7.836 The application concerning LL oilseed rape was submitted to the United Kingdom (lead CA) on 28 January 1999. When Directive 90/220 was repealed on 17 October 2002, the United Kingdom had not yet forwarded the dossier to the Commission. The applicant submitted an updated application on 13 January 2003 in accordance with Directive 2001/18. The application was still pending at the time of establishment of the Panel. It was withdrawn by the applicant on 26 March 2004.

7.837 The **United States** argues that this application was delayed at the member State level for more than four years. The United States submits that although the applicant provided answers to all of the questions raised by the lead CA, the lead CA nonetheless delayed and ultimately suspended consideration or failed to approve the product.

7.838 The **European Communities** argues that the lead CA requested some additional information after having initially received the application. After having received that information, the lead CA forwarded the dossier for a preliminary view to its scientific committee, the Advisory Committee on Releases to the Environment (hereafter ACRE). The ACRE found that the dossier not only showed inconsistent data on molecular characterization but was also generally "rather impenetrable". In December 1999, the dossier was sent back to the applicant for "substantial revision and clarification".

7.839 According to the European Communities, the applicant did not get back to the lead CA on this dossier for almost two years. Contact was only re-established towards the end of 2002 when the applicant inquired about what was needed to up-date the dossier under the new Directive 2001/18. The applicant sent some up-dated documents in January 2003, but not the full dossier. The lead CA requested completion of the up-dated application and the applicant provided further data, which required further clarifications and led the lead CA to suggest that the full dossier should be re-submitted. In March 2004, the applicant withdrew the pending application and submitted a new application a few days later. According to the European Communities, at the time of establishment of the Panel the new dossier was in the course of being assessed by the lead CA. The European Communities maintains that it cannot be responsible for delays arising at the instigation of the applicant.

7.840 The **Panel** understands from the record that the lead CA made some preliminary requests for additional information in the months following receipt of the application. Some, but not all, of the additional requests from the lead CA are included in the information provided to the Panel. For example, a letter from the lead CA dated 20 July 1999 requests that the applicant provide further information and clarification on points raised in an annex to the letter; however the annex has not been provided.[879] There is, moreover, no record of a response from the applicant to this request.

7.841 In November 1999, the lead CA apparently requested the ACRE to provide guidance to the lead CA as to where the application needed improvement and noted that the ACRE would be asked for formal advice only at a later stage. The preliminary advice by ACRE was that there were a number of inconsistencies in the molecular data provided, some deficiencies in the molecular studies

[879] Exhibit EC-72/At. 11.

and too much important material was in annexes rather than being in the core dossier. It was noted that the appropriate experimental data may have been supplied somewhere in the application dossier but it was not immediately obvious where it might be.[880] As advised by ACRE, the lead CA in December 1999 requested that the applicant undertake substantial revision and clarification of the dossier. The lead CA suggested a meeting with the applicant later in the same month to provide the applicant with some guidance. There is no evidence in the information before the Panel that such a meeting took place, and that the applicant provided what was requested in December 1999.

7.842 On 16 January 2003, the applicant submitted an updated application under Directive 2001/18 to the lead CA.[881] In acknowledging receipt of the updated application, the lead CA indicated, on 27 January 2003, that the dossier was still incomplete and information requested in July and December 1999 was still missing.[882] Further requests for clarifications or modification of the application were made by the lead CA in the first half of 2003, with responses apparently provided by the applicant in May 2003.[883] On 13 June 2003, the lead CA requested further clarifications and suggested that a complete version of the application be re-submitted.[884] On 26 March 2004, the applicant withdrew the application, saying that certain elements of that application were incomplete or out-of-date, and submitted a new one (C/GB/04/M5/4).[885] No information was provided to the Panel regarding the assessment of the new application.

7.843 It is clear from the foregoing that the consideration of the application concerning LL oilseed rape was delayed for almost two years between 2 December 1999 and the repeal of Directive 90/220 in October 2002, following a letter from the lead CA advising the applicant that the dossier required substantial revision and clarification. Based on the information submitted to us, we understand that this gap was caused by the failure of the applicant to provide the additional information and clarification requested in July and December 1999. However, the precise reasons for the failure of the applicant to respond to the information solicited by the lead CA in July and December 1999 are unclear.

7.844 We asked the experts advising us whether the information requested by the lead CA up to and in December 1999 was necessary to ensure that conclusions of the safety assessment were valid.[886] Dr. Nutti, the only expert who responded to this question, concurred that the deficiencies in the application as identified by the ACRE were such that the requested information was necessary for the safety assessment.[887]

7.845 Nonetheless, the circumstance that the applicant apparently never responded to the July and December 1999 requests for additional information is consistent with the existence of a moratorium on final approvals. Following the June 1999 declaration by the Group of Five countries and the failure by the Commission to complete some of the previously discussed approval procedures, we think the applicant could have believed that the application concerning LL oilseed rape would not be approved while Directive 90/220 was still in force.

7.846 Taking account of the aforementioned elements, we consider that the gap between December 1999 and October 2002 does not in itself provide direct confirmation of the existence of a general

[880] Exhibit EC-72/At. 12.

[885] Exhibit EC-72/At. 29.
[886] Annex H, Panel Question 29.
[887] Annex H, para. 600.

moratorium on final approvals. But in our view the gap is consistent with the contention that a general moratorium was in effect at the time.

7.847 Regarding the assessment of the application concerning LL oilseed rape under Directive 2001/18, we recall our earlier summary of relevant facts. These facts do not lead us to believe that the lead CA was deliberately delaying the consideration of this application. We also note in this respect that the United States does not assert that the United Kingdom was an active participant in the alleged moratorium on approvals. Indeed, the United Kingdom was not part of the Group of Five countries. However, as of August 2003, when this Panel was established, the application concerning LL oilseed rape had not reached the Community level phase of the approval procedure under Directive 2001/18. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.848 In the light of the above considerations, we conclude that the failure of the United Kingdom to complete its assessment of the application concerning LL oilseed rape prior to August 2003 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium on final approvals during the relevant time period.

BXN cotton (EC-73)

7.849 The application concerning BXN cotton was submitted to the Spanish CA (lead CA) in April 1999. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. An updated application was submitted on 16 January 2003, in accordance with Directive 2001/18. According to the European Communities, the application was withdrawn after the establishment of the Panel.[888]

7.850 The **United States** argues that this application was delayed at the member State level for more than four years. The United States submits that although the applicant provided answers to all of the questions raised by the lead CA, the lead CA nonetheless delayed and ultimately suspended consideration or failed to approve the product.

7.851 The **European Communities** argues that the lead CA forwarded the dossier to its scientific committee, the National Biosafety Committee, which found that the dossier needed to be improved. A considerable amount of information was missing on issues such as compositional analysis, environmental impact, toxicity, nutritional analysis, and a number of points, such as scope, labelling proposal, etc., had to be clarified. The lead CA forwarded these comments to the applicant in July 1999.

7.852 According to the European Communities, after a first exchange of correspondence, the applicant did not respond to the lead CA for three years, until January 2003, when the company which produced the herbicide to which the cotton is tolerant informed the lead CA that it had assigned this pending application to another company. The new applicant company submitted an up-dated application in accordance with Directive 2001/18 on 16 January 2003.

7.853 The European Communities maintains that the lead CA forwarded the new dossier to the National Biosafety Committee, which found that there were deficiencies in the molecular characterization of the product. The lead CA forwarded these comments to the applicant in October 2003. In November 2003, the lead CA was asked by another company to clarify its request for

[888] There is nothing in the record to confirm this EC assertion.

additional information. The lead CA has provided these clarifications and asked for an explanation of the identity of the applicant. The European Communities notes that a response is still awaited.

7.854 The **Panel** begins its analysis by noting that despite its request in June 2004 that the European Communities provide complete documentation relating to the scientific assessments of all applications, the documentation provided in relation to this application is incomplete. None of the substantive information provided by the applicant, either with respect to the original application in May 1999 or with the resubmission of the application in January 2003, has been made available. This makes it very difficult to put into context the requests for clarification and for further information from the lead CA.

7.855 We note that the application was first submitted in May 1999, and in July 1999 the lead CA submitted questions and requested further information from the applicant. The applicant responded in September 1999, clarifying, *inter alia*, that the application was both for the import and processing of seeds of BXN cotton as well as for the cultivation of BXN cotton. Following the further examination of the application in January 2000 by the Spanish National Biosafety Committee, the lead CA requested further clarifications on some of the same issues in a communication dated 2 February 2000.[889] The applicant did not respond to this request before an updated application was submitted in January 2003 under Directive 2001/18.[890]

7.856 The communication from the lead CA in February 2000 made five points. One was to note that the National Biosafety Committee saw fit to request the Ministry of Agriculture to register the associated herbicide for use on this cotton product. Another was to instruct that references to the OECD in relation to the certification of varieties be deleted as not relevant. Two of the remaining points appeared to be related to food and feed safety concerns: that new analyses be conducted regarding the nitrilase level in cottonseed oil, and that the studies proposed on animals fed on feed derived from this product be conducted under normal livestock feeding conditions in Spain. The remaining point was to request rewording of the text with reference to gentamicine resistance. Although this would appear to be a concern about potential risks to human or animal health arising from antibiotic resistance, without the text of the application it is not possible to confirm that this is indeed a food safety issue.

7.857 The Panel asked the experts advising it whether the information requested by the lead CA up to and in February 2000 was necessary to ensure that conclusions of the safety assessment were valid.[891] The experts noted that only the table of contents of the actual submission by the applicant had been provided, and the response from the applicant. On the basis of this limited information, Dr. Nutti was of the view that the responses provided by the applicant in September 1999 appeared to be satisfactory as far as food safety was concerned. These responses provided clarification or explanations of information that presumably was contained in the original application.[892] Dr. Andow noted that the information previously requested by the lead CA was normally necessary to assess environmental risks, particularly those related to the cultivation of the plant. However, without the application itself, he could not determine to what extent relevant information may have already been provided by the applicant, or how much additional information might be necessary. Dr. Andow further observed that, according to the table of contents, only two pages of the text of the application were devoted to issues relating to environmental impact studies, herbicide or residue toxicity or

[889] Exhibit EC-73/At. 6.
[890] This is confirmed by Exhibit EC-73/At. 12.
[891] Annex H, Panel Questions 30 and 31.
[892] Annex H, para. 601.

ecotoxicity tests or proposals to manage, monitor and handle the crop to reduce the risk of herbicide resistance in weeds.[893]

7.858 An updated application was submitted in January 2003 under Directive 2001/18 and completed in March 2003. Again, the application itself has not been provided to the Panel. It seems that the application now concerned the importation of seed for processing, but not cultivation.[894] In August 2003, when this Panel was established, the application appears to have been under review by the National Biosafety Committee.[895]

7.859 It is clear from the foregoing that in this procedure a delay of more than two and a half years occurred between February 2000, when the lead CA requested clarifications, and October 2002, when Directive 90/220 was repealed. Based on the information submitted to us, we understand that this gap was caused by the failure of the applicant to provide the requested clarifications. However, the precise reasons for the failure of the applicant to respond to the lead CA's February 2000 request are unclear.

7.860 We recall that, due to incomplete information, the experts advising us were unable to express definitive views on whether the clarifications requested by the lead CA in February 2000 were necessary to ensure that conclusions of the safety assessment were valid. Nonetheless, the circumstance that the applicant did not respond to the February 2000 request is consistent with the existence of a moratorium on final approvals. Following the June 1999 declaration by the Group of Five countries and the failure by the Commission to complete some of the previously discussed approval procedures, we think the applicant could have believed that the application would not be approved while Directive 90/220 was still in force.

7.861 The European Communities has surmised that the failure to pursue this application may be due to the numerous changes in the ownership of the producing company as well as in the rights on the pending application. From information provided by the European Communities it appears that in 1999 and 2001, the applicant from the EU was merged with or taken over by other EU companies. Subsequently, in 2003, the lead CA was informed that the rights to the application had been transferred to a US company. It is unclear when the application was assigned to the relevant US company. Based on the information before us, we think it is conceivable that the aforementioned changes in ownership had an impact on the efforts made by the applicant in pursuit of its application.

7.862 Taking account of the aforementioned elements, we consider that the gap between February 2000 and October 2002 does not in itself provide direct confirmation of the existence of a general moratorium on final approvals. But in our view the gap is consistent with the contention that a general moratorium was in effect at the time.

7.863 Turning to Spain's assessment of the application concerning BXN cotton under Directive 2001/18, we note that the updated notification was submitted to Spain on 16 January 2003.[896] It was not until 14 February 2003, *i.e.*, almost one month later, that the lead CA requested the applicant to submit a summary of the application as required by Directive 2001/18.[897] The applicant provided such a summary on 19 March 2003, and thus the updated application appears to

[893] Annex H, paras. 604-612.
[894] Exhibit EC-73/At. 12.
[895] There is no information about when the application was submitted to the National Biosafety Committee.
[896] Exhibit EC-73/At. 8.
[897] Exhibit EC-73/At. 9.

have been complete as of that date.[898] The application was apparently forwarded to the National Biosafety Committee for an assessment, but as of August 2003 that assessment had not yet been completed. The record shows that the assessment was completed in September 2003.[899] From the record of the consideration of this application by the National Biosafety Committee, it is clear that the Committee had also been reviewing the applications concerning Bt-531 cotton and RR-1445 cotton, for which Spain was also the lead CA. However, we recall that pursuant to Directive 2001/18, the lead CA is to prepare an assessment report within 90 days after receipt of an application. It should also be noted in this connection that the National Biosafety Committee's assessment concerning BXN cotton is quite short *i.e.*, there is no indication that the preparation of the report itself required much time.

7.864 While there is no indication that Spain in 2003 was actively supporting a general moratorium on final approvals, we consider that the fact that by August 2003 Spain had already exceeded the 90-day period to complete its assessment under Directive 2001/18 is consistent with the existence of a moratorium on final approvals.[900] Following the June 1999 declaration by the Group of Five countries, Spain had reason to believe that these countries would act as a "blocking minority" in the Regulatory Committee and the Council at least pending the adoption of new EC rules on labelling and traceability[901], and that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.865 In the light of the above considerations, we conclude that the failure of the Spanish CA to complete its assessment of the application concerning BXN cotton under Directive 90/220 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period. We further conclude that the time taken by Spain to assess the application concerning BXN cotton under Directive 2001/18 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

Bt-1507 maize (EC-74)

7.866 The application concerning Bt-1507 maize (EC-74) was first submitted to the Netherlands CA (lead CA) in November 2000. The scope of the application was for import of maize for processing and for use as food and feed. A separate application was submitted to the Spanish CA for the cultivation of the product, which we hereafter refer to as the application concerning Bt-1507 maize (EC-75). We will discuss that application separately below. When Directive 90/220 was repealed on 17 October 2002, the Netherlands CA had not yet forwarded the dossier to the Commission. An updated application was submitted in November 2002 under Directive 2001/18. The lead CA completed its initial assessment of the application and submitted the application to the Commission on 15 August 2003.

7.867 The **United States** argues that this application was delayed at the member State level for several years, and was not submitted for a decision by the Regulatory Committee. The United States

[898] Exhibit EC-73/At. 10.
[899] Exhibit EC-73/At. 12.
[900] Since the application was not complete until March 2003, it would appear that the 90-day period started to run as of that time.
[901] We note that Exhibit US-80, which contains an internal Commission note, suggests that several Group of Five countries in October 2001 expressed the view that new EC rules on labelling and traceability needed to enter into force before new biotech products could be approved.

submits that although the applicant provided answers to all of the questions, the lead CA nonetheless delayed consideration of the product. The United States explicitly contests the justifiability of one of the information requests by the lead CA, as well as of a number of the objections raised by other member States following the circulation of the application by the Commission.

7.868 The **European Communities** argues that following receipt of this application, the lead CA requested additional information on molecular characterization, allergenicity and toxicity of CRY1F, and on labelling. Exchanges with the applicant on these issues went on until almost the end of 2002. In two instances, the applicant requested an extension of the time granted by the lead CA to submit further data or information. The applicant updated the application just after the entry into force of Directive 2001/18. After a further exchange on compositional data, a monitoring plan, and confidentiality of the detection method, the lead CA submitted the full application and its assessment report to the Commission in August 2003. Once the application reached the Community level, a considerable number of objections were raised by member States, including on environmental effects, the monitoring plan, molecular characterisation, sampling and detection methods, allergenicity and toxicity. The Commission forwarded the dossier to EFSA for an opinion in February 2004, together with a summary of the remaining objections from seven member States. The European Communities argues that the facts demonstrate that there was neither a suspension of consideration nor a failure to approve this product.

7.869 The **Panel** notes that there was frequent communication between the lead CA and the applicant on this application from the time the application was initially submitted under Directive 90/220 until the lead CA sent its assessment report to the Commission on 15 August 2003. Although extensive documentation was provided to us, it was presented in a manner which did not facilitate its consideration (some documents were reproduced up-side down or sideways, others mislabelled or duplicated, for others only the tables of content were provided).

7.870 The United States explicitly questions the justifiability of only one of the requests for additional information made by the lead CA, a request of 13 December 2001 for additional field trial data. Other US arguments concern objections and requests for additional information from other member States which were made subsequent to the establishment of the Panel and hence are not specifically taken into account.

7.871 We note that in response to the March 2001 request from the lead CA the applicant on 16 October 2001 provided field trials from Chile, France and Italy, which it considered representative for the cultivation areas exporting maize to the European Communities.[902] On 13 December 2001, the lead CA indicated that it was not convinced by the response and maintained its request. Specifically, the lead CA indicated that it was not convinced that these locations would be representative of locations exporting maize to the European Communities. It therefore requested that the applicant conduct additional field trials and provide compositional data for two consecutive growing seasons.[903] The applicant addressed this further request for additional field trials in its responses of 21 November 2002. It provided arguments as to why the results of the field trials for 1998/1999 from Chile, France and Italy should be considered to be sufficient, and also submitted the results of field trials for 1999/2000 from Bulgaria, France and Italy.[904] On 10 February 2003, the lead CA indicated that it accepted this response, but requested that the data provided from the field trials in Chile be

[902] Exhibit EC-74/At. 33.
[903] Exhibit EC-74/At. 52.
[904] Exhibit EC-74/At. 65, response to Panel Question 3.

presented in the same detail and manner as for France and Italy, and suggested a format.[905] This was apparently done by the applicant on 24 March 2003.[906]

7.872 The United States argues that when the lead CA on 13 December 2001 rejected the applicant's compositional data from field trials that had been conducted in France, Italy and Chile, on the grounds that these locations were insufficiently representative of locations exporting maize to the European Communities, the lead CA provided no explanation for its conclusion that the locations were "insufficiently representative." The United States argues that the data provided by the applicant in October 2001 would generally be considered "representative" and relevant for evaluating maize that might be imported into the European Communities. The United States maintains that, in the absence of some further explanation, such as an anomaly in the submitted data, the only explanation for the lead CA's request for additional field trials of 13 December 2001 appeared to be the resulting two-year delay caused by the time it would take for the applicant to generate the data.

7.873 We sought advice from the experts advising us as to whether the field trials in France, Italy and Chile would provide compositional data on maize kernels that would be relevant to evaluating cultivation areas exporting maize to the European Communities. Dr. Nutti drew attention to the Codex Alimentarius *Guidelines for the Conduct of Food Safety Assessment of Foods Derived from Recombinant-DNA Plants*[907] which state that the location of the trials sites should be representative of the range of environmental conditions under which the plant varieties would be expected to be grown. The number of trial sites should be sufficient to allow accurate assessment of compositional characteristics over this range. Similarly, trials should be conducted over a sufficient number of generations to allow adequate exposure to the variety of conditions met in nature.

7.874 Dr. Nutti considered that the field tests in France, Italy and Chile could be considered as supplementary information to previous tests carried out by the applicant, although she did not consider that they were necessary, in particular since the maize in question was for importation and processing and not for cultivation.[908] Dr. Andow noted that it was likely that for some industrial uses of maize, *e.g.*, as biofuel, there was little need to distinguish among regional sources. However, without data supporting this lack of need to distinguish geographic sources, it was not possible, in his view, to determine if maize from Chile would in fact be representative of maize from other regions of the world. He further observed that the scientific rationale for the request for compositional data was not evident from the written record. He considered it essential that the lead CA provide such a rationale concomitant with the request for information, because many of the possible reasons for requesting such information were not necessary for completing a scientific risk assessment.[909]

7.875 In considering the December 2001 request by the lead CA for further field trials, we note that the United States does not assert that, at that time, the Netherlands was an active participant in the alleged moratorium on approvals. However, the United States contends that the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected how it assessed applications.

7.876 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on

[905] Exhibit EC-74/At. 84.
[906] Exhibit EC-74/Ats. 87-88.
[907] CAC/GL 45-2003, para. 45.
[908] Annex H, para. 626.
[909] Annex H, para. 635

labelling and traceability. The Commission made a proposal for such rules in July 2001. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. Consequently, the Netherlands could in our view have come to the conclusion in 2001 that there was no realistic prospect that the application concerning Bt-1507 maize (EC-74) could be approved prior to the repeal of Directive 90/220.

7.877 Against this background, we accept that it is possible that the lead CA's December 2001 request for further field trials could, as the United States argues, be explained as a way to delay consideration of the application concerning Bt-1507 (EC-74) so that it would not be forwarded to the Commission and the other member States until the entry into force of Directive 2001/18, under which the application might eventually be approved, after the adoption of new EC rules on labelling and traceability. The fact that the applicant's response to the December 2001 request did not come until after the repeal of Directive 90/220 is consistent with this explanation. However, the applicant's response was provided together with responses to a request of March 2002 for other additional information which has not been questioned by the United States. It is therefore not clear that the resulting delay is attributable solely to the request for additional field trials.

7.878 It must also be noted that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. In our view, the December 2001 request for additional field trials could also reflect a precautionary approach to evaluating applications. The views expressed by the experts advising us do not appear to rule out this possibility.

7.879 Taking account of the aforementioned elements, we consider that the December 2001 request by the Netherlands for additional field trials does not in itself provide direct confirmation of the existence of a general moratorium on final approvals. But in our view the request is consistent with the contention that a general moratorium was in effect at the time.

7.880 We note that after the applicant had provided an updated application in November 2002, the lead CA requested further information from the applicant on 10 February 2003 with respect to a surveillance plan and the confidentiality of the proposed detection method. Furthermore, as noted, in February 2003 the lead CA dropped its request for the additional field trials, but requested that the data be presented in a uniform manner. The responses to these requests were provided by the applicant on 24 March 2003, and on 28 May 2003 the applicant withdrew the request for confidentiality with respect to the detection method.

7.881 In the light of the foregoing, we consider that by the end of March 2003 the lead CA had all the elements to complete its safety assessment. The outstanding clarification of the confidentiality issue should not have delayed the completion of the safety assessment itself. In any event, as we have noted, the confidentiality issue was resolved in May 2003. Notwithstanding this, the lead CA did not send its completed assessment report to the Commission until 15 August 2003.

7.882 We recall that in accordance with the requirements of Directive 2001/18 the lead CA was to have transmitted its completed assessment report at the latest 90 days after receipt of the updated application. As we have already pointed out, following the receipt of the application in November 2002, the lead CA reviewed the application for more than two and a half months before forwarding its request for additional information. After receiving the applicant's response in March 2003, the lead CA took an additional period of time of more than four and a half months to complete its assessment report and transmit it to the Commission. Thus, by the time the lead CA sent its assessment report to

the Commission it had taken more than seven months to evaluate the updated application instead of the 90 days envisaged in Directive 2001/18.

7.883 We have observed earlier in respect of the 90-day deadline stipulated in Directive 2001/18 that that deadline provides a useful indicator for determining how much time might be needed to complete an assessment. As we have said, in the case of the application concerning Bt-1507 maize (EC-74), by the end of March 2003 the lead CA had all the elements to complete its safety assessment. Even if the lead CA at that point in time had taken a full 90-day period to complete its assessment, it would have completed its assessment before the end of June 2003. By that time, as noted, the confidentiality issue had also been resolved.

7.884 While there is no indication that the Netherlands in 2003 was actively supporting a general moratorium on final approvals, we consider that the fact that the Netherlands exceeded the 90-day period even after it had received all necessary information is consistent with the existence of a moratorium on final approvals. Following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that these countries would act as a "blocking minority" in the Regulatory Committee and the Council at least pending the adoption of new EC rules on labelling and traceability[910], and that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.885 Moreover, we note that it was not until 15 August 2003 that the application concerning Bt-1507 (EC-74) reached the Community level phase of the approval procedure under Directive 2001/18. As we have said before, it is only at the Community level that the Group of Five countries and/or the Commission could take action to delay or prevent the final approval of this application.

7.886 In the light of the above considerations, we conclude that the failure of the Netherlands to complete its assessment of the application concerning Bt-1507 maize (EC-74) earlier than in August 2003 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

Bt-1507 maize (EC-75)

7.887 Neither the date of the initial submission of the application concerning Bt-1507 maize (EC-75) to the Spanish CA (lead CA), nor the application itself, have been made available to the Panel. However, the lead CA acknowledged receipt of the application in a letter dated 11 July 2001. The application was for all uses including cultivation. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. The application was updated in December 2002 under Directive 2001/18. On 5 August 2003, the lead CA submitted the application and its assessment report to the Commission; it was circulated to all member States on 20 August 2003.

7.888 The **United States** argues that this application was delayed at the member State level for several years, and was not submitted for a decision by the Regulatory Committee. The United States submits that although the applicant provided answers to all of the questions, the lead CA nonetheless delayed consideration of the product. The United States contests the justifiability of some of the

[910] We note that Exhibit US-80, which contains an internal Commission note, suggests that several Group of Five countries in October 2001 expressed the view that new EC rules on labelling and traceability needed to enter into force before new biotech products could be approved.

information requested by the lead CA, and particularly of a number of the objections raised by other member States following circulation of the lead CAs' assessment report by the Commission.

7.889 The **European Communities** argues that following a preliminary assessment of this application by the Spanish National Biosafety Committee, the lead CA requested further additional information on molecular characterization, allergenicity and toxicity of CRY1F, environmental impact and a monitoring plan. These requests were dealt with by the applicant during the following 12 months, until 17 July 2002.[911] After the entry into force of Directive 2001/18, the applicant updated the application in line with the requirements of the new legislation. Exchanges between the applicant and the lead CA continued until the 28 May 2003. The lead CA submitted the full application and its assessment report to the Commission on 5 August 2003.

7.890 The European Communities notes that the Commission circulated the application to the member States and received comments and objections from ten of them. These concern issues such as molecular characterization, detection methods, non target organisms, monitoring plans, toxicity, allergenicity and agricultural practices.

7.891 The **Panel** notes that there appeared to be at least two exchanges between the applicant and the lead CA regarding requests for further information before the repeal of Directive 90/220. Unfortunately, although a considerable amount of documentation was provided to us, it was presented in a manner which did not facilitate its consideration. Many of the documents were mislabelled or misrepresented in the chronologies provided by the European Communities; or they did not correspond to the requests for information identified but rather to requests that occurred considerably later.

7.892 As far as we have been able to determine, following the receipt of the application in July 2001, the lead CA consulted with its National Biosafety Committee and on 30 October 2001 requested additional information from the applicant based on the advice received from the Committee. This request was apparently repeated in a communication of 28 November 2001. First and foremost, the lead CA requested that field studies of Bt-1507 maize (EC-75) be conducted in Spain. Other requests concerned molecular characterization, protein expression, effects on target and non-target species, and monitoring of resistance. A response was provided by the applicant on 14 February 2002, including information on field studies undertaken in Spain. Following further advice from the National Biosafety Committee of 13 May 2002, on 17 June 2002, the lead CA submitted requests for additional field studies and other additional information about molecular characterization and protein expression to the applicant. The applicant responded to these requests on 17 December 2002, providing, *inter alia*, information on additional field studies undertaken in Spain. This was after the date of repeal of Directive 90/220.

7.893 The application was apparently updated and re-submitted under Directive 2001/18 on 13 February 2003. The lead CA requested a specific recalculation on the molecular characterization, additional information regarding toxicity studies, and information on herbicide use on 17 February 2003. Following a meeting between the applicant and lead CA on 28 February 2003, the applicant provided the requested information on 7 April 2003. Following another meeting between the applicant and lead CA, the applicant submitted a revised updated application on 28 May 2003. The updated application was forwarded along with a positive assessment by the lead CA to the Commission on 5 August 2003. It was circulated by the Commission to member States on 20 August 2003, with a deadline for comments of 19 October 2003. On the date of establishment of the Panel, the application was thus being reviewed by the member States.

[911] Exhibit EC-75/Ats. 1-3.

7.894 It is clear from the foregoing that the assessment of the application concerning Bt-1507 maize (EC-75) under Directive 90/220 was delayed as a consequence of two requests for information from the lead CA in November 2001 and June 2002, respectively. We sought advice from the experts as to whether the information requested by the lead CA in November 2001 on molecular characterization, allergenicity, toxicity and environmental impact were necessary to ensure that the conclusions of the safety assessment were valid.[912] The experts were unable to assess the original application as it was not provided to the Panel. Dr. Nutti noted, however, that the subsequent explanations and information provided by the applicant with regard to protein toxicity and allergenicity were correct, very well detailed and comprehensive.[913] Dr. Andow opined that the requests for further information on toxicity, including the toxicity of degradation products of Cry1F or PAT proteins, were necessary to ensure that the conclusions of the safety assessment were valid. He also considered that there could be a legitimate basis for requesting studies on non-target species of particular concern to Spain. He noted that there was no scientific consensus regarding the need for field trials to be conducted in the actual location of concern, but he considered the question from the lead CA to be insufficiently specific to guide the applicant in providing a response and therefore concluded that the particular question which was put forward by the lead CA was not necessary to ensure that the conclusions of the safety assessment were valid .[914]

7.895 In connection with the November 2001 and June 2002 requests for information, we further note that on both occasions the lead CA waited for more than one month before forwarding the questions suggested by the National Biosafety Committee. This contrasts with other approval procedures where Spain was also the lead CA and where the Spanish CA forwarded requests for information from the National Biosafety Committee more promptly.[915]

7.896 In examining the lead CA's November 2001 and June 2002 requests for information, we note that the United States does not assert that, at that time, Spain was an active participant in the alleged moratorium on approvals. However, the United States contends that Spain was placed in a position of having to recognize the moratorium as a reality and that this affected how it assessed applications.

