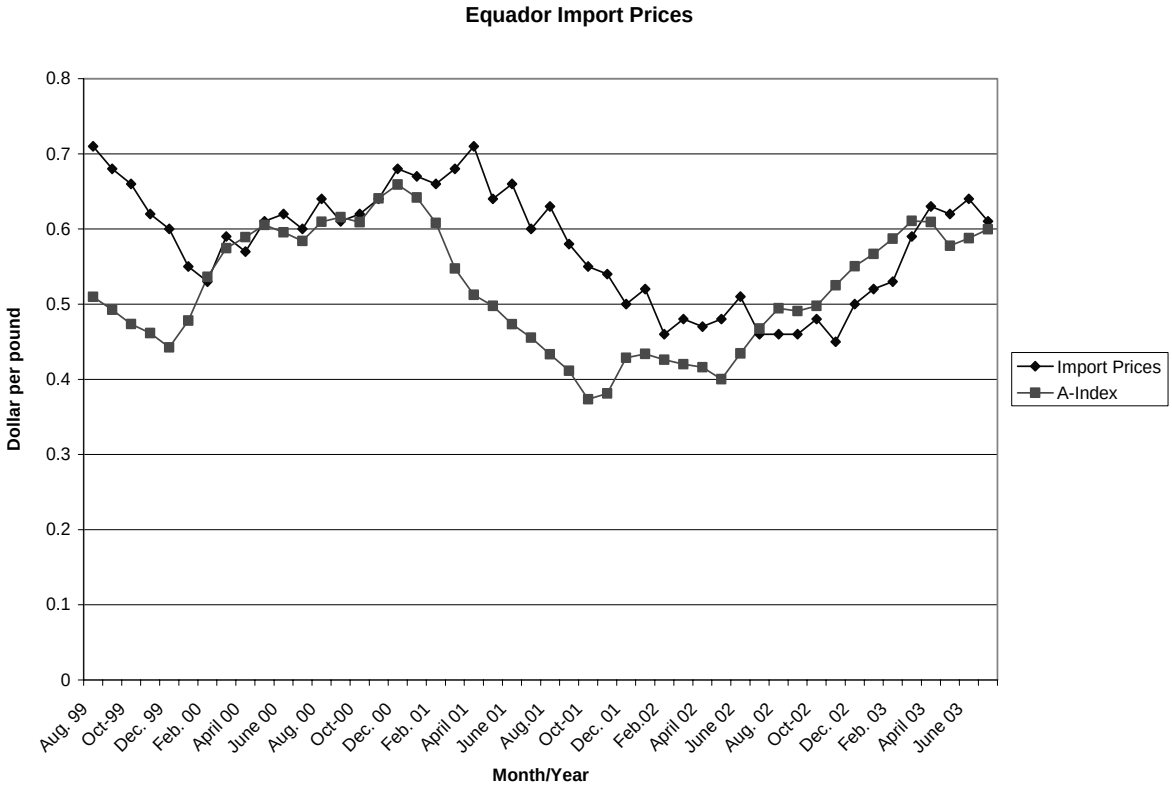
[145] Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC)("Actual prices of imported cotton, in non-producing as well as in producing countries, are based on the A Index or on New York Futures . . . on the day of the contract (concluded prior to shipment, and cotton can be sold more than one year forward). As a result, the average price of imports (value divided by quantity) for a specific period is not directly related to prevailing market prices.").

> Domestic prices of cotton produced and consumed locally are influenced by the supply and demand situation in the country but are not disconnected from international prices.[146]

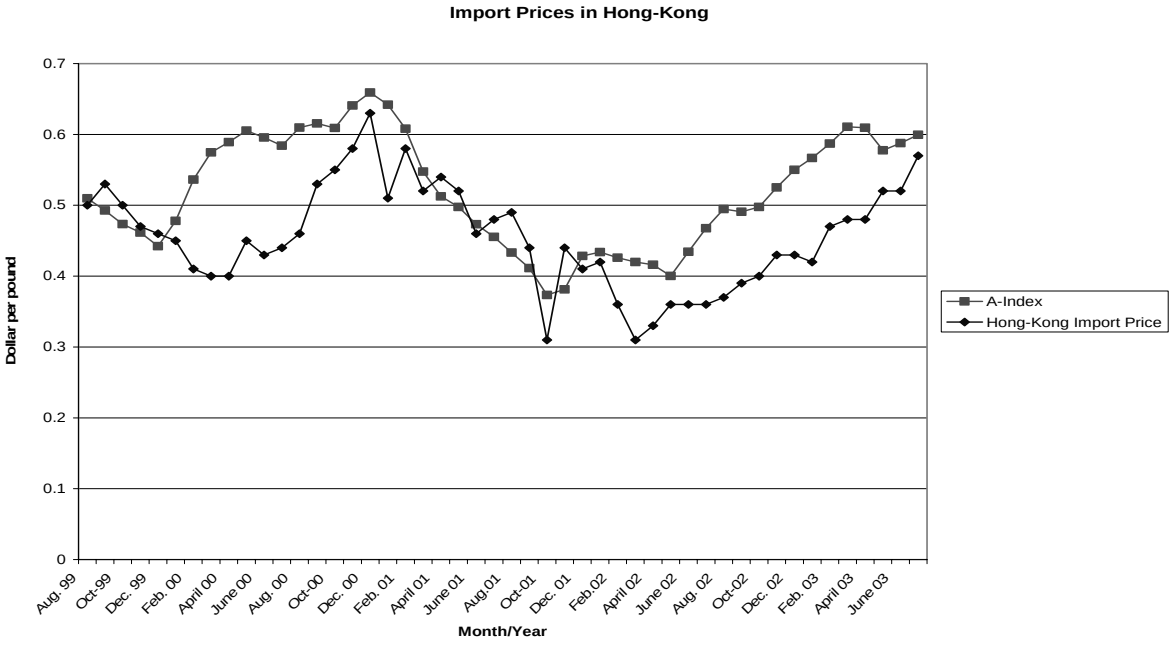
**Individual Country Market Import Price Data**

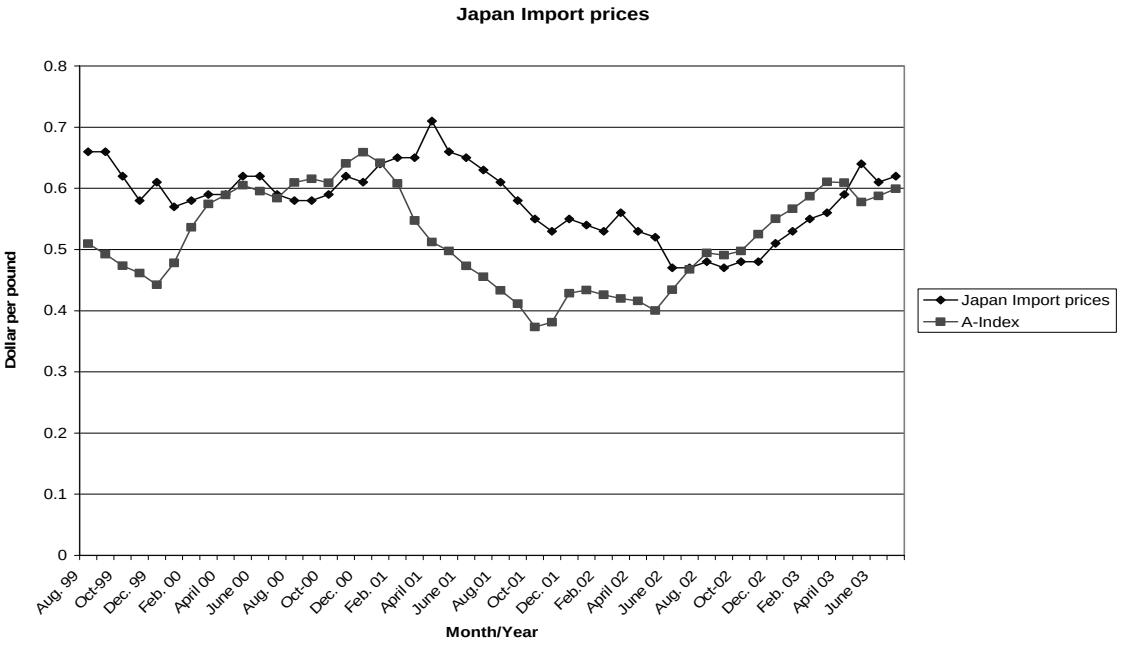
106. Additional evidence responsive to the Panel's question is found in various third country market *import* pricing data that was collected since 9 December 2003 by Brazilian embassies around the world. The data and the graphs are set out in Exhibit Bra-384. This data is available in two forms: (1) *monthly* import data from all sources, and (2) *annual* import data from all sources. While this information is not available to Brazil for many of the 40 export market countries, the available evidence confirms the other third country market data discussed above.

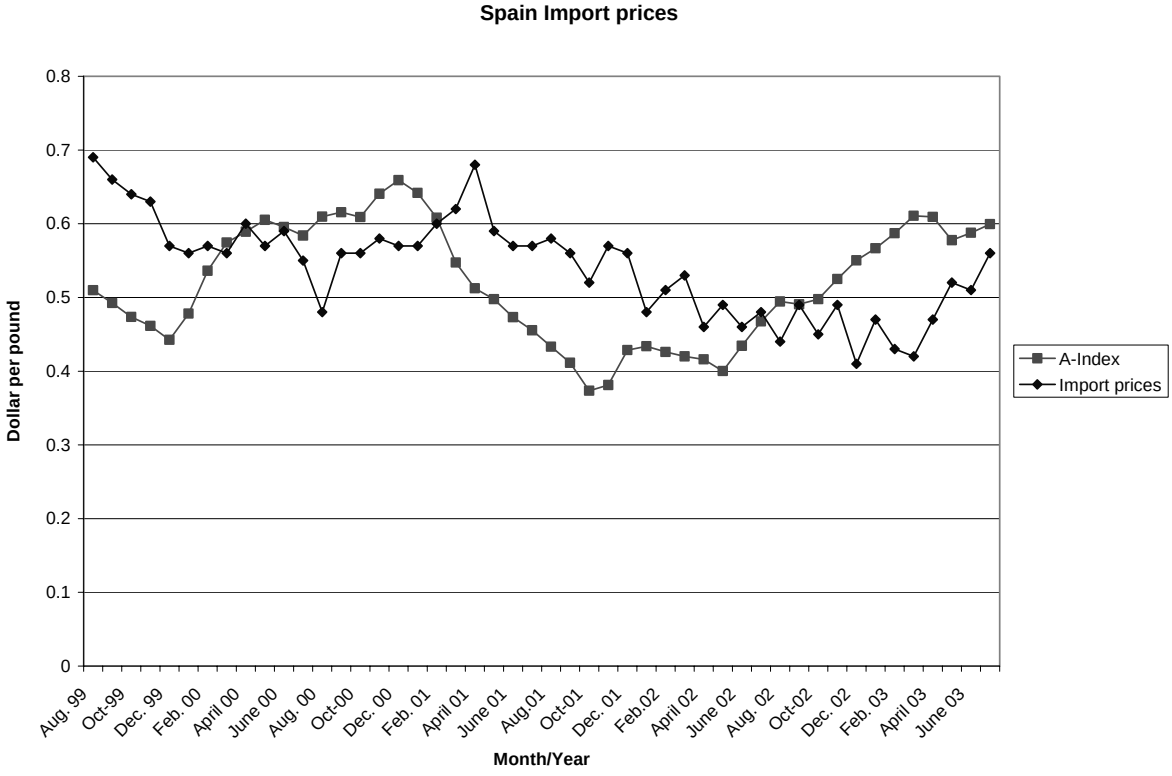
107. Monthly import data is available from Argentina, Ecuador, Hong Kong, Japan, Spain, Thailand, and the Ukraine. The data generally shows a close relationship between the movement of import prices and the movement of the A-Index. For example, set out below are graphs representing the data from Ecuador, Hong Kong, Japan and Spain:



[146] Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC).

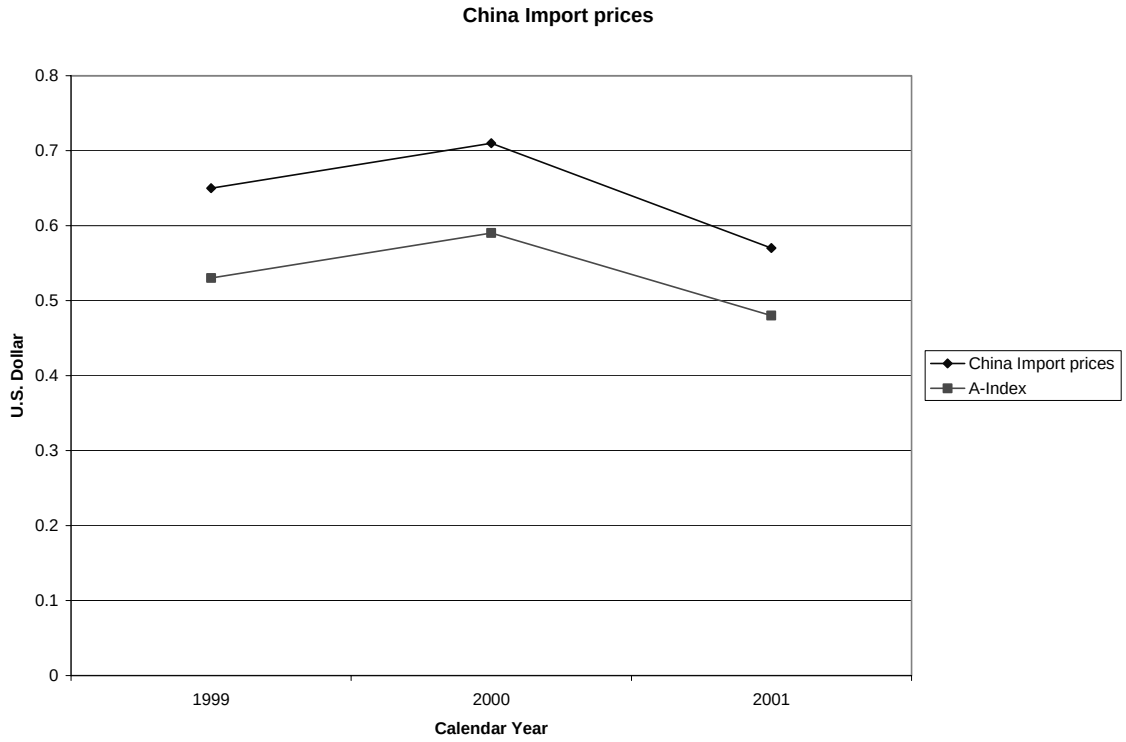






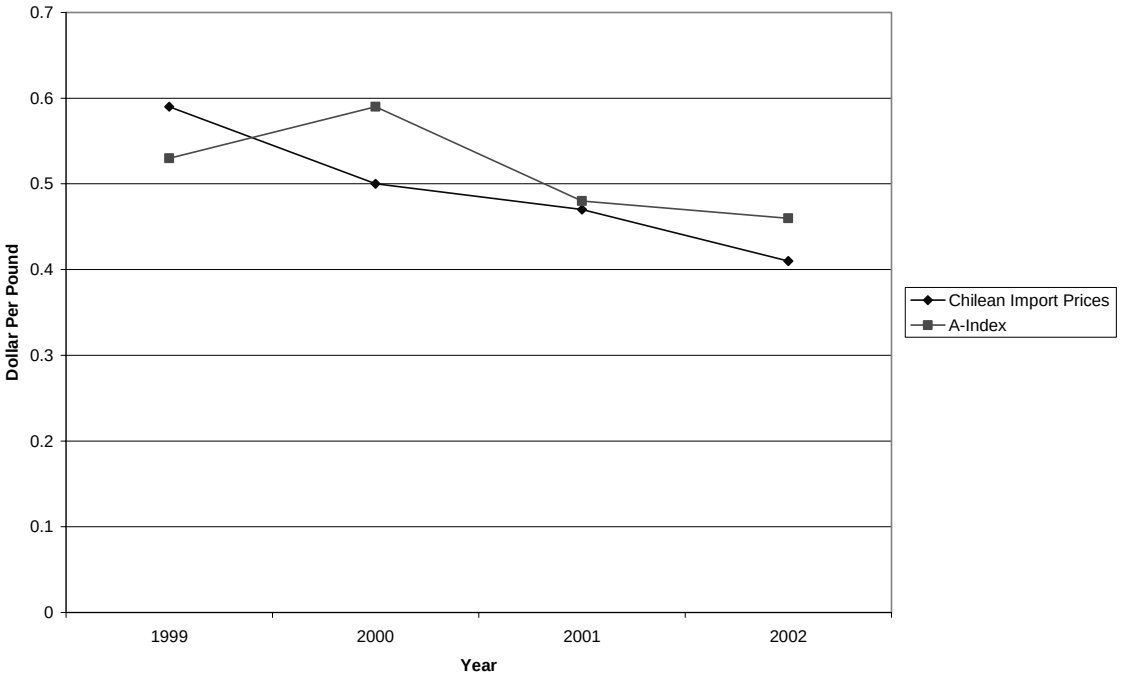
The monthly data for these countries reflects fairly high-volume imports from all worldwide sources. The higher volumes guarantee a more accurate reflection of the bulk of prices within these countries. The link between A-Index and import prices is also confirmed by the data for Argentina, Thailand and the Ukraine in Exhibit Bra-384.