7.897 We consider that following the June 1999 declaration by the Group of Five countries, Spain had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. The Commission made a proposal for such rules in July 2001. In our view, Spain also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. Consequently, Spain could in our view have come to the conclusion in 2001 that there was no realistic prospect that the application concerning Bt-1507 maize (EC-75) could be approved prior to the repeal of Directive 90/220. Spain's conduct, notably the time taken by the lead CA to forward questions from the National Biosafety Committee, is consistent with such a view, in that it contributed to the application not being forwarded to the Commission and the other member States until after the entry into force of Directive 2001/18.

7.898 We recognize that the application in this case was submitted and acknowledged just fifteen months before the date of repeal of Directive 90/220. However, we do not consider that in September 2001, when the lead CA received the suggested questions from the National Biosafety Committee, the lead CA could have legitimately concluded that it was impossible to complete the required steps and

[912] Annex H, Questions No. 36 and 36(a).
[913] Annex H, paras. 636-637.
[914] *Ibid*, paras. 639-651.
[915] *See, e.g.*, the approval procedure concerning BXN cotton. Exhibit EC-73/Ats. 2-3 and 5 and 6.

have the application approved or rejected while Directive 90/220 was still in force. It should also be noted that Spain was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, even if we were to accept, taking account of the views expressed by the experts advising us, that the November 2001 request for information might reflect a precautionary approach to evaluating applications, the delayed transmission of that request cannot, in our view, be said to reflect such an approach.

7.899 We note that under Directive 2001/18, in February 2003, the lead CA requested further information in response to the applicant's replies to the lead CA's request for information of June 2002. The applicant provided a response in April 2003 and a revised updated application in May 2003. The updated application was then forwarded to the Commission together with the lead CA's favourable assessment report within three months, as required by Directive 2001/18. The fact that after obtaining yet further information, the application under Directive 2001/18 appears to have moved promptly to the Community level in our view does not disprove the claim that a moratorium on approvals was in place. As we have said, Spain could have considered that while Directive 90/220 was still in force, the Group of Five countries and the Commission would prevent the final approval of the application in question, whereas after the entry into force of Directive 2001/18, the application might eventually be approved, after the adoption of new EC rules on labelling and traceability.

7.900 In the light of the above considerations, we conclude that Spain's failure to complete its assessment of the application concerning Bt-1507 maize (EC-75) earlier than in August 2003 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

Bt-11 maize (EC-80)

7.901 The application concerning Bt-11 maize (EC-80) was first submitted to the CA of Spain (lead CA) on 29 May 1998. On 30 April 1999, the lead CA forwarded the application with a positive assessment to the Commission. The application was withdrawn by the applicant on 20 May 1999. In withdrawing the application, the applicant referred to the parallel application which had been submitted to France on 28 May 1996 (Bt-11 maize (EC-69)), and which had been forwarded by the French CA to the Commission on 4 April 1999 with a positive assessment.

7.902 The application concerning Bt-11 maize (EC-80) was for approval of the cultivation of this product. It should be noted that Bt-11 maize (EC-163) had been approved in the European Communities as of 22 April 1998 under Directive 90/220 for import and for processing.

7.903 The **United States** argues that this application was delayed at the member State level and was not forwarded for consideration at the Community level. The United States submits that although the applicant provided answers to all of the questions, the member State nonetheless delayed and ultimately suspended consideration or failed to approve the product. The United States considers that the delays in the consideration by the lead CA are evidence of the existence of a moratorium.

7.904 The **European Communities** argues that after discussions between the lead CA and the applicant, this application was withdrawn on 20 May 1999. The applicant gave as the reason for its withdrawal the existence of a parallel application made in France.

7.905 The **United States** argues that the companies had a strong incentive to maintain cordial relations with EC regulators and saw no advantage of complaining to EC regulators about the length of the delays, which the United States maintains results from the moratorium.

7.906 The **Panel** begins by noting the United States' argument that the application concerning Bt-11 maize (EC-80) was not forwarded for consideration at the Community level. This is incorrect. This application was submitted by the lead CA to the Commission in April 1999 and thus did reach the Community level; however, the applicant withdrew the application within a month of this referral.

7.907 The United States further argues that the delays in the consideration by the lead CA are evidence of the existence of a moratorium. In considering this argument, we first recall that it is the United States' contention that the European Communities applied a general moratorium as of October 1998. From the information provided to us, it appears that between October 1998 and April 1999 the application was under assessment by Spain's National Biosafety Committee and by the Spanish CA. There is no indication that in the period from October 1998 to April 1999 further information was to be submitted by the applicant in response to requests for information. This period exceeds the 90-day assessment period provided for in Directive 90/220. We therefore agree with the United States that between October 1998 and April 1999 there were delays in the consideration of the application concerning Bt-11 maize (EC-80).

7.908 No explanation has been offered by the European Communities of the failure of the lead CA to consider this application within the period of time foreseen in Directive 90/220. The United States does not assert that Spain itself was an active participant in the alleged moratorium on approvals and that the time taken by Spain to complete its assessment is a reflection of Spain's support for the moratorium. Rather, its assertion is that the time taken by Spain reflects the impact of the moratorium.

7.909 We note that the relevant delay in the consideration of this application occurred between October 1998 and April 1999, *i.e.*, before the June 1999 declaration by the Group of Five countries. Spain was not a part of the Group of Five countries. Spain was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. Taking into account these elements, we consider that the delay which occurred between October 1998 and April 1999 neither contradicts nor confirms the existence of a moratorium on final approvals as of October 1998. In our view, a general EC moratorium on final approvals as of October 1998 could explain Spain's conduct after 1998. Spain could have considered that strict compliance with the 90-day deadline was effectively not necessary since in any event a final approval of the application concerning Bt-11 maize (EC-80) would not be granted while the alleged moratorium was in effect. On the other hand, since Spain in June 1999 formally declared that it would take a thoroughly precautionary approach, we think it is also possible that Spain reviewed the application particularly carefully and that this resulted in unintended delays.

7.910 In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals as from October 1998. As was pointed out by the Complaining Parties, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning Bt-11 maize (EC-80).

7.911 In the light of the above considerations, we conclude that the failure by Spain to complete its assessment of the application concerning Bt-11 maize (EC-80) earlier than in April 1999 is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

NK603 maize (EC-76)

7.912 In the approval procedure concerning NK603 maize, the applicant submitted an application to Spain (lead CA) in August 2000. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. The application was forwarded with a positive assessment to the Commission on 14 January 2003. The scope of the application covered import and industrial use, including use as animal feed.

7.913 The **United States** argues that the application was delayed at the first stage of the approval process under 90/220 because the lead CA declined to forward the application to the Commission. Although the applicant provided answers to all of the questions raised by the lead CA, the lead CA nonetheless delayed this product under Directive 90/220. The application remained at member State level for a period of 25 months. This product was resubmitted under Directive 2001/18, and received favourable initial assessments from the Spanish CA.

7.914 **Canada** argues that the total time taken by the lead CA for its review was 25 months, and that only 13 of the 25 months were taken by the applicant to respond to questions. The difference of 12 months exceeds the 3-month period provided for in Directive 90/220.

7.915 **Argentina** notes that a risk assessment of NK603 maize was initiated under Directive 90/220 and re-initiated under Directive 2001/18. This was concluded with a favorable opinion from the scientific panel. Argentina notes that, as of April 2004, the approval procedure concerning NK603 maize, which was initiated on 4 August 2000, had lasted 3 years and 8 months and no final decision had been reached on the application for approval.

7.916 The **European Communities** claims that the only delays in the application for NK603 maize arose due to questions on additional information; otherwise the application process has proceeded smoothly. In addition, the European Communities asserts that the application submitted in August 2000 was incomplete and therefore not considered as received until January 2001. The European Communities further claims that 44 days after the application was submitted, the clock was stopped because the scientific committee of the lead CA requested additional information on issues such as molecular characterization, nutritional composition, and environmental impact.[916]

7.917 The **United States** notes that using the January 2001 date of receipt suggested by the European Communities, and taking account of the "clock stop" when requested information was awaited from the applicant, out of the total 25 months for which the application was at the CA level, the European Communities had delayed action on the application for NK603 maize under Directive 90/220 for 12 months.

7.918 The **European Communities** responds that, given that the applicant had taken 13 months to gather additional information, it was not unreasonable that the lead CA required 12 months to digest and process that information.

7.919 The **Panel** understands from the record that the applicant sent the first application to the Spanish CA on 4 August 2000. Four months later, on 20 December 2000, the applicant resubmitted the application in Spanish and apparently with additional studies added to the application.[917] We note that there is no record of these additional studies. The Spanish CA subsequently acknowledged receipt of the letter on 2 January 2001.

[916] Exhibit EC-76/At. 1.
[917] Exhibit EC-76/At. 3.

7.920 It is clear from the record that the progress of this application was adversely affected notably by two elements. *First*, the applicant took more than six months to provide information requested by the lead CA in February 2001. *Secondly*, the applicant took more than five months to provide information requested by the lead CA in October 2001.

7.921 Regarding the February 2001 request for information, we note that the lead CA requested additional information concerning molecular characterization, nutritional analysis and environmental impact of the product in question. We asked the experts advising us whether the information requested by the lead CA in February 2001 was necessary to ensure that conclusions of the product's safety assessment were valid.

7.922 Given that the application was for import and industrial use in the European Communities and not for cultivation, Dr. Andow indicated that "some information is necessary to consider how gene escape can occur either during processing, storage or transport, but detailed information is not necessary." Thus, he concluded that requests for additional detailed environmental studies were not justified.[918]

7.923 Dr. Nutti noted that the food safety information available to the lead CA seemed sufficient given that substantial equivalence had been demonstrated in several feeding studies.[919] Dr. Nutti stated that "whatever studies were further requested by the lead CA [...] were not necessary to ensure that conclusions of the safety assessment were valid since all the relevant information had already been provided."

7.924 Regarding the October 2001 request for information, we understand from the record that one month after the applicant had submitted new information in response to the request of February 2001, in October 2001, the Spanish CA requested that a Polymerase Chain Reaction (PCR) be conducted, and sought additional information on molecular characterization and details of the potential environmental impact of accidental dissemination or germination.[920] More than five months passed before the applicant responded with additional information. After the applicant had submitted new information in March 2002, the Spanish CA communicated persistent doubts.[921]

7.925 The United States notes that the Spanish CA had stressed that PCR should be used to detect small DNA insertions because PCR provides a greater degree of sensitivity.[922] The United States argues that the use of some PCR-based method to detect additional fragments potentially too small to be seen by a Southern blot analysis was scientifically unjustified.

7.926 The European Communities claims that the request from the lead CA was scientifically valid.[923] According to the European Communities, the additional data provided by the applicant indicates that the use of PCR improved the sensitivity of the molecular characterization in comparison to the data previously provided in the application. Therefore, although the applicant stressed that the conclusion in relation to safety provided in the application was not altered, the European Communities maintains that the lead CA's request for additional information was necessary to ensure that conclusions of the safety assessment were valid.

[919] Annex H, Dr. Nutti's response to Panel Question 37.
[920] Exhibit EC-76/At. 10.
[921] Exhibit EC-76/At. 14.
[922] Exhibit EC-76/At. 10.
[923] EC Comments on the experts replies, para. 462.

7.927 In relation to PCR, the Panel recalls that Dr. Nutti expressed the view that the initial information regarding food safety seemed sufficient.[924] The Panel understands from the record, however, that the Spanish CA emphasized that the PCR is also considered "essential for product traceability".[925]

7.928 In relation to the additional October 2001 requests for environmental information, Dr. Andow noted that the applicant had not addressed this question of potential environmental impact of any accidental dissemination or germination. He commented that the applicant "believes, probably rightly, that the likelihood of accidental dissemination and germination (exposure to the environment) is small. If this is true, the applicant is arguing that when exposure is small, risk is small. Consequently, the applicant may believe that it was not necessary to address this question."[926] However, Dr. Andow noted that the lead CA could believe that the potential risk associated with accidental dissemination and germination could be large. Dr. Andow therefore concluded that this request for information to be provided by the applicant was justified.

7.929 In considering the lead CA's February 2001 and October 2001 requests for information, we note that the United States and Argentina do not assert that, at the time of these requests, Spain was an active participant in the alleged moratorium on approvals. Indeed, Spain was not part of the Group of Five countries. However, following the June 1999 declaration by the Group of Five countries, Spain had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability.[927] In our view, Spain also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. Consequently, Spain could in our view have come to the conclusion in 2001 that there was no realistic prospect that the application concerning NK603 maize could be approved prior to the repeal of Directive 90/220.

7.930 Against this background, we consider that Spain could have been requesting information which it would not otherwise have requested, and that it was not concerned about any delays such requests would entail, as it saw no possibility of the application being approved while Directive 90/220 was still in force. The views expressed by the experts advising us are not inconsistent with this possibility. As indicated previously, notably in the case of the February 2001 request the experts questioned the need for the information that was requested.

7.931 It must also be remembered, however, that Spain was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. In our view, the fact that the experts questioned the need for the information that was requested in February 2001 does not rule out the possibility that Spain was taking a precautionary approach to evaluating applications. Therefore, we think the February 2001 and October 2001 requests for additional information could also be a reflection of the June 1999 declaration by the Group of Seven countries.

7.932 Taking account of the aforementioned elements, we consider that Spain's February 2001 and October 2001 requests for additional information do not in themselves provide direct confirmation of the existence of a general moratorium on final approvals. But in our view these requests are consistent with the contention that a general moratorium was in effect at the time.

---

[924] Annex H, Dr. Nutti's response to Panel Question 37.
[925] Exhibit EC-76/At. 10.
[926] Annex H, Dr. Andow's response to Panel Question 38.
[927] We recall that the Commission made a proposal for such rules in July 2001.

7.933 We note that at a very early stage, in August 2002, the applicant submitted an updated application to satisfy the new requirements of Directive 2001/18. The applicant appears to have done so at its own initiative.[928] In August 2002, it was already clear, however, that the approval procedure concerning NK603 maize could not be completed under Directive 90/220. Consistent with the fact that the update was submitted early on, the updated application was promptly forwarded to the Commission with the lead CA's favourable assessment report on 14 January 2003.[929] However, the fact that under Directive 2001/18 the application moved to the Community level very quickly in our view does not disprove the claim that a moratorium on approvals was in effect. As we have said, Spain could have considered that while Directive 90/220 was still in force, the Group of Five countries and the Commission would prevent the final approval of the application in question, whereas after the entry into force of Directive 2001/18, the application might eventually be approved, after the adoption of new EC rules on labelling and traceability.

7.934 In the light of the above considerations, we conclude that the failure of Spain to complete its assessment of NK603 maize earlier than in January 2003 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

GA21 maize (EC-85)

7.935 The application concerning GA21 maize (EC-85) was initially submitted to the United Kingdom (lead CA) on 12 December 1997, for the import of grain and of derived products for animal feed and processing. On 15 October 1999, the lead CA submitted the application to the Commission with its favourable assessment.[930] The application was withdrawn on 27 June 2001.

7.936 The **United States** argues that this application was delayed at the member State level for seven months. In February 1999, the Advisory Committee on Release into the Environment (ACRE) notified the applicant that it would forward the application to the Commission following some amendments to the application.[931] On 23 March 1999 the applicant submitted the final and complete amended application, as agreed between the applicant and the lead CA, which was ready to be forwarded to the Commission as of that date.[932] The application, however, was delayed for more than seven months for no discernible reason before it was finally sent to the Commission on 15 October 1999. More than four months after the positive ACRE opinion, the applicant explicitly inquired about this delay in a letter dated 8 July 1999 to the Minister of the Environment, only to receive a reply back four months later, on 2 November 1999, noting, without explanation, that the application "had recently been forwarded" to the Commission.[933]

7.937 The United States observes that the chronology provided by the European Communities gives the false impression that activity actually occurred on this application after April 1999 by referencing an ACRE meeting on 16 September 1999.[934] As the minutes of that meeting show, however, GA21 maize (EC-85) was not on the agenda and was not discussed. There was no activity during this time period on the side of the lead CA. The United States maintains that these seven months of inaction following the lead CA's positive risk assessment were politically motivated. The exact application as

[928] Exhibit EC-76/At. 18.
[929] Exhibit EC-76/At. 27.
[930] We recall that an application for the same product was submitted to Spain on 29 May 1998 (EC-78).
[931] EC Exhibit 78 + 85/At. 22.
[932] Exhibit US-145.
[933] Exhibit US-146.
[934] Exhibit EC-78 + 85/At. 24.

submitted by the applicant on 23 March 1999 was finally forwarded to the Commission without further discussion or amendment.

7.938 **Canada** argues that the lead CA failed to submit the application to the Commission until November 1999, well after the applicant had made certain amendments to the original application in March 1999 in accordance with the agreement with the lead CA made in February 1999. That is, the lead CA failed to forward the application to the Commission for 7.5 months. Canada argues that this should be considered together with the fact that the lead CA had already spent 15.5 months for its review with regard to the application since the application was submitted by the applicant in November 1997.

7.939 The **European Communities** argues that the delays at the member State level relating to this application were due to the numerous requests for additional information. Furthermore, when the application was withdrawn, the applicant cited as reasons for its withdrawal "unexpected commercial constraints" and the parallel application in Spain.

7.940 The **United States** argues that the application was withdrawn because of the European Communities' excessive delay in carrying out the approval process. The United States maintains that although a company may not have cited undue delays in its withdrawal letter, over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Furthermore, according to the United States, the companies had a strong incentive to maintain cordial relations with EC regulators and saw no advantage of complaining to EC regulators about the length of the delays, which the United States maintains results from the moratorium.

7.941 The **Panel** notes that on 16 February 1999 the lead CA informed the applicant that, in light of some of the new data provided by the applicant in response to requests from the lead CA, ACRE had re-reviewed the application, and requested some amendments in order to permit the dossier to be forwarded to the Commission. ACRE indicated that subject to these amendments being made, it was content for the dossier to be forwarded to the Commission with a favourable opinion.[935] The applicant provided an amended application to the lead CA in March 1999.[936] The chronology provided by the European Communities indicates that a meeting of ACRE was held on 16 September 1999. However, as correctly noted by the United States, the minutes of this meeting make no reference to any discussion of the GA21 maize (EC-85) application.[937] The EC chronology shows no further action on this application until it was forwarded to the Commission with a positive assessment report on 15 October 1999. Evidence submitted by the United States shows, however, that on 8 July 1999, the applicant inquired with the lead CA why the application was not being forwarded.[938] The lead CA replied on 2 November 1999, almost four months later, indicating only that the application had meanwhile been forwarded to the Commission.[939]

7.942 The United States does not assert that the United Kingdom itself was an active participant in the alleged moratorium on approvals and that the delay in question is a reflection of the United Kingdom's support for the moratorium. Nevertheless, the United States contends that the fact that the lead CA did not forward the application to the Commission for almost seven months after receiving an amended version was politically motivated. In response to a request for elaboration from the

[935] Exhibit EC78+85/At. 22.
[936] Exhibit EC-78+85/At. 26. Evidence submitted by the United States confirms that the revised application was submitted on 23 March 1999. Exhibit US-145.

[938] Exhibit US-146.
[939] *Ibid*.

Panel, the United States observed that many EC member States, including the United Kingdom, were divided internally on their position related to biotechnology. On the one hand, elements of the UK government have, in the United States' view, been supportive of agricultural biotechnology. On the other hand, the United States argues that certain political figures were not supportive, including the UK Environment Minister at the time of the delay in question. According to the United States, the conduct of the United Kingdom shows that countries other than the Group of Five countries recognized the political reality of the moratorium, and that this reality at times affected the manner in which they conducted their assessments of biotech applications.

7.943 In considering the United States' arguments, we note that it is reasonable to assume that the lead CA needed some time to review the amended application submitted in March 1999 before it could be forwarded to the Commission with a favourable opinion. Nevertheless, the lead CA had previously indicated that there were no other outstanding issues, and so we agree with the United States that a delay did occur between March 1999 and October 1999. Indeed, this period alone resulted in the consideration of this application at the member State level far exceeding the 90-day assessment period allowed under Directive 90/220.

7.944 The precise reasons for the lead CA's temporary inaction are unclear. We note that during the period from March to October 1999, in June, the Environment Council agreed on a Common Position in relation to the revision of Directive 90/220 and the Group of Five countries made their declarations. It may be that the United Kingdom considered that it was not appropriate to forward the application concerning GA21 maize (EC-85) to the Commission and the other member States with a favourable opinion shortly before this important Council meeting, and that after the meeting the United Kingdom took time to evaluate the impact of the Council meeting on the EC approval process, and to see the reaction of the Commission. It may also be that the delay reflects an internal UK policy debate, as suggested by the United States.

7.945 What is clear, though, is that the United Kingdom completed its assessment and in October 1999 forwarded the application to the Commission with a favourable opinion. This is consistent with the circumstance that the United Kingdom was not part of the Group of Five countries which stated that they would take steps to suspend further approvals. The fact that the United Kingdom completed its assessment does not, however, contradict the claim that a general moratorium on final approvals was in effect in October 1999. If a moratorium was in effect, it was only after the application concerning GA21 maize (EC-85) reached the Community level that the Group of Five countries and/or the Commission could take steps to prevent the final approval of the application concerning GA21 maize (EC-85).

7.946 In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in 2001 is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning GA21 maize (EC-85).

7.947 In the light of the above considerations, we conclude that the time taken by the United Kingdom to complete its assessment of the application concerning GA21 maize (EC-85) is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

MON810 x GA21 maize (EC-82)

7.948 The application concerning MON810 x GA21 maize was initially submitted to Spain (lead CA) on 4 August 1999. This maize is produced by conventionally hybridizing two "parental" biotech products, MON810 maize and GA21 maize. This application was withdrawn by the applicant on 15 September 2003. At that time, the lead CA had not yet submitted the application to the Commission.

7.949 The **United States** argues that this application never reached the Community level stage of review due to the moratorium. On 30 November 1999, the lead CA requested that the applicant provide several additional studies to support the application for this product.[940] The applicant responded in August 2001 to all requests, except for a scientifically unjustified study on the nutritional composition of milk from dairy cows fed this product.[941] Given the demonstrated safety of maize in feed generally, as well as the substantial data submitted to support the feed safety of both transgenic parents, there is no scientific basis to suggest a concern. One of the parental lines (MON810 maize) was approved by the European Communities several years prior to this application, and the feed safety was established as part of that process.[942] In addition, as part of its original submission, the applicant had relied on substantial compositional analyses of the other parent (GA21 maize), as well as feeding studies.[943] None of these studies identified anything that would provide any basis for the concern raised by the member State.

7.950 The United States notes that the lead CA also requested additional studies of the hybrid in order to verify the stability of both events jointly. In the view of the United States, there was no logical basis for this request, which implies some interaction between the MON810 and GA21 events. The United States submits that the applicant had already shown the stability of these transformation events in each parental line. The insertions, having been shown to be stable in the parental lines, would be no more likely to be affected by crossing than any other gene already present in either parent.

7.951 The United States notes that the applicant provided translations in January 2002 of various studies it had previously submitted. Following that, the only activity by the lead CA was a meeting held in April 2002.[944] No further action was taken on this application for over 18 months, until the applicant volunteered to update the application under Directive 2001/18 on 16 January 2003.[945] The applicant, however, subsequently withdrew the application on 15 September 2003, at the same time it withdrew the application for GA21 maize (EC-78), as the delays caused by the moratorium had rendered the applications for GA21 maize (EC-78) and MON810 x GA21 maize commercially obsolescent.[946]

---

[940] Exhibit EC-82/At. 8.

[941] Exhibit EC-82/ Ats. 9, 10 and 11. According to the United States, conducting the dairy cattle feeding study would have involved considerable cost and delay to the applicant. Such a test would require the applicant to obtain approval for further experimental plantings to generate sufficient maize for the feeding study; employ external consultants to undertake the required study; grow maize for the feeding study in the 2000 season; harvest, transport and ensile the maize under rigorous experimental conditions; undertake the cow-feeding phase; analyse the milk samples; and produce all reports to the Standards of Good Laboratory Practice.

[943] Exhibit EC-82/Ats. 2 and 5.

[944] Exhibit EC-82/At. 18.

[945] Exhibit EC-82/At. 20.

[946] Exhibit EC-82/At. 21.

7.952 The **European Communities** argues that the delays identified by the United States can be explained by the fact that the safety of one of the parental lines of this hybrid product, GA 21 maize, had not yet been assessed. The lead CA was awaiting that assessment. The European Communities maintains that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open. Furthermore, according to the European Communities, the United States acknowledges that the delays were caused by the applicant when it stated in response to a question from the Panel that "the applicant was unable to devote resources to respond to the questions posed by the [lead CA] in a timely fashion".[947]

7.953 The European Communities further observes that after discussions between the lead CA and the applicant, the application was withdrawn with a letter of 15 September 2003. The applicant gave three reasons for the withdrawal: first, the progress in the procedure of NK603 maize to a more advanced stage than the GA21 maize (EC-78) application; second, the introduction of the new regulations concerning commercialisation of GM products in the European Communities; and third, the change of the company's commercial priorities.

7.954 The **United States** denies acknowledging that the delays were caused by the applicant. The summary table of the US response to question 47 from the Panel was not intended to indicate that delay was the fault of the applicant. Rather, the applicant recognized that the application for MON810 x GA21 maize would not move forward as long as consideration of the application for the single trait parent GA21 maize (EC-78) remained suspended under the moratorium. The United States contends that it was pointless for the applicant to devote resources to pursue the application for MON810 x GA21 maize when the approval of GA21 maize (EC-78) had been stalled for years under the moratorium. Thus, the delay in the application for MON810 x GA21 maize was a direct consequence of the delay in the application for GA21 maize (EC-78) under the moratorium.

7.955 The United States points out that because of the delay in the approval procedure concerning GA21 maize (EC-78), that product, as well as MON810 x GA21 maize, have been superseded by a second generation Roundup Ready maize product (NK603 maize and NK603 × MON810 maize, respectively). The United States maintains that the applicant may not have cited undue delays in its withdrawal letter because it had a strong incentive to maintain cordial relations with EC regulators and saw no advantage of complaining to EC regulators about the length of the delays.

7.956 The **Panel** begins by noting that much of the information provided to it has been incorrectly identified. In particular, translations into Spanish of information previously submitted in English have been identified as "additional data", and at times the same document was included as several different attachments. Furthermore, it should be recalled at the outset that the Spanish CA in May 1999 had given a favourable assessment to the application concerning GA21 maize (EC-78) and forwarded that application to the Commission. When the application concerning MON810 x GA21 maize was submitted, the application concerning GA21 maize (EC-78) was under assessment at Community level.[948]

7.957 Turning now to Spain's assessment of the application concerning MON810 x GA21 maize under Directive 90/220, we note that the most significant delay in the consideration of this application appears to be due to the time taken by the applicant to provide information in response to a request for additional information from the Spanish CA in November 1999. The applicant did not provide the

[947] The European Communities refers to the United States' response to question 47 of the Panel, table in Annex I.

[948] We recall that the application concerning GA21 maize (EC-78) was withdrawn by the applicant in 2003.

information requested until August 2001, and a translation into Spanish of the documents submitted in the August 2001 response was provided to the Spanish CA in January 2002. The United States has pointed out that the applicant did not comply with the Spanish CA's request that it provide a study on the nutritional composition of milk from dairy cows which had been fed the product in question.

7.958 In April 2002, the Spanish National Biosafety Committee reviewed the January 2002 Spanish translation of the applicant's documents. The National Biosafety Commission concluded that it still needed the results of feeding studies on cows, and other information.[949] However, there is no indication in the record that a further request for information was ever sent to the applicant prior to the repeal of Directive 90/220 in October 2002.

7.959 We note that after receiving the additional information requested from the applicant, it was incumbent on the Spanish CA either to seek further clarifications or to complete its assessment within the 90-day period provided for in Directive 90/220. As indicated, there is no evidence that the Spanish CA requested additional or missing information once the National Biosafety Commission had reviewed the Spanish version of the applicant's documents of August 2001. Nor did the Spanish CA complete its assessment after receiving further advice from the National Biosafety Commission in April 2002. From the information before us, it would appear that the 90-day period had already been exceeded by April 2002.

7.960 According to the European Communities, the failure of the lead CA to forward the application concerning MON810 x GA21 maize to the Commission in 2002 can be explained by the fact that the lead CA was waiting for the result of the Community level assessment of one of the parental lines of this hybrid product, GA 21 maize (EC-78). The European Communities maintains that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open. We are not convinced by this explanation.

7.961 To begin with, as previously noted, the Spanish CA had already favourably assessed the application concerning GA21 maize (EC-78). Furthermore, the SCP in September 2000 had issued a favourable opinion on the application concerning GA21 maize (EC-78).[950] It is not clear, therefore, why the same Spanish CA would not be in a position to reach a conclusion also with regard to the application concerning the hybrid product, *i.e.*, MON810 x GA21 maize. Indeed, the record does not indicate that the Spanish CA ever indicated to the applicant that it was unable to proceed due to the failure of the European Communities to approve the GA21 maize (EC-78) parent. As a general matter, it may be correct that "the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open". However, it would seem that the assessment of the parental lines could also be made in the context of the assessment of the hybrid. At any rate, the Spanish CA could not "conclude" the assessment of the application concerning MON810 x GA21 maize completely on its own. If other member States had concerns with Spain's assessment of GA21 maize (EC-78), even though that assessment appears to have been confirmed by the SCP, they could have raised an objection and the assessment would then have been "concluded" at Community level. Thus, it is not apparent to us that the Spanish CA needed to keep the application at the member State level in order to avoid the possibility of conflicting assessments of GA21 maize.

7.962 The United States argues that this application never reached the Community level stage due to the alleged general moratorium on final approvals. More particularly, the United States contends that the delay in the application for MON810 x GA21 maize was a direct consequence of the delay in the application for GA21 maize (EC-78) under the moratorium. We recall that the United States does not

[949] Exhibit EC-82/At. 18.
[950] Exhibit EC-78+85/At. 90.

assert that Spain itself was an active participant in the alleged moratorium on approvals or that the time taken by Spain in its assessment is a reflection of Spain's support for the moratorium. Rather, it asserts that Spain was placed in a position of having to recognize the moratorium as a reality, and that this affected the speed with which it conducted its assessment.