108. There is also *annual* import data available from a few countries. While annual data does not provide as detailed information concerning price movements within a year, it also supports a link between the A-Index and import prices. These import prices, in turn, serve as a proxy for prices in the third country market generally. For example, the available import data from China, Chile, and the United Kingdom is set forth below:[147]

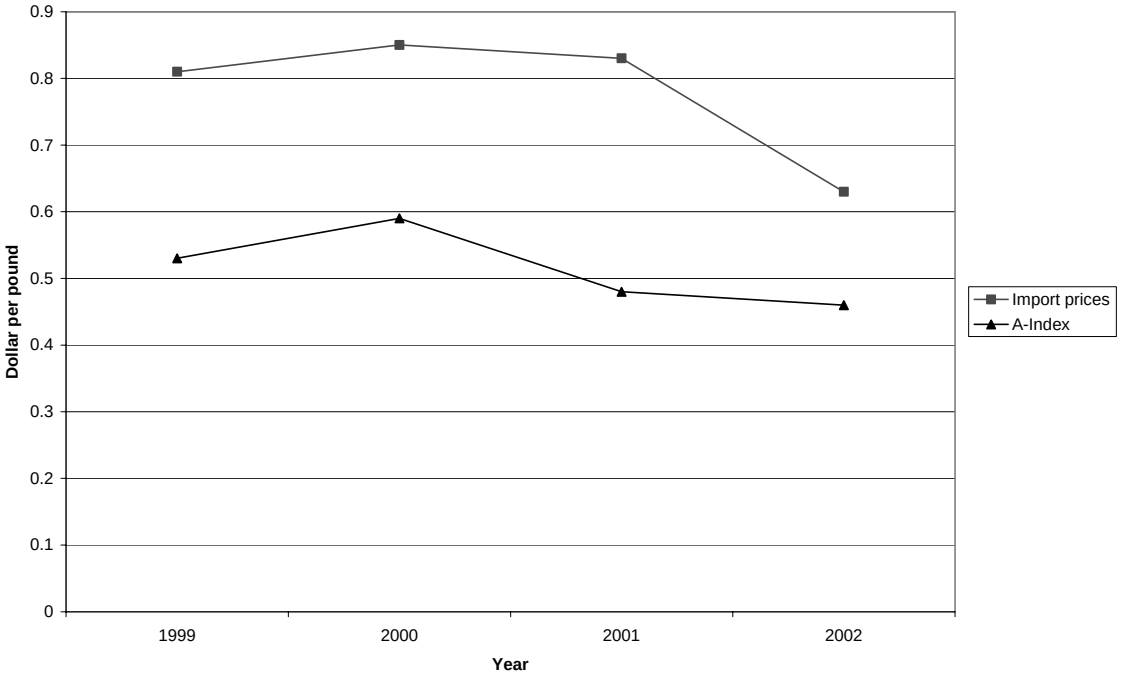


[147] Exhibit Bra-384 (Import Prices from Various Countries).

**Chilean Import prices**



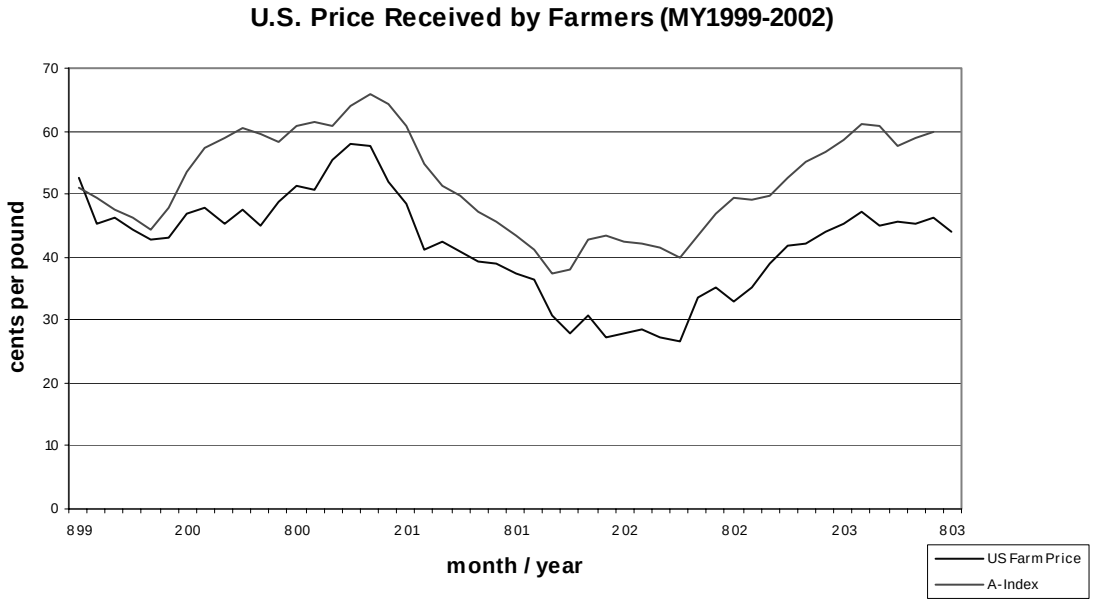
**United Kingdom Import prices**



**Individual Country Domestic Prices**

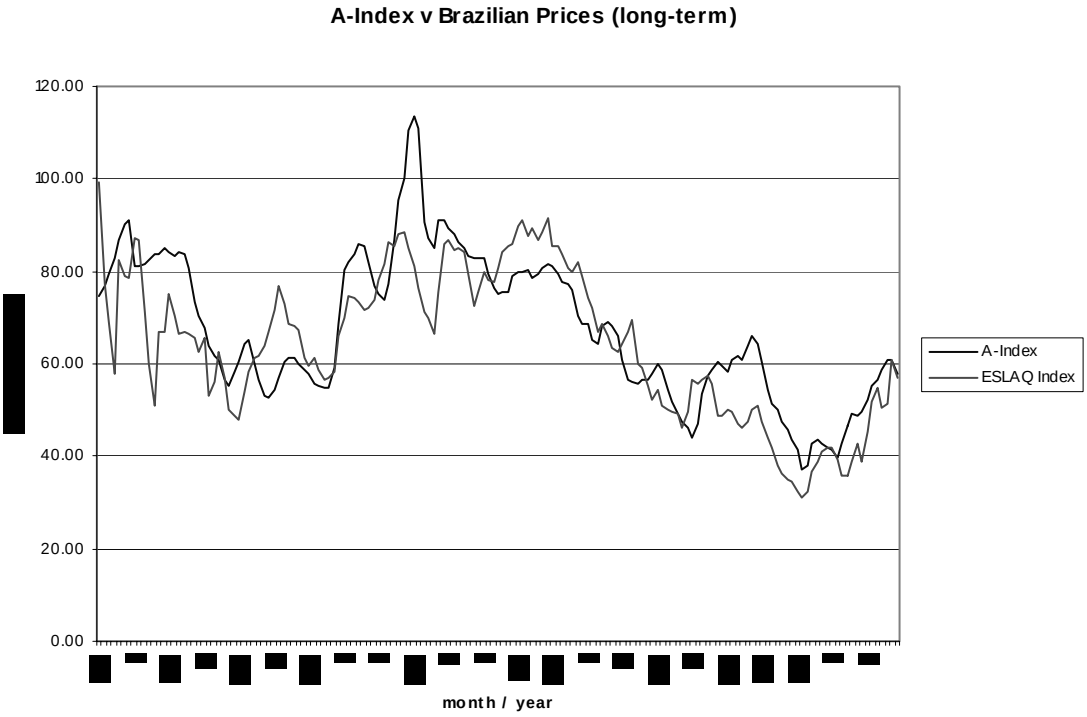
109. Finally, Brazil presents a series of graphs showing domestic prices in those countries for which domestic prices were available. Andrew Macdonald has indicated that most countries do not collect or maintain accessible data on domestic upland cotton prices. This was confirmed by the requests for such data by Brazilian embassies around the world. Therefore, Brazil can only offer information on domestic prices from a limited number of countries. These countries, however, constitute key markets, including the United States, China, Brazil and Pakistan.

110. The record shows that domestic prices within several key producing countries including the United States, Brazil, China and Pakistan also reflect and generally move with the overall trends of A-Index prices. This is shown in the graphs below:[148]



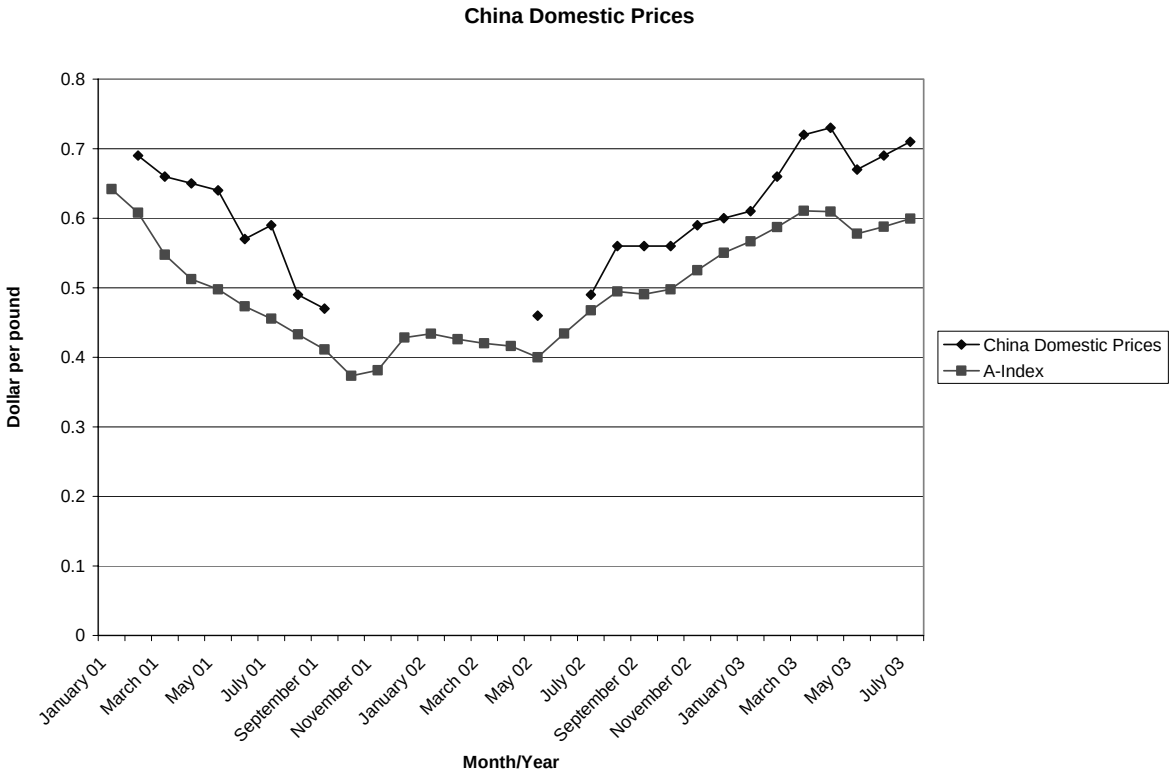
111. This data provides further confirmation of the close link between US domestic prices and the A-Index prices. As set forth below, this close link also exists for the domestic Brazilian market where most of Brazilian production is marketed:[149]

[148] This graph is reproduced from Figure 5 of Brazil's 9 September Further Submission.
[149] This graph is reproduced from Figure 7 of Brazil's 9 September Further Submission.

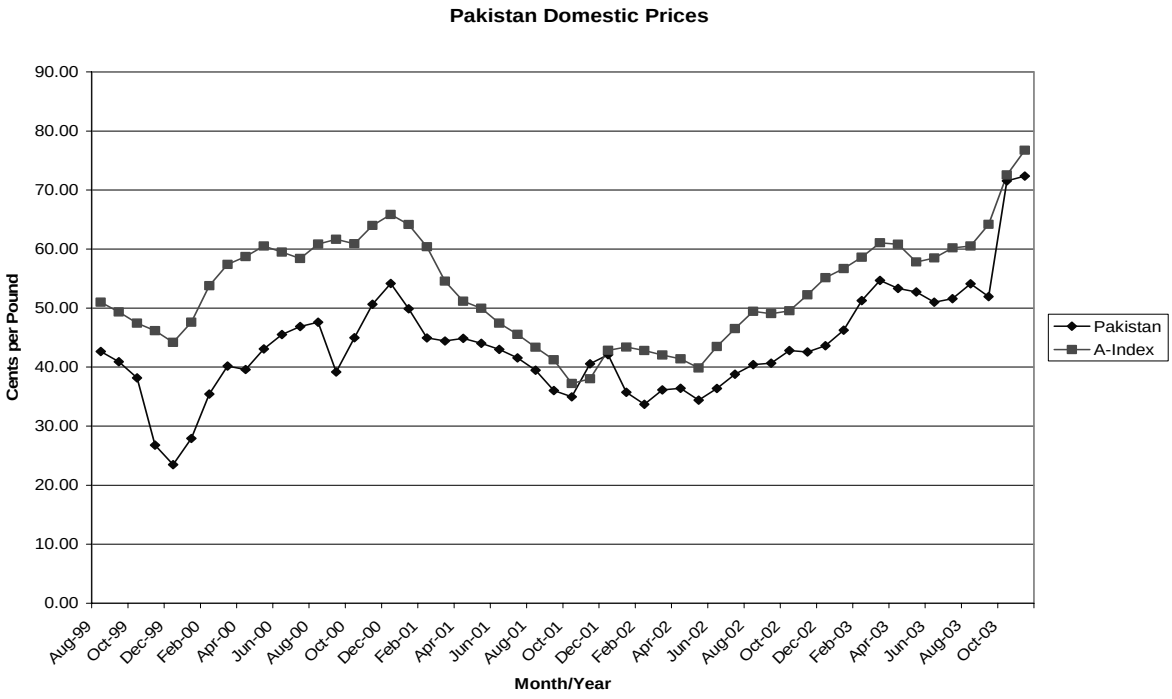


112. Finally, the domestic prices of the world's largest producer and consumer of upland cotton is the Chinese market. Because China is one of the world's largest importers of upland cotton, it is not surprising that its domestic market prices also track the A-Index prices as seen in the graph below:[150]

[150] Exhibit Bra-385 (Domestic Prices from Various Countries).



A similar pattern also evolves for domestic prices in another major producers and user of upland cotton: Pakistan.[151]



[151] Exhibit Bra-385 (Domestic Prices from Various Countries).

**Conclusion**

113. The evidence outlined above and in Brazil's earlier submissions shows that world market prices were transmitted to other markets during MY 1999-2002, and that this continues today. Whether the data is viewed collectively or individually, the data generally shows that Brazilian, US and other exporters' prices to these 42 countries are consistent with movements and trends in the A-Index price. While there are some (particularly low volume) graphs that show monthly differences from A-Index trends or movements, Brazil has set forth the quality, contract, and timing factors accounting for such anomalies. The collective statistical evidence supports the conclusion of the ICAC's chief statistician that "[a]ctual prices of imported cotton, in non-producing as well as in producing countries, are based on the Cotlook A Index or on the New York futures" and "the prices of the major types of cotton … are affected by the supply and demand situation facing the market as a whole."[152] All of this evidence is consistent with the conclusion that these third country market prices are heavily influenced by A-Index and New York futures prices. Professor Sumner analysis and the studies by USDA economists undeniably show that the US subsidies have suppressed A-Index and New York futures prices. Since these indices are the benchmarks for prices in those "same markets" where US and Brazilian upland cotton were exported, it is indisputable that the US subsidies have suppressed the prices in each of the "markets" cited in the introductory paragraph of Brazil's answer to this question.

**234. Does "significant" price suppression under Article 6.3(c) necessarily amount to "serious" prejudice within the meaning of Article 5(c)? Could the level of "significance" of any price suppression under Article 6.3(c) determine whether any prejudice under Article 5(c) rises to the level of "serious prejudice"? USA, BRA**

Brazil's Answer:

114. In response to both questions, Brazil, New Zealand, and Argentina have argued previously that whether price suppression is "significant" cannot be judged solely by reference to a non-textually based "objective" amount of price suppression.[153] Rather, the "significance" of price suppression must be assessed with reference to the quality of the impacts of *whatever* level of price suppression exists on the producers of the like product. For example, a panel could find that even large amounts of price suppression are not "significant" where the complaining party producers had *de minimis* production, or no exports, and/or that the total value of lost revenue from suppressed prices was minimal. On the other hand, very large producers of a commodity product like upland cotton would suffer serious prejudice from even smaller "objective" levels of price suppression in terms of the amount of lost revenue.

115. The Panel's question really comes down to whether Article 6.3 of the SCM Agreement requires a two step process – first, an objective finding of an amount of price suppression that is "significant," and second, whether the complaining party Member suffers serious prejudice from such "significant" levels of price suppression. Brazil does not believe the text requires such a two-step process for the reasons outlined above and in previous submissions. However, the facts of this case show that even if such a test were required, the amount of price suppression caused by the US subsidies is significant and far from *de minimis*. Brazil has also submitted undisputed evidence that its producers have suffered considerable losses in revenue from suppressed prices that could have

[152] Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC).

[153] Brazil's 9 September Further Submission, paras. 251-259; Brazil's 7 October Oral Statement, para. 30; Brazil's 27 October Answers to Questions, paras. 119-122. New Zealand's 3 October Further Submission, paras. 2.21-2.27; New Zealand's 8 October Oral Statement, para. 8; Argentina's 3 October Oral Statement, para. 36; Argentina's 8 October Oral Statement, para. 38.

been used for further investment in high-yielding lower cost production.[154] By any measure, this evidence establishes both "significance" of the price suppression and "serious prejudice" to the interests of Brazil.

**235. Please comment on paragraphs 8, 9 and 10 of the US 2 December oral statement, in particular, why the average Brazilian price is shown as lower than the average US price. BRA**

Brazil's Answer:

116. Brazil previously has set forth its reasoning why evidence of lower Brazilian prices in some markets is irrelevant to the issue of whether or not all the prices in those markets were suppressed by the global effects of US subsidies.[155] This global price transferral mechanism is and remains the relevant analysis of Brazil's Article 6.3(c) price suppression claim as Brazil has outlined in its Answer to Question 233. Brazil sets forth its comments and rebuttal to paragraphs 8, 9 and 10 of the US 2 December Oral Statement and Exhibit US-75 below.

**Cumulative Analysis of 8 Country Export Prices**

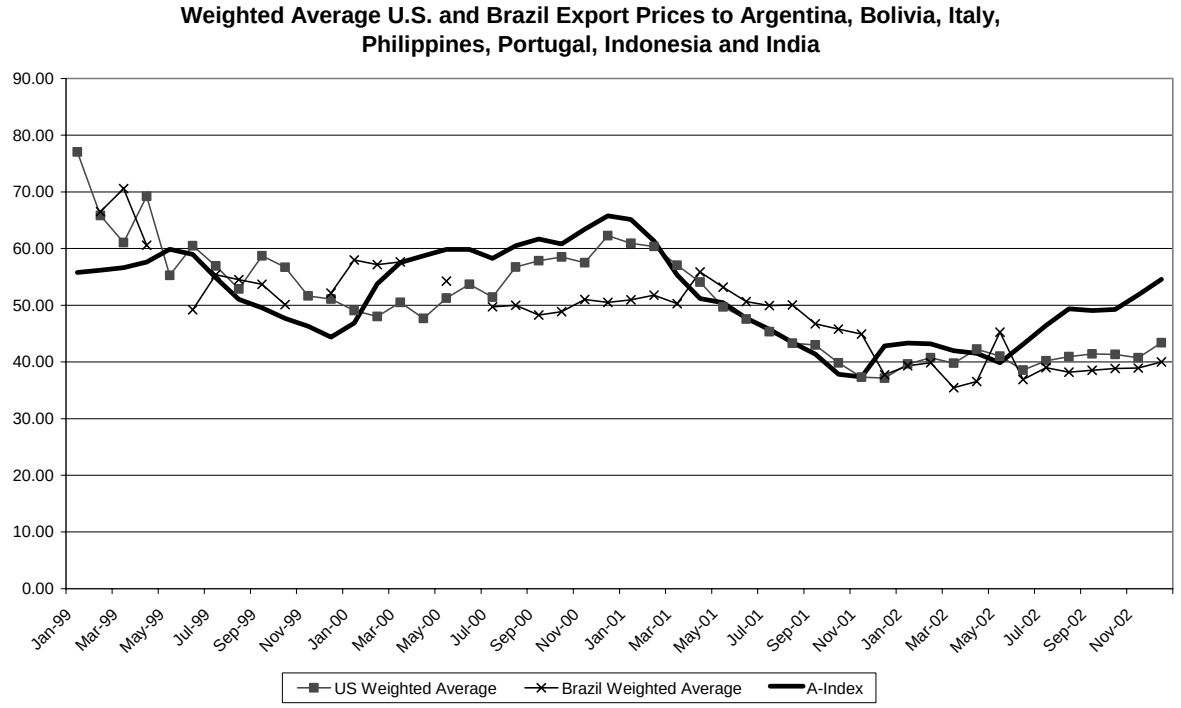
117. With respect to the US "price undercutting" argument, and in particular the US chart set out in Exhibit US-75, the factual assertion that cumulative US prices in the 8 countries examined are consistently much higher than Brazilian prices is simply wrong. One fundamental error with Exhibit US-75 is that the United States did not "weight-average" the data regarding export prices for Argentina, Bolivia, Italy, Philippines, Portugal, Indonesia, Paraguay and India. Rather, Exhibit US-75 is based on a simple average, not taking into account whether Brazilian shipments on a monthly basis were 2 tons or US shipments the same month were 100,000 tons. In addition, the US chart (and accompanying data) in Exhibit US-75 provides no volumes on monthly shipments, provides no published backup material, uses a non-public source of information, and inexplicably does not use official USDA Foreign Agricultural Service (FAS) published data on export prices.

118. Using the proper monthly weighted average methodology and FAS's own official export pricing data together with the Brazilian Government's official export pricing data,[156] the collective situation in the eight countries examined in Exhibit US-75 looks completely different than the US chart in that exhibit:

[154] Brazil's 9 September Further Submission, Section 6 and Annex III. *See* also Exhibit Bra-283 (Statement by Christopher Ward – 7 October 2003).

[155] Brazil's 2 December Oral Statement, paras. 14-19 (providing evidence and references to other evidence supporting Brazil's clams); Brazil's 9 September Further Submission, Section 3.3.4.9.

[156] This data was discussed in some detail in Brazil's Answer to Question 233 and is contained in Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).



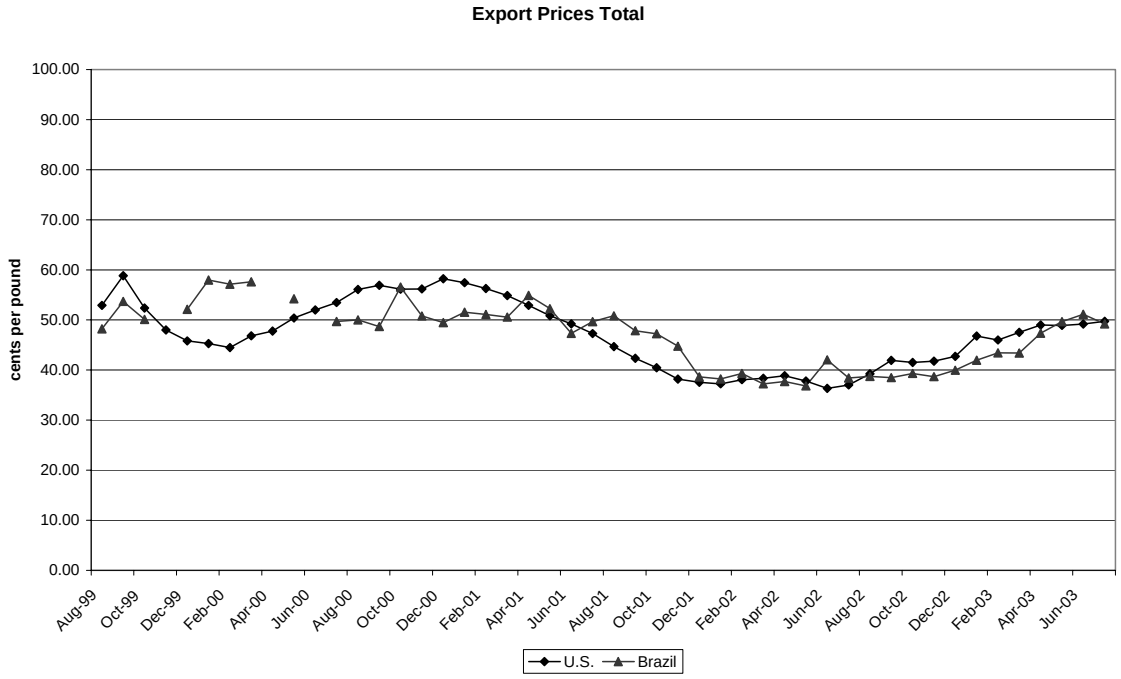
119. The graph shows that US and Brazilian prices fluctuate with Brazilian prices at times higher than US prices and US prices higher than Brazilian prices at other times. The chart shows that beginning in November 2000, US prices plunged along with the A-Index prices and that Brazilian prices quickly followed, with both US and Brazilian prices remaining at record lows until near the end of 2002 when both started rising again. Finally, the chart shows that US prices generally followed the movements or trends in A-Index prices (the solid line in the graph). As discussed in Brazil's Answer to Question 233, this is what is relevant for a price suppression claim under Article 6.3(c) as opposed to any alleged "undercutting" by Brazilian cotton in individual markets as the US claims.

**Cumulative Analysis of US and Brazilian Prices in 40 Third-Country Markets**

120. Moving beyond the 8 countries in Exhibit US-75 to all 41 countries (including Brazil) where Brazil and the US both sold at least some upland cotton between MY 1999-2002 further demonstrates the absence of so-called "price undercutting" by Brazilian products as alleged by the United States. For the period MY 1999-2002, the weighted average price covering a total of 10.5 billion pounds of US upland cotton exported to these same 41 countries (including Brazil) is 45.33 cents per pound.[157] By contrast, the average weighted price of 709 million pounds of exported Brazilian upland cotton to 40 export markets is 44.65 cents per pound.[158] This is a difference of 0.68 cents per pound. For marketing year 2001 – the year when prices plunged to record lows – the weighted average price of US upland cotton in all markets where Brazilian cotton was also exported was 38.83 cents per pound while Brazilian weighted average prices to the same markets was significantly higher at 44.05 cents per pound.[159] Brazilian prices were lower than US prices during MY 2000 and 2002, but were higher than US prices in MY 1999.[160] This is hardly evidence of "price undercutting" by Brazilian upland cotton.

[157] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).
[158] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).
[159] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).
[160] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).

121. These very close relationships – as well as movements – of Brazilian and US cumulative prices in the 41 countries are reflected in cumulative weighted average monthly prices in the graph below:[161]



122. This graph illustrates the absolute closeness of prices between Brazilian and US prices, particularly after mid-2001. But it also shows very similar *movements* in prices between Brazilian and US exports. And, as discussed in Brazil's Answer to Question 233, these similar movements are further evidence of the influence of the global pricing mechanisms on prices received by US and Brazilian exporters in third country markets.

**Individual Third-Country Analysis of Brazilian and US Export Prices**

123. When US and Brazilian prices in the 40 individual markets are examined, the evidence does not support the United States' broad assertion that Brazilian prices are consistently lower than US prices. In some of the key textile producing countries where US exporters ship large quantities of US upland cotton – Hong Kong, Taiwan, India, Pakistan, and Vietnam – US prices during MY 1999-2002 were *lower* than Brazilian prices.[162]

124. In other large consuming (textile producing) countries, while US prices were somewhat higher than Brazilian prices, the volume of US exports vastly exceeded the volume of Brazilian exports, including China (120 times greater), Bangladesh (26 times greater), Colombia (9 times greater), Indonesia (17 times greater), Japan (35 times greater), Korea (3384 times greater), and Peru (631 times greater).[163] Huge volumes of US exports in these 7 markets compared to the volumes of Brazilian exports suggest that US exports, not Brazilian exports, play a dominating role in the conditions of competition in those markets.

[161] Exhibit Bra-386 (Brazil and US Export Price by Country).

[162] A complete set of graphs for each of the 40 countries country markets and the underlying data are set forth in Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country) and Exhibit Bra-386 (Brazil and US Export Prices by Country).

[163] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).

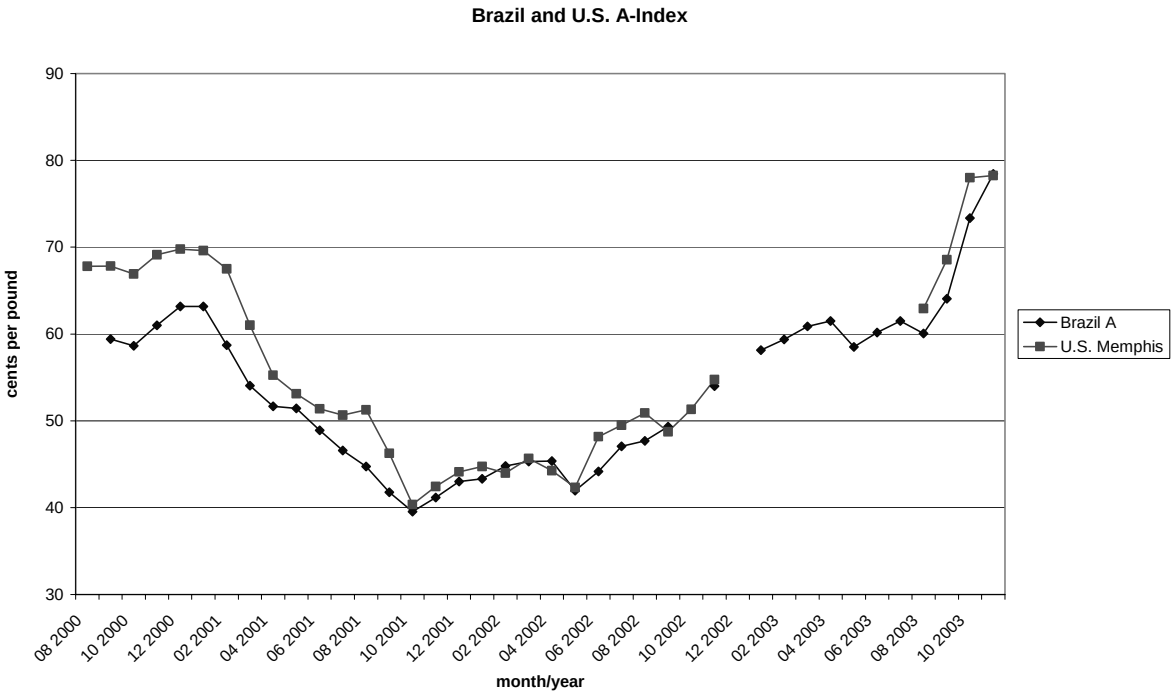
125. Indeed, overall, the cumulative volume of US exports to the 40 countries where Brazilian exports were shipped was *15 times* greater than the volume of Brazilian exports.[164] For Brazilian exports to secure any sales, let alone increase market share in competition with heavily subsidized US exports in these markets, it would not be surprising that textile consumers of upland cotton would expect Brazilian exporters to discount their prices. Andrew Macdonald confirmed that such discount pricing was necessary for non-Brazilian cottons to compete with US cotton.[165] This is particularly true in Argentina, Bolivia, Chile, Colombia, Ecuador, Indonesia, Peru, South Korea, Turkey and Venezuela where US exporters received the benefit of US export credit guarantees.[166] No exporter of non-US cotton could hope to compete with those export credits without discounting its upland cotton prices.[167]

126. But even where the volume of Brazilian exports was greater than US exports, the evidence does not suggest the absence of overall price suppression from the effects of US subsidies.[168] Brazilian exports were greater than US exports in only 10 of the 40 countries (Argentina, Bolivia, Cuba, Poland, France, Germany, Greece, Portugal, South Africa, and Spain) over the MY 1999-2002 period. These 10 countries represented a tiny fraction – 0.49 per cent – of total US exports during MY 1999-2002 to the 41 countries, and only 37.5 per cent of Brazilian exports.[169] Yet, even without significant US exports to these countries, the domestic prices of these countries still largely followed A-Index prices, as discussed in Brazil's Answer to Question 233.

127. Further, in the 10 countries where the volume of Brazilian exports was larger than the United States, Brazilian prices were higher than US prices in 3 of the 10 countries – Poland, Greece, and South Africa.[170] Further, US prices in 4 of the 10 countries – France, Germany, Spain, and Portugal – were much higher than Brazilian prices.[171] The very low volume of US exports to these same four countries suggests that far higher quality US cotton was sold in these countries which produce low-volume specialized cotton textile products.[172] Finally, US and Brazilian prices were very close in remaining 3 countries – Argentina, Bolivia, and Cuba.[173] Thus, contrary to the US arguments, this evidence does not suggest that Brazilian prices are suppressing US prices, even in those markets where there are larger volumes of Brazilian imports.