7.963 We consider that following the June 1999 declaration by the Group of Five countries, Spain had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability.[951] In our view, Spain also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. We note in this regard that the single trait parent application concerning GA21 maize (EC-78) did not progress at Community level after the SCP had issued its favourable opinion in September 2000.[952] In relation to that application, we have previously concluded that the Commission's failure to submit a draft measure concerning GA21 maize (EC-78) to the Regulatory Committee following the issuance in September 2000 of the SCP's opinion is consistent with the United States' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

7.964 Against this background, and in particular in view of the situation with regard to the single trait parent application concerning GA21 maize (EC-78), we consider that Spain could have come to the conclusion in 2002 that there was no realistic prospect that the application concerning MON810 x GA21 maize could be approved prior to the repeal of Directive 90/220. In our view, Spain's failure to complete its assessment prior to the repeal of Directive 90/220 is therefore consistent with the view that a general moratorium on approvals was in effect at the time.

7.965 We note that Spain was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, it is not apparent that the Spanish CA's conduct as of April 2002 reflects a precautionary approach. Indeed, the Spanish CA did not follow up with the applicant to seek more information or additional clarifications after receiving further advice from the National Biosafety Commission in April 2002. We recognize that, by that time, the date of repeal of Directive 90/220 was approaching. However, we note that in another approval procedure, the Spanish CA forwarded questions from the National Biosafety Commission as late as mid-June 2002.[953]

7.966 Furthermore, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in 2003 is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning MON810 x GA21 maize.

7.967 Regarding Spain's assessment of the application concerning MON810 x GA21 maize under Directive 2001/18, we note that the applicant on 16 January 2003 indicated its intention to submit an updated application in accordance with Directive 2001/18. The European Communities has indicated, however, that the updated application was never received by the lead CA. We have seen no evidence

[951] We recall that the Commission made a proposal for such rules in July 2001.

[952] It is reasonable to assume that as the lead CA in the approval procedure concerning GA21 maize (EC-78), Spain was aware of this situation.

[953] Exhibit EC-75/At. 13.

to the contrary. The only other information regarding this application relates to its withdrawal by the applicant on 15 September 2003. Thus, it appears that the application was never considered by the lead CA under Directive 2001/18. This said, without an updated application, the lead CA could not have done so.

7.968 In the light of the above considerations, we conclude that the failure of Spain to complete its assessment of the application concerning MON810 x GA21 maize prior to the repeal of Directive 90/220 in October 2002 is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

High-oleic soybeans (EC-87)

7.969 The application concerning High-oleic soybeans was submitted to the Netherlands (lead CA) on 19 June 1998. Following several requests for additional information from the lead CA and responses by the applicant, the application was withdrawn by the applicant on 12 December 2002.

7.970 The **United States** argues that the application for High-oleic soybeans was withdrawn because of the European Communities' excessive delay in carrying out the approval process. The United States maintains that this delay was a manifestation of the moratorium on approvals.

7.971 The **European** Communities argues that when the application was withdrawn by the applicant in December 2002, the justification given for the withdrawal pointed to "entirely commercial reasons".

7.972 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in its reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.973 The **Panel** notes that in a communication dated 7 December 1998, the Netherlands Institute for Food Safety (RIKILT), one of the advisory scientific bodies considering the application, informed the lead CA that not enough information was available to assess the safety of livestock feed made from High-oleic soybeans.[954] The applicant was formally informed of the request for further data in a letter dated 8 January 1999. However, it appears that the RIKILT's questions had been made available to the applicant by e-mail already on 4 December 1998.[955] On 1 July 1999, the applicant provided responses to the RIKILT's questions "from 4 December 1998". The applicant submitted almost 270 pages of replies and studies.[956] The new information was apparently reviewed by the RIKILT, and on 27 October 1999, the Dutch CA on behalf of the RIKILT requested the applicant to provide further substantiation of the compositional analysis it had submitted.[957] The applicant did not provide the requested substantiation, however. There is no indication of any further communications on this application until it was withdrawn by the applicant more than three years later, on 12 December 2002, *i.e.*, after the repeal of Directive 90/220.

[954] Exhibit EC-87/At. 11.
[955] Exhibit EC-87/Ats. 13 and 14.
[956] Exhibit EC-87/At. 14.
[957] Exhibit EC-87/At. 15.

7.974 It is clear from the foregoing that the progress of this application was adversely affected notably by two elements. *First*, the lead CA's request for additional information of December 1998/January 1999 and the time taken by the lead CA to review the additional information once it had been received. *Secondly*, the applicant's failure, over a period of more than three years, to respond to a follow-up request for additional information.

7.975 Regarding the first element, we have asked the experts advising us whether the information requested in December 1998/January 1999 and October 1999 on the composition of the product and the alteration in the protein profile were necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti considered that the data requested in December 1998/January 1999 on the lectin content and composition data for at least two seasons was necessary to ensure that conclusions of the safety assessment concerning human use were valid. She also noted, however, that the changes in the fatty acid composition would not be expected to have an impact on livestock feed safety.[958]

7.976 In considering the requests of December 1998/January 1999, it must also be noted, however, that a few months later, in June 1999, the Netherlands formally declared that it would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. In our view, the December 1998/January 1999 requests might reflect a precautionary approach to evaluating applications.

7.977 On 1 July 1999, the applicant provided the information requested in December 1998/January 1999. Almost four months later, on 27 October 1999, the Dutch CA forwarded additional questions from the RIKILT to the applicant. This means that during that period alone, the Netherlands exceeded the 90 days available to it under Directive 90/220 to assess the application. On the one hand, it should be recalled in this context that the applicant's technical response consisted of a 270-page document. In comparison, the original application contained 170 pages.[959] On the other hand, we consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. It is also reasonable to assume that the Netherlands was aware that after May 1999, in the approval procedures concerning Bt-531 cotton and RR-1445 cotton, the Commission failed to discharge its responsibility inasmuch as it did not submit a draft measure to the Council. Consequently, it is possible, in our view, that the Netherlands considered that the application concerning High-oleic soybeans could not be promptly approved at Community level, and that this affected the speed of its own assessment at the member State level. Hence, we think the Netherlands' conduct is consistent with the view that a general moratorium on approvals was in effect at the time.

7.978 Regarding the second element which contributed to a delay in the completion of this procedure, we note that the reasons for the applicant's failure to provide further substantiation are unclear. In its December 2002 letter of withdrawal, the applicant indicated that there was no safety concern relating to High-oleic soybeans and that the withdrawal was related entirely to commercial reasons.[960] In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in 2002 is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning High-oleic soybeans.

[958] Annex H, paras. 673-674.
[959] Exhibit EC-87/At. 1.
[960] Exhibit EC-87/At. 16.

7.979 In the light of the above considerations, we conclude that the failure by the Netherlands to complete its assessment of the application concerning High-oleic soybeans prior to December 2002, when it was withdrawn by the applicant, is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

RR sugar beet (EC-88)

7.980 The application concerning RR sugar beet was submitted for approval in Belgium (lead CA) in December 1998 under Directive 90/220. Following the entry into force of Directive 2001/18, an updated application was submitted by the applicant on 16 January 2003. At the time of establishment of the Panel, the lead CA had not yet submitted its assessment to the Commission. On 16 April 2004, the application was withdrawn by the applicant.

7.981 The **United States** claims that the application for RR sugar beet was delayed at the first stage of the approval process under 90/220 because the member State declined to forward the application to the Commission. Although the applicant provided answers to all of the questions raised by the lead CA, the member States nonetheless delayed and ultimately suspended consideration or failed to approve this product under Directive 90/220. This product was resubmitted under Directive 2001/18.

7.982 **Canada** argues that the lead CA failed to complete its review with regard to the application, and thus exceeded the 90-day limit provided for by Directive 90/220 by several years. Canada argues that during the review process, the lead CA requested three times (April 1999, November 2000 and January 2001) the applicant to "voluntarily" comply with the requirements provided for by Directive 2001/18, even though Directive 2001/18 would not be in force until October 2002.

7.983 The **European Communities** notes that after discussions between the lead CA and the applicant, the application was withdrawn by the companies producing the product on 16 April 2004. As the reason for the withdrawal, the applicant pointed to a decision to stop any further development of the RR sugar beet derived from event T9100152.

7.984 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in its reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.985 The **Panel** observes that the application was apparently sent to the lead CA in December 1998, however no record of this application is available to us. Also, the lead CA considered the application to be incomplete. After the applicant submitted further information, the lead CA on 1 March 1999 acknowledged receipt of a complete application.[961] Apparently, the application was considered at a meeting of the Belgian Biosafety Advisory Council held on 26 April 1999. The questions which were generated by this meeting were transmitted to the applicant in June 1999 and included questions on agricultural practices, molecular characterization, toxicology, allergenicity, and

[961] Exhibit EC-88/At. 3.

food/feed equivalence.[962] The applicant provided responses to some of these questions in July 1999.[963] Other questions were answered in December 1999.[964]

7.986 In October 1999 the lead CA requested additional information on gene transfer in digestive tracts.[965] The applicant provided such information in January 2000.[966] We asked the experts advising us whether the information regarding allergenicity, molecular characterization and gene transfer in digestive tracts requested by the lead CA was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti stated that the information provided by the applicant prior to October 1999 on these three topics was adequate to ensure that the conclusions of the assessment were valid.[967]

7.987 In February 2000, the lead CA requested missing bibliographical references. The applicant provided the relevant references in February and March 2000.[968] According to the chronology provided to us, in April 2000 the applicant met with the CA to discuss issues relating to identity preservation, Good Agricultural Practices, post-market monitoring, traceability, public information, line-specific detection methods and primers. The record of this meeting was not provided to us, however. In July 2000, the applicant at its own initiative provided additional information on the characterization of a protein and detection protocols. The applicant noted that this data did not change the conclusions of the safety assessment.[969]

7.988 In November 2000, the lead CA requested further clarifications regarding molecular characterization and allergenicity of "event '77'".[970] We asked the experts if the information regarding molecular characterization and allergenicity of "event '77'" requested by the lead CA was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti emphasized that the information "for allergenicity was not necessary to ensure that the conclusions of the safety assessment were valid", as the initial application had satisfactorily established the safety of this product in this respect.[971] The applicant apparently did not provide the requested information.

7.989 In January 2001 the lead CA "invited" the applicant to provide a proposal for labelling and traceability as well as a proposal for a monitoring plan and Good Agricultural Practices in accordance with the principles of the Common Position of the Council on the amendment of Directive 90/220. The lead CA indicated that in the absence of voluntary compliance with these principles, it seemed that the Commission and the other member States would oppose the approval of the application even if the lead CA forwarded it with a positive assessment.[972] The applicant apparently did not reply to the lead CA's invitation. In June 2001, the lead CA sent the applicant some comments on its application, asking the applicant to make corresponding corrections.[973] After the June 2001 communication from the lead CA there appear to have been no further exchanges between the lead CA and the applicant until the repeal of Directive 90/220 in October 2002.

[972] Exhibit EC-88/At. 29.
[973] Exhibit EC-88/At. 30.

7.990 In January 2003, the applicant submitted an updated application under Directive 2001/18. There was an acknowledgement by the lead CA in February 2003 that the applicant had provided updates and a request for further information.[974] The applicant apparently did not provide the requested information. Instead, in April 2004 the applicant submitted a letter of withdrawal.

7.991 We begin our examination of the lead CA's assessment of the application concerning RR sugar beet by recalling that the applicant did not respond to the lead CA's November 2000 request for additional information.[975] It would therefore appear that after November 2000 the lack of progress under Directive 90/220 is attributable to the applicant. The question to be examined, then, is why the lead CA did not complete its assessment prior to November 2000. We note in this respect that by the end of March 2000 the applicant had provided all additional information requested by the lead CA. Notwithstanding this, the lead CA did not complete its assessment in the next several weeks. Instead, more than seven months later, in November 2000, the lead CA requested further clarification on molecular characterization and allergenicity issues previously addressed by the applicant. The European Communities did not provide an explanation for why the Belgian CA could not have sought these clarifications much earlier, given that the applicant had provided additional information on these issues before the end of 1999. We note in this connection that by November 2000, Belgium had already far exceeded the 90-day period provided for in Directive 90/220 for the assessment to be made by a lead CA.

7.992 We also recall that in June 1999 Belgium was one of the Group of Seven countries which declared, not that they would take steps to suspend further approvals, but that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in view of the timing of Belgium's November 2000 request for additional information – it was forwarded more than seven months after the applicant had submitted additional information in March 2000 – we are not convinced that that request was a reflection of the precautionary approach referred to in the June 1999 declaration of the Group of Seven countries.

7.993 We consider that following the June 1999 declaration by the Group of Five countries, Belgium had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. The Commission made a proposal for such rules in July 2001. In our view, Belgium also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. Consequently, it is possible, in our view, that Belgium considered that the application concerning RR sugar beet could not be promptly approved at Community level, and that this affected the speed of its own assessment and led it to request information which it might not otherwise have requested.[976] As indicated previously, notably in the case of the clarifications sought concerning allergenicity, Dr. Nutti questioned the need for the information that was requested. The circumstance that the applicant did not respond to the November 2000 request is also consistent with this possibility, for it may indicate that the applicant had lost confidence that its application would be forwarded to the Commission by Belgium while Directive 90/220 was still in force.

[974] Exhibit EC-88/At. 34.

[975] The lead CA in January 2001 reminded the applicant of its November 2000 request for information. Exhibit EC-88/At. 29.

[976] In fact, as noted earlier, in January 2001 Belgium itself indicated to the applicant that it expected opposition to the approval of the application concerning RR sugar beet if the applicant did not voluntarily comply with certain principles set out in the Common Position on the revision of Directive 90/220.

7.994 Taking account of the aforementioned elements, we consider that Belgium's failure to complete its assessment prior to its November 2000 request for additional information is consistent with the existence of a general moratorium on approvals. This view is not contradicted by the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in 2004. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning RR sugar beet.

7.995 In the light of the above considerations, we conclude that the time taken by Belgium for its assessment of RR sugar beet is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

Transgenic green-hearted chicory (EC-110)

7.996 The application concerning Transgenic green-hearted chicory was submitted for approval in the Netherlands (lead CA) on 11 March 1996 under Directive 90/220. On 15 April 2003, the application was withdrawn.

7.997 The **European Communities** has indicated that, after assessment at both national and European Community level, the notification was withdrawn by the applicant on 15 April 2003. The applicant gave two reasons for the withdrawal: first, the absence of a market for these products; and second, the fact that the company preferred not to be associated with GMOs any longer.

7.998 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in it reasons for withdrawal. Over time, as the delays mounted and new products were developed, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.999 The **Panel** notes that a draft of a favourable opinion prepared for submission to the European Commission was provided to the applicant for comments on 8 July 1996.[977] Six months later, in January 1997, the applicant submitted a letter requesting that the application not be forwarded to the Commission until there was greater clarity regarding the authorization of Transgenic red-hearted chicory (EC-77).[978]

7.1000 More than two years later, on 25 March 1999, the Dutch advisory body for feed safety, the RIKILT, submitted an assessment report to the Dutch CA. Contrary to the description of this report given by the European Communities, the RIKILT did not request additional information. Rather, the RIKILT stated that given the conclusions of the Provisional Committee For Safety Evaluation of Novel Foods and/or the SCP, there were no indications that occasional use of the modified green-hearted chicory as feed would not be safe. The report did indicate that by current EU standards the data provided on the composition of the modified green-hearted chicory was insufficient to comment on its comparability with non-modified green-hearted chicory. It went on to state, however, that as green-hearted chicory was not a normal ingredient of feed, and in light of the opinion of the Provisional Committee on the Safety of Novel Foods regarding its safety for human consumption,

[977] Exhibit EC-110/At. 4.
[978] Exhibit EC-110/At. 5.

there was no indication that the product would not be safe for both animals and consumers of animal products if occasionally used as feed.[979]

7.1001 On 19 May 1999, the applicant voluntarily provided some supplementary data on food safety aspects "in response to requests by different Member States" in the context of the discussion of the application concerning the same product submitted under Regulation 258/97. The application provided the information, although the application concerning Transgenic green-hearted chicory concerned feed use, not food use.[980] No information was provided to us regarding any further exchanges concerning this application after this date. The application was not re-submitted under Directive 2001/18 and formally withdrawn on 15 April 2003. The withdrawal letters submitted to us are in Dutch and no translation was provided.

7.1002 It is evident from the foregoing that the consideration of this application by the lead CA was not completed within the 90 days foreseen under Directive 90/220. Unfortunately, however, based on the information that was provided to us we are unable to ascertain to what extent any delays which occurred after May 1999, when the applicant voluntarily submitted further information, were attributable to the lead CA. As noted, the evidence seems to suggest that in July 1996, the application was deemed sufficient for the relevant scientific committees within the Netherlands to conclude that the Transgenic green-hearted chicory presented no risk to human or animal health or the environment. But in January 1997, the applicant requested that the application not be forwarded until there was greater clarity about the approval of Transgenic red-hearted chicory. From the evidence before us, it is not clear whether in May 1999, the lead CA was still waiting for the applicant to withdraw its holding request. If that was the case, the failure of the lead CA to complete its assessment after May 1999 and forward the application to the Commission would be the result of the applicant's own request.

7.1003 Even assuming, however, that the lead CA was waiting for the applicant to give it the go-ahead, this would not demonstrate that no moratorium on final approvals was in effect during the relevant time period. As of October 2002, when Directive 90/220 was repealed, the application concerning Transgenic green-hearted chicory had not reached the Community level phase of the approval procedure under Directive 90/220. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.1004 In the light of the above considerations, we conclude that the failure by the Netherlands to complete its assessment of Transgenic green-hearted chicory prior to October 2002, when Directive 90/220 was repealed, is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

Member State failure to give consent to placing on the market

7.1005 In support of their assertion that the European Communities applied a general moratorium on approvals the United States and Canada have pointed to approval procedures in which the member State to which the application was submitted – the lead CA – failed to give its written consent to the placing on the market of a biotech product, after that biotech product had been approved by Commission decision. We consider these approval procedures below, recalling that Article 13(4) provides in relevant part that "[w]here the Commission has taken a favourable decision, the competent authority that received the original notification shall give consent in writing to the notification so that

[979] Exhibit EC-110/At. 7.
[980] Exhibit EC-110/At. 8.

the product may be placed on the market". Article 13(5) further provides that "[o]nce a product has received a written consent, it may be used without further notification throughout the Community in so far as the specific conditions of use and the environments and/or geographical areas stipulated in these conditions are strictly adhered to".

MS1/RF1 oilseed rape (EC-89)

MS1/RF2 oilseed rape (EC-90)

7.1006 The applications for both MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were submitted to France (lead CA) in April 1995 for cultivation, import and marketing. After consideration by the lead CA and subsequently at Community level, these applications were approved by the Commission on 6 June 1997.[981]

7.1007 The **United States** argues that numerous applications that were blocked under Directive 90/220 were not resubmitted under Directive 2001/18, including MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape. These applications languished at the final stage of the process for more than five years because the lead CA withheld its final approval.[982] Both applications were submitted to France in April 1995, which forwarded them with favourable opinions to the European Commission on 27 July 1995. The Commission reviewed the applications and found "no reason to believe that there will be any adverse effect on human health and the environment" from placing MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape on the market.[983] Accordingly, the Commission approved both products on 6 June 1997,[984] consistent with the favourable opinion of the Regulatory Committee.[985] Despite the favourable decision of the Commission, France refused to complete the process by giving its final consent so that MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape could be placed on the market.[986]

7.1008 **Canada** argues that MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape have been affected by the moratorium, as these products have been prevented from receiving the approval necessary for the product to be legally marketed in the European Communities. Canada submits that although these products were approved prior to October 1998, these products are the victims of the moratorium after October 1998 as much as any products.

7.1009 Canada notes that the EC decisions approving the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape in July 1997 stated that "consent shall be given by the competent authority of France to the placing on the market" of the products in question[987], on the basis, in part, that there was no reason to believe that there would be any adverse effects on human health and the environment. However, the lead CA failed to give its consent for either product contrary to this stipulation and Article 13(4) of Directive 90/220 and despite the fact that the same competent authority originally provided a favourable opinion.

[986] Questions and Answers on the Regulation of GMOs in the EU, at Annex 1 (Exhibit US-107).

[987] Canada refers to Article 1(1) of each Commission Decision, respectively.

7.1010 Canada further notes that on 7 July 1999, the Commission sent a "reasoned opinion" to France in relation to the withholding of consent for these products. This procedural step necessarily precedes any legal proceedings by the Commission against a member State for infringement of EC law before the European Court of Justice.[988] However, the Commission did not pursue this matter any further; it did not bring an infringement procedure. Although Canada requested additional information from the European Communities during consultations, the European Communities has yet to provide any additional information on what steps were actually taken. Furthermore, in a judgment dated 4 November 2000, the French Conseil d'Etat, following the decision of an earlier European Court of Justice ruling in relation to Article 13(4) of Directive 90/220, concluded that without new information concerning the risks associated with MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, the French Ministry could not call into question the decision taken by the Commission.[989]

7.1011 Canada argues that despite the Commission's decisions to place both products on the market over 6 years ago (and the completion of the most recent favourable risk assessment by an EC scientific body on a closely related use of the same product at least 5 years ago), France has continued to withhold consent to the placement of these products on the market. Accordingly, the applicant has been unable to place either plant variety on the EU market.[990]

7.1012 The **European Communities** argues that from a legal point of view, the absence of the final consent does not mean that the applicant is not entitled to place MS1/RF1 oilseed rape (EC-89) and/or MS1/RF2 oilseed rape on the market. These products have obtained marketing approval by virtue of Commission decisions of 6 June 1997. While those decisions were addressed to France and placed an obligation upon France to grant final consent, they could nevertheless develop a direct effect *vis-à-vis* the applicant as well.

7.1013 According to the European Communities, in the case law of the European Court of Justice, EC member States cannot prevail themselves of the fact that they have not implemented (or refuse to implement) Community obligations addressed to them in order to deny an individual a right granted through those same Community provisions.[991] The individual, therefore, can assert this right by directly relying on the Community law in question. These principles form the so-called doctrine of "direct effect." The Court has based this doctrine on a teleological interpretation of Community law, and in particular, on the so-called "effet utile" principle.

7.1014 The European Communities confirms that the Commission initiated infringement proceedings against France in 1998, however it decided not to take the case to the Court. This was because the very legislation on the basis of which the approval had been granted had been identified to be insufficient and was being revised. Furthermore, France had raised the same environmental risk

[989] European Communities, Commission, Eighteenth Annual Report on Monitoring the Application of Community Law (2000), COM (2001) 309 final, Brussels, 16 July 2001 (Sector on Chemicals and Biotechnology), p. 67 (Exhibit CDA-50); *see also*, European Court of Justice, *Association Greenpeace France v. Ministère de l'Agriculture et de la Pêche*, C-6/99, [2000] E.C.R. I-01651 (Exhibit CDA-51).

[990] Canada notes that the processed oil from canola/oilseed rape hybrid MS1/RF1 was approved for placing on the market pursuant to the simplified procedures of Article 5 of Regulation 258/97 as of 24 June 1997 (*see* the summary of Article 5 applications received in 1997, product number 2, contained in Exhibit CDA-25). The application was submitted to the Commission by the United Kingdom following a scientific assessment conducted by its Advisory Committee on Novel Foods and Processes.

[991] *See only* European Court of Justice, Leberpfennig, C-9/70 [1970] ECR 825.

concerns regarding these two products as it had for the products for which it subsequently adopted safeguard measures (*i.e*. the identical product MS1/RF1 oilseed rape which had been approved for breeding activities in 1996).

7.1015 The approvals of MS1/RF1 and MS1/RF2 oilseed rape for import, processing and cultivation in 1996 and 1997 did not provide for any reporting or monitoring of marketing in the European Communities. Accordingly, the European Communities claims it is unable to say whether these products have been sold in the European Communities. According to the European Communities, no oilseed rape varieties derived from MS1/RF1 or MS1/RF2 oilseed rape have been registered in member States' national catalogues or in the Common Catalogue of varieties of agricultural plant species – which is a prerequisite for allowing their commercial cultivation – because there has been no application from companies to do so.

7.1016 The **United States** maintains that under Directive 90/220, the "Community level" approval is not effective unless and until the member State that initially received the application takes the final step of placing the product on the market. In this case, the lead CA never allowed the product to be placed on the market. Thus, these products in fact were never approved for cultivation, import, and marketing in the European Communities. This is an example of how in certain circumstances a single member State can block a product approval, and is furthermore an example of the existence of the general moratorium. Neither of these products is in fact on the market in the European Communities and EC Customs officials would not admit either of these products without the final step (the French consent) in the approval process. The European Communities has failed to explain how a product can be considered approved if additional legal proceedings are required to allow the product to be placed on the market.

7.1017 **Canada** argues that one cannot reasonably conclude that an approval procedure has been brought to an end if an applicant must undergo potentially expensive and time-consuming litigation to enforce its rights.

7.1018 The **Panel** notes that although the two applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were formally approved by the Commission for placing on the market in June 1997, the lead CA subsequently failed to take the final step of the approval procedure provided for in Article 13(4) of Directive 90/220, which is to grant written consent to the placing on the market of a product. The relevant Commission decisions, which are addressed to the member States, also provide in their Article 1(1) that "consent shall be given by the competent authority of France to the placing on the market" of the oilseed rape products in question.[992]

7.1019 Neither Article 13(4) of Directive 90/220 nor the relevant Commission decisions lay down specific time periods within which the lead CA had to give consent. However, it is clear to us that this does not mean that the lead CA could take any amount of time to complete the step required of it. If it were otherwise, the deadlines stipulated in Directive 90/220 for the completion of other steps of the approval procedure, such as the 90-day member State assessment period set out in Article 12, the 60-day objection period set out in Article 13 and the three-month action period set out in Article 21, could easily be nullified and rendered meaningless. We recall that in the case of the two applications at issue, the approval for both applications was given by the Commission on 6 June 1997. As of October 2002, when Directive 90/220 was repealed, France had not granted its consent to the placing

[992] Exhibits US-43 and -44; CDA-48 and -49.

on the market of the products at issue. Thus, France did not grant its consent for more than five years.[993]

7.1020 The European Communities has suggested that France's inaction after June 1997 was due to concerns about environmental risks, and that these same risks led France in November 1998 to adopt a safeguard measure on MS1/RF1 oilseed rape (EC-161). The application concerning MS1/RF1 oilseed rape (EC-161) had been submitted to the United Kingdom and was approved for breeding activities in 1996. In considering this assertion, we note that we have been provided very little information on the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape. In particular, we have seen no evidence which points to the alleged environmental concerns by France. To the contrary, the Commission decisions approving the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape make clear that France forwarded the application to the Commission with a favourable opinion.

7.1021 Furthermore, there is no indication that France after June 1997 sought additional information from the applicant, or proposed to the applicant voluntarily to accept stricter conditions to meet France's alleged environmental concerns. Moreover, the Commission decisions approving the two products specify that Directive 90/220 provides for additional safeguards if new information on risks of the products in question became available. In the light of this, even if France considered that by June 1997 there were justifiable reasons for it to consider that the products in question constituted a risk to the environment, it could have taken a safeguard measure, as it did for MS1/RF1 oilseed rape (EC-161), *after* giving its written consent to the placing on the market of the two products in question.[994] The concerns underlying France's safeguard measure would then have been examined by the SCP, and a decision on the validity of France's concerns would then have had to be taken at Community level.

7.1022 For all these reasons, we are not persuaded that there were outstanding environmental issues which were specific to the products in question, and which France was trying to have the applicant address prior to giving its written consent to the placing on the market of these products.

7.1023 We recall that in June 1999 France was one of the Group of Five countries which declared that they would take steps to suspend further approvals under Directive 90/220 pending the adoption of new EC rules on labelling and traceability. As previously noted, the Complaining Parties argue that one of the steps which the Group of Five countries could take to prevent further approvals was to withhold written consent to the placing on the market of the product to be approved in cases where they were acting as the lead CA. We consider that France's conduct is consistent with the June 1999 declaration by the Group of Five countries. Indeed, despite a clear legal obligation to give written consent to the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, France withheld its consent and thus did what was within its power to prevent these products from being approved.

7.1024 Therefore, we consider that at least as from June 1999, France's failure to give its written consent supports the Complaining Parties' assertion that the European Communities was applying a

[993] We note, by way of example, that in the approval procedure concerning the Red-hearted chicory, which was also conducted under Directive 90/220, the lead CA gave its written consent two-and-a-half months after the Commission approved the application for breeding activities. Exhibit EC-77/At. 42.

[994] There is nothing in Directive 90/220 which says that a lead CA forwarding an application with a positive opinion and giving written consent to the placing on the market of a product may not subsequently take a safeguard measure in respect of that product.

general moratorium on final approvals. France's conduct is not inconsistent with the Complaining Parties' assertion that a general EC moratorium was in effect already as from October 1998. However, the fact that France withheld its consent already as from June 1997 could also support the view that although France, for its part, opposed further approvals and used its powers to prevent approvals, no general EC-wide moratorium was in effect in October 1998.

7.1025 We should note that there is uncertainty as to the status of the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape after the repeal of Directive 90/220. Article 35 of Directive 2001/18 provides that applications submitted under Directive 90/220 in respect of which the approval procedures under Directive 90/220 have not been completed by 17 October 2002 are subject to Directive 2001/18. It further provides that by 17 January 2003 applicants had to complement their applications in accordance with Directive 2001/18. There is no indication that the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were complemented in accordance with Directive 2001/18.

7.1026 The European Communities appears to argue, however, that the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were completed under Directive 90/220. The European Communities contends that in accordance with the jurisprudence of the European Court of Justice the absence of the final consent from the lead CA does not mean that the applicant is not legally entitled to place MS1/RF1 oilseed rape (EC-89) and/or MS1/RF2 oilseed rape on the market. According to the European Communities, the applicant could invoke before French courts the obligation imposed by the above-noted Commission decisions on France to give its consent to the placing on the market of the products in question. The United States and Canada did not contest that the applicant would have this right under EC law. In these circumstances, and in the absence of evidence to the contrary, we see no grounds for rejecting the European Communities' contention regarding the position under its own law.