128. Similarly, the unqualified US assertion that "the Brazilian A-Index quote is consistently *below* the US A-Index quote"[174] is both untrue as well as irrelevant to the question of whether US production subsidies caused suppression of world and third country market prices. Comparing US Memphis A-Index prices with Brazil A-Index prices shows the following graph:[175]

[164] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).
[165] Brazil's 9 September Further Submission, Annex II, para. 50.
[166] Exhibit Bra-73 (Summary of Export Credit Guarantee Programmes, FY 1999-2003) and Exhibit Bra-299 ("Summary of FY 2003 Export Credit Guarantee Activity," USDA, Covering GSM 102, GSM 103 and SCGP).
[167] Brazil's 9 September Further Submission, Annex II, paras. 49-53.
[168] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[169] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[170] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[171] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[172] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[173] Exhibit Bra-383 (Brazil and US Export Data on Quantities and Values by Country).
[174] US 2 December Oral Statement, para. 10.
[175] Based on Exhibit Bra-242 (A and B-Index Quotes from Major Producers), extended to November 2003 using Cotton Outlook quotes.



129. As the Panel can see from the graph, since October of 2001, the US Memphis A-Index price has been slightly higher or slightly lower than the Brazilian A-Index price.[176] But throughout the entire period, the *movements* of both US Memphis and Brazilian A-Index prices track each other very closely.[177] This is the key fact illustrating the transmission of global price-suppressing effects as discussed in Answer to Question 233 *supra.*

**Domestic Prices for Brazil, US and China**

130. Nor does the record support the US claim that Brazilian prices undercut US export prices to the Brazilian market. Indeed, the evidence suggests the opposite. More than 90 per cent of Brazilian production of upland cotton was sold in Brazil during MY 1999-2002.[178] Imports represented approximately 20 per cent of Brazilian consumption during MY 1999-2002.[179] US exports to Brazil represented 21 per cent of Brazilian imports with a total of 306 million pounds of US upland cotton exported to Brazil[180] in MY 1999-2002.[181] US annual weighted average export prices to Brazil were lower in every year except MY 2000 when US exports volumes fell to very low levels.[182] Significantly, in MY 1999, when US export volumes to Brazil represented 17.6 per cent of very large Brazilian imports of upland cotton, the US weighted average prices were 10.27 cents *below* Brazilian domestic prices.[183] Similarly, in MY 2002, when US exports represented 50 per cent of total Brazilian imports, US export prices were 4.57 cents per pound *lower* than Brazilian domestic

[176] The US comparison between the Brazilian quote and the California/Arizona quote is misleading given the much higher quality of the latter cotton, as discussed above.

[177] The absence of data in MY 2002 for Memphis cotton was due to weather-related quality problems according to Gerald Estur of the ICAC. *See* Exhibit Bra-375 (Information Provided by Gerald Estur, ICAC).

[178] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 76).

[179] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 76).

[180] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).

[181] Exhibit Bra-208 ("Cotton: World Statistics," ICAC, September 2003, p. 76).

[182] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).

[183] Exhibit Bra-383 (Brazil and US Export Data on Export Quantities and Values by Country).

prices.[184] This evidence confirms the testimony of Andrew Macdonald that Brazilian textile purchases of cotton used, *inter alia,* US imports – or the threat of US imports – to negotiate lower Brazilian domestic prices during MY 1999-2002.[185] It may also be an effect of US GSM 102 export credit guarantees. And this evidence further confirms the price suppressing effects of US subsidies in the Brazilian market.

**Conclusion**

131. The evidence set out above refutes the inappropriate non-weighted average analysis in Exhibit US-75, and confirms the effects of the US subsidies in each market where Brazil and the US upland cotton were found in MY 1999-2002. Any "competition" between US and Brazilian cottons took place against the background of subsidy-distorted marketplaces. In the final analysis, the fact that selected US prices are higher[186] or lower in the A-Index or in individual third country markets is largely irrelevant to the question whether US subsidies are causing significant price suppression "in the same market" where US and Brazilian cotton is marketed. Rather, as Brazil has established, it is the impact of the US subsidies on the global supply and demand factors that suppresses prices in the world market as well as in the third countries where upland cotton is marketed. This means that the prices in each of those 40 third country markets – as well as the Brazilian and US markets – were already suppressed before any cotton was shipped by US or Brazilian exporters.

132. Finally, the generalized price-suppression effect manifests itself in all 42 individual country markets[187] in which Brazilian upland cotton is consumed. Professor Sumner estimates that over 40 per cent of US upland cotton exports during MY 1999-2002 would not have been made *but for* the US subsidies.[188] Forty per cent fewer US exports necessarily means lower, or even non-existent, US exports in many of the 40 markets where Brazil exported its upland cotton. Had significant volumes of US upland cotton not received Step 2 export payments, US exports and, thus, the amount of US upland cotton competing with Brazilian cottons would have been lower. Similarly, far fewer bids of US upland cotton financed by the GSM 102 programme may well have meant higher prices for Brazilian exporters and/or an expanded market share in each of these markets.

**236. The Panel notes Exhibit US-47 (and the chart in paragraph 13 of the US 2 December oral statement). Please provide a conceptually analogous chart to Exhibit US-63 with respect to data relating to the US interpretation of "world market share". USA**

**237. Could a phenomenon that remains at approximately the same level over a given period of time be considered a "consistent trend" within the meaning of Article 6.3(d)? Do parties have any suggestions as to how to determine a "consistent trend", statistically or otherwise? BRA, USA**

[186] *See* Brazil's 9 September Further Submission, Figure 17 (US California A-Index prices were higher than Brazilian prices).

[187] 40 export markets plus the United States and Brazil.

[188] Brazil's 9 September Further Submission, Annex I, Table 5a. This conclusion is conservative in view of the huge $12.5 billion loss that would have been suffered by US producers with no US subsidies between MY 1997-2002.

Brazil's Answer:

133. In responding to this question, Brazil starts from the ordinary meaning of the term "consistent trend." A "trend" means "a general course, tendency or drift."[189] "Consistent" means "congruous, compatible with, not contradictory, marked by uniformity or regularity."[190] A consistent trend within the meaning of Article 6.3(d) therefore means a non-contradictory tendency marked by regularity.

134. Generally, a phenomenon that remains at approximately the same level could be considered a consistent trend. However, read in the context of Article 6.3(d), which speaks of an "increase that follows a consistent trend over a period when subsidies have been granted," the consistent trend must reflect the increase in the world market share of a Member over its previous three-year average. Thus, for a given period of time, the world market share of a Member could remain at approximately the same level and be compatible with a finding of a consistent trend. Yet, there will not be a consistent trend, within the meaning of Article 6.3(d), if during the final year there is no increase of a Member's world market share over its previous three-year average. It follows that over the period when subsidies have been granted there must be a regular tendency of an increase in the world market share of a Member – although no increase in each and every year is required for the conditions of Article 6.3(d) to be fulfilled.

135. This interpretation is confirmed by the scope of Article 6.3(d), which applies to primary products or commodities. The parties agree that this includes agricultural products that necessarily will be affected by favourable or adverse weather conditions. The United States, for example, repeatedly asserts that the weather-related problems of MY 1998 mean that data for that year should be disregarded. These weather-related effects alone could cause in particular years the world market share of a Member to increase or decrease. This may well be the reasoning behind requiring examination of a longer trend in Article 6.3(d). But to require a constant increase in the world market share during each year "when subsidies have been granted" would render the disciplines of Article 6.3(d) largely inutile for agricultural products faced with weather-related production fluctuations.

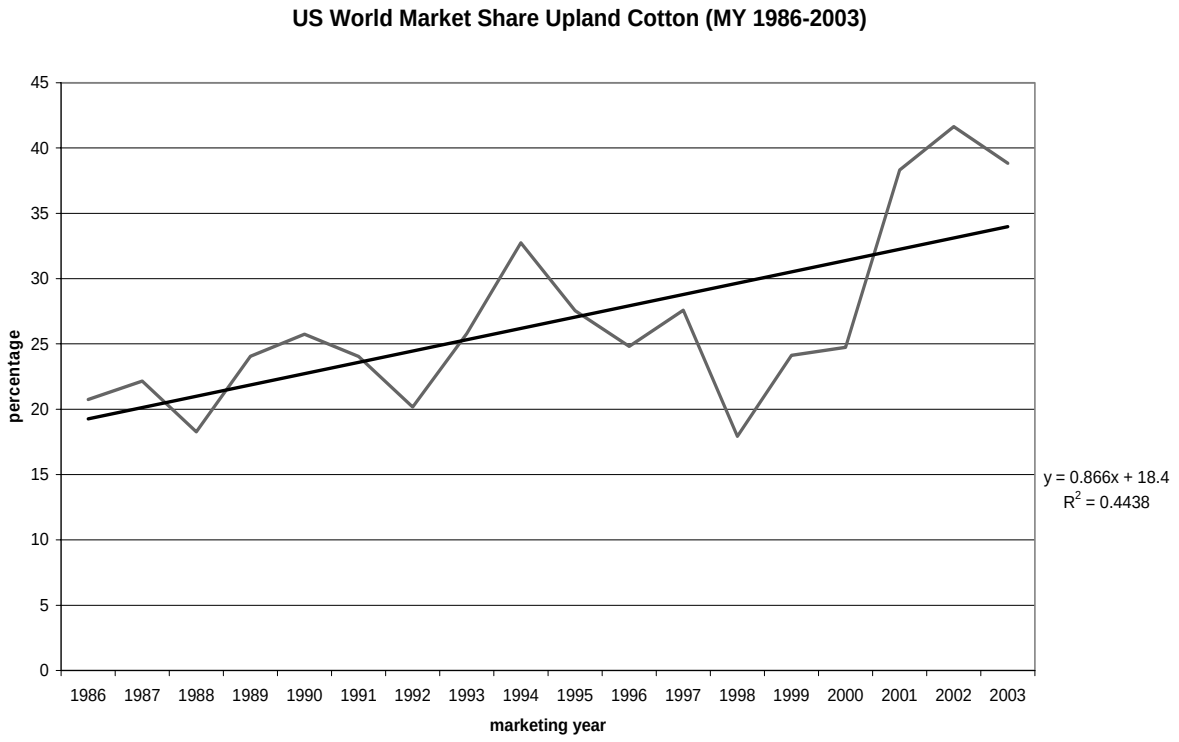
136. Brazil has offered data on the US world market share over the period since MY 1996 as well as since MY 1986.[191] The data shows that the trendline for the US world market share increases whether based on MY 1996 or MY 1986 as the starting point. The Panel's question asks for guidance on the conditions for a finding whether this trend is consistent.

137. Brazil cautious that statistical methods may not be helpful in analyzing the consistency of a trend within the meaning of Article 6.3(d) for two reasons: first, Article 6.3(d) is concerned with yearly data over a relatively short period. That means that only very few data points will be available, which will affect the statistical significance of any results. Second, as discussed above, it is the nature of world market shares in agricultural products to fluctuate due to weather-related effects. This phenomenon tends to further weaken any statistical significance of methods analyzing the consistency of a trend.

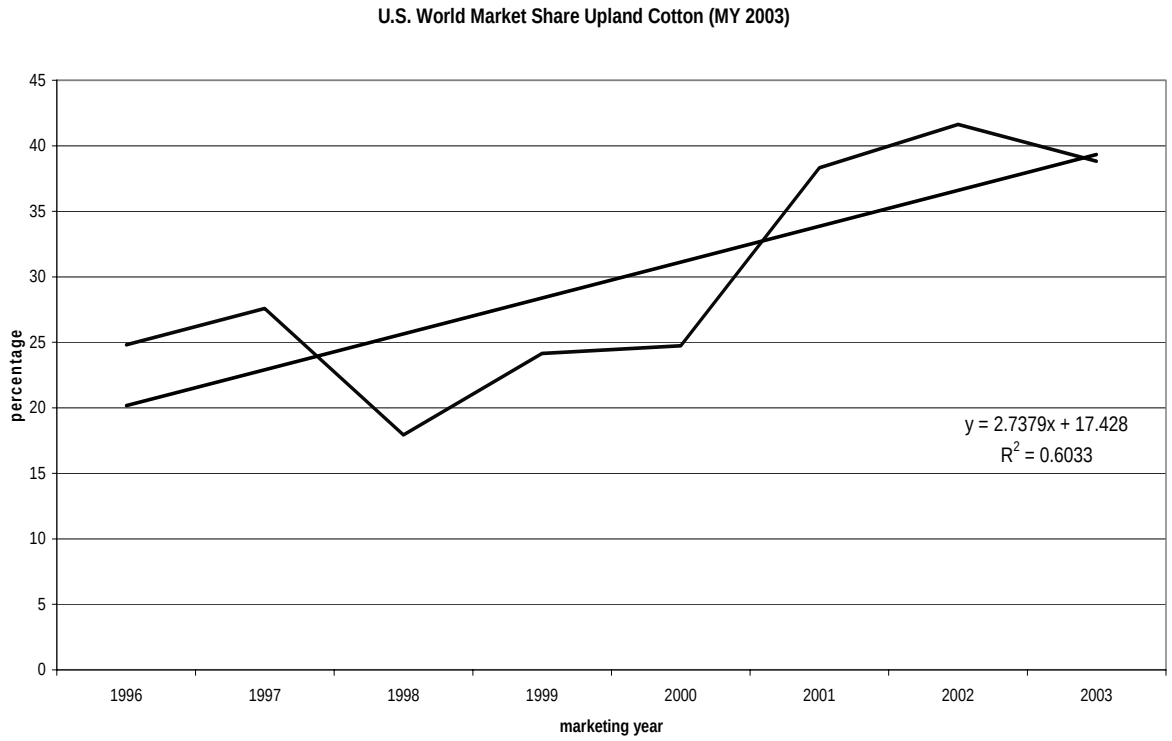
138. With these considerations in mind, Brazil suggests that the Panel analyze the trendlines offered by Brazil[192] and decide whether on their face they demonstrate – as Brazil has argued – a trend consistent with a finding that the effect of the subsidies is an increase in the US world market share for upland cotton. Brazil believes they do, particularly if the severe MY 1998 decline is disregarded.

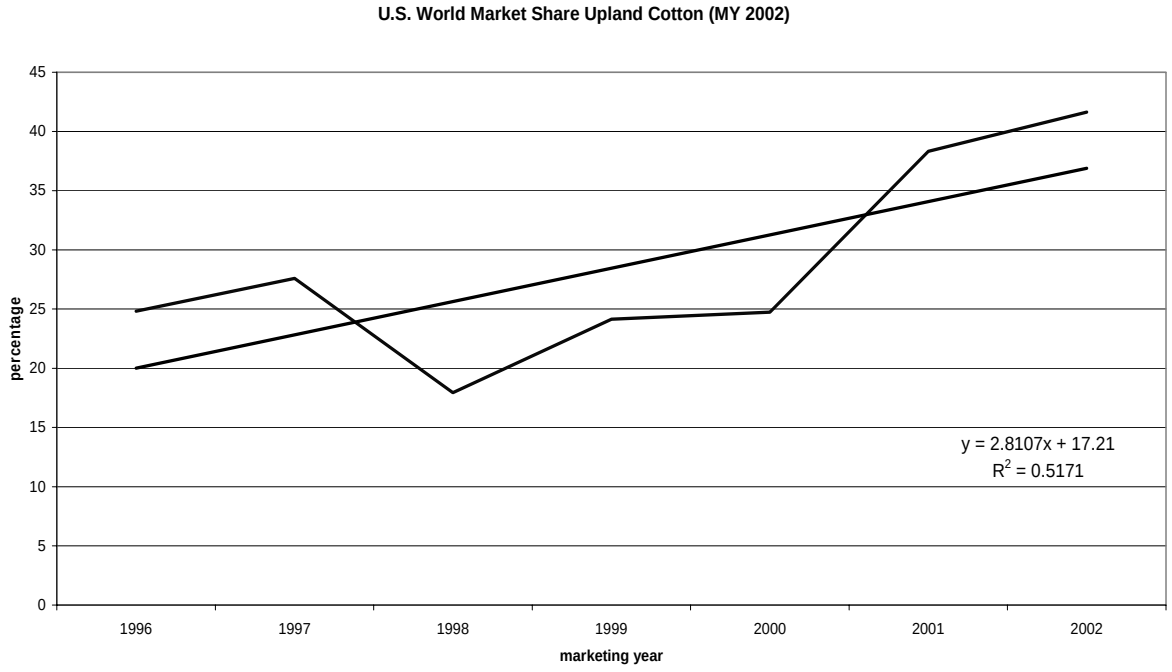
[189] The New Short Oxford English Dictionary 1993 edition, p. 3384.
[190] The New Shorter Oxford English Dictionary, 1993 edition, p. 486.
[191] Brazil's 27 October Answers to Questions, paras. 123-129 and Brazil's 9 September Further Submission, Sections 3.4 and 4.12.2.
[192] Brazil's 27 October Answers to Questions, paras. 123-129 and Brazil's 9 September Further Submission, Sections 3.4 and 4.12.2.

139. However, Brazil has also run a regression analysis for the trends over the period MY 1986-2003, MY 1996-2003 and MY 1996-2002, with the results being reproduced in the graphs below.[193]



[193] The results are based on data as reported in Exhibit Bra-302 (Revised and Extended Data on Article 6.3(d) Claim).





The $R^2$ – the measure for the fit of a regression analysis – varies between 0.44 for MY 1986-2003 and 0.60 for MY 1996-2003. The $R^2$ demonstrate that there is a positive relationship between the US world market share and its increase over time. In view of the limited number of observations and the nature of the commodity market in question, this is a very high number.

**238. According to the US interpretation of the term "world market share":**

**(a) should the domestic consumption of closed markets be added into the denominator?**

**(b) if US production and consumption increased by the same percentage, whilst the rest of the world's production and consumption remained steady, would this imply an increase in the US "world market share" by a different percentage?**

**(c) does Saudi Arabia have a small world market share for oil? USA**

**239. How does the US respond to Brazil's assertions that, under the US interpretation of the term "world market share":**

**(a) there would be no WTO disciplines on production-enhancing subsidies that increase a Member's world market share of exports? (see paragraph 64 of Brazil's 2 December oral statement);**

**(b) a Member's exports would have to be disregarded in calculating their "world market share" in terms of "world consumption"? (see e.g. paragraph 65 of Brazil's 2 December oral statement) USA**

**240. Does Article XVI:3 of GATT 1994 provide context in interpreting Article 6.3(d) of the *SCM Agreement*? Do these provisions apply separately? If not, could it indicate that "world market share" is intended to mean the same as "share of world export trade"? USA**

**241. How does the US reconcile its data on consumption for 2002 in US Exhibit 40, Table 1 with the "consumption" data it refers to in its 30 September submission, paragraph 34, Exhibit US-47 or US-71? USA**

**242. How much of the benefits of PFC, MLA, CCP and Direct Payments go to land owners? If not all of the benefits go to land owners, what proportion goes to producers? USA**

**243. Can the Panel assume that any support at all, even marketing loan programme payments, benefits upland cotton if an upland cotton producer has other agricultural production besides upland cotton? USA**

**244. What proportion of the 2000 cottonseed payments benefited *producers of upland cotton*, given that payments were made to *first handlers*, who were only obliged to share them with the producer to the extent that the revenue from sale of the cottonseed was shared with the producer? (see 7 CFR §1427.1104(c) in Exhibit US-15). BRA**

Brazil's Answer:

140. Brazil does not know "what proportion of the 2000 cottonseed payments" were paid *directly* to producers of upland cotton by first handlers. Any such information would be within the exclusive control of USDA. Therefore, Brazil looks forward to the United States providing this information in its 19 January comments.

141. However, there is evidence that the MY 2000 cottonseed payments – together with the MY 1999 and MY 2002 payments – benefited upland cotton producers either directly or indirectly. First, producers who ginned their own cotton received payments directly as "first handlers." But even producers who did not gin their own cotton received indirect benefits because the purpose and effect of the subsidy was to prevent producers from having to pay *more* for ginning because of low

cottonseed prices. This was made clear by the official USDA announcement of the USDA Secretary Glickman in announcing the MY 2000 cottonseed payments:

> Agriculture Secretary Dan Glickman announced today that USDA will propose to pay cotton farmers and ginners about $74 million to help offset losses from low 1999-crop cottonseed prices.
>
> Because of those low prices, many gins were unable to meet operating expenses normally covered by cottonseed revenues and some cotton farmers had to pay higher ginning costs," Glickman said. "This discretionary programme will help farmers make up this lost income."
>
> The proposed payments would be made to cotton gins based on seed tonnage produced from the 1999 crops of upland and Extra Long Staple cotton. USDA plans to propose that *gins share cottonseed programme payments with cotton farmers commensurate with any increased 1999-crop ginning charges as a condition of accepting programme payments.*[194]

142. This analysis makes it clear that upland cotton producers in MY 1999-2000 were required to pay more for ginning when cottonseed prices fell because ginning companies accept as part of the payment for ginning the cottonseed produced from the ginning process of raw cotton. The benefits of the cottonseed programme to producers explains why the NCC strongly supported the "the establishment of a permanent programme for cottonseed" during the debate for the 2002 FSRI Act.[195] In testimony before Congress, the Chairman of the NCC stated as follows:

> *Cottonseed is a critical component of total farm revenue* generated from cotton production. From 1994-1998, cottonseed accounted for approximately 13 per cent of the total value of cotton production, averaging $58 per acre. Unfortunately cottonseed prices weakened significantly in 1999 as a result of weak crushing demand ads well as low oilseed prices. Cottonseed values remain well below those of previous years. The special cottonseed payment authorized by Congress for the 1999 and 2000 marketing years were *vitally important on boosting producer income* and helping to maintain the industry's ginning infrastructure.[196]

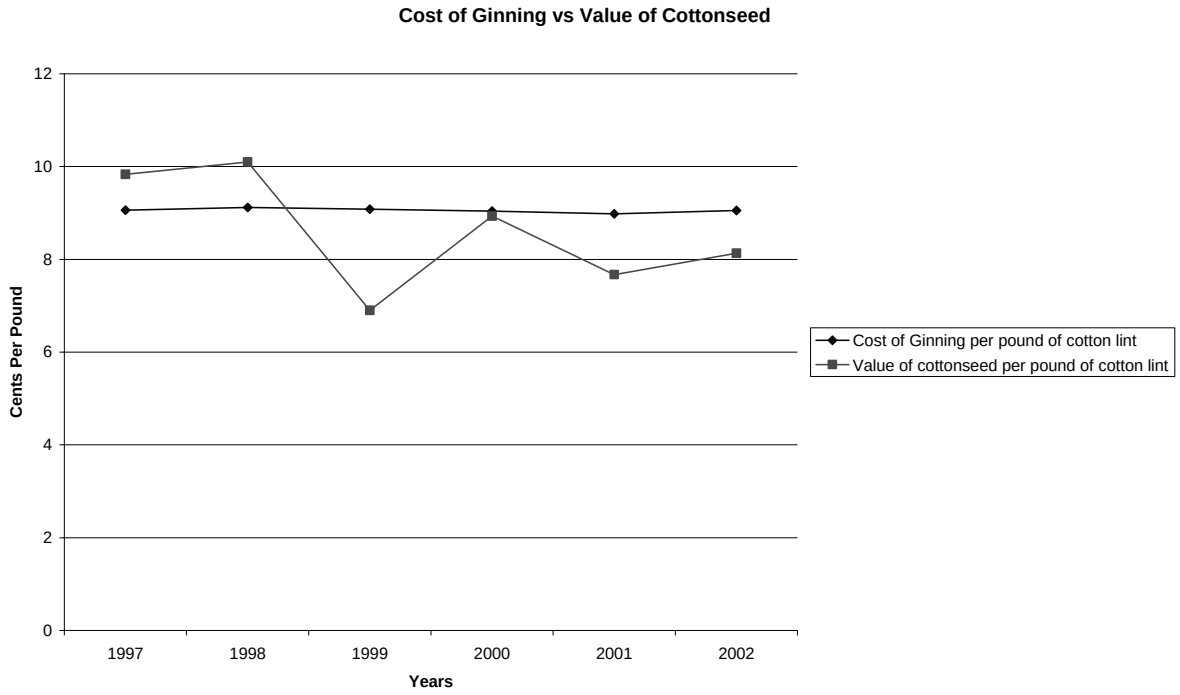
143. Finally, the importance of cottonseed payments to producers is further demonstrated by comparing the costs of ginning to the value of cottonseed. This is illustrated in the graph below:[197]

[194] Exhibit Bra-390 ("Glickman Proposes Cottonseed Payment Programme," USDA News Release, 29 February 2000) (emphasis and underlining added).

[195] Exhibit Bra-41 (Congressional Hearing, "The Future of Federal Farm Commodity Programmes (Cotton)," House of Representatives, 15 February 2001, p. 5).

[196] Exhibit Bra-188 (Testimony of James Echols, Chairman of the National Cotton Council before the Committee of Agriculture, Nutrition and Forestry of the US Senate, 17 July 2001, p. 9).

[197] This graph is based on per pound figures for the value of cottonseed and the cost of ginning per pound of cotton lint produced as calculated from Exhibit Bra-323 (Costs and Returns of US Upland Cotton Farmers, MY 1997-2002). They calculated figures are reproduced in Exhibit Bra-391 (Cost of Ginning and Value of Cottonseed per Pound of Cotton Lint).



144. This graph shows that producers were the primary beneficiaries of the cottonseed programme. When cottonseed prices declined in MY 1999, ginning costs exceeded cottonseed prices by 2.18 cents per pound of cotton lint.[198] This gap between ginning costs and cottonseed prices totalled $170.5 million.[199] Congress authorized $185 million in cottonseed payments in MY 2000[200], which covered much of the MY 1999 losses. As noted, it was upland cotton *producers* – not ginners – who were required to pay the $170.5 million difference in MY 1999 between the costs of ginning and the value of the cottonseed. When cottonseed prices again plunged in MY 2001 and MY 2002, Congress provided relief to producers with the 2002 cottonseed payments. For example, the $50 million in cottonseed payments in MY 2002 covered part of a gap of $73 million between the ginning cost and the value of the cottonseed.[201] Thus, this evidence suggests not only that cottonseed payments were support to upland cotton within the meaning of Article 13(b)(ii) of the Agreement on Agriculture, but that these payments, while relatively small in comparison to the billions of dollars paid to US producers, nevertheless, provided yet further subsidies supporting large quantities of US upland cotton production.

**245. Can a panel take Green Box subsidies into account in considering the effects of non-Green Box subsidies in an action based on Articles 5 and 6 of the *SCM Agreement*? BRA, USA**

[198] Exhibit Bra-391 (Cost of Ginning and Value of Cottonseed per Pound of Cotton Lint).

[199] This figure has been calculated based on the price gap of 2.18 cents per pound multiplied by the MY 1999 production of 16.294 million 480-pound bales (Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 4).

[200] Brazil's 9 September Further Submission, Table 1.

[201] This figure has been calculated based on the price gap of 0.92 cents per pound multiplied by the MY 2002 production of 16.531 million 480-pound bales (Exhibit Bra-391 (Cotton and Wool Outlook, USDA, 12 December 2003, Table 1).

Brazil's Answer:

145. The Panel is well aware of Brazil's view that all of the US subsidies are non-green box. But if the Panel were to find that certain of the subsidies are green-box subsidies, then under the specific circumstances of this dispute, Article 13(a)(ii) of the Agreement on Agriculture prohibits – during the implementation period – the effects of these subsidies being included along with other effects of non-green box subsidies in assessing Brazil's actionable subsidy claims. Professor Sumner's analysis in Annex I of Brazil's 9 September Further Submission permits the Panel to examine both the individual as well as collective effects of the various US subsidies. In response to Question 146, Professor Sumner analyzed the production, export and price effects of all of the subsidies except PFC subsidies.[202] This analysis would also permit the Panel to ensure that effects caused by, for example, PFC payments, were not attributed to the effects caused by the other non-green box subsidies.

146. After the 9-year implementation period of the Agreement on Agriculture, there is nothing in that Agreement that exempts the effects of green box subsidies from being considered by panels in actions based on Articles 5 and 6 of the SCM Agreement. Subsidies that conform to Annex 2 of the Agreement on Agriculture are exempt from the reduction commitments established under Article 6, but there is nothing in Articles 5 or 6 of the SCM Agreement that provides for any type of exemption, beginning in 2004. On the contrary, Article 5 of the SCM Agreement clearly states the Members should not cause, "… through the use of *any* subsidy … adverse effects to the interests of other Members." The only exception provided therein refers to the temporary exception of Article 13 of the Agreement on Agriculture.

**246. Can a panel take prohibited subsidies into account in considering the effects of subsidies in an action based on Articles 5 and 6 of the *SCM Agreement*? BRA, USA**

Brazil's Answer:

147. Yes, the Panel is required to take into account *all* non-green box subsidies, including prohibited subsidies in assessing Brazil's Article 5 and 6 claims under the SCM Agreement.[203] Even if the Panel were to conclude that the effects of prohibited subsidies, such as Step 2 and export credit guarantees, should not be assessed for the purposes of Brazil's Article 5 and 6 claims, Professor Sumner's analysis permits the Panel to analyze such claims for those non-green box and non-prohibited subsidies (marketing loan payments, crop insurance subsidies and contract payments).

**247. Can the Panel take into account trends and volatility in market and futures prices of upland cotton after the date of establishment of the Panel? If so, how do they affect the analysis of Brazil's claim of a threat of serious prejudice? BRA, USA**

Brazil's Answer:

148. Yes. Nothing prevents the Panel from considering – in assessing Brazil's threat of serious prejudice claims – the volatility of the upland cotton market and current and likely futures price developments after the date of establishment of the Panel. Brazil has proposed that the Panel follow the guidance of the GATT *EC – Sugar Exports* panels and the Appellate Body in *US – FSC* and analyze whether there is any mechanism that stems, or otherwise controls, the flow of US upland

[202] Brazil's 27 October Answers to Questions, paras. 114-118 and Exhibit Bra-301 (Additional Results from Professor Sumner's Model, Table "Impact of removal of all domestic support except PFC/direct payments and crop insurance).

[203] *See* Brazil's 27 October Answer to Question 145(b).

cotton subsidies and whether these mandated and unlimited subsidies constitute a permanent source of uncertainty in the upland cotton market.[204]

149. The Panel's question raises both legal and factual issues. First, as a legal matter, Brazil has previously argued that it is appropriate for the Panel to consider pricing, export, production, acreage and other evidence occurring after the date of establishment of the Panel.[205] The Panel's terms of reference in this case involve both *present* and *threat* of serious prejudice claims (*i.e.*, matters) with each of these types of claims overlapping during the period of MY 2002. Thus, the "matter" before the Panel has not changed (and cannot) since the establishment of the Panel.

150. In "making an objective assessment of the matter," the Panel must make "an objective assessment of the facts of the case" pursuant to DSU Article 11. Nothing in the text of DSU Article 11 suggests that this objective assessment of "facts" cannot include collecting and analyzing facts occurring after the establishment of a Panel. Indeed, there are a number of precedents in which panel's have considered evidence that came into existence *after* the date of the establishment of a panel.[206] As with investigating authorities in trade remedy investigations, a "period of investigation" for a WTO Panel in an Article 5 and 6 claim is useful for assessing whether present or threatened effects presently exist. There is nothing in the text of Part III of the SCM Agreement or the DSU that suggests that the time period for the collection of evidence or data to investigate must stop with the establishment of the Panel.

151. The second question raised by the Panel's question is a factual one, *i.e.*, what weight should the Panel give to the most recent evidence of volatility in the cotton futures and spot markets? It is fact that upland cotton prices have risen – and fallen – significantly since the Panel was established in March 2003. For example, futures prices for the nearby March 2004 contract rose from 55.80 cents on 6 March 2003 to a high of 86 cents on 30 October before falling to 72.32 cents on 19 December 2003.[207] But the record shows that such volatile futures price increases – and decreases – also occurred between MY 1999-2002.[208] And they will no doubt exist during MY 2003-2007.

152. In assessing whether there is a threat of serious prejudice, the Panel should be cautious about relying too heavily on only 3-4 months worth of the most recent data. Indeed, the Appellate Body has cautioned that "competent authorities are required to examine the trends in [data] over the entire period of investigation," because the "analysis could be easily manipulated to lead to different results, depending on the choice of end points."[209] Similarly, in *Argentina – Footwear* the Appellate Body held that "competent authorities are required to consider the trends in imports over the period of investigation (rather than just comparing the end points)."[210] The panel in *Argentina – Peach Safeguards* stated that "[t]the most recent past should not be considered separately from the overall

[204] *See* Brazil's 18 November Further Rebuttal Submission, Section 4.

[205] Brazil repeatedly in its many submission to the Panel refers to data that originates after the establishment of the Panel, including in these answers to the Panel's questions.

[206] Panel Report, *India – Quantitative Restrictions*, WT/DS90/R, para. 5.161-5.163 ("In this case the parties and the IMF have supplied information concerning the evolution of India's balance of payments and reserve situation until June 1998. To the extent that such information is relevant to our determination of the consistency of India's balance of payments measures with GATT rules as of the date of establishment of the Panel [18 November 1997], we take it into account."); Panel Report, *Japan – Apples*, WT/DS245/R, para. 8.49; GATT Panel Report, *Korea – Beef*, BISD 36S/268, paras. 122-123.

[207] Exhibit Bra-393 (Futures Prices as of 19 December 2003).

[208] *See* Exhibit Bra-311 (Side-By-Side Chart of the Weekly US Adjusted World Price, the A-Index, the nearby New York Futures Price, the Average Spot Market Price and Prices Received by US Producers from January 1996 to the Present).

[209] Appellate Body Report, *US – Steel Safeguards*, WT/DS248/AB/R, paras 353-356.

[210] Appellate Body Report, *Argentina – Footwear*, WT/DS121/AB/R, para. 129.

trends during the period of analysis," as otherwise the resulting picture may be "quite misleading."[211] The Panel in this case performs a task similar to a domestic competent authority in a trade remedy case.