7.1027 Accepting the European Communities' contention means that as of the date of establishment of this Panel, the above-noted Commission decisions were still legally binding, and that as of that date the applicant could still invoke the above-noted Commission decisions against France, since France had not given its written consent by then. This does not mean, however, that either before or after the repeal of Directive 90/220 France itself was no longer required to comply with the Commission decisions and was not obliged to grant its written consent. Therefore, the European Communities' contention does not detract from our view that at least as from June 1999 France's continued failure to give its written consent supports the Complaining Parties' assertion that the European Communities was applying a general moratorium on final approvals.

7.1028 In the light of the above considerations, we conclude that at least as from June 1999 the failure of France to give its written consent to the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape supports the contention of the Complaining Parties that the European Communities applied a general moratorium on approvals.

Delays due to changes in the legislative framework

7.1029 As we have noted at the outset, the European Communities acknowledges that delays occurred in some approval procedures which were pending under Directive 90/220. According to the European Communities, these delays occurred as a result of legislative changes which were being made at the time. Specifically, the European Communities refers to the revision of Directive 90/220 which led to the adoption of Directive 2001/18. The European Communities observes that while Directive 90/220 continued to be the basis for the processing of applications, pending applications presented a problem in that they did not generally contain the data/information necessary to address

the concerns which led to the adoption of Directive 2001/18. The European Communities says that it therefore had to find ways to ensure that the applicant provided the necessary data/information. The European Communities points out that most applicants agreed to do so on a voluntary basis. The European Communities submits that with the adoption and entry into force of the new legislation, all relevant concerns have been addressed. The European Communities asserts that, as a consequence, under Directive 2001/18 all approval procedures have been proceeding normally.

7.1030 Thus, the European Communities essentially argues that to the extent there were delays in the processing of Directive 90/220 applications, they were linked to legislative changes which were completed in October 2002 with the entry into force of Directive 2001/18. They were not linked to legislative changes sought by the Group of Five countries and obtained in September 2003 with the adoption of new EC rules on labelling and traceability. In support of this assertion, the European Communities submits that there were delays before the entry into force of Directive 2001/18, but not after.

7.1031 It is apparent from the above review of individual approval procedures that delays occurred which were linked to the adoption of Directive 2001/18 or to its more or less imminent entry into force. In our view, however, these delays are entirely consistent with the Complaining Parties' contention that a general moratorium on approvals was in effect until at least August 2003. We recall in this respect that in June 1999 the Group of Five countries declared that "pending the adoption of [new EC rules ensuring labelling and traceability of GMOs and GMO-derived products]"[995], they would take steps to have any new authorizations for growing and placing on the market suspended. By October 2002, when Directive 2001/18 entered into force, the new EC rules on labelling and traceability had not been adopted.[996] Thus, it is clear from the June 1999 declaration that the Group of Five countries would oppose approvals until the adoption of the new rules, that is to say, until after the entry into force of Directive 2001/18. We also recall the Complaining Parties' assertion that the Commission was instrumental in the adoption and application of the alleged general moratorium on approvals and that it decided not to discharge its responsibility under Directive 90/220 to complete approval procedures, in view of opposition to final approvals by the Group of Five countries. Accordingly, if a general moratorium on approvals was in effect until at least August 2003, it was to be expected that the Group of Five countries (acting as lead CA or through the Regulatory Committee/Council) and/or the Commission would cause delays prior to the repeal of Directive 90/220 so as to prevent applications from being approved while that Directive was still in force.

7.1032 The European Communities claims that after the entry into force of Directive 2001/18, there were no further delays, except for delays which were the result of a clock-stop while further information was awaited. However, as our preceding analysis has shown, there were in fact delays in the processing of applications under Directive 2001/18 which are consistent with the existence of a moratorium on approvals. Such delays occurred at the member State level in the approval procedures concerning Bt-531 cotton, RR-1445 cotton, BXN cotton and Bt-1507 maize (EC-74). Our analysis also showed that in a number of instances, applications moved to the Community level relatively promptly.[997] However, we have said that, in our view, this does not disprove the Complaining Parties' claim that a moratorium on approvals was in effect during the relevant time period. We observed that the lead CA in the relevant cases could have considered that while Directive 90/220 was still in force, the Group of Five countries and the Commission would prevent the final approval of the application

[995] Exhibits US-76 and -77; CDA-3; ARG-12.
[996] The Commission did not propose such rules until July 2001.
[997] *See, e.g.*, the approval procedures concerning RR oilseed rape (EC-70), Bt-1507 maize (EC-74), Bt-1507 maize (EC-75) and NK603 maize.

in question, whereas after the entry into force of Directive 2001/18, the application might eventually be approved, after the adoption of new EC rules on labelling and traceability. In other words, the lead CAs had reason to believe that under Directive 2001/18 any delays caused by them at member State level might have an impact on when the relevant applications would be approved.

7.1033 The European Communities' contention that there were and should have been no delays after the entry into force of Directive 2001/18 is also inconsistent with the June 1999 declaration by the Group of Five countries. As noted earlier, the Group of Five countries announced that they would take steps to prevent approvals pending the adoption of the new EC rules on labelling and traceability. Such rules were adopted in September 2003, *i.e.*, after the entry into force of Directive 2001/18. The record shows that Group of Five countries continued to oppose the approval of applications even though they had been updated in accordance with the requirements of Directive 2001/18.[998]

7.1034 Furthermore, we note that, as of August 2003, there had been no case where an approval procedure conducted under Directive 2001/18 reached the stage where the Commission had to submit a draft measure to the Regulatory Committee/Council or adopt a draft measure not adopted by the Council. In other words, there was no procedure which reached the stage where the Commission could have taken action to delay or prevent the final approval of an application. Moreover, the first Commission approval of an application under Directive 2001/18 occurred only in July 2004, that is to say, after the establishment of the Panel and after the entry into force of the new EC rules on labelling and traceability. Hence, as far as the Commission's conduct is concerned, the record does not disprove the Complaining Parties' claim that the Commission had decided not to complete approval procedures for as long as the new EC rules had not been adopted.

7.1035 In the light of the above considerations, we are not persuaded by the European Communities' contention that to the extent there were delays in the processing of applications for deliberate release into the environment, they were attributable in part to legislative changes which were completed in October 2002 with the entry into force of Directive 2001/18, but not to legislative changes sought by the Group of Five countries. We consider that the delays which occurred prior to the entry into force of Directive 2001/18 are entirely consistent with the contention of the Complaining Parties that the European Communities was applying a general moratorium on approvals at least until August 2003. We also consider that the record does not support the European Communities' assertion that under Directive 2001/18 there were no delays or at least none which are consistent with the existence of a moratorium on approvals.

(ii) Novel Foods – Applications submitted under Regulation 258/97

7.1036 The Panel now turns to address those of the relevant applications which were submitted and dealt with under the provisions of Regulation 258/97 concerning novel foods and novel food ingredients. From the information provided to us, it appears that all of the biotech products which were the subject of the relevant Regulation 258/97 applications had also been submitted for approval under Directive 90/220.[999] It is also noteworthy that all Regulation 258/97 applications were submitted after the corresponding Directive 90/220 applications.[1000] Furthermore, the two biotech food products which were approved by the Commission in 2004, Bt-11 sweet maize (food) and

[998] *See, e.g.*, the approval procedures concerning RR oilseed rape (EC-70) (Exhibit EC-70/At. 71) and NK603 maize (Exhibit EC-76/At. 46).

[999] In some cases, the Directive 90/220 and Regulation 258/97 applications were submitted to the same lead CA. In most cases, they were submitted to different lead CAs.

[1000] In some cases, the Regulation 258/97 applications were submitted a few days later, in other cases more than a year later.

NK603 maize (food), were approved after having been approved under Directive 90/220 (Bt-11 maize (EC-163)) and Directive 2001/18 (NK603 maize).

7.1037 Some of the approval procedures we address below are for applications covering foods or food ingredients which contain or consist of GMOs.[1001] It should be noted in this respect that according to Regulation 258/97 "risks to the environment may be associated with novel foods or food ingredients which contain or consist of [GMOs]".[1002] Article 9(1) of Regulation 258/97 therefore requires that applications concerning such foods or food ingredients be accompanied by the technical dossier supplying the relevant information required under Article 11 of Directive 90/220 and the environmental risk assessment based on this information or, where appropriate, the decision approving the placing on the market of the relevant product under Directive 90/220. Article 9(2) provides that the decision approving the placing on the market under Regulation 258/97 must "respect the environmental safety requirements laid down by [Directive 90/220] to ensure that all appropriate measures are taken to prevent the adverse effects on human health and the environment which might arise from the deliberate release of [GMOs]". It would seem to follow from Article 9 that if the applicant did not submit an environmental risk assessment, a Regulation 258/97 application could not be approved by the Commission unless the corresponding Directive 90/220 application had previously been approved.

7.1038 The Complaining Parties assert that the facts and histories of the relevant approval procedures support their view that the European Communities applied a general moratorium on final approvals of biotech products, including biotech food products. We recall in this respect that in June 1999 the Group of Five countries declared that "in exercising the powers vested in them regarding the growing and placing on the market of genetically modified organisms (GMOs)", "pending the adoption of [EC rules ensuring labelling and traceability of GMOs and GMO-derived products], in accordance with preventive and precautionary principles, they will take steps to have any new authorizations for growing and placing on the market suspended".[1003] This declaration was made in the context of the revision of Directive 90/220. However, by its terms, the declaration does not exclude from its scope GMOs which are directly used as foods or food ingredients, GMOs contained in foods or food ingredients, or GMOs from which foods or food ingredients are produced, but which do not contain the relevant GMOs.

7.1039 Furthermore, we note that the new EC rules on labelling and traceability of GMOs and GMO-derived products referred to in the June 1999 declaration by the Group of Five countries clearly include those which were adopted in September 2003 as Regulation 1830/2003. That Regulation, as its title makes clear, concerns "the traceability and labelling of [GMOs] and the traceability of *food and feed products produced from [GMOs]*" (emphasis added). The preamble to Regulation 1830/2003 notes that traceability requirements for food and feed produced from GMOs should be established to facilitate accurate labelling of such products in accordance with the requirements of Regulation 1829/2003 on genetically modified food and feed, which was also adopted in September 2003. In the light of this link between the two Regulations, and above all in view of the reference in the Group of Five declaration to new EC rules on "labelling [...] of GMOs and GMO-derived products", it is plausible that the Group of Five declaration was intended to cover also Regulation 1829/2003. That Regulation lays down additional labelling requirements for genetically modified food and feed. In particular, unlike Regulation 258/97, it requires labelling of GMO-derived

[1001] In some cases, from the information provided to us, we could not determine whether an application covered foods or food ingredients containing or consisting of GMOs.
[1002] Fifth preambular paragraph of Regulation 258/97.
[1003] Exhibits US-76 and -77; CDA-3; ARG-12.

food products also in cases where the DNA or protein of GM origin is not detectable in the final food products.

7.1040 In relation to Regulation 1829/2003, we should add that Canada and Argentina submitted to us a Council document which indicates that on the issue of "authorization of new GMO food products" Denmark, supported by France, Italy, Austria, Portugal and Luxembourg, in January 2003 pointed to "the conditions for further approval of [GMOs] since a political agreement had been reached at the Council on 28 November 2002 [...] on the proposal for a Regulation on [GM food and feed]". The document further states that "[s]ome of these delegations" considered that "no new procedure of authorization for placing on the market new GMOs should be granted as long as this Regulation had not yet entered into force".[1004] However, we cannot give much weight to this document as it is not clear what is meant by "the conditions for further approval", nor is it clear how many and which of these delegations were against further approvals pending the entry into force of the new Regulation 1829/2003 on GM food and feed.

7.1041 Finally, we note that if the Group of Five countries considered it appropriate, pending the adoption of new EC rules on labelling and traceability, to take steps to prevent the approval under Directives 90/220 or 2001/18 of biotech products which are for cultivation and/or feed use, it would be surprising if they did not oppose on the same grounds the approval under Regulation 258/97 of the identical products for food use, at least where those products contain or consist of GMOs. To recall, Regulation 258/97 indicates that environmental risks may also be associated with the food use of biotech products and requires that food products containing or consisting of GMOs satisfy the environmental safety requirements of Directives 90/220 and 2001/18. In fact, the record shows that Denmark and France have invoked the June 1999 declaration by the Group of Five countries in the context of approval procedures conducted under Regulation 258/97, when raising objections to favourable lead CA assessments of specific applications.[1005]

7.1042 With these observations in mind, we now turn to review the approval procedures conducted for the relevant Regulation 258/97 applications. As with our review of the procedures conducted for the Directive 90/220 applications, we will first focus on the Commission's conduct. Then, we consider the conduct of the SCF. Finally, we examine the conduct of individual member States acting as lead CAs.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.1043 In support of their assertion that the European Communities applied a general moratorium on approvals the Complaining Parties have pointed to a number of approval procedures in which the Commission failed to submit to the Regulatory Committee[1006] a draft measure on the relevant applications. We consider these approval procedures below, recalling that Article 13(3) of Regulation 258/97 provides in relevant part that "[t]he representative of the Commission shall submit to the Committee a draft of the measures to be taken".

[1004] Press Office of the Council, 2481st Council meeting – Agriculture and Fisheries, Brussels, 27 and 28 January 2003, p. 23 (Exhibit ARG-52). *See also* Exhibit CDA-118.

[1005] Exhibits EC-91/At. 32 (food containing or consisting of GMOs and food produced from, but not containing GMOs); EC-92/Ats. 23 and 27 (food containing or consisting of GMOs); EC-96/At. 27 (food containing or consisting of GMOs and food produced from, but not containing GMOs).

[1006] We recall that the Regulatory Committee established under Article 13 of Regulation 258/97 was the Standing Committee on Foodstuffs.

GA21 maize (food) (EC-91)

7.1044 The application for GA21 maize (food) was submitted to the Dutch CA (lead CA) on 24 July 1998. The initial assessment of the lead CA was provided to the Commission on 21 January 2000, and circulated by the Commission to member States on 18 February 2000. On 18 May 2000, the Commission requested the SCF to evaluate the application; the opinion of the SCF was issued on 27 February 2002. At the time the Panel was established, the Commission had not submitted a draft measure on the application to the Regulatory Committee.

7.1045 The **United States** argues that the Commission asked the SCF for an opinion on 18 May 2000. However, it was eleven months later that the SCF contacted the applicant for the first time, asking for additional information.[1007] Within less than one month, the applicant provided answers to all questions.[1008] It took a further 11 months for the SCF to issue an opinion on 27 February 2002.[1009] Hence the application was delayed for 17 months at the Community level before the SCF rendered its positive opinion on 27 February 2002. In its opinion, the SCF concluded that the data submitted, including the two whole food studies, were "sufficient for evaluation"[1010] and cited these studies in support of its ultimate conclusion that "from the point of view of consumer health, maize grain from maize line GA21 and derived products […] are as safe as grain and derived products from conventional maize lines."[1011]

7.1046 According to the United States, almost two months passed after the positive SCF opinion with no activity on this application. On 23 April 2002, the applicant offered to reduce the scope of the application to include only processed grain and derived ingredients, but not unprocessed grains, in order to enable the authorization procedure under Regulation 258/97 to proceed immediately.[1012] The applicant explained that the reason for this proposal was because the food use of unprocessed grains is also subject to Directive 90/220 and that "progress under this Directive has been suspended for some time, with the result that GA21 maize grain has not yet been considered for consent."[1013]

7.1047 The United States argues that despite the efforts of the applicant to remove any possible impediments, the Commission still failed to forward the application to the Regulatory Committee after the positive SCF opinion. Instead, as reflected in the minutes of a meeting on 5 June 2002 between the Commission and the applicant, the Commission noted that although the next step was to take a Community Decision, "[i]t is desirable that such a Decision would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and feed as well as the labelling of GM products".[1014] The United States maintains that the European Communities simply halted the processing of this application in anticipation of possible upcoming changes to its regulations, an action entirely consistent with the moratorium which the European Communities and member State officials had announced. Although both the new food and feed and traceability and labelling legislations would not enter into force until 2004, and although the applicant stated its preference to apply the labelling requirements currently in effect under Regulation 258/97, the Commission noted that "it is clear that it would be more difficult to obtain a favourable opinion by

[1007] Exhibit EC-91/At. 39.
[1008] Exhibit EC-91/At. 40.
[1009] The United States observes that the current revised regulatory framework recognizes that a period of six months is an achievable timeframe for the European Communities' scientific authority (EFSA GMO Panel) to come to an opinion. Regulation (EC) No. 1829/2003, Article 6.1.
[1010] Exhibit EC-91/At. 43, pp. 11-12.
[1011] Exhibit EC-91/At. 43.
[1012] Exhibit EC-91/At. 44.
[1013] Exhibit EC-91/At. 44.
[1014] Exhibit EC-91/At. 45, p. 1.

a majority of Member States in the Comitology procedure" if the applicant were not required to anticipate the new labelling requirements before the new legislation was adopted.[1015] In other words, the applicant was required to wait until the requirements for labelling under pending legislation were finalized. Thus the Commission failed to forward a draft measure to the Regulatory Committee as is required to complete the approval process, resulting in further delay that lasted until the new Food and Feed regulation was passed in September 2003.

7.1048 **Canada** notes that after GA21 maize received a favourable assessment by the lead CA, other member States raised objections. The SCF was then requested to conduct its own independent risk assessment and specifically "to focus its deliberations on the issues raised in the comments made by member States' authorities."[1016] The risk assessment, taking into consideration the objections raised by member States, concluded that the product in question was as safe as conventional maize. Specifically, the SCF concluded in February 2002:

> "Having reviewed all the information provided by the petitioner and in the light of current published scientific information it is concluded that from the point of view of consumer health maize grain from maize line GA21 and derived products that are the subject of this application are as safe as grain and derived products from conventional maize lines."[1017]

7.1049 Canada notes, however, that GA-21 maize is among those products where no decision has been taken despite having received a favourable opinion from the relevant scientific committee. Since 1998, the Regulatory Committee has not delivered a single favourable opinion in relation to the authorization of biotech products under Regulation 258/97. Canada rejects the European Communities' attempt to rationalize the "delay" in approving this product on the basis that legislative change was required to enable regulators to adopt "risk management". The risk assessment of GA21 maize under Regulation 258/97 did not identify any risks for which risk management measures would be justified. Therefore there is no justification for imposing "risk management" measures, be they labelling, post market monitoring or tools to facilitate the implementation and enforcement of such risk management measures (*e.g.* product tracing or detection). Canada maintains, rather, that the "delays" in approving GA21 maize under Regulation 258/97 are a result of the moratorium on the approval of biotech products.

7.1050 **Argentina** argues that for GA21 maize (food), the risk assessment required by Regulation 258/97 has been completed. However, since 27 February 2002, the date on which the SCF expressed its favourable opinion, there has been no further progress in the approval process. Argentina indicates that the application was withdrawn in September 2003 because no progress had been made since 27 February 2002. This means that the process dragged on for a total of 5 years and 2 months since the initial submission of the application without a definitive response.

7.1051 The **European Communities** recalls that in May 2000, the Commission requested the opinion of the SCF. The SCF issued its opinion in February 2002, finding that the application did not contain sufficient information concerning substantial equivalence and toxicity testing, and requested additional information from the applicant.[1018]

[1015] Exhibit EC-91/At. 45, p. 2.
[1016] Exhibit CDA-35-J, p. 2; Exhibit CDA-35-K, p. 2; Exhibit CDA-35-M, p. 11.
[1017] Exhibit CDA-35-K, pp. 11-12; Exhibit EC-91/at.43.
[1018] Exhibit EC-91/At. 17.

7.1052 The European Communities notes the difference between risk assessment and risk management and argues that the former is the task of the scientific committees, while the latter is the function of the Regulatory Committee. Since the Regulatory Committee fulfils risk management functions, it has to take into account all relevant factors, including risk assessment *stricto sensu*. The European Communities argues that the draft measures forwarded by the Commission to the Regulatory Committee are therefore supported by scientific assessments, but also address other legitimate issues, including risk management issues, which are not addressed by a scientific committee.

7.1053 Specifically in relation to the application concerning GA21 maize (food), the European Communities submits that the SCF's opinion did not address sufficiently all relevant elements. The elements which determined the insufficiency of the SCF's opinion related to the issues of detection and validation methods, which were requirements to be included in the new legislation on "Food and Feed" and on whose importance the applicant agreed. More particularly, the European Communities notes that in view of the pending legislative proposal for "Food and Feed", in June 2002 the applicant committed on a voluntary basis to providing detection and validation methods for its product in collaboration with the Joint Research Centre of the Commission (hereafter the "JRC").

7.1054 The European Communities notes that agreement on the amount of data and material and the circumstances of their submission to the JRC took a considerable amount of time. All the necessary data were received in proper condition in mid-September 2003. The pre-validation study was initiated in October and was concluded after the applicant delivered the full data set at the end of November 2003. Some additional testing on the method and materials was carried out in early 2004. The collaborative study of method validation was launched in April 2004 and was expected to be finished by the end of June 2004.

7.1055 The **Panel** notes that the lead CA forwarded the application with its positive assessment to the Commission on 21 January 2000. After the circulation of this assessment report to all member States three weeks later, a number of member States submitted comments, requested further data, or raised objections within the 60-day period provided under Regulation 258/97. On 18 May 2000, the Commission requested the SCF to give an opinion regarding potential health concerns related to GA21 maize (food), and to focus specifically on the issues raised in the comments by member States.

7.1056 Shortly after the application was submitted to the SCF, the applicant provided responses to questions from two member States and submitted a revised labelling proposal; all of this possibly new information was, however, available by the end of August 2000. In April 2001, the SCF requested further information from the applicant. The applicant apparently provided the data requested by the SCF within two months. However, another eight months elapsed before the SCF issued its favourable opinion on 27 February 2002.

7.1057 On 23 April 2002, the applicant informed the Commission that it was no longer seeking to obtain approval to place on the market unprocessed GA21 maize grain for food use. The applicant explained that this food use would be subject to Directive 90/220[1019], and noted that the progress of the application concerning GA21 maize (EC-78) under Directive 90/220 had been suspended for some

[1019] Pursuant to Article 9 of Regulation 258/97, in the case of foods or food ingredients containing or consisting of GMOs, the approval decision to be taken must "respect the environmental safety requirements laid down by Directive 90/220 to ensure that all appropriate measures are taken to prevent the adverse effects on human health and the environment which might arise from the deliberate release of [GMOs]".

time. The applicant was hoping that this move would enable the application under Regulation 258/97 to proceed immediately.[1020]

7.1058 More than a month later, on 5 June 2002, the Commission services met with the applicant. The Commission in its report of the meeting states that "it would be desirable that a [draft measure on the application] would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and feed as well as the labelling of GM products".[1021]

7.1059 The report first addresses the issue of the labelling of foods and food ingredients derived from GA21 maize. It states that the applicant preferred to comply only with the labelling requirements set out in Article 8 of Regulation 258/97, which requires labelling only of foodstuffs where detectable traces of modified DNA or the resulting protein are present (*i.e.*, GM-maize oil was not required to be labelled). According to the report, the applicant believed that this was the scheme which would be in force at the time a decision would be made on this application, and would also avoid that GA21 maize would be treated differently from foods derived from other varieties of GM maize already on the EC market. The report notes that the applicant considered that if and when the labelling scheme was changed, those changes would automatically become obligatory for all authorized foodstuffs derived from any GM-maize variety. However, the Commission observed that it was clear that it would be more difficult to obtain a favourable opinion by a majority of member States if not all foods and food ingredients derived from GA21 maize had to be labelled, recognizing that anticipating the new labelling requirements (before the new legislation was adopted) would require re-consideration of the labelling of foods derived from GM maize already on the market. It was agreed that the Commission and the applicant would meet again to discuss the labelling issue once the European Parliament had debated the proposal for the new legislation in July 2002. There is nothing in the record to indicate that such a meeting took place in July 2002, or that the labelling issue was otherwise pursued further.

7.1060 The report of the meeting then goes on to address the issue of "[d]etection methods, traceability, reference materials [and] identification". The report indicates that the applicant "agreed to provide" the necessary information and materials to the JRC in a timely manner. There is nothing in the record which indicates that this "agreement" from the applicant was not voluntary. The report of the meeting indicates that there should be "no particular problem with respect to the validation. However, the availability of reference material has not been discussed."[1022] The report notes that a draft measure might be presented to the Regulatory Committee in November 2002, provided that a validated detection method was available by then.

7.1061 In September 2002, another meeting took place between the Commission and the applicant. The report of the meeting indicates that little progress had been made with regard to the validation of a detection method. This was because of a deadlock resulting from a request by the applicant that the method be kept confidential until the date of approval of the application. The report further notes that once a material transfer agreement was reached and a detection method and the necessary materials were available, the validation would take three months.[1023] Apparently, a material transfer agreement was finally signed in late February 2003, but a detection method was not provided until the end of March 2003.[1024] At the time of establishment of the Panel, the question of the validation of the detection method had not yet been resolved by the JRC, and so by August 2003 no draft measure had been forwarded to the Regulatory Committee.

[1023] Exhibit EC-91/At. 46.
[1024] Exhibit EC-91/At. 50.

7.1062 It is clear from the foregoing that after the SCF opinion was issued, the progress of the application was adversely affected by the fact that the Commission waited for more than three months before seeking voluntary commitments from the applicant. As well, the applicant agreed to provide additional information and materials so as to provide a basis for traceability, as envisaged in the new EC rules proposed by the Commission. This in turn resulted in further delays, due to the need for validation of a detection method.

7.1063 The Complaining Parties consider that the Commission's failure promptly to submit a draft measure to the Regulatory Committee, without seeking additional commitments from the applicant, reflects the adoption by the European Communities of a general moratorium, that is, a decision not to allow any application to proceed to final approval. We recall in this regard the June 1999 declaration by the Group of Five countries in which these countries stated that they would take steps to suspend approvals pending the adoption of new EC rules ensuring the labelling and traceability of GMOs and GMO-derived products. Thus, in April 2002, following the issuance of the SCF opinion, the Commission had reason to believe that the Group of Five countries would act as a "blocking minority" in the Regulatory Committee and the Council, and that the Commission would then have to adopt the draft measure submitted to the Regulatory Committee and Council, as required under Regulation 258/97. It is the Complaining Parties' contention, however, that the Commission decided not to discharge its responsibility under Regulation 258/97 to complete approval procedures, in view of opposition to final approvals by the Group of Five countries and that the Commission was therefore instrumental in the adoption and application of the alleged general moratorium.

7.1064 In considering the Complaining Parties' contention, we note, first of all, that the Commission could have forwarded a draft measure based on the requirements of Regulation 258/97 only. It did not do so. Instead, the Commission sought voluntary commitments from the applicant with regard to labelling and traceability. The commitments sought were based on legislative proposals for new EC rules on labelling and traceability. In relation to labelling, the Commission specifically pointed out that it would be difficult to obtain a majority without additional commitments. These elements suggest that the Commission wanted to prepare and forward a draft measure which could obtain qualified majority support in the Regulatory Committee or the Council. As pointed out earlier, however, in view of the June 1999 declaration by the Group of Five countries, the Commission had reason to believe that no qualified majority could be achieved before the new EC rules on labelling and traceability of GMOs and GMO-derived products were adopted.[1025] It should also be noted in this connection that the record contains no example of an approval procedure, whether it be one conducted under Directives 90/220 and 2001/18 or one conducted under Regulation 258/97, where the Commission adopted its own draft measure prior to the adoption of the new EC rules on labelling and traceability. For these reasons, we consider that the Commission's conduct in the approval procedure concerning GA21 maize (food) is consistent with the Complaining Parties' contention that at least until August 2003 the Commission followed a decision not to discharge its responsibility under Regulation 258/97 to prevent the Group of Five countries from blocking the approval of applications.

7.1065 In the light of the above considerations, we conclude that the Commission's failure to submit a draft measure concerning GA21 maize (food) to the Regulatory Committee prior to August 2003 is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

[1025] This view is supported by the fact that Denmark invoked the June 1999 declaration by the Group of Five countries in the approval procedures concerning GA21 maize (food), when raising objections to the lead CA's favourable assessment of the application. Exhibit EC-91/At. 32.

Bt-11 sweet maize (food) (EC-92)

7.1066 A request for the approval of products processed from Bt-11 sweet maize (food) was initially submitted to the Netherlands (lead CA) on 6 April 1998. An amendment submitted on 24 November 1998 extended the scope of the request to cover also the consumption of fresh Bt-11 sweet maize. The documentation for these two requests was joined in a single document, which was submitted to the Commission on 11 February 1999 in accordance with Regulation 258/97. On 12 May 2000, the lead CA forwarded its initial assessment report to the Commission who circulated it to all member States on 15 June 2000. The Commission requested the opinion of the SCF in December 2000; the SCF issued its opinion in April 2002. At the time the Panel was established, the Commission had not submitted a draft measure on the application to the Regulatory Committee.

7.1067 Subsequent to the establishment of the Panel, on 10 November 2003, the Regulatory Committee failed to vote on the draft measure submitted by the Commission. On 8 December 2003, the Regulatory Committee voted on the draft measure but failed to reach a qualified majority. On 24 April 2004, the Council failed to reach a qualified majority on the draft measure submitted by the Commission. On 19 May 2004, the Commission adopted its draft measure concerning Bt-11 sweet maize (food).