153. The Panel has before it two different methodologies to judge the present price levels and threat of serious prejudice. The first methodology before the Panel is the use of baseline projections such as the USDA's and FAPRI's baseline projections to assess the effects of mandated US subsidies in the year ahead. Professor Sumner's analysis based on the January 2003 FAPRI baseline, shows that the US subsidies continue to maintain large amounts of US production whether prices are high or low. Professor Sumner found that during MY 2003-2007 annual US production would be 19.4 per cent lower leading to a reduction in projected US exports by 32.4 per cent annually and world prices that would be 8.3 per cent higher absent the US subsidies.[212] Similarly, Professor Ray of the University of Tennessee also found significant production, export, and price suppressing effects from the US subsidies from MY 2003-2007.[213] These findings by two of the leading US economists cannot be ignored by the Panel.

154. A second far less valid methodology would be to use the US "futures methodology." This methodology would examine the December futures price at the time of planting (January-March 2004). What is significant about current futures prices (in December 2003) is that the "futures market" is predicting that prices will fall in MY 2004. The December 2003 price of the December 2004 futures contract is 65.85 cents per pound as of 19 December 2003, while the March 2004 futures contract is 72.32 cents per pound.[214] Assuming that the current 65.85 cents per pound December 2004 futures contract price will continue during the planting decision marking time between January-March 2004, the expected adjusted world price will be 52.48 cents per pound[215] and the expected average MY 2004 price received by US producers would be 59.73 cents per pound.[216] This means that US producers "expect" to receive a considerable CCP payment of 6 cents per pound in MY 2004 (65.73 cents minus 59.73 cents).

155. As discussed by Professor Sumner on 3 December, given the probability distribution of the expected adjusted world price,[217] producers would also expect to receive some marketing loan payments because producers expect with a certain probability that the adjusted world price would be below the marketing loan rate triggering marketing loan payments.

156. As with the period MY 1999-2002, the existing (December 2003) price levels in the upland cotton world and US markets mean that US producers will be planting in 2004 for government support during MY 2004, not for the market. This constant theme was recently emphasized by the world's largest cotton trader, William Dunavant:

> The [US] farm programme can return more when prices are low rather than when prices are high . . . [and] [t]he loan deficiency payment created by the farm programme is the name of the game – not necessarily the futures price or the cash price . . .

---

[211] Panel Report, *Argentina – Peach Safeguards*, WT/DS238/R, para. 7.64-7.65 citing para. 138 of the Appellate Body Report in *US – Lamb*.

[212] Exhibit Bra-326 (Results of Professor Sumner's Modified Model, Table B).

[213] *See* Brazil's 9 September Further Submission, paras. 204-205.

[214] Exhibit Bra-393 (Futures Prices as of 19 December 2003).

[215] Exhibit Bra-370 (The Difference between the Average World Price and the Nearby December Futures Contract Price).

[216] The spread of 6.12 cents has been calculated based on the data in Exhibit Bra-370 (The Difference between the Average World Price and the Nearby December Futures Contract Price) and the average farm price in Exhibit Bra-4 ("Fact Sheet: Upland Cotton," USDA, January 2003, p. 5).

[217] *See* Exhibit Bra-371 (Simple Example of the Calculations of Marketing Lon Benefits (Probability Distribution)).

> It's interesting that we project nearly an 8 per cent increase in world production [in MY 2003], but US production is forecast to rise only slightly. *This tells me the world is certainly more price sensitive and responsive than the US cotton producer*. I think the nature of our farm programme definitely creates this situation. *Cotton futures prices need to rise to nearly 70 cents a pound to make cash prices better than the farm programme protection.*[218]

In addition, Mr. Dunavant emphasized that US producers "must have" the GSM-102 programme "if we are to export the quantities needed to support our level of cotton production in this country [*i.e.*, the United States]."[219] These statements by the world's leading cotton trader confirm the significant effects that have existed and will continue to exist at current price levels because of the mandatory nature of the subsidy programmes.

157. Finally, nothing about the price levels that have increased since 18 March 2003 has changed in any way the mandatory nature of the US subsidies. At current price levels, producers would receive benefits from crop insurance subsidies, direct payments, and indirectly from Step 2 payments and export credit guarantees. Whether prices are at 70 cents per pound or 30 cents per pound, US producers know and expect that they will be protected by the wide range of US subsidies. When US prices decline, as they inevitable will, US producers will be provided direct production incentives to continue producing at any price level. Historical data convincingly demonstrates that this downside risk protection guarantees high levels of production. Brazil proved that US planted acreage remains high within relatively narrow ranges whether market prices increase or decrease. This lack of US producers' production response to huge costs overruns of $12.5 billion over six years or to record low prices, or even to increasing prices, is at the heart of Brazil's threat case. While the cumulative price-suppressing and export-enhancing effects of the US subsidies may be smaller now than they were on 18 March 2003, they are, and will remain significant for MY 2003 and for MY 2004 based on current prices.

158. In sum, Brazil reiterates its arguments that taking all available data into account, the US subsidies pose a threat of serious prejudice to the interests of Brazil, in violation of Articles 5(c) and 6.3 of the SCM Agreement and GATT Articles XVI:1 and XVI:3.[220]

## VI. Step 2

**248. In respect of the level of Step 2 payments in certain time periods, the Panel notes, *inter alia*, footnote 129 in the US first written submission; footnote 33 in the US 18 November further rebuttal submission; and Exhibit BRA-350. Have Step 2 payments ever been zero since the elimination of the 1.25 cent per pound threshold in the FSRI Act of 2002? In what circumstances could a Step 2 payment be zero? How does the elimination of the 1.25 cent per pound threshold in the FSRI Act of 2002 affect your response? BRA, USA**

Brazil's Answer:

159. Under the 2002 FSRI Act (with the elimination of the 1.25 cent per pound threshold), Step 2 payments will be zero when the lowest US A-Index quote is equal or below the average A-Index.[221] Thus, for Step 2 payments to expire, the lowest US quote will have to be one of the cheapest of the

[218] Exhibit Bra-392 ("William Dunavant Says: Overproduction Thwarts Cotton Price Upturn," Western Farm Press).
[219] Exhibit Bra-392 ("William Dunavant Says: Overproduction Thwarts Cotton Price Upturn," Western Farm Press).
[220] *See* Section 4 of Brazil's 18 November Further Rebuttal Submission.
[221] Exhibit Bra-29 (Section 1207 (a) of the FSRI Act).

only five quotes making up the given A-Index. During MY 2002, there were zero Step 2 payments during five weeks: 20 September, 27 September, 4 October, 11 October and 18 October 2002.[222]

160. By contrast, during MY 2001, Step 2 payments were zero during 15 weeks: 14 December, 21 December, 28 December, 4 January, 11 January, 18 January, 25 January, 1 February, 8 February, 15 February, 22 February, 1 March, 8 March, 15 March, and 22 March.[223]

161. The elimination of the 1.25 cent per pound threshold under the 2002 FSRI Act has reduced the likelihood of zero payments under the Step 2 programme because the lowest US quote must now be even lower relative to the A-Index for Step 2 payments to expire. It also means that the US government will pay the entire difference between the cheapest US price quote for the A-Index and the A-Index itself.

**249. The Panel notes that the definition of eligible "exporter" in 7 CFR 1427.104(a)(2) includes "a producer":**

**(a) How does this reconcile with Brazil's argument that Step 2 "export payments" do not directly benefit the producer?[224] How, if at all, would this be relevant for an analysis of the issue of export contingency under the *Agreement on Agriculture* or the *SCM Agreement*? BRA**

Brazil's Answer:

162. As set out in Brazil's Answer to Question 125, Step 2 payments generally are not received by US producers but rather by eligible exporters and domestic users.[225] Of course, it is theoretically possible for a producer to receive directly Step 2 payments when the producer meets the definition of an exporter "regularly engaged in selling eligible upland cotton for *exportation* from the United States."[226] However, the fact that most US producers do not *directly* receive Step 2 payments does not mean that they do not benefit *indirectly* from Step 2 payments. Quite the contrary. Step 2 payments support significant quantities of planted upland cotton acreage, production and exports by stimulating the demand for high-cost and high-priced US cotton.[227] Brazil has provided considerable evidence of these effects in its earlier submissions that has never been rebutted by the United States.[228]

163. The answer to the second question is "not at all." Exporters are only eligible to receive Step 2 export payments if they produce evidence to CCC that they have exported an amount of US upland cotton. Thus, payments are conditional upon proof of export. Exporters will not receive any Step 2 export payments if they have not produced evidence of the export of US upland cotton. In sum, the fact that producers – in their capacity as exporters – may benefit from Step 2 export payments does not impact the export contingency of these payments.

[222] Exhibit Bra-350 (Weekly Step 2 Certificate Values).

**(b) How does this reconcile with Dr. Glauber's statement in Exhibit US-24, p. 3 (referring to "the 1990 Farm Bill and subsequent legislation") that Step 2 payments do *not* go directly to the producer? USA**

**(c) What proportion of Step 2 "export payments" go to producers? Please supply supporting evidence. USA**

## VII. Remedies

**250. Does Brazil seek relief under Article XVI of *GATT 1994* in respect of expired measures? What type of recommendation would the Panel be authorized to make? (Brazil further submission, paragraph 471 (iii)) BRA**

Brazil's Answer:

164. Brazil does not seek relief under GATT Article XVI of GATT 1994 in respect of expired measures, which Brazil understands the Panel to mean only the legal instruments consisting of the 1996 US Farm Bill providing, *inter alia,* for production flexibility contract payments, as well as the various emergency appropriation Acts in 1998-2001 providing, *inter alia,* for market loss assistance payments.[229]

165. With respect to the second question, the Appellate Body held in *US – Certain EC Products,* that a panel may *not* make a recommendation to the DSB that a Member bring a measure into conformity with its WTO obligations if that measure no longer exists.[230] Therefore, as detailed in paragraph 471(x) of Brazil's 9 September Further Submission, Brazil requests the Panel to recommend that the United States bring its existing measures providing or facilitating the payment of subsidies to producers, users and exporters of upland cotton into conformity with GATT Article XVI.

**251. In light, *inter alia,* of Article 7.8 of the *SCM Agreement,* if the Panel were to find that any subsidies have resulted in adverse effects to the interests of another Member within the meaning of Article 5 of the *SCM Agreement,* should it make any recommendation other than the one set out in the first sentence of Article 19.1 of the DSU? BRA**

Brazil's Answer:

166. Yes. If the Panel agrees with Brazil that the US subsidies to upland cotton cause and threaten to cause serious prejudice to the interests of Brazil, in violation of Article 5 of the SCM Agreement, the Panel should recommend pursuant to Article 7.8 of the SCM Agreement that the United States remove these adverse effects or withdraw the subsidies.[231]

**252. Without prejudice to any findings by the Panel, if the Panel were to find that any of the challenged measures constitute prohibited subsidies within the meaning of Article 3 of the *SCM Agreement,* what are the considerations that should guide the Panel in making a recommendation under Article 4.7 of the *SCM Agreement* relating to the time period "within which the measure must be withdrawn"? What should that time period be? BRA**

[229] Brazil's claims under Articles 5(a) and 6(c) of the SCM Agreement do include the continuing adverse effects today and in the future of subsidies provided under these expired legal provisions. *See* Brazil's 24 July Closing Statement, paras 4-7.

[230] Appellate Body Report, *US – Certain EC Products*, WT/DS165/AB/R, para. 81

[231] *See* Brazil's 9 September Further Submission, paras. 471(viii) and 471(ix).

Brazil's Answer:

167. Brazil suggests that the Panel follow the precedent of all previous WTO panels[232] that made findings of prohibited subsidies and specify that the measure must be withdrawn within 90 days.[233]

## VIII. Miscellaneous

**253. Regarding the adjustment authority related to Uruguay Round compliance in s.1601(e) of the FSRI Act of 2002 (the so-called "circuit-breaker provision"):**

**(a) Does it relate to export credit guarantees, crop insurance and cottonseed payments?**

**(b) Does it relate only to compliance with AMS commitments?**

**(c) Is the authority discretionary? If so, can its exercise be limited by the legislative branch of government?**

**(d) How would the Secretary exercise her authority to prevent serious prejudice to the interests of another Member? How would she exercise her authority to prevent a threat of serious prejudice to the interests of another Member? At what time and on the basis of what type of information would she exercise her authority?**

**(e) What does "to the maximum extent practicable" mean? In what circumstances would it not be practicable for the Secretary to exercise her adjustment authority? USA**

**254. Would payments made after the date of panel establishment be *mandatory* under the marketing loan, direct payments, counter-cyclical payments and user marketing certificate (step 2) programmes, but for the circuit-breaker provision? USA**

**255. How does Brazil respond to US assertions concerning the circuit-breaker provision? (see US 2 December oral statement, paragraph 82). Does this mean that US subsidies cannot be "mandatory" for the purposes of WTO dispute settlement? BRA**

Brazil's Answer:

168. The United States has admitted what the text of the "circuit breaker" provision in Section 1601(e)(1) of the 2002 FSRI Act already makes clear, *i.e.* that it only applies to "total allowable domestic support levels under the Uruguay Round Agreements," *i.e.*, "total AMS."[234] The United States further acknowledges that this provision "is not specifically addressed to forestalling

[232] Panel Report, *Brazil – Aircraft*, WT/DS46/R, para. 8.5; Panel Report, *Canada – Aircraft*, WT/DS70/R, para. 10.4; Panel Report, *Australia – Leather*, WT/DS126/R, paras. 10.6-10.7, Panel Report, WT/DS139/R and WT/DS142/R, paras. 11.6-11.7 and Panel Report, *Canada – Aircraft II*, WT/DS222/R, para. 8.4.

[233] Brazil notes that the panel in *US – FSC* took account of the fact that the US tax system could only be changed from the beginning of the next fiscal year and therefore set the 1 October 2001 as the deadline for withdrawing the FSC subsidies "without delay."

[234] US 2 December Oral Statement, para. 82

serious prejudice."[235] Indeed, no provision in US law is designed to forestall serious prejudice to US trading partners caused by US agricultural subsidies *specifically in support of upland cotton*.

169. The current US "total AMS" is $19.1 billion. As long as the United States stays below this level, there is no legal provision in the 2002 FSRI Act granting the Secretary of Agriculture any authority to stem, or otherwise control, the amount of upland cotton subsidies. Indeed, the numerous mandatory provisions of the 2002 FSRI Act text cited in Brazil's earlier submissions[236] *requires* the Secretary to make the payments to which eligible producers, users and exporters have a legal entitlement. No exceptions for upland cotton are provided for. Thus, these provisions continue to be mandatory in all circumstances where the US total AMS is below $19.1 billion. The Appellate Body and WTO panels have held that measures are mandatory where they cannot be applied in a WTO consistent manner in certain circumstances.[237]

170. And even were the US total AMS to exceed $19.1 billion, the text of Section 1601(e)(1) does not mandate any reductions if it is not "practicable" to do so. Nor does the text mandate an even, across the board, cut for *all* programme crops. For example, the Secretary appears to have the discretion to cut corn or wheat subsidies but retain the full amount of upland cotton subsidies. Brazil will provide further comments on the "circuit breaker" provision on 19 January in response to the US Answers to Questions 253-254.

**256. The United States submits that the Panel cannot make rulings without allocating precise amounts of payments to upland cotton production. However, to the extent that such precise data is not on the Panel record, to what extent can the Panel rely on less precise data, and on reasonable assumptions, in fulfilling its duty under Article 11 of the *DSU* in this case? USA**

# ANNEX I-8

## ANSWERS OF THE UNITED STATES TO QUESTIONS POSED BY THE PANEL FOLLOWING THE SECOND SUBSTANTIVE MEETING OF THE PANEL

(22 December 2003)

### A. TERMS OF REFERENCE

**192. Regarding the interest subsidies and storage payments listed by the United States in its response to the Panel's Question No. 67:**

**(a) Please provide a copy of the regulations under which they are currently and under which they were provided during the marketing years 1996-2002;**

1. For interest subsidies and storage payments under the 1996 Act (marketing years 1996-2002), the relevant regulations are found at 7 CFR 1427.13 and 1427.19 (2000 ed.) (first published at 61 FR 37601, 18 July 1996).[1] Under the 2002 Act, those rules are found at 7 CFR 1427.13 and 1427.19 (2003 ed.) (first published at 67 FR 64459, 18 October 2002).[2] We describe and discuss these provisions below in response to part "(b)" of this question.