7.1068 The **United States** notes that Bt-11 sweet maize (food) application was for marketing the maize as a fresh vegetable or after processing, not for cultivation. Moreover, the maize line was derived from an already reviewed and approved version of Bt-11 field maize.[1026] On 10 February 1998, the SCF published an opinion in which it concluded that the use of seed carrying the Bt-11 event was as safe as the use of seed from conventional maize varieties.[1027]

7.1069 The United States argues that following the positive assessment of the SCF in April 2002, there were delays in the processing of this application. The United States notes that the European Communities attempts to justify delays in the processing of the Bt-11 sweet maize (food) application by claiming that "[b]etween October and early December 2003 [after the SCF positive opinion], three new risk assessment were issued by the Member States, all of which conflicted with the SCF opinion".[1028] These risk assessments were supposedly provided by Austria, Belgium and France. The United States maintains that the EC contention is unsupported by the record. No risk assessments were in its view submitted during that time period. According to the European Communities' own chronology, the only events that occurred between October to December 2003 were: the finalization of a method validation by the JRC on 2 October 2003;[1029] the applicant's agreement to making public the validation method on 20 October 2003[1030]; a meeting of the Standing Committee on the Food Chain and Animal Health on 10 November 2003;[1031] a comment from France on 27 November 2003;[1032] the vote at the Regulatory Committee on 8 December 2003 (which did not reach a qualified majority);[1033] and a 20 November 2003 letter from the applicant to the Commission releasing technical data.[1034] None of these documents contain any purported risk assessments conducted by

[1026] According to the United States, the key difference between sweet and field maize is that, irrespective of whether it is genetically modified or not, sweet maize has a higher amount of natural sugars.

[1033] Exhibit EC-92/At. 70.
[1034] Exhibit EC-92/At. 68.

France, Austria, or Belgium. At the 10 November 2003 meeting of the Standing Committee on the Food Chain and Animal Health,[1035] only a comment was provided by France, not a risk assessment.[1036] At the Regulatory Committee meeting on 8 December 2003, Austria[1037], Belgium[1038] and France[1039] submitted written declarations to their votes. But none of these was a risk assessment. Rather, when the Regulatory Committee failed to obtain a qualified majority in December 2003 it was because certain member States objected due to the proposed new traceability and labelling regulations (which did not become effective until April 2004).[1040]

7.1070 In May 2004, the novel food application for Bt-11 sweet maize was finally approved. The United States contends that the history of this application confirms the delays resulting from the moratorium, and its ultimate approval does not indicate that the moratorium has finally ended. Rather, in the view of the United States, the Bt-11 approval in May 2004 is entirely consistent with, and in fact supports, the existence of a general moratorium during the period covered within the Panel's terms of reference. Both the Commission and the Council have stated that the entry into force of the new traceability and labelling rules for biotech products might finally allow for the lifting of the moratorium. Those new rules went into effect on 19 April 2004. The United States considers that the fact that the Commission then approved the application concerning Bt-11 sweet maize (food) just one month later is not mere coincidence. To the contrary, this timing indicates that the EC approval system was held up not by any problems with particular applications, but by events outside the scope of its approval legislation. Moreover, the United States emphasizes that the Council itself acknowledged the existence of the "moratorium" – using this very word – in a statement concerning the scheduled approval of the application concerning Bt-11 sweet maize (food).[1041]

7.1071 **Canada** argues that Bt-11 sweet maize is one of six products whose approval was delayed for as long as five years, despite having received a favourable assessment from the lead CA, and, in the case of this product, having also received a positive assessment from the SCF. Canada notes that the Regulatory Committee held a vote on the application concerning Bt-11 sweet maize (food) on 8 December 2003, after the establishment of the Panel. However, the Regulatory Committee failed to obtain the qualified majority necessary for approval, despite having received a favourable opinion from the SCF.

7.1072 Canada further argues that it is unjustifiable to fail to approve products under Regulation 258/97 on the basis that the existing legislation does not provide for risk management

[1035] Exhibit EC-92/At. 67.

[1036] The French comment does not "evaluate the potential for adverse effects on human or animal health" posed by the sweet corn's different sugar metabolism from field corn. The comment is concerned with unintended effects, theoretical risks not identified by any of the existing protein toxicity or animal studies conducted. As the Commission stated in its Proposal for a Council Decision of 28 January 2004, "[t]he concerns raised in the opinion of the 'Agence française de sécurité sanitaire des aliments' (AFSSA) of 26 November 2003 do not bring any new scientific elements in addition to the initial assessment of sweet maize Bt-11 carried out by the competent authorities of the Netherlands". In fact, these concerns were also expressed in two AFSSA opinions of 21 July 2000 and 20 March 2001 and were duly considered by the SCF in its opinion of 17 April 2002, which confirmed the findings of the initial assessment that Bt-11 sweet maize is as safe for human food use as conventional maize. [1040] Exhibit EC-92/Ats. 67 (noting that "[f]inally, several Member States questioned the opportunity to proceed with the authorization of this product in anticipation of the coming into application of Regulation (EC) 1829/2003 and 1830/2003."), 71, 74, 75 and 76.

[1041] EC first written submission, para. 157.

measures, where the risk assessments for those products have not identified any risks that need to be managed. The SCF concluded in April 2002 that Bt-11 sweet maize (food) is as safe for human food use as its conventional counterparts.[1042]

7.1073 In relation to the Commission's decision of May 2004 to approve the placing on the market of Bt-11 sweet maize (food), Canada observes that the Commission has been forced to adopt a decision authorizing Bt-11 sweet maize (food) only after resort to the exceptional Regulatory Committee procedure. Despite favourable opinions of EFSA and despite the entry into force of the new legislative regime,[1043] member States voted against the Commission's proposal for the approval of the product in question at the Regulatory Committee stage. Moreover, the Council failed to act. Far from demonstrating that the moratorium has been lifted, the fact that approval is granted only at the last possible step is another indication of the existence of the moratorium.

7.1074 **Argentina** argues that although some products, including Bt-11 sweet maize (food), received positive scientific opinions under Regulation 258/97, approval of these products was nonetheless stalled, both before reaching the Regulatory Committee stage and within that stage.

7.1075 The **European Communities** notes that following the submission of this application to the Netherlands in 1999, the lead CA requested additional information relating mainly to the antibiotic resistance marker used (PAT protein) and to the toxicity studies done in relation to this protein. After the lead CA sent its initial assessment report to the Commission in May 2000, four member States raised objections and several more requested additional information, relating mainly to the above issues as well as to molecular characterization. The Commission requested an opinion of the SCF in December 2000. The SCF requested further data which the applicant only supplied in February 2002. The SCF issued its opinion in April 2002, stating that on the basis of the information supplied in the application and further material supplied by the applicant in response to queries raised by member States and in the light of the published literature, it was to be concluded that Bt-11 sweet maize (food) was as safe for human food use as its conventional counterparts.

7.1076 According to the European Communities, in view of the pending legislative proposal on "Food and Feed", the applicant, on a voluntary basis agreed to provide detection and validation methods for its product in collaboration with the JRC. The amount of data and material and the circumstances of their submission to the JRC were agreed upon in a planning meeting in October 2002. The first set of material sent at the beginning of 2003 was inadequate in terms of necessary amounts of information, and the method provided by the applicant performed very poorly in a pre-validation study. The applicant delivered a proper method and all the necessary materials only by July 2003. The JRC finalized the validation method in October 2003. Following the finalization of the validation method, the Commission prepared a proposal for a decision on a market authorization. The proposal did not obtain a qualified majority in the Regulatory Committee or in the Council and was adopted by the Commission on 19 May 2004.

7.1077 The European Communities argues that the history of the application concerning Bt-11 sweet maize (food) is an illustration of the fact that the approval process has been steadily proceeding over the past years. The marketing authorization of Bt-11 sweet maize (food) did not occur because of a sudden change in the European Communities' policy on GMOs, but as the result of a normal process of assessment, which has known no suspension and has been conducted taking into account the

[1042] Exhibit CDA-35-J, pp. 9-10.

[1043] Regulation 1829/2003 (GM food and feed) (Exhibit CDA-20) and Regulation 1830/2003 (traceability and labelling) (Exhibit CDA-30) entered into force on 18 April 2004.

reactions of the applicants, the constant evolution of the scientific and regulatory debate concerning GMOs and the entry into force of new legislation resulting from this debate.

7.1078 The **Panel** notes that the lead CA forwarded the application with its positive assessment to the Commission on 12 May 2000. After the circulation of this assessment report to all member States, a number of member States submitted comments, requested further data, or raised objections within the 60-day period provided under Regulation 258/97. On 13 December 2000, the Commission requested the SCF to give an opinion regarding potential health concerns related to Bt-11 sweet maize (food), and to focus specifically on the issues raised in the comments by member States. The SCF apparently considered the application for four months before requesting further information from the applicant on 15 April 2001. It appears that no response was forthcoming from the applicant, and on 12 November 2001 the SCF reminded the applicant that it was awaiting information requested in April. The applicant apparently replied that it expected to provide the requested data in January 2002. On 17 April 2002, the SCF issued its report with the conclusion that Bt-11 sweet maize (food) is as safe for human food use as its conventional counterparts.

7.1079 More than a month and a half later, on 5 June 2002, the Commission services met with the applicant. The Commission in its report of the meeting states that "it would be desirable that a [draft measure on the application] would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and feed as well as the labelling of GM products".[1044]

7.1080 The report of the meeting addresses the issue of "[d]etection methods, traceability, reference materials [and] identification". The report indicates that the applicant "agree[d] to provide" the necessary information and materials to the JRC in a timely manner.[1045] There is nothing in the record which indicates that this "agreement" from the applicant was not voluntary. The report notes that a draft measure might be presented to the Regulatory Committee in November 2002, provided that a validated detection method was available by then.

7.1081 Apparently, the applicant did not transfer any material until late January 2003. Following unsatisfactory results of the detection methods validation, and further provision of materials for the validation, in January 2003 the JRC indicated that it would provide a template protocol for the validation for use by the applicant.[1046] The JRC continued to find the results unacceptable, and in July 2003 the applicant accepted to use the method proposed by the JRC and submitted materials.[1047] The JRC finalized its method validation in October 2003.[1048] Thus, at the time of establishment of the Panel, the question of the validation of the detection method had not yet been resolved by the JRC, and so by August 2003 no draft measure had been forwarded to the Regulatory Committee.

7.1082 It is clear from the foregoing that after the SCF opinion was issued the progress of the application was adversely affected by the fact that the Commission waited for more than a month and a half before seeking voluntary commitments from the applicant. As well, the applicant agreed to provide additional information and materials so as to provide a basis for traceability, as envisaged in the new EC rules proposed by the Commission. This in turn resulted in further delays, due to the need for validation of a detection method.

[1044] Exhibit EC-92/At. 54.
[1045] *Ibid*.
[1046] Exhibit EC-92/Ats. 56 and 57.
[1047] Exhibit EC-92/Ats. 59 and 63.
[1048] Exhibit EC-92/At. 66.

7.1083 In its responses to questions by the Panel, the European Communities submits that another reason for the delay in the forwarding of a draft measure to the Regulatory Committee was the circumstance that between October and early December 2003 new risk assessments were issued by Austria, Belgium and France, all of which, according to the European Communities, conflicted with the SCF opinion. We note that this explanation concerns a period of time that post-dates the date of establishment of this Panel, and we will therefore not consider this explanation.

7.1084 The Complaining Parties consider that the fact that the Commission did not promptly submit a draft measure to the Regulatory Committee, without seeking additional commitments from the applicant, reflects the adoption by the European Communities of a general moratorium, that is, a decision not to allow any application to proceed to final approval. We recall in this regard the June 1999 declaration by the Group of Five countries in which these countries stated that they would take steps to suspend approvals pending the adoption of new EC rules ensuring the labelling and traceability of GMOs and GMO-derived products. Thus, in April 2002, following the issuance of the SCF opinion, the Commission had reason to believe that the Group of Five countries would act as a "blocking minority" in the Regulatory Committee and the Council, and that the Commission would then have to adopt the draft measure submitted to the Regulatory Committee and Council, as required under Regulation 258/97. It is the Complaining Parties' contention, however, that the Commission decided not to discharge its responsibility under Regulation 258/97 to complete approval procedures, in view of opposition to final approvals by the Group of Five countries and that the Commission was therefore instrumental in the adoption and application of the alleged general moratorium.

7.1085 In considering the Complaining Parties' contention, we note, first of all, that the Commission could have forwarded a draft measure based on the requirements of Regulation 258/97 only. It did not do so. Instead, the Commission sought voluntary commitments from the applicant. The commitments sought were based on legislative proposals for new EC rules on labelling and traceability of GMOs and GMO-derived products. These elements suggest that the Commission wanted to prepare and forward a draft measure which could obtain qualified majority support in the Regulatory Committee or in the Council. As pointed out earlier, however, in view of the June 1999 declaration by the Group of Five countries, the Commission had reason to believe that no qualified majority could be achieved before the new EC rules on labelling and traceability of GMOs and GMO-derived products were adopted.[1049] It should also be noted in this connection that the record contains no example of an approval procedure, whether it be one conducted under Directives 90/220 and 2001/18 or one conducted under Regulation 258/97, where the Commission adopted its own draft measure prior to the adoption of the new EC rules on labelling and traceability. We recall that in the case of the application concerning Bt-11 sweet maize (food), the Commission adopted its own draft measure only after the entry into force of the new EC rules. For these reasons, we consider that the Commission's conduct in the approval procedure concerning Bt-11 sweet maize (food) is consistent with the Complaining Parties' contention that at least until August 2003 the Commission followed a decision not to discharge its responsibility under Regulation 258/97 to prevent the Group of Five countries from blocking the approval of applications.

7.1086 We note the European Communities' argument that the approval of the application concerning Bt-11 sweet maize (food) did not occur because of a sudden change in the European Communities'

[1049] This view is supported by the fact that Denmark and France invoked the June 1999 declaration by the Group of Five countries in the approval procedures concerning Bt-11 sweet maize (food), when raising objections to the lead CA's favourable assessment of the application. Exhibit EC-92/Ats. 23 and 27. We also note that even after the adoption of the new EC rules in September 2003, neither the Regulatory Committee in its December 2003 vote nor the Council in its April 2004 vote achieved a qualified majority in favour of the application concerning Bt-11 sweet maize (food).

policy on GMOs, but as the result of a normal process of assessment, which steadily proceeded and knew no suspension. We recall that the Complaining Parties' contention is that the European Communities was applying a general moratorium on final approvals. Thus, "steady progress" of an application short of final approval is not inconsistent with the Complaining Parties' contention. As of August 2003, the application concerning Bt-11 sweet maize (food) had not yet been approved by the Commission. The application was only approved after the entry into force of the new EC rules on labelling and traceability in April 2004, and then only after every procedural step had been exhausted. Neither the Regulatory Committee nor the Council achieved a qualified majority in favour of the application.

7.1087 In the light of the above considerations, we conclude that the Commission's failure to submit a draft measure concerning Bt-11 sweet maize (food) to the Regulatory Committee prior to August 2003 is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

Transgenic tomato (food) (EC-100)

7.1088 The application concerning the Transgenic tomato (food) was initially submitted to the United Kingdom (lead CA) and to the Commission on 2 March 1998. The lead CA forwarded its initial assessment to the Commission on 4 June 1998, and this was circulated to all member States on 22 June 1998. On 23 December 1998, the SCF was requested to evaluate the application; the opinion of the SCF was given on 7 September 2000. The application was withdrawn by the applicant on 24 September 2001.

7.1089 The **United States** argues that after this application received a positive assessment from the SCF, the application was withdrawn because of the excessive delay in carrying out the approval process.

7.1090 The **European Communities** contends that after assessment at the national level, the request was withdrawn by the applicant. As the reason for its withdrawal, the applicant pointed to "commercial re-positioning" following a merger.

7.1091 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in it reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.1092 The **Panel** notes that the initial assessment by the lead CA was completed well within the 90-day time period established in Regulation 258/97. Following the circulation of the initial positive assessment to member States, a number of member States submitted comments and objections. On 23 December 1998, after further comments from other member States had been submitted, and responses provided by the applicant, the Commission requested an opinion of the SCF.

7.1093 On 23 September 1999, the SCF gave its opinion and concluded that from the human health point of view, processed tomato products derived from these tomatoes were as safe as products from conventional fruit.[1050] The next step in the procedure was for the Commission to prepare and submit a

[1050] Exhibit EC-100/At. 48.

draft measure on the application to the Regulatory Committee. However, there is no evidence of this step being completed during the eleven months following the SCF opinion.

7.1094 On 7 September 2000, the SCF issued another opinion on the application concerning the Transgenic tomato (food).[1051] Apparently, the Commission had requested this further opinion to obtain the SCF's comments on the relevance of particular studies undertaken in the United States on transgenic tomatoes for fresh consumption. This request was apparently prompted by a question to the Commission from a member of the European Parliament. The SCF concludes that these results have no relevance for the assessment of the safety of the processed tomato products which were to be approved in accordance with the application concerning the Transgenic tomato (food).

7.1095 Even after this second positive assessment by the SCF, the Commission did not forward a draft measure to the Regulatory Committee before the application was withdrawn by the applicant more than one year after the second positive opinion by the SCF. As noted by the European Communities, in the letter of withdrawal the applicant made reference to recent mergers and to its commercial re-positioning.[1052]

7.1096 It is clear from the foregoing that the application concerning the Transgenic tomato (food) did not progress because the Commission did not forward a draft measure to the Regulatory Committee. The SCF gave a favourable opinion of the application on two separate occasions, and no reasons for the lack of progress were provided to us.

7.1097 The United States considers that the Commission's failure, over a period of more than two years, to submit a draft measure to the Regulatory Committee reflects the adoption by the European Communities of a general moratorium on approvals, that is to say, of a decision not to allow any application to proceed to final approval. We recall in this regard the June 1999 declaration by the Group of Five countries in which these countries stated that they would take steps to prevent approvals pending the adoption of new EC rules ensuring the labelling and traceability of GMOs and GMO-derived products. Thus, in September 1999, following the issuance of the first SCF opinion, the Commission had reason to believe that the Group of Five countries would act as a "blocking minority" in the Regulatory Committee and the Council, and that the Commission would then have to adopt the draft measure submitted to the Regulatory Committee and Council, as required under Regulation 258/97. It is the United States' contention, however, that the Commission decided not to discharge its responsibility under Regulation 258/97 to complete approval procedures, in view of opposition to final approvals by the Group of Five countries and that the Commission was therefore instrumental in the adoption and application of the alleged general moratorium.

7.1098 We consider that the Commission's conduct in the approval procedure concerning the Transgenic tomato (food) is consistent with the contention that the Commission followed a decision not to discharge its responsibility under Regulation 258/97 to prevent the Group of Five countries from blocking the approval of applications. In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals at the time. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning the Transgenic tomato (food).

[1051] Exhibit EC-100/At. 49.
[1052] Exhibit EC-100/At. 50.

7.1099 In the light of the above considerations, we conclude that the Commission's failure to submit a draft measure concerning the Transgenic tomato (food) to the Regulatory Committee prior to the withdrawal of the application in September 2001 is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

Failure by the Scientific Committee on Food to complete its review

7.1100 In support of its assertion that the European Communities applied a general moratorium on approvals, the United States has pointed to two approval procedures in which it says the Scientific Committee for Food (SCF) which the Commission consulted with regard to these applications did not complete its review. We consider these approval procedures below, recalling that Article 11 of Regulation 258/97 provides that "[t]he Scientific Committee for Food shall be consulted on any matter failing within the scope of this Regulation likely to have an effect on public health".

Transgenic red-hearted chicory (food) (EC-97)

Transgenic green-hearted chicory (food) (EC-98)

7.1101 The applications concerning Transgenic red-hearted chicory (food) and Transgenic green-hearted chicory (food) for human consumption were initially submitted to the Netherlands (lead CA) in April 1998. The lead CA provided initial positive assessments for both products to the Commission on 23 April 1998, which was circulated to member States as drafts on 13 May 1998. On 27 October 1998, the Commission informed member States that the initial assessments were not draft texts, and that the lead CA was not undertaking any further assessment. A large number of member States submitted comments or objections on these applications, and on 29 April 1999 the Commission requested the SCF to give an opinion. The SCF considered both products at the same time in its evaluation. No opinion had been issued by the SCF at the time these applications were withdrawn on 27 May 2003.

7.1102 The **United States** argues that although these products received favourable initial assessments by the lead CA, as of May 2003, when the application for both was withdrawn, the products had been "under assessment" by the SCF for more than five years. The United States contends that these withdrawn applications are direct evidence of the existence of a general moratorium, and that the withdrawal evinces the applicant's frustration with the suspension of the EC approval process.

7.1103 The **European Communities** notes that after assessment of these products by the lead CA, the request was withdrawn by the applicant with the indication that the applicant preferred to no longer be associated with genetically modified products because of the negative response from the market.

7.1104 The **Panel** notes that the initial assessments by the lead CA were made within the 90-day period foreseen for this purpose under Regulation 258/97. Delays in the consideration of the applications for these two products occurred primarily in the course of the evaluation by the SCF. For example, more than four months went by after the SCF received the request by the Commission to evaluate these products before the SCF requested better quality images of certain analytical results from the applicant. The information provided does not indicate when or if the applicant provided the requested data, but only that, two months later, the SCF requested additional information, and after a 7-month delay, the SCF requested that the applicant provide studies covering two growing seasons and at least six locations. The applicant apparently instead offered to provide data from previous growing seasons, which the SCF indicated might be acceptable.

7.1105 In a communication to the SCF of 14 November 2000, the applicant expressed very apparent frustration with the progress of evaluation of these two products.[1053] The applicant noted that much information had been provided to permit the determination of substantial equivalence between the transgenic chicory and conventional chicory, and expressed the view that "it does not make sense to continue year after year with experiments without having any indication that there is no substantial equivalence".[1054] The applicant also expressed concern that since the SCF had not indicated whether it would accept the new experiments as proposed by the applicant, "this might be a new reason for the SCF to ask the company to do new experiments after the proposed experiments have been finished".[1055] The alternative suggested by the SCF would require the applicant to apply for additional field trials in several countries, and the applicant indicated that it would take at least one year to get permission from all competent authorities. The total process would thus take at least three additional years, and the applicant indicated that this would have negative financial implications. The applicant indicated that it had reached the conclusion that the applications for the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food) were a kind of "never ending story", and that "the procedure, time energy and costs are disproportionate compared to conventional breeding programs. This may lead to the conclusion that development and marketing of transgenic vegetable crops in the European Union do not have any opportunity."[1056] The applicant nevertheless provided additional information from various years of field introductions to substantiate its claims of substantial equivalence, and requested that the SCF extract its conclusions and take decisions based on the information now available to it.

7.1106 Five months after the November 2000 communication from the applicant, the SCF informed the applicant that it would accept the data provided regarding field studies, and requested additional information regarding nutritional composition.[1057] The applicant indicated, in response, that it had not yet decided whether to execute additional experiments. It expressed concern that the question regarding antibiotic resistance markers would need to be resolved before new experiments were started, and requested clarification regarding whether products containing antibiotic resistance markers would be permitted to enter the EC market after the entry into force of Directive 2001/18.[1058] In a response dated 24 July 2001, the Commission indicated that the provisions of Directive 2001/18 did not include a general legal ban on antibiotic resistance marker genes as such but linked their phasing out to certain qualifiers. The Commission also indicated that consideration of the applications for the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food) was suspended until the requested information on nutritional composition had been provided.[1059] The record does not include any further response from the applicant until the formal withdrawal of the applications on 27 May 2003.[1060] However, the European Communities asserts that the SCF was requested as early as 24 September 2001 to suspend its consideration of the applications concerned.

7.1107 We sought the views of the experts advising us regarding the necessity of the information requested by the SCF on substantial equivalence, molecular characterization and antibiotic resistance marker genes to ensure that the safety assessment was valid.[1061] The only expert who provided a

[1060] Exhibits EC-97/At. 32 and EC-98/At. 42.
[1061] Annex H, Question 55 and 56.

response to this question, Dr. Nutti, considered that the information requested regarding the establishment of substantial equivalence was necessary, and that the information requested on nutritional composition was also required.[1062]

7.1108 The United States considers that the SCF's failure, for more than two years, to complete its assessment of the applications in question reflects the adoption by the European Communities of a general moratorium, that is, a decision not to allow any application to proceed to final approval. We note that the United States does not assert that the SCF was an active participant in the alleged moratorium on approvals and that the time taken by the SCF for its assessment is a reflection of the SCF's support for the moratorium. We understand the United States to argue instead that the alleged general moratorium on approvals affected the manner in which, and the speed with which, the SCF conducted its assessments of the applications in question.

7.1109 It is reasonable to assume that the SCF was aware of the June 1999 declaration by the Group of Five countries, and thus of their declared intention to act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability.[1063] In our view, it can further be assumed that the SCF was aware of the failure by the Commission in the approval procedure concerning the Transgenic tomato (food) to submit a draft measure to the Regulatory Committee following the two positive SCF opinions. Against this background, it is conceivable that the SCF could have been requesting more information than it would otherwise have requested, notwithstanding the fact that such requests could be expected to result in delays.

7.1110 The November 2000 communication from the applicant, referring to a "never ending story", clearly documents the applicant's frustration with the long delays and repeated requests for information. This communication is therefore consistent with the possibility that the progress of the SCF's assessment was affected by the alleged general moratorium on approvals. In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals at the time. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the applications concerning the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food).

7.1111 On the other hand, the record shows that in other approval procedures, and during the relevant time period, the SCF completed its assessment of applications within a shorter timeframe.[1064] Furthermore, we recall the advice of Dr. Nutti that the information requested by the SCF may be considered necessary to ensure that the conclusions of the safety assessment of the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food) were valid. However, even if it is accepted that the time taken by the SCF may be explained by the need for valid conclusions, this would not contradict the United States' assertion that the European Communities applied a general moratorium on approvals. In June 1999, the Group of Five countries indicated that they would act as a "blocking minority" in the Regulatory Committee and in the Council, and we recall that in the approval procedure concerning the Transgenic tomato (food), the Commission failed to discharge its

[1062] Annex H, paras. 759-760.
[1063] We recall that the Commission made a proposal for such rules in July 2001.
[1064] *See*, *e.g*, the approval procedure concerning Bt-11 sweet maize (food), where an SCF opinion was requested in December 2000 and provided in April 2002. During that period, the clock was stopped for several months. Exhibit EC-92/Ats. 47-53.

responsibility inasmuch as it did not submit a draft measure to the Regulatory Committee. These acts and omissions affect and concern stages of the approval procedure subsequent to the SCF's involvement. The applications concerning the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food) had not reached these stages as of September 2001, when the SCF was apparently requested to suspend its work.

7.1112 In the light of the above considerations, we conclude that the failure of the SCF to complete its assessment of the applications concerning the Transgenic red-hearted chicory (food) and the Transgenic green-hearted chicory (food) prior to September 2001, when the SCF was apparently requested by the applicant to suspend its work, is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

Delays at member State level

7.1113 In support of their assertion that the European Communities applied a general moratorium on approvals the Complaining Parties have pointed to a number of approval procedures in which they say the member State to which the application was submitted – the lead CA – either did not complete its assessment of the relevant application or completed it with considerable delay. We consider these approval procedures below, recalling that Article 6(3) of Regulation 258/97 provides that "[t]he initial assessment report [by the lead CA] shall be drawn up within a period of three months from receipt of [the application]". Article 6(4) further provides that the lead CA "shall without delay forward the [initial assessment report] to the Commission, which shall forward it to the other Member States."

GA21 maize (food) (EC-91)

7.1114 The application for GA21 maize (food) was submitted to the Netherlands CA (lead CA) on 24 July 1998. The initial assessment of the lead CA was provided to the Commission on 21 January 2000, and circulated to member States on 18 February 2000. At the time the Panel was established, the Commission had not submitted a draft measure on the application to the Regulatory Committee.

7.1115 The **United States** argues that the application for GA21 maize (food) under Regulation 257/98 was delayed at the member State level for 18 months while the lead CA completed its risk assessment. The lead CA requested the applicant to perform a further study on compositional analysis. The request was made on 24 February 1999, and the applicant provided its response by 26 October 1999.[1065] Thus, the total time between the first submission, 24 July 1998, and the lead CA's opinion, 17 January 2000, was 18 months. Of those 18 months, 8 were used by the applicant to answer questions.

7.1116 **Canada** argues that the total time taken by the lead CA for its review was 18 months, and that only 8 of the 18 months were taken by the applicant to respond to questions. The difference of 10 months exceeds the 3-month period provided for in Regulation 258/97.

7.1117 The **European Communities** argues that this application was pending at the member State level for about a year and a half due to requests by the lead CA for completion of the dossier and for additional scientific data. The United States ignores the fact that the 18 months spent at member State level were due to the incompleteness of the dossier initially submitted by the applicant and to the need for additional scientific data.[1066]

[1065] Exhibit EC-91/Ats. 11 and 14.
[1066] The European Communities refers to Exhibit EC-91/Ats. 1-6.

7.1118 The **Panel** notes from the record that this application was submitted to the Netherlands in July 1998. A month and a half later, the applicant was apparently requested to complete the dossier. The applicant seems to have provided the missing information in December 1998, although some references were provided only in January 1999. In February 1999, the Dutch Health Council put forward its first substantive request for information. The applicant provided the requested information in March 1999. In June 1999, the Health Council informed the applicant that it needed more data than that provided by the applicant in March. The applicant provided the data in October 1999. The Health Council completed its assessment in December 1999, and the Dutch CA forwarded its initial assessment report in January 2000.

7.1119 We note that the record for this approval procedure is incomplete, but it appears that the Dutch CA did not have a reasonably complete file until December 1998. We also note, however, that the Dutch CA then waited for almost three months before forwarding an initial request for information. After receiving the requested information, the Dutch CA again waited for almost three months before making a follow-up request for more data. Finally, after obtaining the necessary data, the lead CA spent another period of almost three months finalizing its assessment. It is clear, therefore, that the lead CA exceeded the three-month period foreseen in Regulation 258/97 for an initial assessment.

7.1120 The United States and Canada do not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, their assertion is that the time taken by the Netherlands reflects the impact of the alleged moratorium. According to the United States and Canada, the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

7.1121 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission might not complete the approval procedure in the face of systematic opposition by the Group of Five countries. We note, however, that the lead CA's initial request for additional information and its follow-up request for more data were made in February and early June 1999, respectively, and thus pre-date the June 1999 declaration of the Group of Five countries. On the other hand, it was after the June 1999 declaration that the lead CA spent an additional three months finalizing its initial assessment report.

7.1122 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that the Dutch CA could not forward its June 1999 follow-up request for more data sooner than it did even while following a precautionary approach, or that after receiving the applicant's response it could not finalize its initial assessment earlier than in January 2000.