**(b) Please indicate whether there are any such payments which are not provided to implement the repayment rate for upland cotton within the marketing loan programme. USA**

2. Interest subsidies and storage payments are support provided in connection with the marketing loan programme. On a forfeit of warehouse-stored upland cotton under loan, the Commodity Credit Corporation (CCC) pays warehouse charges for the loan period (even though the farmer had title during that period) and forgives interest. 7 CFR 1427.13 (2000 ed. and 2003 ed.). As for redemption of cotton under loan, repayment rates depend on the world market price. If the repayment amount set on that price is low enough, CCC may have to forgive interest and pay storage charges because the repayment amount will not be enough to satisfy the loan amount and those charges. *See* 1427.19(e) (2000 and 2002). By contrast, if the repayment rate set on the world market price is high enough, the producer pays both. *Id.* In general, if the loan is repaid, there is not an interest subsidy at all; rather, in 7 CFR Part 1405, it is provided that CCC will charge the sum of (1) the rate that CCC pays the Treasury and (2) another 1 per cent per annum. We are not aware of any other payments that would be responsive to the panel's question.

[1] *See* Exhibit US-117 (7 CFR 1427.13 and 1427.19 (2000 ed.)).
[2] *See* Exhibit US-118 (7 CFR 1427.13 and 1427.19 (2003 ed.)).

**194. Does the United States maintain its position stated in response to the Panel's Question No. 67 that "it would not be appropriate for the Panel to examine payments made after the date of panel establishment"? If so, please explain why. Can Brazil comment on this statement? BRA, USA**

3. In response to the Panel's Question 67, which asked the parties "to calculate and submit estimates of the AMS for upland cotton for marketing years 1992, 1999, 2000, 2001 and 2002," the United States stated, in the context of its calculation of the AMS for marketing year 2002, that "it would not be appropriate for the Panel to examine payments made after the date of panel establishment, on which the Panel's terms of reference were set. Measures taken after the Panel was established cannot be within the Panel's terms of reference."[3] The United States continues to believe that this statement is accurate. Past panels have frequently been confronted with the issue of the date as of which measures should be examined. Panels have generally determined to examine those measures as of the date of panel establishment as a matter both of terms of reference as well as for practical reasons (for example, so as to allow findings to be made with respect to a measure withdrawn after the panel was established but before panel proceedings were completed).

4. The Panel's terms of reference were set by the DSB at its meeting on 18 March 2003, namely, "[t]o examine, in the light of the relevant provisions of the covered agreements cited by Brazil in document WT/DS267/7, the matter referred to the DSB by Brazil in that document and to make such findings as will assist the DSB in making the recommendations or in giving the rulings provided for in those agreements."[4] In that panel request, Brazil identifies the measures at issue as "prohibited and actionable subsidies provided to US producers, users and/or exporters of upland cotton."[5] In Brazil's answer to question 19 from the Panel, Brazil clarified: "Brazil's Request for Establishment of a Panel ('Panel Request') challenges two types of domestic support 'measures' provided to upland cotton and various different types of export subsidy measures. *The first type of domestic support "measure" is the payment of subsidies* for the production and use of upland cotton. These payments were and continue to be made between MY 1999 to the present (and will be made through MY 2007) through the various statutory and regulatory instruments listed on pages 2-3 of Brazil's Panel Request. Brazil referred to these payments at pages 2-3 of the Panel Request as 'subsidies and domestic support provided under' or 'mandated to be provided' under the various listed statutory and regulatory instruments. Brazil has tabulated the *different types of payments (i.e., the measures)* made under these legal instruments in paragraphs 146-149 of its First Submission."[6] That is, to the extent that "payments" are at issue (as opposed to Brazil's challenge of certain legal instruments "as such")[7], the "measure" is "the payment of subsidies for the production and use of upland cotton." Only those payments made through the date of panel establishment could be "measures at issue" within the meaning of DSU Article 6.2 (as opposed to measures not yet taken, such as the Agricultural Assistance Act of 2003, which had not been enacted at the time of Brazil's panel request).

5. Thus, for purposes of the Panel's Peace Clause analysis or the evaluation of the "effect of the subsidy" for purposes of the Panel's actionable subsidies analysis, Brazil's choice to obtain establishment of this Panel several months into the 2002 marketing year but well before that marketing year was completed necessarily impacts the payments ("measure") that the Panel may examine. The payment of subsidies *after* panel establishment cannot alter the measures within the Panel's terms of reference and properly before the Panel, just as the cessation of payments after panel establishment would not prevent the Panel from making findings as to those payments that had been made as of the date of establishment.

[7] Brazil's Answer to Question 19 from the Panel, para. 16.

## B. ECONOMIC DATA

**195. Does the United States wish to revise its response to the Panel's Question No. 67bis, in particular, its statement that "the United States ... does not maintain information on the amount of expenditures made under the cited programmes to US upland cotton producers"? Did the United States make enquiries of the FSA in the course of preparing its original answer?**

6. Question No. 67*bis* inquired about annual amounts granted to upland cotton producers per pound and in total expenditures under each of the decoupled payment programmes. The United States of course conferred with US Department of Agriculture personnel, including FSA personnel, concerning this question and reported to the Panel that USDA "does not maintain information on the amount of expenditures made under the cited programmes to US upland cotton producers."[8] That response remains accurate today: because those payments are decoupled from current production, expenditures under such programmes are not tracked by whether the recipient produces upland cotton. In fact, the United States does not collect production data based on actual harvesting figures reported by farmers; we do not understand Brazil to have asserted the contrary.[9]

7. Brazil has also not asserted that the United States maintains information on the receipt of decoupled payments for upland cotton base acres by upland cotton producers. Rather, it has presented a novel methodology developed by the Environmental Working Group (EWG) to compare disparate data separately collected by the United States to attempt to infer that information. [10]EWG compared the farm numbers of recipients of decoupled payments for upland cotton base acres with the farm numbers of recipients of marketing loan payments in marketing years 2000-2002. It bears emphasis that the latter database is not a production database based on actual harvesting figures reported by farmers; the marketing loan database merely records the quantities of cotton on which a recipient has received payments. By comparing the matches by farm number between the two databases, EWG calculated that the share of decoupled payments for upland cotton base acres paid to upland cotton "producers" (that is, recipients of marketing loan payments) was 71.3 per cent in marketing year 2000, 76.9 per cent in marketing year 2001, and 73.6 per cent in marketing year 2002.

8. As we have previously mentioned[11], using the marketing loan payments database to identify "producers" would be contingent on marketing year prices; only if prices are sufficiently low would a high proportion of production of a crop receive marketing loan payments. This appears to have been the case for upland cotton in some recent marketing years but will not always be so (for example, no marketing loan payments are being made in the 2003 marketing year) and was not the case for other commodities (in marketing year 2002, *total* marketing loan payments of only $16.3 million for soybeans, $16.3 million for corn, and $16.1 million for wheat were made).[12]

---

[8] US Comments and Answer to Additional Question, para. 20.

[9] We do note that the record reflects the extensive evidence the United States has presented on the programmes and crop in question, from the actual data of amounts paid under the programmes to the amounts of cotton that have been planted from year to year. Further, in response to a Brazilian request for certain information that was presented for the first time at the second panel meeting, the United States generated, through significant expenditures of time and resources, aggregate and farm-by-farm records for both the "PFC" and "DCP" period for every "cotton farm" in the United States, including the planting records for all such farms. These data were transmitted on 18 and 19 December 2003.

[10] *See* Brazil's Further Rebuttal Submission, para. 31 ("If USDA was able to provide comprehensive payment data for all (or most) payments in an electronic format, it is also able to *generate information* on subsidy payments made to farms.") (emphasis added).

[11] US Opening Oral Statement at Second Panel Meeting, para. 29.

[12] Exhibit US-93. For this reason, it is fallacious for Brazil to argue that the specialization of cotton farms on cotton is show by the alleged fact that "[i]n MY 2002, 92.45 per cent of marketing loan payments for all crops made to farms producing upland cotton were made with respect to upland cotton." Brazil's Further

9. We note that Brazil has not made any adjustment in the outlay figures it has presented to the Panel for purposes of both Peace Clause and its actionable subsidy claims to reflect the fact that the EWG percentages are substantially lower than the 87 per cent revision made by Brazil to correct its initial Peace Clause analysis. The adjustment resulting from the EWG data in the total decoupled payments for upland cotton base acres made to upland cotton "producers" is also substantial. Since Brazil presents the EWG percentages as Brazil's own data, Brazil has effectively conceded that its own figures should be corrected at least as follows:

| Decoupled payments for upland cotton base acres to upland cotton "producers" ($ millions) | | | |
|---|---|---|---|
| | Brazil initial amount[13] | Brazil corrected amount[14] | EWG amount[15] |
| 1999 PFC | 616 | 547.8 | no data presented |
| 1999 MLA | 613 | 545.1 | no data presented |
| 2000 PFC | 575 | 541.3 | 373.4 |
| 2000 MLA | 612 | 576.2 | 436.7 |
| 2001 PFC | 474 | 453 | 364.3 |
| 2001 MLA | 654 | 625.7 | 402.8 |
| 2002 Direct | 523 | 485.1 | 451.4 |
| 2002 CC | 1077 | 998.6 | 893.5 |

The Panel can see a rather striking decline in the decoupled payments at issue that have not been reflected in Brazil's argumentation to the Panel.

10. We note further, however, that the EWG figures do not end the story. These figures represent only the first step in a proper calculation of the decoupled payments received by upland cotton producers that benefit upland cotton. For example, as detailed in the US answer to question 242 from the Panel, the literature on decoupled payments indicates that these payments benefit the owners of the base acres on which payments are made; payments made on rented acres will be captured by landowners through increased rent or other arrangements. Brazil itself has conceded that as of marketing year 1997 – that is, only the first year after introduction of the production flexibility contracts – already *34-41 cents per dollar* of production flexibility contract payment were capitalized into land rents.[16] Thus, *based on its own evidence*, Brazil should have adjusted the EWG figures *downwards by 22 to 27 per cent* to reflect the capture by landowners (who are not producers) through increased rent of 34-41 per cent of decoupled payments on the 65 per cent of cotton acres that are rented.[17] Furthermore, this study as of marketing year 1997 is consistent with the evidence presented by the United States that as rental contracts come up for renewal the full value of the decoupled

---

Rebuttal Submission, para. 26. If prices were above the respective loan rates for other crops produced by a farm also producing upland cotton, then logically the share of marketing loan payments for upland cotton will be high, given that upland cotton prices were so low in marketing year 2002. The fallacy of Brazil's argument is further demonstrated by reviewing the data submitted by the United States on 19 December 2003. In the aggregated data file "Dcpsum.xls", for marketing year 2002 upland cotton planted area represented only 30.7 per cent of total cropland for "cotton farms" (13.541 million acres out of total cropland of 44.036 million acres).

[13] Brazil's First Written Submission, paras. 148-49.

[14] Brazil's Answer to Question 67 from the Panel, para. 130 (adjusted amount of decoupled payments for upland cotton base acres estimated as "support for upland cotton").

[15] Brazil's Further Rebuttal Submission, para. 23 (EWG data on amount of decoupled payments for upland cotton base acres received by upland cotton "producers")

[16] Brazil's Answer to Question 179 from the Panel, para. 165; Brazil's Opening Oral Statement at the Second Panel Meeting, para. 57.

[17] *See* Exhibit US-69 (cost of production data published by the Economic Research Service, based on the 1997 ARMS survey, showing cotton producers owning 35 per cent of land they operate).

payments on rented acres will be captured by landowners and capitalized into land values.[18] Thus, to reflect the benefit to upland cotton producers, the EWG data should be adjusted *downwards by 65 per cent* to reflect the fact that "[n]ot all operators [producers] can therefore be considered as true beneficiaries of the [PFC] programme, since competitive cropland rental markets work to pass through payments from PFC recipients who are tenants to the owners of base acres."[19] Only those upland cotton producers who are owners of upland cotton base acres will receive the benefit of those decoupled payments.

11. Finally, to answer the Panel's question on the total payments for upland cotton base acres that benefit upland cotton producers would require information relating to the total value of each recipient's production. The EWG figures, adjusted to account for the capture of 65 per cent of those payments by owners of base acreage who are not cotton producers, would need to be allocated across the total value of production in order to calculate the subsidy benefit to upland cotton. Brazil has not brought forward information to permit that allocation; in fact, as discussed in more detail in the US answer to question 256 from the Panel, Brazil has not even claimed that such an allocation is necessary. Accordingly, it does not appear possible to calculate the total payments to upland cotton producers that benefit upland cotton nor any per pound measurement.

**196. Please provide the latest data for the 2002 marketing year on payments under the marketing loan, direct payments, counter-cyclical payments, user marketing certificate (step 2) programmes and export credit guarantee programmes. BRA, USA**

12. Data for marketing loan and user marketing certificate programmes are for upland cotton only and are current as of 12 December 2003.[20]

- Marketing loan programme (includes loan deficiency payments, marketing loan gains, and certificate gains): $832,836,963
- Step 2 payments (data are on a October 2002 - September 2003 fiscal year basis): $415,379,000

13. Data for direct payments and counter-cyclical payments are presented for upland cotton base acres only and are current as of 12 December 2003.[21]

- Direct payments: $181,811,374 million. (Because the 2002 marketing year was a transition year between the 1996 and 2002 farm bills, $436,805,000 in Production Flexibility Contract payments were made in 2002.)
- Counter-cyclical payments: $1,309,471,167

14. Data for export credit guarantee programmes are only available on a fiscal year basis (October 2002 - September 2003) and apply to all cotton. No breakout is available for upland cotton. The value of registration guarantees is $234,423,344. This figure represents the coverage applied for by exporters, not actual exports. An exporter may apply for a guarantee but not actually ship the goods.[22] Outstanding claims are $280,898, less than one-tenth of one per cent of the value of

[18] *See* US Further Rebuttal Submission, paras. 75-77.

[19] Burfisher, M. and J. Hopkins. "Farm Payments: Decoupled Payments Increase Households' Well-Being, Not Production." *Amber Waves*, Vol. 1, Issue 1, (February 2003): 38-45, at 44 (Exhibit US-78)

[20] Source: Official data base of the Commodity Credit Corporation, maintained by the Farm Service Agency, USDA; latest data are unpublished and may differ from published FSA data.

[21] Source: Official data base of the Commodity Credit Corporation, maintained by the Farm Service Agency, USDA; latest data are unpublished and may differ from published FSA data.

[22] Published data on guarantee values can be found in *Export Assistance, Food Aid, and Market Development Programmes, FY 2003 Summary* at http://www.fas.usda.gov/excredits/quarterly/archive.html. Data for FY 2003 found in this report are current as of 9/30/03 and differ slightly from these figures, which reflect exporter activity through mid-December, including cancellations and reserve activity. Data for FY 2003

registrations (further evidence, specific to cotton export credit guarantees in particular, that premiums are more than sufficient to cover operating costs and losses).

**197. Please provide actual data for 2002/2003 for US exports, US consumption and per cent of world consumption to replace the projected data in Exhibit US-47. If available, please provide projected data for 2003/2004 to replace the forecast data. USA**

15. The 11 December 2003 *World Agricultural Supply and Demand Estimates* report, published by USDA's Office of the Chief Economist, the Department's official commodity estimates, provide the latest data available. Note that 2002/03 is still considered an estimate and 2003/04 is considered a projection.[23]

**US and World Cotton Consumption** (1,000 480-lb bales)

| | 2002/03 (e) | 2003/04 (p) |
|---|---|---|
| US exports | 11,900 | 13,200 |
| US mill use | 7,270 | 6,200 |
| Total US consumption[24] | 19,170 | 19,400 |
| World consumption | 97,930 | 97,690 |
| US as a per cent of world | 19.6% | 19.9% |

The updated data show that the US world market share is basically unchanged from Exhibit US-47; in fact, US world market share using the 11 December 2003 data is the same (19.6 per cent) as reported in the exhibit.[25] Viewed in conjunction with the data in Exhibit US-47, the data further confirm that there has been no increase in US world market share following a consistent trend over a period when subsidies to upland cotton have been granted.

**198. Please comment on the respective merits of the price-gap calculations of MY1992 deficiency payments in US comments of 27 August, footnote 14 ($867 million), and Brazil's response to the Panel's Question No. 67 ($812 million).**

16. The two calculations use similar methodologies to measure MY 1992 deficiency payments. Both measures calculate deficiency payments as the deficiency payment rate times eligible production. Both the US and Brazil measures use the same deficiency payment rate for MY 1992 of 15 cents per pound. The difference between the two measures can thus be attributed to how each calculated the amount of production eligible for deficiency payments.

17. In their response to the Panel's Question No. 67, Brazil provides a simplistic calculation of payment production by multiplying the upland cotton programme yield times the amount of area eligible for deficiency payments. But as the United States previously indicated[26], the average programme yield for deficiency payment recipients in MY 1992 was 601 pounds per acre and the average programme yield for 50/92 recipients was 628 pounds per acre. By contrast, Brazil

found in this report are current as of 9/30/03 and differ slightly from these figures, which reflect exporter activity through mid-December, including cancellations and reserve activity.

[23] USDA Office of the Chief Economist, *World Agricultural Supply and Demand Estimates*, 11 December 2003 (Exhibit US-119).

[24] The US consumption figure includes imports. However, US cotton imports are often zero and, even when positive, have accounted for less than one per cent of consumption over the past decade. *See* USDA, Economic Research Service, Fibers Yearbook, Appendix Table 2, Upland Cotton Supply and Use (Exhibit US-120).