7.1123 It is pertinent to note in this regard that the applicant had submitted two other applications concerning the same product under Directive 90/220, one to the United Kingdom (GA21 maize (EC-85)) and one to Spain (GA21 maize (EC-78)). By the time the Dutch CA was finalizing its assessment report, the two Directive 90/220 applications were under assessment at Community level. As we have noted, following the June 1999 declaration by the Group of Five countries, the Dutch CA in our view had reason to believe that at Community level the Group of Five countries and/or the Commission could take action to delay or prevent the final approval of these applications. Since a

special environmental safety assessment was necessary for the application concerning GA21 maize (food) to be approved under Regulation 258/97[1067], we think it could also be that the time taken by the Dutch CA before forwarding its initial assessment report in January 2000 reflects a view on the part of the Dutch CA that the Directive 90/220 applications concerning GA21 maize would be delayed at Community level.

7.1124 In the light of the above considerations, we conclude that the time taken by the Netherlands for its initial assessment of the application concerning GA21 maize (food), and in particular the time taken by the lead CA as from October 1999 to finalize its initial assessment report, is consistent with the contention of the Complaining Parties that during the relevant time period the European Communities applied a general moratorium on final approvals.

LL soybeans (food) (EC-93)

7.1125 The application concerning LL soybeans (food) was submitted to Belgium on 30 November 1998. The application was sent to the Commission on 2 February 1999. At the time of establishment of the Panel, the lead CA had not completed its assessment of the application. In July 2004, the applicant withdrew the application.

7.1126 The **United States** submits that Belgium refused to forward the application for LL soybeans (food) for consideration at the Community level.

7.1127 **Argentina** argues that there was an overall delay of 5 years and 8 months since the application was submitted.

7.1128 The **European Communities** notes that the application for LL soybean (food) was with the Belgian CA only as of February 1999. The Commission gave notice of the Belgian application to all other member States in March 1999. In April 1999, the Belgium Biosafety Council requested additional information from the applicant in order to proceed with the initial assessment. The request touched upon the issues of substantial equivalence and presence of transgenic PAT DNA and PAT protein.[1068] The applicant did not fully respond to this request for additional information. Greece (June 1999) and Italy (July 1999) also asked for additional information on various points such as nutritional and biochemical characterization and toxicity of the transgenic plant, but did not receive any answer.[1069] In April 2004, the lead CA reminded the applicant to respond to the requests for additional information so that it would be able to finalize the pending assessment report.

7.1129 The European Communities submits that the Complaining Parties choose to ignore the fact that the applicant failed to provide the additional information that was requested by the lead CA in April 1999, and by Greece and Italy in June and July 1999. According to the European Communities, all three requests for additional information remained mostly unanswered. The European Communities points out that on 6 July 2004, the applicant withdrew its application.

7.1130 The **Panel** notes that contrary to what the European Communities asserts, the application concerning LL soybeans (food) was with the Belgian CA as of early December 1998, and not only as

[1067] We note that the application concerning GA21 maize (food) as submitted to the Dutch CA *inter alia* concerned foods or food ingredients containing or consisting of GMOs and as such would appear to be subject to the provisions of Article 9 of Regulation 258/97. To recall, Article 9 requires that approval decisions concerning foods or food ingredients containing or consisting of GMOs must respect the environmental safety requirements laid down in Directive 90/220.

[1068] Exhibit EC-93/At. 11.

[1069] Exhibit EC-93/Ats. 16 and 17.

of February 1999.[1070] On 8 December 1998, the Belgian General Food Inspectorate requested the Belgian Biosafety Council to prepare a first evaluation report within 90 days of referral of the file.

7.1131 The record indicates that the Biosafety Council met on the application on 17 December 1998. At that meeting, concerns were raised that while the application focused on animal nutrition, a number of tests concerning possible human consumption impacts were absent. The applicant apparently gave a written undertaking to address these concerns relating to substantial equivalence following instructions from a Belgian expert.[1071]

7.1132 In March 1999, the Commission circulated the application for information to all member States. The chronology provided by the European Communities indicates that Denmark requested further information from the applicant at that time, however this correspondence was not provided to us.

7.1133 Towards the end of April 1999, the Belgian Biosafety Council responded to a query from the Belgian General Food Inspectorate. The letter notes that the applicant had still not addressed the Biosafety Council's concerns relating to substantial equivalence. The letter further states that the applicant needed to provide additional information regarding the implementation of labelling and, more specifically, the presence of PAT DNA and PAT protein in derived soya products.[1072] The letter of the Biosafety Council concludes by saying that due to the absence of data and information on substantial equivalence and the presence of transgenic PAT DNA and PAT protein it was not possible for the Biosafety Council to issue a final evaluation report with regard to the application concerning LL soybeans (food). We asked the experts advising us whether information regarding substantial equivalence and the presence of transgenic PAT DNA and PAT protein was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti responded that these requests were valid.[1073]

7.1134 In May 1999, the lead CA sent a reminder to the applicant informing it that it had yet to reply to the two requests for additional information from April 1999.[1074] The lead CA also informed the Commission that the deadline for evaluation of this application would not be met due to the lack of response from the applicant to the aforementioned two requests for additional information.[1075] The record indicates that as of August 2003, the applicant had still not fully replied to the first request relating to substantial equivalence.[1076] It appears that the applicant responded to the first request concerning the presence of PAT DNA and PAT protein in derived soya products, but it is not clear when.[1077]

7.1135 Greece (June 1999) and Italy (July 1999) also requested additional information regarding nutritional and biochemical characterization and toxicity of the transgenic plants. We again asked the experts advising us whether the additional information requested by Greece and Italy was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti responded that the application did not provide all the information which would be expected in order to comply with the recommended Codex evaluation procedure, and therefore the requests for some of this information

[1070] Exhibit EC-93/Ats. 1 and 3.
[1071] Exhibit EC-93/At. 11.

[1073] Annex H, Dr. Nutti's response to Panel Question 48.
[1074] Exhibit EC-93/At. 14.
[1075] Exhibit EC-93/At. 13.
[1076] Exhibit EC-93/At. 25.
[1077] *Ibid*.

were justified.[1078] In December 2000 and again in July 2001, the applicant apparently provided additional information to the lead CA regarding insert characterization, however this information was not provided to us. In the same correspondence, the applicant indicated that information on compositional analyses would be forthcoming at a later date.[1079] Seven months later, in correspondence dated July 2001, the applicant apparently provided information to satisfy these requests, although this information was not included in the evidence provided to us.[1080]

7.1136 In August 2001, the lead CA requested clarification regarding nutritional composition, stating that the data provided by the applicant in July 2001 had not adequately addressed the lead CA's request of April 1999. We again asked the experts whether this clarification was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti noted that the information requested would normally be necessary to judge the safety of the product, however given the incompleteness of the record, it was impossible for her to determine whether or not this information had previously been provided to the lead CA.[1081] The lead CA also inquired about a broiler chicken growth performance study which the applicant had said was already included in the dossier, but which the lead CA could not find. Finally, the lead CA indicated that in accordance with new recommendations by the Biosafety Council on molecular characterization, the lead CA would be requesting some additional information on molecular characterization.

7.1137 The record suggests that the applicant never replied to the August 2001 request for clarification. Indeed, in June 2003, in internal e-mail correspondence concerning a request from the Commission for an update on this dossier, the lead CA highlighted the fact that the applicant had not provided the requested broiler chicken growth study. The lead CA also indicated that it had requested, but not received, additional information on molecular characterization. However, the record does not indicate that such a request was forwarded to the applicant.[1082]

7.1138 It is unfortunate that the evidence provided on this application is incomplete. While the experts indicated that much of the information requested by the lead CA and by other member States was necessary to ensure a valid safety assessment, it was not possible to determine to what extent such information may already have been provided by the applicant. It is also very difficult to determine from the information before us whether particular requests for information were met by the applicant.

7.1139 This said, as noted earlier, it appears that the applicant never fully replied to the lead CA's April 1999 request for additional information. It also seems that the responses which were given were not provided in a timely manner. Furthermore, the record suggests that the applicant never responded to the August 2001 request for clarification. In fact, there does not appear to have been any further communication from the applicant until it withdrew its application in July 2004.

7.1140 In considering the applicant's conduct, and in particular its failure to respond to the August 2001 request for clarification, it is important to recall that the applicant had submitted an application concerning the same product under Directive 90/220. That application was also being evaluated by Belgium. As we have noted earlier, however, the consideration of that application – the application concerning LL soybeans (EC-71) – appears to have been suspended as from September 2001 as a result of the applicant's refusal to discontinue another Directive 90/220 application concerning the

[1082] Exhibit EC-93/At. 25.

same product, which had been submitted to Portugal. Directive 90/220 was repealed in October 2002. The applicant withdrew its application from Portugal and submitted an updated application to Belgium. Belgium then continued its consideration of the application under Directive 2001/18 as of February 2003.

7.1141 We further recall that Article 9(2) of Regulation 258/97 provides that decisions approving the placing on the market of foods or food ingredients containing or consisting of GMOs must "respect the environmental safety requirements laid down by [Directive 90/220] to ensure that all appropriate measures are taken to prevent the adverse effects on human health and the environment which might arise from the deliberate release of [GMOs]". As noted, the environmental safety assessment under Directive 90/220 was suspended as of September 2001. Since a specific environmental safety assessment was necessary for the application concerning LL soybeans (food) to be approved under Regulation 258/97, it seems plausible that the applicant did not see much use in seeking progress in the Regulation 258/97 procedure as long as the Directive 90/220 procedure was suspended. In relation to the application concerning LL soybeans (EC-71), we said earlier that the fact that Belgium suspended consideration of that application – in response to the applicant's refusal to discontinue one of the two Directive 90/220 applications – does not directly confirm that a general moratorium was in effect in the European Communities.

7.1142 Nevertheless, we consider that the history of the approval procedure concerning LL soybeans (food) at the member State level is consistent with the Complaining Parties' assertion that the European Communities applied a general moratorium on approvals. We recall in this regard that in June 1999, the Group of Five countries indicated that they would act as a "blocking minority" in the Regulatory Committee and in the Council, and that in the approval procedure concerning the Transgenic tomato (food), the Commission after October 1999 failed to discharge its responsibility inasmuch as it did not submit a draft measure to the Regulatory Committee following the first SCF opinion of September 1999. These acts and omissions affect and concern the Community level phase of the approval procedure under Regulation 258/97. However, the application concerning LL soybeans (food) as of August 2003 had not reached the Community level.

7.1143 In the light of the above considerations, we conclude that the record of the progress of the application concerning LL soybeans (food) at the member State level is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

MON810 x GA21 maize (food) (EC-94)

7.1144 The application concerning MON810 x GA21 maize (food) was submitted to the Netherlands (lead CA) on 29 February 2000. A summary of the file was circulated by the Commission to all member States on 29 March 2000. At the time of establishment of the Panel, the lead CA had not completed its initial assessment.

7.1145 The **United States** argues that approval for MON810 x GA21 maize (food), which is produced by conventionally hybridizing two "parental" biotech products, MON810 maize and GA21 maize, has been delayed by the failure of the lead CA to complete its initial assessment. More specifically, the United States argues that at the time of establishment of the Panel, the application had already been under consideration by the lead CA for three and a half years. The United States contends that this lag had two distinct causes.

7.1146 According to the United States, one cause for the lag was the undue delay in the EC approval of GA21 maize under Regulation 258/97. The application for approval of MON810 x GA21 maize

(food) submitted under Regulation 258/97 referenced the detailed risk assessments undertaken on the parental biotech products, complemented with confirmatory safety and characterization data on the MON810 x GA21 hybrid. One parent, MON810 maize, was approved under Directive 90/220 in 1998[1083] and was notified in 1998 on the basis of an opinion of substantial equivalence as required under Regulation 258/97 in 1998.[1084] However, the application for the single trait parent GA21 maize (food) under Regulation 258/97 stalled at the Commission level after the Commission requested an opinion from the SCF in May 2000 and then again after the final SCF opinion in February 2002. Therefore, progress on GA21 maize (food) was a limiting step on the progress of the application concerning MON810 x GA21 maize (food) in the regulatory process. In fact, in its comments on the application for MON810 x GA21 maize (food), Italy stated that "examination of the documentation relating to authorization [of MON810 x GA21 maize] should only be carried out after the marketing of GA21 has been authorized [under Regulation 258/97]."[1085] At the time of establishment of the Panel, the approval of GA21 maize (food) under Regulation 258/97 had not yet been granted.

7.1147 The United States contends that the other cause of the lag reflected, in part, the need for the applicant to respond to requests for information that were scientifically unjustified. The United States points out that the lead CA insisted on molecular characterization of the MON810 x GA21 line without regard to the previous data that had been submitted on the parental lines. In particular, the lead CA requested an additional whole food study in mice.[1086] The rationale offered for this request was the need to address hypothetical concerns that unknown pieces of DNA could be scattered over the genome. The impact of any such insertions can be determined by evaluating the compositional analyses of the plant as well as its agronomic performance. If both analyses indicate no unexpected changes, the United States argues, there is no basis on which to hypothesize a food safety concern for food from the plant. In this case, such assessments had been performed on each of the parental lines and no unexpected changes were observed. At no time did the lead CA provide any explanation of the reason it believed that the compositional analyses or feeding studies previously submitted on both the parent lines, as well as the compositional analyses submitted on the hybrid, did not adequately address this issue.

7.1148 The United States notes that, nonetheless, the applicant analysed the composition of the MON810 x GA21 maize, which was found to be comparable to that of the parental lines and other commercial maize varieties.[1087] The applicant also had previously submitted several whole food feeding studies, including a 90-day feeding study in rats using MON810 maize or GA21 maize, and a broiler chicken feeding study using grain from MON810 x GA21 maize. None of these studies revealed any adverse effects.

7.1149 Furthermore, the United States notes, the lead CA requested further information on the levels of EPSPS protein expressed in the hybrid lines, although such information is not relevant to assessing the risks given the known safety information about the EPSPS protein.[1088] The lead CA also

[1083] Commission Decision concerning the placing on the market of genetically modified maize (zea mays L. line MON810) pursuant to Council Directive 90/220/EEC, (98/294/EC), April 22, 1998, Official Journal of the European Communities, L 131/32, May 5, 1998 (Exhibit US-131).

[1084] Exhibit US-132.

[1085] Exhibit EC-94/At. 11.

[1086] Exhibit EC-94/At. 12.

[1087] Exhibit EC-82/At. 9.

[1088] The United States refers to LA Harrison, MR Bailey, MR Naylor, JE Ream, BG Hammond, DL Nida, BL Burnette, TE Nickson, TA Mitsky, ML Taylor, RL Fuchs, and SR Padgette, "The Expressed Protein in Glyphosate-Tolerant Soybean, 5-Enolypyruvylshikimate-3-Phosphate Synthase from Agrobacterium sp. Strain CP4, Is Rapidly Digested in Vitro and Is Not Toxic to Acutely Gavaged Mice", *Journal of Nutrition* 126:728-740 (1996) (Exhibit US-143).

requested unnecessary comparisons of compositional data between the new hybrid and non-transgenic control lines. The data submitted in the application analysed the new hybrid in comparison to the transgenic parental lines.[1089] The transgenic parental lines had already been shown to be substantially equivalent to non-genetically modified maize except for the introduced traits. Given all of the data that had been submitted on both parental lines, the United States argues that the requests for yet further studies lacked any scientific basis.

7.1150 According to the United States, the United Kingdom also insisted that the applicant provide extensive characterization of the new hybrid, rather than rely on the analyses previously carried out on the transgenic parental lines.[1090] As part of this request, the United Kingdom requested molecular characterization to "confirm[] the absence of antibiotic resistance markers and have details regarding the homology between the two constructs introduced as a result of the crosses."[1091] Given that neither parent contained an antibiotic marker gene, there is absolutely no scientific basis, in the United States' view, for theorizing that cross-breeding between the two products would somehow introduce such a gene.

7.1151 Under these circumstances, the United States argues that it was pointless for the applicant to devote resources to pursue the application for MON810 x GA21 maize (food) as long as consideration of the applications for the single trait parent GA21 maize remained suspended under the moratorium. The United States contends that the delay in the application for MON810 x GA21 maize (food) and GA21 maize (food) is thus a direct consequence of the delays in the application for GA21 maize under the moratorium. The United States further points out that because of the delay in the approval procedure concerning GA21 maize (food), that product, as well as MON810 x GA21 maize, have been superseded by a second generation Roundup Ready maize product (NK603 maize and NK603 × MON810 maize, respectively). Nonetheless, the applicant has continued to pursue the necessary regulatory clearance for MON810 x GA21 maize (food).

7.1152 **Canada** argues that the application is still pending with the lead CA.

7.1153 The **European Communities** argues that the lead CA requested additional information from the applicant in July 2000, however the request was only partly answered in February 2002. Contrary to the United States, the European Communities maintains that the lead CA request for a whole food study in mice was necessary to assess unintended effects caused by possible additional DNA fragments. Since the request was made on valid grounds, the delay caused by it cannot be considered "undue." Furthermore, issues such as molecular characterization of inserted DNA from transgenic parent lines, the determination of flanking DNA or compositional analysis still remain unanswered. Finally, the European Communities considers that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open.

7.1154 The **Panel** notes that under Regulation 258/97 the initial assessment report is to be drawn up by the lead CA within a period of three months from receipt of an application meeting the applicable conditions. When the Commission circulated notice of this application to all member States on 29 March 2000, it indicated that the initial assessment was to be completed by 16 June 2000 at the latest.[1092] However, the lead CA's assessment had not been completed by the time of the establishment of the Panel, that is, three and a half years after submission of the application.

[1089] Exhibit EC-94/At. 2.
[1090] Exhibit EC-94/At. 10.
[1091] *Ibid*.
[1092] Exhibit EC-94/At. 5.

7.1155 The first indication of any contact from the lead CA was a request for additional data sent to the applicant on 17 July 2000.[1093] No specific explanation has been provided as to why this information was not requested much sooner, rather than one month after the normal deadline for completion of the assessment. The response to the July 2000 request was provided by the applicant only on 15 February 2002. Subsequently, there was a five-month delay before the lead CA followed up with the applicant to request additional information on 2 July 2002. No specific explanation has been provided for this further delay. Furthermore, no information has been provided regarding any action on this application between July 2002 and August 2003. It appears that during that period the applicant did not respond to the lead CA's July 2002 request for information.

7.1156 We sought the views of the experts advising us regarding the necessity of the information requested by the lead CA in July 2000 to ensure that the conclusions of the safety assessment were valid.[1094] Dr. Nutti addressed the lead CA's requests regarding the EPSPS protein, the effect of glyphosate treatment on the composition of maize plants, the additional information on the composition of the hybrid, and the additional toxicological feeding study. Dr. Nutti did not consider that any of this requested information was necessary to ensure the validity of the safety assessment, in light of the information already provided in the application and already known about the parental lines. In her view, the responses provided by the applicant in February 2002 confirmed the data previously submitted.[1095] Dr. Andow addressed the requests regarding the effect of glyphosate treatment and toxicology. In his view, the request regarding the glyphfosate treatment was necessary, as he believes the applicant had provided an incorrect statistical analysis. With regard to the toxicology request, Dr. Andow considered that the underlying concern was valid, but he considered that the applicant should have been able to address this concern through other means, and the request for toxicity testing was not necessary to ensure that the conclusions of the safety assessment were valid for MON810 x GA21 maize.[1096]

7.1157 We are cognizant of the fact that the European Communities disagrees with some of the responses by the experts. The European Communities notes that the results of the additional studies were required to confirm the information provided in the application, and that there are different regulatory approaches regarding the comparisons of a GM hybrid and the data requirements needed to assess the safety of these hybrids. In particular, the European Communities argues that the fact that the approach of the lead CA differs from the one preferred by the Panel's experts does not mean it is not valid. Furthermore, the European Communities submits that the lead CA requested information on additional substances in light of the information that had just become available regarding the presence of unintended DNA fragments in a genetically modified glyphosate-resistant soybean.

7.1158 We accept that different regulatory practices may result in differences in perceptions as to what information is necessary to a safety assessment. However, even accepting that contrary to the views of the experts the information requested by the lead CA in July 2000 was necessary to ensure the validity of the safety assessment, this still would not explain the long delays in responses by the lead CA both before and after the July 2000 request.

7.1159 The United States argues that these delays reflect the alleged general moratorium on final approvals. More particularly, the United States contends that the delay in the application for MON810 x GA21 maize (food) was a direct consequence of the delays in the applications for GA21 maize (EC-78) and GA21 maize (food) under the moratorium. We recall that the United States does

[1093] Exhibit EC-94/At. 12.
[1094] Annex H, question 44.
[1095] Annex H, paras. 682-687.
[1096] Annex H, para. 700.

not assert that the time taken by the Netherlands in its assessment of the application concerning MON810 x GA21 maize (food) is a reflection of its support for the alleged moratorium. Rather, the United States asserts that the Netherlands was placed in a position of having to recognize the moratorium as a reality, and that this affected the speed with which it conducted its assessment.

7.1160 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries. We note in this regard that in 2000, when the application concerning MON810 x GA21 maize (food) was submitted, the single trait parent applications concerning GA21 maize (EC-78) and GA21 maize (food) were both under assessment at Community level. In relation to these single trait parent applications, we have previously noted that the Commission in both procedures failed to submit a draft measure concerning these applications to the Regulatory Committee prior to August 2003, and that this is consistent with the assertion that the European Communities applied a general moratorium on final approvals.

7.1161 Against this background, and in particular in view of the situation with regard to the single trait parent applications concerning GA21 maize (EC-78) and GA21 maize (food)[1097], we consider that the Netherlands could have come to the conclusion that there was no realistic prospect that the single trait parent applications concerning GA21 maize would be approved prior to the date of repeal of Directive 90/220, and that as long as they were not approved the hybrid application concerning MON810 x GA21 maize (food) would likewise not be approved.[1098] In our view, the time taken by the Netherlands both before and after its July 2000 request for information is therefore consistent with the existence of a general moratorium on approvals.

7.1162 We note that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. Indeed, we are not convinced that the Dutch CA could not forward its July 2000 and July 2002 requests to the applicant sooner than it did even while following a precautionary approach.

7.1163 Regarding the fact that the applicant took more than a year and a half to provide its response to the lead CA's July 2000 request, and that it did not respond to the July 2002 request for information, we consider this is consistent with the United States' suggestion that the applicant thought that the single trait parent applications concerning GA21 maize (EC-78) and GA21 maize (food) were being delayed at Community level as a result of the alleged moratorium and that the applicant therefore saw little value in actively pursuing the hybrid application for MON810 x GA21 maize (food).

7.1164 In the light of the above considerations, we conclude that the time taken by the Netherlands for its assessment of the application concerning MON810 x GA21 maize (food) is consistent with the

[1097] Since these applications were at Community level, it is reasonable to assume that the Dutch CA was aware of the relevant situation.

[1098] We note that the application concerning MON810 x GA21 maize (food) referenced Article 9 of Regulation 258/97 which applies to foods or food ingredients containing or consisting of GMOs and which requires that the approval decision respect the environmental safety requirements laid down in Directive 90/220.

Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

Bt-1507 maize (food) (EC-95)

7.1165 The application concerning Bt-1507 maize (food) was submitted to the Netherlands (lead CA) on 15 February 2001. At the time of establishment of the Panel, the lead CA had not completed its initial assessment. This assessment was completed on 4 November 2003, and the report circulated to all member States by the Commission on 10 December 2003.

7.1166 The **United States** argues that the lead CA refused to forward this application to the Commission.

7.1167 The **European Communities** observes that after receiving the application in February 2001, the lead CA asked for additional information in June 2001. This information was finally provided in February 2003. Between February 2003 and July 2003, there was ongoing correspondence between the applicant and the lead CA on additional information to be submitted by the applicant, in particular on labelling, monitoring, molecular characterisation, and event-specific detection methods. The lead CA finalized the initial assessment report in November 2003, and concluded that the consumption of Bt-1507 maize as well as foods and food ingredients derived from it were as safe for humans as the consumption of the non-genetically modified counterparts.

7.1168 The European Communities further notes that the Commission forwarded the initial assessment report to member States for comments in December 2003, and received comments and reasoned objections against the initial assessment. On 26 March 2004, the complete dossier (including responses to the objections and comments raised by member States) was forwarded to EFSA for consideration under Regulation 1829/2003. In parallel, the applicant undertook the steps to ensure the production of certified reference material and for the validation of a detection method by the JRC.

7.1169 The **Panel** recalls that according to Regulation 258/97, an initial assessment report is to be drawn up by the lead CA within a period of three months from receipt of an application meeting the applicable conditions. In this case, this initial assessment was not completed until 4 November 2003, that is, almost three years after receipt of the application. We note, however, that an initial request for additional data was made by the lead CA on 28 June 2001, that is four months following receipt of the application.[1099] The applicant apparently provided some information in November 2001, although this was not given to us, but did not provide all of the information requested until 12 February 2003.[1100] In March 2003, the lead CA requested further clarifications, which were provided in May 2003.[1101] In June 2003, the lead CA posed questions in relation to the applicant's May 2003 reply.[1102] The applicant provided answers by 9 July 2003.[1103] The information as provided by 9 July 2003 was apparently deemed sufficient by the lead CA to conclude its assessment. As noted, a positive assessment was reported on 4 November 2003.

7.1170 It is clear from the foregoing that the major delay in the assessment of this application is attributable to the time taken by the applicant to provide the information requested in June 2001. We

[1099] Exhibit EC-95/At. 8.
[1100] Exhibit EC-95/At. 12.
[1101] Exhibit EC-95/Ats. 13 and 14.
[1102] Exhibit EC-95/At. 15.
[1103] Exhibit EC-95/At. 16.

asked the experts advising us for their views on the necessity of the information requested by the lead CA in June 2001 to ensure that the conclusions of the safety assessment were valid.[1104] Dr. Nutti responded to this question and commented specifically on the lead CA's requests related to compositional and toxicological analyses. She considers that some of the information requested, such as three seasons of field tests (as opposed to two seasons as provided in the application), was not necessary to ensure the safety assessment. On the other hand, the request for compositional data regarding certain substances and the oral toxicity study to rule out unintended change in Bt-1507 maize were necessary in her view.[1105] All of this information was provided by the applicant in February 2002, except for the results of the oral toxicity study which was submitted only in February 2003.

7.1171 Even accepting that the information requested by the lead CA in June 2001 was necessary to ensure the validity of the safety assessment, it should be noted that the application concerning Bt-1507 maize (food) had been under review in the Netherlands for almost four and a half months before the Dutch CA forwarded its June 2001 request for information. Similarly, the lead CA on two occasions took a month to analyse responses provided by the applicant and forward follow-up requests for information. And once the applicant had provided information in response to the Dutch CA's last request for information, the lead CA still took several months to complete its initial assessment report.

7.1172 The United States does not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, its assertion is that the time taken by the Netherlands reflects the impact of the moratorium. The United States contends that the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

7.1173 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.1174 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that the Dutch CA could not forward its June 2001 request for information to the applicant sooner than it did even while following a precautionary approach, or that it could not complete its assessment report earlier than in November 2003.

7.1175 It is pertinent to note in this regard that the applicant had submitted an application concerning the same product under Directive 90/220. That application was also under assessment by the Dutch CA. The Dutch CA did not complete its assessment of the application concerning Bt-1507 maize (EC-74) until August 2003. We have previously concluded in this respect that the failure of the Netherlands to complete its assessment of the application concerning Bt-1507 maize (EC-74) earlier than in August 2003 is not inconsistent with the contention that the European Communities applied a general moratorium during the relevant time period. Since a special environmental safety assessment

[1104] Annex H, Question 51.
[1105] Annex H, Dr. Nutti's responses to Question 51.

was necessary for the application concerning Bt-1507 maize (food) to be approved under Regulation 258/97[1106], we think it could also be that the time taken by the Dutch CA before forwarding its June 2001 request or before completing its initial assessment report in November 2003 reflects the delays in the approval procedure concerning Bt-1507 maize (EC-74).

7.1176 Taking account of the aforementioned elements, we consider that the Dutch CA's conduct in the approval procedure concerning Bt-1507 maize (food) is consistent with the United States' view that a general moratorium on final approvals was in effect in the European Communities at the time. It should be recalled, in addition, that the application concerning Bt-1507 maize (food) as of August 2003 had not reached the Community level. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken actions to delay or prevent its final approval.

7.1177 In the light of the above, we conclude that the failure of the Netherlands to complete the initial assessment of the application concerning Bt-1507 maize (food) by August 2003 is consistent with the contention of the Complaining Parties that during the relevant time period the European Communities applied a general moratorium on final approvals.

NK603 maize (food) (EC-96)

7.1178 The application for NK603 maize (food) was submitted to the Netherlands (lead CA) in April 2001. The lead CA forwarded its initial assessment report to the Commission in November 2002. In January 2003, the Commission forwarded the initial assessment report by the lead CA to member States for comments and objections.

7.1179 The **United States** argues that although the application concerning NK603 maize (food) eventually received a positive assessment from the lead CA, this product was at the member State level for almost 19 months, instead of the 90 days foreseen by Regulation 258/97. Of this period of time, only 3½ months were used by the applicant to provide additional information; the lead CA used the remaining 14½ months.

7.1180 The United States questions certain requests for additional information from the lead CA, arguing they were scientifically unnecessary. For example, the lead CA requested an additional whole food feeding study in mice or rats, to address concerns about the presence of unintended DNA fragments that the applicant had identified as part of their molecular characterization data.[1107] The lead CA stated that "the presence of additional unintended modifications cannot be excluded with sufficient certainty". The United States argues that the mere fact that an additional insert is present does not necessarily mean that the product presents an additional risk. Rather, the determination turns on the results of all of the other data and information provided by the applicant, which the lead CA failed to take into consideration in making this request. If the results of those tests raise questions, then further examination would be warranted. But in this case, the applicant had conducted compositional analysis and a broiler chicken whole food study with the product containing the additional insert, and in these circumstances would have detected any resulting changes relevant to

[1106] We note that the application concerning Bt-1507 maize (food) applies to foods or food ingredients containing or consisting of GMOs and as such would appear to be subject to the provisions of Article 9 of Regulation 258/97. To recall, Article 9 requires that approval decisions concerning foods or food ingredients containing or consisting of GMOs must respect the environmental safety requirements laid down in Directive 90/220.

[1107] Exhibit EC-96/At. 7.

food safety. The United States observes that the applicant nevertheless conducted the requested test, which identified no adverse effects.

7.1181 **Canada** argues that the total time taken by the lead CA for its review was 18 months, and that only 3.5 of the 18 months were taken by the applicant to respond to questions. The difference of 14.5 months exceeds the 3-month period provided for in Regulation 258/97.

7.1182 **Argentina** argues that the assessments performed by the lead CA and subsequently the EFSA concluded that there was no evidence of risk to human health or life. Therefore, the delays by the lead CA to complete its initial assessment and forward this application to the Commission were not justified.

7.1183 The **European Communities** notes that the application for food use of the NK603 maize was submitted to the Netherlands in 2001. After the applicant submitted additional information requested by the lead CA, the lead CA completed its evaluation in November 2002 and sent its initial assessment report to the Commission. The 18 months spent at member State level were due to the incompleteness of the dossier initially submitted by the applicant and the need for further data on molecular characterization and compositional analysis.

7.1184 The **Panel** understands from the record that the applicant first submitted the application to the lead CA in April 2001. Two months later the lead CA requested copies of cited literature and data in order to facilitate the lead CA's work. The applicant provided these documents in July 2001.

7.1185 There were two separate requests for additional information before the lead CA forwarded its initial assessment report to the Commission in November 2002. First, the lead CA requested further information in December 2001 on the sequence of the inserted DNA fragment as well as further information on the flanking sequences, semi-chronic toxicity study, and further information on compositional data from the field trials.[1108] A cover letter indicates that the applicant provided this information three months later, however the record does not include the details from the applicant's response.

7.1186 We asked the experts advising us whether the information regarding molecular characterization, toxicity effects of unintended changes and compositional data requested by the lead CA was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti noted that the applicant had provided all the information usually requested for the food safety assessment, and had also confirmed that the GM maize in question was equivalent in composition and nutrition to the conventional counterpart. She emphasized that "there was no need for requesting a semi chronic toxicity study in mice or rats, using maize grain or meal, in order to rule out possible undesired effects of additional, unidentified changes".[1109] The European Communities contests Dr. Nutti's conclusion that the additional 90-day toxicity study was not necessary. The European Communities indicates that the lead CA provided as rationale for its request for the 90-day study that it would provide additional reassurance of no unintended undesired effects.[1110] The European Communities argues that Dr. Nutti's conclusion should be dismissed on the basis of the available scientific evidence on the relevance of such studies.

7.1187 The second request for information came from Italy in January 2002 in a letter to the Commission. This request asked for further information on the evaluation of substantial equivalence,

[1108] Exhibit EC-96/At. 7.
[1109] Annex H, Dr. Nutti's responses to question 53.
[1110] Exhibit EC-96/At. 7.

molecular characterization, and detection analysis. Italy noted that the request was particularly important as "in the Community context, it has been shown that the simplified procedure needs to be suspended for GMOs".[1111]

7.1188 We again asked the experts whether the information requested by Italy was necessary to ensure that the conclusions of the safety assessment were valid. Dr. Nutti noted that "additional animal feeding studies may be warranted for GM foods if changes in the bioavailability of the nutrients are expected or if the composition of the GM food is not comparable to conventional food".[1112] She considered that the applicant had adequately established the substantial equivalence of the NK603 maize with its conventional counterpart, and that the request from Italy for more animal feeding studies was therefore not necessary to ensure that conclusions of the safety assessment were valid. In any event, there is no evidence on the record that the applicant was ever requested by the lead CA to provide the information sought by Italy. Nor is there any evidence that the applicant submitted information to address the requests made by Italy.

7.1189 In August 2002, five months after the applicant supplied the information requested by the lead CA, the lead CA's advisory body, the Dutch Health Council's Committee on the Safety Assessment of Novel Foods, finished its assessment report. The Committee concluded that "the consumption of NK603 maize and food and food ingredients derived from this is just as safe for humans as the consumption of non-genetically modified maize and maize products".[1113] It was not until November 2002 that the lead CA forwarded its assessment report to the Commission.[1114]

7.1190 In considering the foregoing, we note that this application was under assessment at the member State level for eighteen months. The lead CA's December 2001 request for information led to a delay, inasmuch as the applicant took three months and a half to respond to the request. We recall the view expressed by one of the experts that the request in question was not necessary to ensure the validity of the safety assessment. However, even accepting that the information requested by the lead CA in December 2001 was appropriate to ensure the validity of the safety assessment, it should be noted that the Netherlands took considerably more time for its assessment than the three months foreseen under Regulation 258/97. Notably, the application concerning NK603 maize (food) had been under review in the Netherlands for more than seven months before the Dutch CA forwarded its December 2001 request for information.[1115] Moreover, once the applicant had provided information in response to the Dutch CA's December 2001 request for information, the Health Council's Committee on the Safety Assessment of Novel Foods still took more than four months to complete its initial assessment report. While this report needed to be adopted by the Dutch CA, the report was not forwarded to the Commission for another two and a half months.

7.1191 The United States does not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, its assertion is that the time taken by the Netherlands reflects the impact of the moratorium. The United States contends that the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

[1111] Exhibit EC-96/At. 9.
[1112] Annex H, Dr. Nutti's responses to question 54.
[1113] Exhibit EC-96/At. 7.
[1114] Exhibit EC-96/At. 12.
[1115] The application had been under review for more than four and a half months after receipt of copies of the cited literature and data. These copies were requested by the lead CA two months after receipt of the application.

7.1192 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.1193 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that the Dutch CA could not forward its December 2001 request for information to the applicant sooner than it did even while following a precautionary approach, or that it could not forward its completed assessment report earlier than in November 2002.

7.1194 It is pertinent to note in this regard that the applicant had submitted an application concerning the same product under Directive 90/220. That application was under assessment by the Spanish CA during the same time period. The Spanish CA did not complete its assessment while Directive 90/220 was still in force. Under Directive 2001/18, the Spanish CA forwarded its positive assessment report concerning NK603 maize to the Commission on 14 January 2003. We have previously concluded in this respect that Spain's failure to complete its assessment of NK603 maize earlier than in January 2003 is not inconsistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period. Since a special environmental safety assessment was necessary for the application concerning NK603 maize (food) to be approved under Regulation 258/97[1116], we think it could also be that the time taken by the Dutch CA before forwarding its December 2001 request or before forwarding its initial assessment report in November 2003 reflects a view on the part of the Dutch CA that the Spanish CA would not forward the application concerning NK603 maize to the Commission and the other member States until after the entry into force of Directive 2001/18.

7.1195 Taking account of the aforementioned elements, we consider that the Dutch CA's conduct in the approval procedure concerning NK603 maize (food) is consistent with the Complaining Parties' view that a general moratorium on final approvals was in effect in the European Communities at the time. It should also be recalled in this regard that the application concerning NK603 maize (food) as of August 2003 had not reached the Community level. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.1196 In the light of the above considerations, we conclude that the time taken by the Netherlands to complete its initial assessment of the application concerning NK603 maize (food) is consistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

[1116] We note that the application concerning NK603 maize (food) concerns foods or food ingredients containing or consisting of GMOs and as such would appear to be subject to the provisions of Article 9 of Regulation 258/97. To recall, Article 9 requires that approval decisions concerning foods or food ingredients containing or consisting of GMOs must respect the environmental safety requirements laid down in Directive 90/220.

High-oleic soybeans (food) (EC-99)

7.1197 The application concerning High-oleic soybeans (food) was submitted to the Netherlands (lead CA) on 24 July 1998. The application was withdrawn by the applicant on 12 December 2002. At that time, the lead CA had not yet issued its initial assessment of the application.

7.1198 The **United States** argues that the application for High-oleic soybeans (food) was withdrawn because of the European Communities' excessive delay in carrying out the approval process.

7.1199 The **European Communities** argues that after discussions between the lead CA and the applicant, the applicant in December 2002 withdrew its application. The applicant gave as the reason for its withdrawal "entirely commercial reasons."

7.1200 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in it reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.1201 The **Panel** observes that in circulating notice of this application to all member States, the Commission indicated that the initial assessment by the lead CA would be available by 5 November 1999 at the latest. In contrast, at the time this application was withdrawn in December 2002, this initial assessment had not yet been completed.

7.1202 It appears that the lead CA requested further references from the applicant sometime before mid-October 1998, which was when these were provided. The information provided is incomplete and does not permit identification of when these references had been requested. Furthermore, in March 1999, the lead CA contacted the applicant to request explanations regarding certain results reported in the initial application.[1117] This was more than seven months after its receipt of the application. No explanation has been provided for this delay. The applicant provided the explanations and information requested in May 1999.[1118] More than three months later, in September 1999, the lead CA requested further clarification of the information provided.[1119] The applicant responded within three weeks, on 22 September 1999.[1120] It appears that the applicant's response addressed all questions asked by the lead CA. There is no indication that subsequent to September 1999 the lead CA sought further information or took any further action on this application until the application was withdrawn more than three years later on 12 December 2002.

7.1203 We note that no explanation has been provided to us for why the lead CA did not complete its assessment during the three years following the applicant's September 1999 response to a request for clarification. The United States argues that this delay was due to the alleged general moratorium on approvals. The United States does not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, its assertion is that the time taken by the Netherlands reflects the impact of the moratorium. The United States contends that the

[1117] Exhibit EC-99/At. 11.
[1118] Exhibit EC-99/At. 14.
[1119] Exhibit EC-99/At. 15.
[1120] Exhibit EC-99/At. 16.

Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

7.1204 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands at the time also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.1205 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that it was not possible for the Dutch CA to complete its assessment before December 2002 even while following a precautionary approach.

7.1206 It is pertinent to note in this context that the applicant had submitted an application concerning the same product under Directive 90/220. That application was also under assessment by the Dutch CA. In the procedure conducted under Directive 90/220, the Dutch CA requested additional information in October 1999.[1121] However, the applicant did not provide a response to that request until it withdrew its application in December 2002. Since a special environmental safety assessment was necessary for the application concerning High-oleic soybeans (food) to be approved under Regulation 258/97[1122], we think it could be that the time taken by the Dutch CA after the September 1999 response by the applicant reflects the delays in the approval procedure concerning High-oleic soybeans. We have previously concluded that the record of the member State level assessment of that application is not inconsistent with the contention of the Complaining Parties that the European Communities applied a general moratorium during the relevant time period.

7.1207 Taking account of the aforementioned elements, we consider that the unexplained failure by the lead CA to complete its assessment of the application concerning High-oleic soybeans (food) after September 1999 is consistent with the United States' view that a general moratorium on final approvals was in effect in the European Communities at that time. It should also be recalled in this regard that the application concerning High-oleic soybeans (food) as of August 2003 had not reached the Community level. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.1208 In our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in December 2002 is not inconsistent with the United States' assertion that the European Communities was applying a general moratorium on approvals at the time. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning High-oleic soybeans (food).

[1121] Exhibit EC-87/At. 15.

[1122] We note that the application concerning High-oleic soybeans (food) concerns foods or food ingredients containing or consisting of GMOs and as such would appear to be subject to the provisions of Article 9 of Regulation 258/97. To recall, Article 9 requires that approval decisions concerning foods or food ingredients containing or consisting of GMOs must respect the environmental safety requirements laid down in Directive 90/220.

7.1209 In the light of the above considerations, we conclude that the failure by the Netherlands to complete its assessment of the application concerning High-oleic soybeans (food) prior to December 2002, when it was withdrawn by the applicant, is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

T25 x MON810 maize (food) (EC-101)

7.1210 The application concerning T25 x MON810 maize (food) was submitted to the Netherlands (lead CA) on 20 April 2000. The application was withdrawn on 12 December 2002. At that time, the lead CA had not completed its initial assessment. (An application for approval of this product under Regulation 90/220 was also submitted; see EC-86 above.)

7.1211 The **United States** argues that the application for T25 x MON810 maize (food) was withdrawn because of the European Communities' excessive delay in carrying out the approval process.

7.1212 The **European Communities** maintains that after discussions between the lead CA and the applicant, in its letter withdrawing the application the applicant pointed to "entirely commercial reasons."

7.1213 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly so indicated in it reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.1214 The **Panel** notes that in bringing the application to the attention of all member States on 3 May 2000, the Commission stated that the initial assessment was to be concluded by 28 July 2000 at the latest.[1123] However, it was apparently only on 17 July 2000 that the lead CA first contacted the applicant to request additional information.[1124] After the applicant responded on 22 November 2000, another five months lapsed before the lead CA requested further information on 23 April 2001.[1125]

7.1215 In responding to the April 2001 request from the lead CA, on 21 November 2001 the applicant noted that not only had both parental lines been previously approved, but the same hybrid T25 x MON810 maize product had been reviewed under Directive 90/220 and had received a favourable assessment from the Dutch CA and from the SCP in June 2000. Given these circumstances, the applicant questioned the need for providing additional information on molecular characterization. It also noted that the request for a semi-chronic toxicity study was "an unexpected requirement".[1126] Nonetheless, the applicant indicated its intention to provide the information requested by mid-2002, and asked that the Dutch Health Council allow the applicant the opportunity to provide the additional information before completing its safety assessment. It appears from the applicant's November 2001 response that the Health Council had previously indicated its intention to finalize its safety assessment before the end of 2001.

[1123] Exhibit EC-101/At. 4.
[1124] Exhibit EC-101/At. 11.
[1125] Exhibit EC-101/Ats. 13 and 14.
[1126] Exhibit EC-101/At. 15.

7.1216 No evidence has been provided of further correspondence on this application until the letter of 12 December 2002 from the applicant withdrawing the application. We can only presume that the applicant did not provide the information as indicated in its letter of 21 November 2001, and that the lead CA did not explain to the applicant the reasons for its "unexpected requirement" nor otherwise further seek information requested from the applicant.

7.1217 We sought the advice of the experts assisting us as to whether the additional information regarding molecular characterization, field trials, secondary plant metabolites, and toxicological tests requested by the lead CA in April 2001 were necessary to ensure that conclusions of the safety assessment were valid.[1127] Dr. Nutti did not consider that the requests regarding compositional and toxicological analysis were necessary, in light of the information available on the parental lines. She characterized the likelihood of fortuitous changes in the plant metabolism as a result of the conventional cross-breeding of two GMO maizes as being "vanishingly small".[1128]

7.1218 Dr. Andow considered that there is a scientific justification for requiring comparison of T25 maize with and without the pesticide treatment with conventional and untreated maize, although he indicates that there is a scientific debate as to whether all three comparisons are necessary to ensure the safety assessment. With respect to the secondary plant metabolites, Dr. Andow also considers that the likelihood of a change in the plant metabolism may be very small, but that it is difficult to argue how small, and since a potential human health risk could arise from such changes, he considered the requested information to be necessary to ensure a valid safety assessment. Dr. Andow, however, agreed that the requested toxicology study was not necessary for the safety assessment.[1129]

7.1219 Dr. Squire considered that the requests by the lead CA were arguably consistent with the type of information required in the Codex Guideline for the conduct of food safety assessment of food derived from recombinant-DNA plants.[1130]

7.1220 We are cognizant of the European Communities' disagreement with the views of Drs. Andow and Nutti regarding the need for the toxicology study, and with Dr. Nutti regarding the data on herbicide treatment and on secondary compounds. Even accepting that the information requested by the Health Council in April 2001 was necessary to ensure the validity of the safety assessment, this would not explain the time taken by the lead CA before initially requesting additional information in July 2000 (three months), and the time taken to review the information received in November 2000 (five months).

7.1221 The United States does not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, its assertion is that the time taken by the Netherlands reflects the impact of the alleged moratorium. The United States contends that the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

7.1222 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case

[1127] Annex H, Question 57.
[1128] Annex H, para.766.
[1129] Annex H, para. 772.
[1130] Annex H, para. 774.

of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.1223 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that the Dutch CA could not forward its July 2000 request for information to the applicant sooner than it did even while following a precautionary approach, or that after receiving the applicant's response it could not identify the need for more detailed information earlier than in April 2001.

7.1224 It is pertinent to note, furthermore, that the applicant had submitted an application concerning the same product under Directive 90/220. That application had also been assessed by the Dutch CA. At the time the application concerning T25 x MON810 maize (food) was submitted to the Dutch CA, the application concerning T25 x MON810 maize was being assessed at Community level. In June 2000, the SCP issued a favourable opinion, but the Commission subsequently did not forward a draft measure to the Regulatory Committee prior to the withdrawal of the application in December 2002. We have previously concluded in this respect that the Commission's failure to submit a draft measure concerning T25 x MON810 maize to the Regulatory Committee is consistent with the Complaining Parties' assertion that the European Communities applied a general moratorium on final approvals.

7.1225 Taking account of the aforementioned elements, we consider that the time taken by the lead CA before initially requesting additional information in July 2000, and the time taken to review the information received in November 2000, is consistent with the United States' view that a general moratorium on final approvals was in effect in the European Communities at that time. It should also be recalled in this regard that the application concerning T25 x MON810 maize (food) as of the date of its withdrawal had not reached the Community level. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.1226 Furthermore, in our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in December 2002 is not inconsistent with the assertion that the European Communities was applying a general moratorium on approvals at the time. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning T25 x MON810 maize (food).

7.1227 In the light of the above, we conclude that the time taken by the Netherlands for its initial assessment of the application for T25 x MON810 maize (food) is consistent with the contention of the Complaining Parties that during the relevant time period the European Communities applied a general moratorium on final approvals.

RR sugar beet (food) (EC-102)

7.1228 The application concerning RR sugar beet (food) was submitted to the Netherlands (lead CA) in November 1999. At the time of establishment of the Panel, the lead CA had not yet completed its initial assessment. The application was withdrawn by the applicant on 16 April 2004.

7.1229 The **United States** argues that the lead CA refused to forward this application to the Commission.

7.1230 The **European Communities** argues that after discussions between the Dutch CA and the applicant, the request was withdrawn on 16 April 2004. As the reason for its withdrawal the applicant pointed to a decision to stop any further development of the RR sugar beet.

7.1231 The **United States** argues that in many cases the withdrawal of applications resulted from the applicant's frustration with the European Communities' suspension of its approval process, although the applicant may not have explicitly indicated so in it reasons for withdrawal. Over time, as the delays mounted, in some cases the commercial incentive for seeking approval changed. Second, the companies have a strong incentive to maintain cordial relations with EC regulators, and saw no advantage of complaining to EC regulators about the length of the delays resulting from the moratorium.

7.1232 The **Panel** notes from the record that this application was submitted to the Netherlands in November 1999. Four months later, in March 2000, the Health Council of the Netherlands requested information from the applicant regarding missing and illegible references and a request for information on the nutritional value of glyphosate-treated RR sugar beet.[1131] The applicant responded one month later and indicated that further studies on DNA and protein detection from sugar produced from RR sugar beet were in process.[1132] In May 2000, the lead CA requested further information on protein toxicity.[1133] The applicant provided a response in December 2000, which included new scientific reports and data.[1134]

7.1233 In January 2001, Denmark requested further information regarding compositional analysis of RR sugar beet treated with herbicide, as well as non-treated, and field management for RR and conventional sugar beet. The Danish CA also requested information on the level of amino acid in treated sugar beet as well as a series of technical reports which were cited in the application, but not provided, by the applicant.[1135] There is no indication on record that the applicant responded to the request from Denmark.

7.1234 In May 2001, after reviewing the additional information provided by the applicant in December 2000, the lead CA requested further information on protein analysis. The lead CA indicated that it was not yet fully satisfied with the information provided by the applicant concerning the likelihood of specific protein formation. In addition, mentioning recent studies which had shown that "unintended effects on GMOs" were possibly caused by transformation of plant cells, the lead CA also requested a semi-chronic oral toxicity study on rats in order to "to rule out possible undesirable effects [...] with sufficient certainty".[1136] No specific study was cited in this regard.

7.1235 There is no indication in the evidence before us that the applicant responded to the requests from the lead CA for further information. Although the European Communities indicates in the chronology it provided on this application that the applicant sent a message regarding the status of the application in November 2001, there is no such document in the record. The next item in the chronology is the withdrawal of the application by the applicant in April 2004.

7.1236 We sought the advice of the experts assisting us as to whether the additional information requested by the lead CA in May 2001 was necessary to ensure that the conclusions of the safety

[1131] Exhibit EC-102/At. 21.
[1132] Exhibit EC-102/At. 22.
[1133] Exhibit EC-102/At. 23.
[1134] Exhibit EC-102/At. 26.
[1135] Exhibit EC-102/At. 31.
[1136] Exhibit EC-102/At. 32.

assessment were valid. Dr. Nutti expressed the view that "the information requested by the lead CA regarding the derived proteins and the request for a semi-chronic oral toxicity test on mice or rats with edible parts of sugar beet was not necessary to ensure that the conclusions of the safety assessment were valid". She emphasized that the applicant had already completed an acute toxicity test on rats and conducted studies which confirmed that RR sugar beet "was equivalent in composition and nutrition to the conventional counterpart".[1137]

7.1237 Even accepting that contrary to the views of Dr. Nutti the information requested by the Health Council in May 2001 was necessary to ensure the validity of the safety assessment, this would not explain the time taken by the lead CA before initially requesting additional information in March 2000 (almost five months), and the time taken to review the information received in December 2000 (five months).

7.1238 The United States does not assert that the time taken by the Netherlands to complete its assessment is a reflection of Dutch support for the moratorium. Rather, its assertion is that the time taken by the Netherlands reflects the impact of the alleged moratorium. The United States contends that the Netherlands was placed in a position of having to recognize the moratorium as a reality and that this affected the speed with which it conducted its assessment.

7.1239 We consider that following the June 1999 declaration by the Group of Five countries, the Netherlands had reason to believe that the Group of Five countries would act as a "blocking minority" both in the Regulatory Committee and in the Council pending the adoption of new EC rules on labelling and traceability. In our view, the Netherlands also had reason to believe that, as in the case of some of the previously discussed approval procedures, the Commission would not complete the approval procedure in the face of systematic opposition by the Group of Five countries.

7.1240 We also note, however, that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. In particular, we are not convinced that the Dutch CA could not forward its March 2000 request for information to the applicant sooner than it did even while following a precautionary approach, or that after receiving the applicant's response it could not identify the need for more detailed information earlier than in May 2001.

7.1241 It is pertinent to note, furthermore, that the applicant drew the Dutch CA's attention to an application concerning the same product which the applicant had previously submitted to Belgium under Directive 90/220.[1138] Belgium did not complete its assessment of that application, and the applicant withdrew it in April 2004. We have previously concluded in relation to that application that the time taken by Belgium for its assessment of RR sugar beet is consistent with the Complaining Parties' assertion that during the relevant time period the European Communities applied a general moratorium on final approvals.

7.1242 Taking account of the aforementioned elements, we consider that the time taken by the lead CA before initially requesting additional information in March 2000, and the time taken to review the information received in December 2000, is consistent with the United States' view that a general moratorium on final approvals was in effect in the European Communities at that time. It should also be recalled in this regard that the application concerning RR sugar beet (food) as of the date of its

[1137] Annex H, para. 775.
[1138] Exhibit EC-102/At. 20.

withdrawal had not reached the Community level. In other words, it had not yet reached the procedural stage where the Group of Five countries and/or the Commission could have taken action to delay or prevent its final approval.

7.1243 Furthermore, in our view, the fact that the applicant did not specifically cite a general EC moratorium on approvals as a reason for the withdrawal of the application in April 2004 is not inconsistent with the assertion that the European Communities was applying a general moratorium on approvals at the time. As was pointed out by the United States, if a moratorium was in effect, there are plausible explanations for why the applicant did not specifically cite the alleged moratorium or resulting delays as a reason for withdrawing the application concerning RR sugar beet (food).

7.1244 In the light of the above, we conclude that the time taken by the Netherlands for its initial assessment of the application concerning RR sugar beet (food) is consistent with the contention of the Complaining Parties that during the relevant time period the European Communities applied a general moratorium on final approvals.

(iii) Conduct of Group of Five countries generally

7.1245 In the preceding analysis, the Panel has addressed certain conduct of one particular Group of Five country, France, in its capacity as lead CA in individual approval procedures.[1139] In what follows, the Panel focuses on the conduct of Group of Five countries in approval procedures in which they were not acting as the lead CA. In particular, the Panel considers how Group of Five countries voted in the Regulatory Committee or Council and whether they raised objections to favourable assessments circulated by the lead CA.

Voting behaviour by Group of Five countries in the Regulatory Committee or Council

7.1246 We begin by considering the voting behaviour by Group of Five countries in the Regulatory Committee or Council. The record makes clear that there was no vote on any application in the Regulatory Committee or the Council between June 1999, when the Group of Five countries made their joint declaration, and August 2003. It is therefore not possible to establish whether, consistent with their June 1999 declaration, the Group of Five countries cast their votes in the Regulatory Committee or the Council in such a way as to prevent the necessary qualified majority from being reached.

7.1247 In response to a question from the Panel, the European Communities pointed out that between October 1998 and June 1999 four votes took place in the Regulatory Committee and that during that time period two Group of Five countries voted in favour of applications.[1140] Specifically, the European Communities mentions that Italy cast a favourable vote in the Regulatory Committee on four applications submitted under Directive 90/220[1141] and that Denmark did the same in relation to one application submitted under Directive 90/220[1142].

[1139] *See* the approval procedures concerning RR oilseed rape (EC-79) and MS1/RF1 oilseed rape (EC-89) as well as MS1/RF2 oilseed rape.

[1140] EC reply to Panel question No. 87.

[1141] The applications in question are those concerning Bt-531 cotton, RR-1445 cotton, MON809 maize and the Transgenic tomato.

[1142] The application in question is that concerning the Transgenic tomato. It should be noted that Denmark voted against the applications concerning Bt-531 cotton and RR-1445 cotton. Exhibits EC-65/At. 59 and EC-66/At. 57. Regarding the application concerning MON809 maize, Denmark abstained. Exhibit EC-83/At. 65.

7.1248 In the Panel's view, the fact that Italy and Denmark voted in favour of a number of applications between October 1998 and June 1999 does not support the inference that if there had been votes between June 1999 and August 2003, these two member States would have voted in favour of additional applications. To begin with, in June 1999 Italy and Denmark declared that they would take steps to prevent new applications from being approved. In addition, between June 1999 and August 2003, Italy and Denmark repeatedly objected to the placing on the market of biotech products which had received a favourable initial assessment from the lead CA.[1143]

7.1249 The European Communities also points out that in February 2004, Italy and France in the Regulatory Committee voted in favour of a Commission draft measure approving the application concerning NK603 maize.[1144] The Panel notes that the vote referred to by the European Communities occurred well after 29 August 2003, the date of establishment of this Panel. As these votes may have been influenced by the establishment of this Panel, it would be inappropriate to infer from these votes that if votes had been held prior to August 2003, Italy and France would have voted in favour of applications.[1145] Also, the voting behaviour by Italy and France in the procedure concerning NK603 maize is consistent with the June 1999 declaration of the Group of Five, in that the new EC rules on labelling and traceability were adopted in September 2003.

Objections by Group of Five countries to favourable assessments by lead CAs

7.1250 We now turn to consider whether the Group of Five countries raised any objections to favourable assessments by lead CAs in the period between June 1999, when the Group of Five countries made their joint declaration, and August 2003. In considering this issue, we first of all recall that under the approval procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97, when the lead CA circulates a favourable assessment report, the other member States have 60 days within which to raise objections to the placing on the market of the biotech product in question. If such objections are maintained, the decision on whether to approve the relevant biotech product must be made at Community level.

7.1251 The record indicates that there were relatively few individual approval procedures in which the 60-day period for objections ended between June 1999 and August 2003. More specifically, it is possible to identify a total of nine applications which fall within this category. They include six applications which were being assessed under Directives 90/220 and/or 2001/18[1146] and three applications which were being assessed under Regulation 258/97[1147].

7.1252 We note that in the case of each of the nine applications in question, there was at least one Group of Five country which raised and maintained an objection to the placing on the market of the biotech product in question. The nine applications include three in which Group of Five country

[1143] *E.g.*, in the approval procedures concerning Bt-11 maize (EC-69) (Denmark and Italy), RR oilseed rape (Denmark and Italy), GA21 maize (EC-85) (Denmark and Italy), T25 x MON810 maize (Denmark and Italy), GA21 maize (food) (Italy) and Bt-11 sweet maize (food) (Denmark and Italy.

[1144] EC first written submission, para. 565; EC reply to Panel question No. 87. It should be noted that other Group of Five countries – Greece, Luxembourg and Denmark – voted against approving the application. Exhibit EC-114.

[1145] For completeness, it should be noted that in February 1999, France in the Regulatory Committee voted against approving Bt-531 cotton and RR-1445 cotton. Exhibits EC-65/At. 59 and EC-66/At. 57.

[1146] The six approval procedures are the approval procedures concerning (i) Bt-11 maize (EC-69), (ii) RR oilseed rape (EC-70), (iii) NK603 maize, (iv) GA21 maize (EC-78), (v) GA21 maize (EC-85) and (vi) T25 x MON810 maize.

[1147] The three approval procedures are the approval procedures concerning (i) GA21 maize (food), (ii) Bt-11 sweet maize (food) and (iii) NK603 maize (food).

objections were raised and maintained under the provisions of Directive 2001/18. We further note that in none of the nine cases did all Group of Five countries raise objections.[1148] It should, however, be recalled in this connection that under Directives 90/220 and 2001/18 as well as Regulation 258/97 an objection from a single Group of Five country was sufficient to force a decision at Community level and hence for the Group of Five countries to obtain the opportunity to use their "blocking minority" in the Regulatory Committee and Council.