[25] *See also* US Opening Oral Statement at the Second Panel Meeting, para. 13.

[26] US Comments and Answer to Additional Question, para. 8 fn. 14.

incorrectly estimates programme yields to be 531 pounds per acre. This underestimates deficiency payments for MY 1992.

18. The US calculation uses the methodology set out in paragraphs 10 and 11 of Annex 3. Consistent with the 1995 US WTO notification, payment production is the sum of production eligible for basic deficiency payments and production eligible for 50/92 payments. Eligible production for basic deficiency payments in 1992 was equal to 5,544 million pounds (9.226 million acres times the average programme yield of 601 pounds per acre). Multiplying the price gap times eligible production gives basic deficiency payments equal to $832 million. The same formula is used to calculate deficiency payments under the 50/92 programme. For 1992, the price gap is the same as that calculated for the basic deficiency payments (15 cents per pound). Eligible production under the 50/92 programme was 254 million pounds (404 thousand acres times the average programme yield of 50/92 participants of 628 pounds per acre). Deficiency payments under the 50/92 programme were thus equal to $35 million (0.92 times 254 million times $0.15). Total deficiency payments under the price gap methodology were thus equal to $867 million ($832 million plus $35 million).

19. We also note that this calculation is conservative in that it uses the actual payment acreage (that is, acres planted for harvest or participating in the 50/92 programme on which payment was received) rather than eligible acreage to calculate the "quantity of production eligible to receive the applied administered price."[27] Using instead the base acreage minus the 10 per cent acreage reduction figure and the 15 per cent normal flex acres (14.9 million effective base acres[28] *x* 0.75 = 11.175 million acres) and multiplying by the programme yield (602 pounds per acre), the "quantity of production eligible to receive the administered price" is 6,727 million pounds, yielding a price gap deficiency payment calculation of $1,009 million.

**201. Is data available to show the proportion of US upland cotton production sold under futures contracts, and the prices under those contracts, at different times during the marketing year? If so, please provide summarized versions to the Panel. How does a futures sale impact the producer's entitlement to marketing loan programme payments? BRA, USA**

20. In April 1999, the US General Accounting Office published a report on farmers' use of risk management strategies.[29] Based on survey data from the 1996 USDA Agricultural Resource Management Study, the study showed that between 35 and 57 per cent of cotton farmers used a hedging instrument in 1996. (The ranges reflect a 95 per cent confidence interval.) In addition, an estimated 63 to 89 per cent of cotton farms used cash forward contracts in 1996.[30] These survey results suggest that even seven years ago a large proportion of cotton farmers either directly or indirectly priced their cotton off of organized futures and options markets.

21. For 18 December 2003, total open interest for all cotton futures contracts on the New York Board of Trade was 79,283 contracts[31] while open interest for all cotton options contracts on the

[27] Agreement on Agriculture, Annex 3, para. 10.

[28] *See* Exhibit Bra-105, Annex 2 (1st source document: US Department of Agriculture, *Provisions of the Federal Agricultural Improvement and Reform Act of 1996*, at 142) (giving 1992 effective base acreage of 14.9 million acres); *id.*, Annex 2 (2nd source document: Daniel A. Sumner, *Farm Programmes and Related Policy in the United States*, at 4) (same).

[29] US General Accounting Office. *Agriculture in Transition: Farmers' Use of Risk Management Strategies*. GAO/RCED-99-90. April 1999. See page 9, table 4 (Exhibit US-121)

[30] A forward contract is defined as a cash market transaction in which two parties agree to buy or sell a commodity or asset under agreed-upon conditions. For example, a farmer agrees sell, and a ginner or warehouse agrees to buy, cotton at a specific future time for an agreed-upon price or on the basis of an agreed on pricing mechanism (such as a futures or options market). See Exhibit US-121, page 22.

[31] *See*, Exhibit US-122.

NYBOT totalled 320,657 contracts.[32] Based on a contract size of 50,000 pounds, total open interest on futures and options contracts represent 41.7 million bales. While a bale of cotton may be hedged several times throughout the marketing chain, we note that 41 million bales is approximately 2.3 times the total size of the US upland cotton crop. A futures or options contract transaction has no effect on a producer's entitlement to marketing loan programme payments.

**202. Concerning paragraph 7 of the US oral statement, are the expected cash prices shown for February only? Can the US provide the prices for January and March of each year as well? USA**

22. The following tables show the average daily closing futures price for the December contract for January, February and March, as well as the average for the three months. As the United States previously noted[33], the differences between months is small. As outlined in paragraph 162 of the US further rebuttal submission, the expected cash price is calculated as the futures prices minus a 5-cent basis.

**Average Daily December Futures Closing Prices ($/lb)**

| Month | Contract Month | | | | |
|---|---|---|---|---|---|
| | DEC 1999 | DEC 2000 | DEC 2001 | DEC 2002 | DEC 2003 |
| January | 0.6335 | 0.5912 | 0.6188 | 0.4295 | 0.5808 |
| February | 0.6027 | 0.6131 | 0.5863 | 0.4218 | 0.5960 |
| March | 0.5980 | 0.6233 | 0.5321 | 0.4292 | 0.5975 |
| Average January – March | 0.6114 | 0.6092 | 0.5791 | 0.4268 | 0.5914 |

Source: New York Board of Trade (Exhibit US-124)

**Expected Cash Price ($/lb)**

| Month | MY 1999 | MY 2000 | MY 2001 | MY 2002 | MY 2003 |
|---|---|---|---|---|---|
| January | 0.5835 | 0.5412 | 0.5688 | 0.3795 | 0.5308 |
| February | 0.5527 | 0.5631 | 0.5363 | 0.3718 | 0.5460 |
| March | 0.5480 | 0.5733 | 0.4821 | 0.3792 | 0.5475 |
| Average January – March | 0.5614 | 0.5592 | 0.5291 | 0.3768 | 0.5414 |

**205. Does the United States accept or agree with the EWG data submitted by Brazil? If not, please explain your reasons. USA**

23. USDA provided the EWG with payment data under a Freedom of Information Act Request. Although the United States can confirm the data transmitted to EWG was correct, we do not know if the data has changed after EWG further processed the information. Taking that data at face value, the United States would note the following.

[32] *See*, Exhibit US-123.

[33] US Further Rebuttal Submission, para. 162 fn. 124 ("The United States notes that the January-March average futures price for December delivery does not differ significantly from the February average presented in the text.").

24. As was reported in the US Answer to Panel Question 125(5) and the US oral statement of 2 December, a preliminary review of data from the Farm Service Agency shows that approximately 47 per cent of upland cotton farms eligible for decoupled income support payments planted no cotton in marketing year 2002. This number is consistent with the Environmental Working Group data presented by Brazil in its further rebuttal submission that showed the per cent of farms receiving only contract payments in 2000, 2001, and 2002 (46, 45, and 45 per cent, respectively).[34] Thus, the EWG data support the US position that decoupled income support is, in fact, decoupled from production decisions since nearly half of historic upland cotton farms no longer plant even a single acre of cotton.[35]

25. The EWG data also show that Brazil's 14/16 adjustment to decoupled payments, even on Brazil's faulty allocation theory, is too small an adjustment. Brazil has asserted that 87 per cent of decoupled payments for upland cotton base acres are received by upland cotton producers and support to upland cotton. However, the EWG data suggest that in marketing years 2000, 2001, and 2002 only 71, 77, and 74 per cent, respectively of upland cotton base acreage payments went to farms that planted upland cotton. Thus, the EWG data support the US position that Brazil has overestimated and failed to properly calculate the subsidy benefit to upland cotton provided by these payments. For further detail, please see the US answer to question 195.

26. We also note a serious misuse of the EWG data when Brazil claims that, because approximately 92 per cent of total marketing loan payments received in MY 2002 by farms planting upland cotton were upland cotton payments, therefore such farms must predominantly produce cotton. In fact, marketing loan payments crucially depend on whether prices are above or below the loan rate for the crop at issue. Soybeans and corn saw high prices in MY 2002, meaning few marketing loan payments were made in MY2002.[36] Furthermore, the data collected by the United States in response to Brazil's request for certain information demonstrate that for MY 2002 upland cotton planted acres accounted for only 29.4 per cent of total cropland of those farms receiving production flexibility contract payments for upland cotton base acreage. Thus, the EWG data on marketing loan payments does *not* support an inference that farms producing upland cotton are so "specialized in upland cotton"[37] that it would be "reasonable" to attribute decoupled payments for upland cotton base acres almost entirely (87 per cent) to upland cotton.

> **206. Please explain how the graph in paragraph 40 of the US further rebuttal submission was derived. In so doing, please clarify whether the figures are on a cents per pound basis or some other basis. What averaging method was used? Can you prepare individual charts showing average US and Brazilian cotton prices for each of those third country markets? USA**

27. The data were based on official export data reported by the United States and Brazil, as obtained and published in the "World Trade Atlas". The World Trade Atlas is a service that monthly provides world-wide trade information for a fee.

28. The United States reports its export values to the World Trade Atlas as F.A.S. and Brazil reports its values as F.O.B.

---

[34] Brazil's Further Rebuttal Submission, para 23.

[35] Indeed, even Brazil states that "the evidence still suggests that there are a *large number of very small farms* (with base acreage resulting from production dating back as far as MY 1981-85) *that no longer produce upland cotton*," Brazil's Further Rebuttal Submission, para. 27 (emphasis added), which would seem to support the US view that contract payments are decoupled from production decisions.

[36] *See* US Opening Oral Statement at the Second Panel Meeting, para. 29.

[37] *See* Brazil's Further Rebuttal Submission, para. 26.

> **Free Along Ship Export Value (F.A.S.) –** The value of exports at the seaport, airport, or border, port of export, based on the transaction price, including inland freight, insurance, and other charges incurred in placing the merchandise alongside the carrier at the port of exportation. The value, as defined, excludes the cost of loading the merchandise aboard the exporting carrier and also excludes freight, insurance, and any charges or transportation costs beyond the port of exportation**.**
>
> **Free On Board (F.O.B.)** – A standard reference to the price of merchandise on the border or at a national port. In F.O.B. contracts, the seller is obliged to have the goods packaged and ready for shipment at the place agreed upon, and purchaser agrees to cover all ground transport costs and to assure all risks in the exporting country, together with subsequent transport costs and expenses incurred in loading the goods onto the chosen means of transport.

FOB is greater than FAS except when the vessel is not changed at the port of export, in which case the values are equal.

29. The World Trade Atlas publishes an average unit price for exports. The average unit price is calculated by dividing the value of the exports by the quantity for selected HS codes. Average unit prices are expressed in dollars per kilogram. This value was converted to dollars per pound for the graphs.

30. The graph in paragraph 40 of the US further rebuttal submission is a comparison of simple average unit prices of cotton exports from the United States and Brazil to Argentina, Bolivia, Italy, Philippines, Portugal, Indonesia, Paraguay, and India. The data for each third country market is provided in the following table.

## Unit Export Values to Selected Countries

US

Source: *World Trade Atlas*

**207. Please indicate whether any of the measures challenged in this dispute obliges cotton farmers to harvest their crop in order to receive the benefit of the programme (subsidy).**

31. One programme at issue in this dispute requires that a cotton farmer harvest upland cotton in order to receive payment: the marketing loan programme. In addition, the user marketing certificate programme (Step 2) requires that upland cotton have been harvested and marketed although payment is made to upland cotton users and not to farmers directly.

**208. Please provide data for the marketing years 1992 and 1999-2002 of the "quantity of production to receive the applied administered price" (Agreement on Agriculture, Annex 3, paragraph 8) for purposes of a price-gap calculation of support through the marketing loan programme.**

32. The marketing loan programme is a direct payment to support producer income that is "dependent on a price gap," namely, the difference between the loan rate and the Adjusted World Price. Thus, the price-gap calculation of support would be calculated under paragraphs 10 and 11 of Annex 3 of the Agreement on Agriculture on "non-exempt direct payments," not paragraph 8 on "market price support." That said, the calculations to quantify the support under these provisions are similar. Under paragraph 10, "non-exempt direct payments which are dependent on a price gap shall be calculated either using the gap between the fixed reference price and the applied administered price multiplied by the quantity of production eligible to receive the administered price, or using budgetary outlays."

33. Under the 1990 Act, only production produced on cotton base acres or other programme crop base acres was eligible for marketing loans. Based on the 1992 *Compliance Report* (Exhibit US-39), 11,164,726 acres programme acres were planted to upland cotton. Based on an average crop yield of 694 pounds per acre[38], 7,748,319,844 pounds or 16,142,333 480-lb bales, would have been eligible for marketing loans in 1992.

34. Under provisions of the 1996 farm bill, upland cotton planted on farms with any programme crop base were eligible for marketing loans. While production data are not collected by the Farm Service Agency, the following quantities of upland cotton were put under loan or collected a loan deficiency payment in 1999, 2000, 2001 and 2002.

**Upland cotton loan activity (pounds)**

| | Quantity receiving loan deficiency payment | Quantity placed under loan | Total |
|---|---|---|---|
| 1999 | 3,393,678,940 | 4,290,958,570 | 7,684,637,510 |
| 2000 | 3,499,431,430 | 4,349,621,850 | 7,849,053,280 |
| 2001 | 2,618,109,300 | 6,718,513,500 | 9,336,622,800 |
| 2002 | 1,603,527,850 | 6,292,102,810 | 7,895,630,660 |

Source: USDA, Farm Service Agency, *Loan Deficiency Payment and Price Support Cumulative Activity as of 10 December 2003.* Available at: http://www.fsa.usda.gov/dafp/psd

35. Thus, compared to MY1992, the quantity of cotton placed under marketing loans or receiving loan deficiency payments in MYs 1999, 2000, and 2002 were similar. In MY 2001, as a result of exceptional weather conditions and yields, a much larger quantity of cotton was eligible.

36. As noted above, the price gap calculation involves comparing a fixed reference price to an applied administered price. Under paragraph 11 of Annex 3, the fixed reference price "shall be based

[38] *See* Upland Cotton Fact Sheet at 4 (Exhibit BRA-4).

on the years 1986 to 1988 and shall generally be the actual price used for determining payment rates." The applied administered price for marketing loan payments is the marketing loan rate. The fixed reference price is the average over 1986 to 1988 of the Adjusted World Price (the "actual price used for determining payment rate").

37. The average Adjusted World Price for 1986-88 was 53.65 cents per pound – that is, higher than the loan rate in marketing years 1992 (52.35 cents per pound), 1999-2001 (51.92 cents per pound), and 2002 (52 cents per pound). The result is that the gap between the fixed reference price and the applied administered price is always negative as would be the AMS calculation. When these price gap calculations for marketing loan payments are utilized, negative numbers result, reflecting the decrease in support from the 1986-88 level. Similarly, if the applied administered price for marketing years 1999-2002 were compared to the 1992 applied administered price, the resulting negative numbers would again show the decrease in the level of support from MY 1992. Thus, the large budgetary expenditures for marketing loan payments in recent years obscures the fact that the level of support decided by the United States had declined; the price gap calculation, on the other hand, reflects this reduction in support. As the United States demonstrated in its rebuttal submission, by calculating both deficiency payments and marketing loan payments using a price gap methodology, the upland cotton AMS reveals that in no year have the challenged US measures granted support in excess of that decided during the 1992 marketing year.[39]

**209. It is understood that the data in the graph in paragraph 5 of the US oral statement are as at harvest time, while the data in the graph in paragraph 39 of Brazil's oral statement are as at planting time. Please explain why the trend of US acreage increase/decrease differs between these two graphs. BRA, USA**

38. The planted and harvested area differ because of abandonment. Over the period 1965 to 2003, the rate of abandonment (abandoned acres divided by total acres) for US upland cotton averaged 8.3 per cent, but the rate will vary from year to year primarily because of weather, primarily in the Southwest. In 1997, for example, weather in the Southwest was generally good and the abandonment rate for that year was only 3.6 per cent. By contrast, dry weather in Texas, Oklahoma and parts of the Southeast in 1998 led many farmers to abandon their cotton crop because of poor yields, resulting in an abandonment rate of 20 per cent.

**Planted and Harvested Upland Cotton Acres** (1,000 acres)

| Crop year | Planted acres | Harvested acres | Abandoned acres | Rate of abandonment |
|---|---|---|---|---|
| 1995 | 16,717 | 15,796 | 921 | 5.5% |
| 1996 | 14,395 | 12,632 | 1,763 | 12.2% |
| 1997 | 13,648 | 13,157 | 491 | 3.6% |
| 1998 | 13,064 | 10,449 | 2,615 | 20.0% |
| 1999 | 14,584 | 13,138 | 1,446 | 9.9% |
| 2000 | 15,347 | 12,884 | 2,463 | 16.0% |
| 2001 | 15,499 | 13,560 | 1,939 | 12.5% |
| 2002 | 13,714 | 12,184 | 1,530 | 11.2% |