7.1253 The fact that at least one Group of Five country raised and maintained an objection in the case of each of the nine relevant applications does not necessarily mean that all of these objections were maintained for the reasons underlying the June 1999 declaration by the Group of Five countries.[1149] Nonetheless, the existence of an objection from at least one Group of Five country in each of the nine cases is consistent with the Complaining Parties' assertion that certain member States intentionally delayed or prevented the final approval of applications. Even if the reason presented by a Group of Five country for its objection differed from the reasons underlying the June 1999 declaration, this fact alone would not contradict the Complaining Parties' assertion. Since this particular Group of Five country raised an objection, it cannot simply be assumed that if the reason offered for the objection had not existed, the country in question would have refrained from objecting on the basis of the June 1999 declaration.[1150]

(iv) Commission conduct prior to the June 1999 declaration by the Group of Five countries

7.1254 We note that Argentina has commented on the conduct of the Commission prior to the issuance of the June 1999 declaration by the Group of Five countries. The conduct in question affected the progress in the approval process of a number of applications which had been submitted under Directive 90/220. In Argentina's view, the Commission's conduct in respect of these applications confirms the existence of a general moratorium on approvals as from October 1998.

7.1255 **Argentina** argues that all applications which had received positive opinions from EC scientific committees in 1998 were prevented by the Commission from progressing in the approval process. The Commission did so by holding lengthy inter-service consultations in September 1998 and May 1999. According to Argentina, a first group of these applications – those concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet – was delayed by inter-service consultations which began in September 1998. The relevant applications did not reach the Regulatory Committee stage until June or October 1999. A second group of applications – those concerning Bt-531 cotton and RR-1445 cotton – reached the Regulatory Committee stage, but failed to achieve a qualified majority vote in the Regulatory Committee in February 1999. The Commission launched inter-service consultations in May 1999 on draft measures to be submitted to the Council, but the Commission did not submit any draft measures, and so the applications in question made no progress

[1148] In three approval procedures there were three Group of Five countries which raised and maintained objections, and in another three approval procedures there were two Group of Five countries which did so.

[1149] In relation to DS291 and DS292, we note that the United States and Canada have demonstrated that in some of the nine relevant approval procedures objections by Group of Five countries were based on reasons which explicitly included those underlying the June 1999 declaration.

[1150] Indeed, if a Group of Five country opposed the placing on the market of a biotech product and it considered there existed, in its view, clear product- or application-specific reasons for doing so, then there was no need for it to fall back on the more general reasons underlying the June 1999 declaration. In other cases, however, the relevant Group of Five country might well have wished to base its opposition to the product in question on the June 1999 declaration. Cases in point are Denmark's first objection concerning Bt-11 maize (EC-69), which was based on product- and application-specific reasons (Exhibit EC-69/At. 66), and Denmark's objection concerning Bt-11 sweet maize (food), which was based on the June 1999 declaration (Exhibit EC-92/At. 27).

until they had to be updated under Directive 2001/18 in January 2003. For Argentina, the September 1998 and May 1999 inter-service consultations undertaken by the Commission are evidence of the existence of a general *de facto* moratorium. Argentina finds further support for this view in the circumstance that the "inter-service consultation" phase was not provided for in Directive 90/220.

7.1256 The **Panel** has already addressed the delays that occurred as from May 1999 as a result of the Commission's inter-service consultations on the applications concerning Bt-531 cotton and RR-1445 cotton. Accordingly, the Panel need only address the inter-service consultations on the applications concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet. These consultations were all launched in September 1998. The Panel considers that in addition to these three approval procedures mentioned by Argentina, the approval procedures concerning MON809 maize, the Transgenic tomato, Bt-531 cotton and RR-1445 cotton are also relevant. These additional applications also received favourable opinions from EC scientific committees in 1998[1151], and the Commission launched inter-service consultations on them in or before September 1998[1152]. The following table summarizes the factual situation.

Application	Commission inter-service consultations on draft measure to be submitted to Regulatory Committee	Launch by Commission of vote in Regulatory Committee	Vote in Regulatory Committee	Commission inter-service consultations on draft measure to be submitted to Council
MON809 maize	12/06/1998	04/09/1998	23/10/1998 (absence of qualified majority)	01/02/1999
Transgenic tomato	05/10/1998	26/11/1998	18/12/1998 (absence of qualified majority)	16/02/1999
Bt-531 cotton	04/09/1998	26/11/1998	22/02/1999 (absence of qualified majority)	07/05/1999
RR-1445 cotton	04/09/1998	26/11/1998	22/02/1999 (absence of qualified majority)	07/05/1999
Falcon oilseed rape	04/09/1998	29/06/1999	29/10/1999 (no vote) 09/03/2000 (no vote)	
MS8/RF3 oilseed rape	04/09/1998	30/06/1999	29/10/1999 (no vote) 09/03/2000 (no vote)	
RR fodder beet	04/09/1998		29/10/1999 (no vote)	

7.1257 The above table shows that the Commission on 4 September 1998 began inter-service consultations on five different applications. While in the approval procedures concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet, these consultations apparently went on for almost ten months (or more in the case of RR fodder beet), in the approval procedures concerning Bt-531 and RR-1445 cotton, the consultations were completed much sooner, in less than three months. In considering this discrepancy, account should be taken of the four votes which took place in the Regulatory Committee after 4 September 1998. As is clear from the table, the application concerning MON809 maize was voted on in October 1998, the application concerning the Transgenic tomato in December 1998, and the applications concerning Bt-531 cotton and RR-1445 cotton in February 1999. In each case, the Commission's draft measure approving the relevant application failed to obtain the necessary qualified majority. It may well be that in view of these four successive "defeats" in the Regulatory Committee, the Commission did not find it opportune quickly to launch

[1151] Exhibits EC-83/At. 54; EC-84/At. 42; EC-65/At. 47; EC-66/At. 43.
[1152] Exhibits EC-83/At. 55; EC-84/At. 43; EC-65/At. 48; EC-66/At. 44.

further votes on other applications submitted under Directive 90/220. The timing of the launch of the next votes – 29 June 1999 for Falcon oilseed rape and 30 June 1999 for MS8/RF3 oilseed rape – tends to suggest that the Commission preferred to wait until after the Environment Council meeting of 24/25 June 1999 at which a Common Position was adopted on the proposal to amend Directive 90/220.[1153]

7.1258 The Panel is not convinced that the Commission's conduct in respect of the applications concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet supports Argentina's and the other Complaining Parties' assertion that a general moratorium on approvals was in effect already as from October 1998. It was not until June 1999 that the Group of Five countries announced that they would take steps to suspend new approvals. Moreover, the record of the above-mentioned four votes shows that only some of the five member States which later issued the June 1999 joint declaration voted against the Commission's draft measures.[1154] In the absence of evidence of systematic member State opposition to final approvals, comparable to the kind of opposition announced in June 1999 by the Group of Five countries, there is no apparent reason to believe that the Commission's conduct reflects a decision to prevent the final approval of applications.

7.1259 It might be argued that the Commission's four successive "defeats" in the Regulatory Committee could be evidence of reluctance on the part of certain member States to approve applications under Directive 90/220 which was considered to require amendment. Even accepting this argument, the circumstance that the Commission could have found it increasingly difficult to get member States to vote in favour of applications submitted under Directive 90/220 might provide a rationale for not precipitating further votes. But it does not provide a plausible rationale for the Commission deciding not to make full use of its powers under Directive 90/220 and not to complete approval procedures on its own, if necessary. It is noteworthy in this respect that the Commission eventually did call votes on the applications concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet. The Commission did not do so in the case of applications which had obtained favourable opinions from EC scientific committees after the June 1999 declaration by the Group of Five countries. The view that a moratorium on approvals was not already in effect as from October 1998 draws further support from the explanation offered by Greece for abstaining from voting on the Transgenic tomato in December 1998. Greece stated that "we support the *idea* of a 'moratorium' for G.M.O., as presented by some Member-States".[1155] This statement suggests that a moratorium was an idea entertained by some member States at the time, but not that it was a reality.

7.1260 The Panel does not agree with Argentina that the very fact that the Commission launched inter-service consultations is evidence of a *de facto* moratorium on approvals.[1156] It is correct that Commission inter-service consultations were not provided for in Directive 90/220 as a distinct stage in the approval process.[1157] However, as the European Communities explained in response to a question from the Panel, inter-service consultation is a process internal to the Commission, designed

[1153] Particularly in relation to MS8/RF3 oilseed rape and RR fodder beet, some of the delay may also be attributable to additional information supplied by the applicant.

[1154] Regarding MON809 maize, only Greece voted against, with Denmark, France and Luxembourg abstaining. Exhibit EC-83/At. 65. Regarding the Transgenic tomato, no Group of Five country voted against. Greece and Luxembourg abstained. Exhibit EC-84/At. 45. Regarding Bt-531 cotton, Denmark, France and Greece voted against, with Luxembourg abstaining. Exhibit EC-65/At. 59. Regarding RR-1445 cotton, Denmark, France and Greece voted against, with Luxembourg abstaining. Exhibit EC-66/At. 57.

[1155] Exhibit EC-84/At. 45 (emphasis added).

[1156] The United States makes a similar argument about the inter-service consultations launched in May 1999 on the applications concerning Bt-531 cotton and RR-1445 cotton. US second written submission, paras. 56-57; US first oral statement, para. 30.

[1157] *En passant*, the Panel notes that the same is true for Directive 2001/18 and Regulation 258/97.

to ensure that the Commission services with a legitimate interest in the matter on which a Commission decision is being prepared, work in close co-operation and in co-ordinated fashion.[1158] As the European Communities also pointed out, inter-service consultation is mandated by the Commission's rules of procedure for the preparation and implementation of each Commission decision.[1159] It is clear to the Panel, therefore, that the inter-service consultations of September 1998 were not an additional procedural stage devised by the Commission to prevent the approval of biotech products.

7.1261 In the light of the above considerations, the Panel concludes that the time taken by the Commission to submit to the Regulatory Committee draft measures on the applications concerning Falcon oilseed rape, MS8/RF3 oilseed rape and RR fodder beet does not support Argentina's and the other Complaining Parties' assertion that the European Communities applied a general moratorium on final approvals already as from October 1998.

(v) Concluding observations

7.1262 The Panel notes that the Complaining Parties did not present detailed arguments in respect of each of the individual approval procedures discussed above. In fact, Canada and Argentina did not present any arguments in respect of some of these approval procedures. The European Communities argues in this regard that addressing only a limited selection of individual approval procedures is not sufficient to prove the existence of an across-the-board moratorium, *i.e.*, of a moratorium which applies to any and all applications which were pending during the relevant time period.[1160] In other words, according to the European Communities, the Complaining Parties cannot sustain their burden of establishing a prima facie case of the existence of a general moratorium on approvals unless they provide detailed evidence and arguments in respect of each and every of the above-mentioned individual approval procedures. In response to a question from the Panel, the Complaining Parties dispute this EC argument.[1161]

7.1263 The Panel agrees with the European Communities that the Complaining Parties could have sought to establish a prima facie case of the existence of a general, or across-the-board, moratorium by offering evidence and argumentation in respect of each and every of the individual approval procedures which were pending between October 1998 and August 2003. But the Panel cannot accept the European Communities' suggestion that this was the only way in which the Complaining Parties could discharge their burden of demonstrating prima facie that the alleged moratorium applied to all pending applications.

7.1264 As is clear from the Panel's preceding analysis, the Complaining Parties have provided other relevant evidence and argumentation to demonstrate the generality of the alleged moratorium. First and foremost, the Complaining Parties demonstrated that not a single biotech application under consideration between October 1998 and August 2003 was approved on or before the date of establishment of this Panel. Moreover, the Complaining Parties relied on the June 1999 declaration by the Group of Five countries, which states that the Group of Five countries "will take steps to have *any* new authorizations for growing and placing on the market suspended" (emphasis added). Finally, the Complaining Parties submitted numerous EC documents and statements by EC or member State

[1158] EC reply to Panel question No. 94. In response to a question from Argentina, the European Communities defined "inter-service consultation" as the process by which the lead service(s) consults with other interested services. EC reply to Argentina's question Nos. 9 and 10.

[1159] *Ibid*.

[1160] EC second written submission, footnote 212.

[1161] Complaining Parties' replies to Panel question No. 179.

officials. The Panel found that these documents and statements support the Complaining Parties' assertion that the European Communities applied a general moratorium during the relevant time period. In the specific circumstances of this case, these elements of proof taken together are sufficient, in the Panel's view, to establish a prima facie case of the generality of the alleged moratorium.

7.1265 Having regard to the individual approval procedures which the Complaining Parties did address, the Panel notes that, according to the Complaining Parties, these approval procedures confirm that certain member States and/or the Commission did cause delays or prevent the final approval of applications in the manner alleged by the Complaining Parties. The relevant approval procedures support this contention. To illustrate this, the Panel recalls below its findings on member States' and the Commission's ability to delay or prevent the final approval of applications and indicates whether it has been established that member States and/or the Commission actually did delay or prevent the approval of applications in this manner. The Panel begins with the relevant member State actions and/or omissions:

(a) The Panel found that the lead CA could delay the completion and circulation of its initial assessment. The United States and Canada have established that a Group of Five country delayed the completion and circulation of its initial assessment, so much so that the applicant withdrew the application.[1162] The European Communities has correctly pointed out, however, that the same Group of Five country in another approval procedure[1163] in April 1999 transmitted to the Commission a favourable initial assessment and that it confirmed that assessment in June 2003, after the application had been updated in accordance with the requirements of Directive 2001/18.[1164] To the extent this is viewed as inconsistent behaviour[1165], it suggests that in situations where the relevant Group of Five country acted as the lead CA, it was not in all cases prepared to assume the possible consequences of delaying or blocking action[1166].

[1162] The approval procedure in question is that concerning RR oilseed rape (EC-79).
[1163] The approval procedure in question is that concerning Bt-11 maize (EC-69).
[1164] EC reply to Panel question No. 87.
[1165] A special circumstance which should be pointed out is the previously mentioned fact that the biotech product at issue – Bt-11 maize – had already been approved for marketing in the European Communities in April 1998, although not for cultivation (Bt-11 maize (EC-163)), which was the use at issue in the approval procedure concerning Bt-11 maize (EC-69).
[1166] By failing to complete its initial assessment, a lead CA exposes itself to the risk of legal action being instituted against it under its own domestic law. EC first written submission, para. 186. There is no such risk, or less of a risk, where a Group of Five country avails itself of its right to object to an initial assessment prepared by a lead CA, or exercises its right to vote against a draft measure submitted by the Commission to the Regulatory Committee or to the Council. For this reason, the Panel does not consider that the fact that France in April 1999 and June 2003 transmitted a favourable initial assessment of Bt-11 maize (EC-69) to the Commission is necessarily inconsistent with the June 1999 declaration by the Group of Five countries. France may have considered that other Group of Five countries, and even the Commission, would take the necessary steps to delay or prevent Bt-11 maize (EC-69) from being approved at member State level or at Community level.

With reference to DS291, the Panel notes that the United States submitted a July 1999 news report which is consistent with the view that Group of Five countries which acted as lead CAs might not always have been willing to face the possible legal consequences of delaying or blocking action. The news report states that "the Commission pointed out on 15 July 1999 that France and Denmark have GMO applications pending, even though they were the leading proponents of GMO moratorium in June". The news report then reports the spokesman for then-Environment Commissioner Ritt Bjerregard to have said that "[w]e cannot understand why

(b) The Panel found that member States other than the lead CA could object to the placing on the market of a biotech product following a favourable assessment by the lead CA. The record establishes that one or more Group of Five countries raised and maintained an objection in each of the approval procedures in which the deadline for raising objections expired in the period between June 1999, when the Group of Five countries made their joint declaration, and August 2003.

(c) The Panel found that a group of member States that constituted a blocking minority could prevent the appropriate Regulatory Committee or the Council from reaching the qualified majority necessary to adopt a draft measure proposing approval of an application. The Panel also found that the Group of Five countries constitute such a group of member States and that the formation of that group was announced in June 1999 in a joint declaration. In this respect, the record makes clear that there was no vote on any application in the Regulatory Committee or the Council between June 1999 and August 2003. It is therefore not possible to establish that consistent with their June 1999 joint declaration, the Group of Five countries cast their votes in the Regulatory Committee or the Council in such a way as to prevent the necessary qualified majority from being reached.

(d) The Panel found that the lead CA could refuse to give its consent to the placement on the market of a biotech product after the Commission has approved an application. The United States and Canada have established that one Group of Five country refused to give its consent to the placement of a biotech product after the Commission had approved the application.[1167]

7.1266 The Panel now turns to relevant Commission actions and/or omissions:

(a) The Panel found that the Commission could delay the submission of a draft measure to the appropriate Regulatory Committee, or it could fail to convene the Regulatory Committee for a vote on a draft measure which has been submitted. The United States, Canada and Argentina have established that the Commission failed to submit draft measures to the appropriate Regulatory Committee.[1168] The United States and Canada have further established that the Commission failed to re-convene the Regulatory Committee for a vote on a draft measure which had been previously submitted, but on which no vote was held.[1169]

(b) The Panel found that the Commission could delay the submission of a draft measure to the Council where the Regulatory Committee was unable to reach the qualified

---

these countries do not withdraw their applications after all the statements they made at the Council of Ministers. [...] It is one thing to make all these grand declarations and go before the press and assert their desire for a moratorium. But it seems to be another to take the step of withdrawing their applications. Until these applications are withdrawn, the Commission has a clear legal obligation to pursue the procedures set out in the EEC/90/220 directive". The news report also quotes the spokesman as saying that "[w]e are basically asking the member states to put their money where their mouth is". "EU Official Calls on Members to Pull GMO Applications in Light of 'Moratorium'", International Trade Reporter, 21 July 1999, p. 1214 (Exhibit US-96).

[1167] *See* the Panel's earlier analysis of the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape.

[1168] *See* the Panel's earlier analysis of various approval procedures under the sub-headings "Failure by the Commission to submit a draft measure to the Regulatory Committee".

[1169] *See* the Panel's earlier analysis of various approval procedures under the sub-heading "Failure by the Commission to re-convene the Regulatory Committee for a vote on a draft".

majority necessary to deliver an opinion. The United States, Canada and Argentina have established that the Commission failed to submit draft measures to the Council in a situation where the Regulatory Committee was unable to reach the qualified majority necessary to deliver an opinion.[1170]

7.1267 As a final matter, the Panel recalls the European Communities' assertion that the Complaining Parties' claims in respect of the general moratorium would collapse when the facts and history of each approval procedure are considered. The European Communities contended that an analysis of the relevant facts would show that during the relevant time period there were no acts and/or omissions which stalled applications at key decision-making stages in the approval process. In the alternative, the European Communities argued that even if the delays that occurred could be viewed as the result of a moratorium, that moratorium ended with the entry into force in January 2003 of Directive 2001/18.

7.1268 The Panel has undertaken an extensive analysis of each individual application discussed by the European Communities as well as of those applications which were withdrawn during the time period in question. As is clear from the above analysis, the facts and histories of the relevant approval procedures do not demonstrate that there were no acts and/or omissions which stalled applications at key decision-making stages in the approval process. To the contrary, for the time period from June 1999 to August 2003, the facts and histories of all approval procedures which have been examined are consistent with the Complaining Parties' assertion that during that time period Group of Five countries and/or the Commission were delaying or preventing the final approval of applications.

7.1269 Moreover, the Panel's analysis does not bear out the European Communities' alternative contention that any acts and/or omissions which might have served to prevent the final approval of applications prior to the entry into force of Directive 2001/18 ended when that Directive entered into force in January 2003. The Panel found in this regard (i) that at the member State level there were delays in the processing of applications under Directive 2001/18 which are consistent with the existence of a moratorium on final approvals, (ii) that Group of Five countries continued to oppose the approval of applications even though they had been updated in accordance with the requirements of Directive 2001/18; and (iii) that, as of August 2003, no procedure had reached the stage where the Commission could have taken action to delay or prevent the final approval of an application.[1171]

7.1270 It follows from the foregoing that the Panel's analysis of individual approval procedures does not lead to the "collapse" of the Complaining Parties' claim that the European Communities applied a general *de facto* moratorium on approvals. Nevertheless, while the Panel considers that the facts and histories of individual approval procedures are consistent with the Complaining Parties' contention that a general moratorium was in effect in August 2003, the Panel was not persuaded that the facts and histories of these procedures support the Complaining Parties' claim that a general moratorium was in effect already before June 1999, and, more specifically, as from October 1998.

(f) Overall conclusions

7.1271 The Panel has now completed its consideration of the various elements it said it would address. To determine to what conclusion these elements lead, it is useful to recall the Panel's main findings:

[1170] *See* the Panel's earlier analysis of various approval procedures under the sub-heading "Failure by the Commission to submit a draft measure to the Council".

[1171] *See supra*, paras. 7.1032-7.1034.

(a) The Panel found that during the relevant time period (October 1998 to August 2003) member States and the Commission had the ability and opportunity to prevent or delay the approval of applications in the manner identified by the Complaining Parties.

(b) The Panel found that the June 1999 joint declaration by the Group of Five countries constitutes direct evidence of an intention on the part of the relevant five member States (Denmark, Italy, France, Greece and Luxembourg) to do what was within their power to prevent the approval of further applications, pending the adoption of EC rules concerning labelling and traceability of biotech products. The Panel also found that because of the June 1999 declaration by the Group of Five countries, the Commission had reason to believe that it could no longer approve applications with the (qualified majority) support of the member States. The Panel found it plausible that the systematic opposition by the Group of Five countries was an issue for the Commission, and that this situation, while it continued, could have affected the Commission's readiness to make full use of the relevant procedures to complete the approval process.

(c) The Panel found that no applications were approved between October 1998 and August 2003. This is despite the fact that a large number of applications were pending and that many of these had received one or more favourable scientific assessments. The Panel also noted that before October 1998 ten agricultural biotech products had been approved and that after August 2003 three applications were approved. The Panel highlighted the fact that the post-August 2003 approvals were granted when the present panel proceedings were already under way.

(d) The Panel found that each of the Complaining Parties had submitted numerous official and internal EC documents and statements by high-ranking officials which explicitly state that the reason for the absence of approvals was a general *de facto* moratorium on approvals. The Panel also found that the documents and statements submitted by each Complaining Party permit the inference that a general moratorium was in effect between June 1999 and August 2003. The Panel was not convinced that they warrant the inference that a general moratorium was in effect already as from October 1998, or that it ended in January 2003, when Directive 2001/18 entered into force.

(e) The Panel found that the facts and histories of individual approval procedures confirm that Group of Five countries and/or the Commission did cause delays or prevent final approvals in the manner alleged by the Complaining Parties.

(f) The Panel found that for the time period from June 1999 to August 2003 the facts and histories of all approval procedures examined by the Panel are consistent with the Complaining Parties' assertion that the final approval of applications was intentionally being prevented by Group of Five countries and/or the Commission. The Panel was not persuaded that it can be inferred from the facts and histories of the relevant approval procedures that a general *de facto* moratorium was in effect already as from October 1998, or that it ended in January 2003, when Directive 2001/18 entered into force.

7.1272 The Panel considers that all of these findings taken together lead logically to the following conclusion:

(i) that a moratorium on approvals was in effect in the European Communities between June 1999 and August 2003, when this Panel was established;

(ii) that this moratorium was generally applicable, *i.e.*, to all applications for approval which were pending between June 1999 and August 2003 under Directives 90/220 and/or 2001/18 or under Regulation 258/97; and

(iii) that this moratorium was applied *de facto*, *i.e.*, without having been adopted through a formal EC rule- or decision-making process, and, more particularly, that the final approval of applications was prevented by the Group of Five countries[1172] and/or the Commission through their actions and/or omissions.

7.1273 The Panel also considers that the record supports the inference that the Group of Five countries and the Commission prevented the final approval of applications pursuant to decisions which were intended to be generally applicable. In the case of the Group of Five countries, it can be inferred from their June 1999 joint declaration that they decided to use their powers in the approval process so as to prevent any and all new applications from being approved, until new EC rules on labelling and traceability were adopted. The actual conduct of these countries in the context of individual approval procedures is consistent with the existence of such decisions. During the relevant time period (June 1999 to August 2003), numerous applications received favourable initial assessments from the lead CA. But in each case, one or more Group of Five countries objected to the placing on the market of the relevant biotech product, sometimes explicitly invoking the Group of Five declaration as a reason for their objection. This meant that no application was approved at member State level. At Community level, the Regulatory Committee or the Council did not proceed to a vote on any application between June 1999 and August 2003. There thus exists no information about the voting behaviour of the Group of Five countries during that time period.

7.1274 Regarding the Commission, the Panel made the point that the Commission was faced with highly exceptional circumstances when in June 1999 the Group of Five countries formally signalled its systematic opposition to final approvals. In the Panel's view, it is plausible that the Commission in those circumstances effectively decided not to make full use of the relevant procedures to complete the approval process. In fact, during the relevant time period there was no case where the Commission completed the approval process. Moreover, the Panel's analysis of the facts and histories of individual approval procedures reveals a clear and repeated pattern of inaction, or delayed action, by the Commission at certain stages of the EC approval processes. It shows that the Commission repeatedly failed to forward draft measures to the Council in situations where the Regulatory Committee did not reach the required qualified majority. It also shows that the Commission repeatedly failed to submit a draft measure to the Regulatory Committee, or failed to call a vote in the Regulatory Committee. In the Panel's assessment, the aforementioned elements – the exceptional circumstances presented by the formation of the Group of Five, the fact that the Commission did not approve a single application during the relevant time period, and the fact that during the same time period there was an observable pattern of inaction by the Commission – warrant the inference that the

[1172] The Panel's reference to the Group of Five countries is not intended to suggest that there were no member States other than the Group of Five countries which took steps, during part of the relevant time period (June 1999 to August 2003), with a view to delaying or preventing the final approval of any and all applications. It should be recalled in this respect that Canada submitted evidence which shows that in February 2001 Austria formally expressed its support for the June 1999 declaration by the Group of Five countries, and that the United States submitted a document which suggests that Belgium as of December 2001 also supported the June 1999 declaration by the Group of Five countries.

Commission's conduct was the result of an effective decision not to make full use of the relevant procedures to complete the approval process.[1173]

7.1275 The European Communities appears to argue that the described pattern of inaction by the Commission should rather be considered as a practice in the sense of a pattern of similar responses to a similar set of circumstances.[1174] The European Communities' concept of practice implies that the Commission was engaged in case-by-case decision-making to formulate and develop policy, and that the Commission's conduct in specific cases was subsequently repeated in similar cases, with the consequence that this conduct crystallized into a practice.

7.1276 The Panel is not persuaded that the Commission's conduct reflects nothing more than a practice as that term is understood by the European Communities. True enough, a pattern of inaction could point to the existence of a Commission practice. But it may equally be the consequence of a generally applicable decision by the Commission. Furthermore, the mere fact that the record contains no document embodying such a Commission decision does not imply that no such decision existed and that the described pattern of inaction amounted to a practice. It is important to bear in mind in this regard that the Commission had to respond to decisions of the Group of Five countries which were applicable to all pending and new applications. In these circumstances, the most logical course of action was for the Commission to define and establish a policy which was likewise applicable to all pending and new applications. This was not a situation where the Commission lacked the necessary information to make a general decision and where it was therefore advisable to proceed on a case-by-case basis. The June 1999 declaration by the Group of Five countries provided the Commission with a clear and predictable scenario of how the Group of Five countries would exercise their powers in the context of the EC approval process.

7.1277 Without prejudice to the preceding remarks, the Panel would accept that, in one sense, the Commission's conduct might be considered to reflect a practice. The practice the Panel is referring to relates to the implementation of the Commission's effective decision not to make full use of the relevant procedures to complete the approval process. It is reasonable to assume that there was no predetermined general policy with regard to implementation, as implementation necessarily had to take account of attendant circumstances, including, most notably, the stage in the relevant EC approval procedure to which particular applications had progressed. Indeed, the record shows that the Commission's conduct varied according to the procedural stage reached by a given application.[1175] Another indicator that there was no predetermined general policy with regard to implementation is the circumstance that at one point the Commission changed its conduct in relation to applications which

[1173] For present purposes, it matters little whether the Commission's effective decision was intended to establish Commission policy for several years or whether the decision was tacitly renewed from time to time. Regarding the 2004 approvals of Bt-11 maize (food), NK603 maize and NK603 maize (food), it should be noted that there is no evidence on record which would demonstrate that the Commission decided before 29 August 2003 to complete the approval process in respect of the aforementioned applications. In the case of Bt-11 sweet maize (food), a draft measure was on the agenda of the relevant Regulatory Committee on 8 November 2003. The record does not indicate when the Commission forwarded the draft measure. Exhibit EC-92/At. 67. In the case of NK603 maize, the Commission launched inter-service consultations on a draft measure only on 8 December 2003. Exhibit EC-76/At. 71. Finally, in the case of NK603 maize (food), a draft measure was presented to the Regulatory Committee on 30 April 2004. Here again, the record does not indicate when the Commission forwarded the draft measure. Exhibit EC-96/At. 42. In the light of the evidence on record, there is therefore no reason to doubt that a general *de facto* moratorium was still in effect on 29 August 2003.

[1174] EC first written submission, paras. 566 *et seq.*; EC second written submission, footnote 213.

[1175] For instance, the Commission did not forward draft measures to the Council when the Regulatory Committee did not reach the required qualified majority. In contrast, the Commission initially did forward draft measures to the Regulatory Committee for a vote.

had reached a certain procedural stage. Specifically, the Commission initially forwarded draft measures to the Regulatory Committee for a vote.[1176] Subsequently, however, the Commission stopped doing so.[1177] This shift from one pattern of conduct to another could be interpreted as a change in implementation practice. Such a change in implementation practice would in no way be inconsistent with the view that there was an effective decision by the Commission not to complete the approval process with respect to any pending or new application.[1178]

7.1278 The Panel now turns to address the European Communities' argument that in cases where, as here, the actions and/or omissions of different entities are alleged to be part of a single measure, it is necessary to show that these entities follow a common plan or course of action. The European Communities asserts in this respect that the term "measure" is defined as "a plan or course of action intended to achieve some object".

7.1279 The Panel considers that by not making full use of its powers to complete the approval process, the Commission knowingly entered into effective (*de facto*) co-operation with the Group of Five countries. Indeed, in the Panel's view, the absence of final approvals during the relevant time period is a direct consequence of effective co-operation between the Group of Five countries and the Commission. The Group of Five countries could not have imposed the desired general moratorium on approvals without the co-operation of the Commission. And it is most unlikely that the Commission would have been dissuaded from making full use of the approval procedures if it had not been of the view that the Group of Five countries constituted a credible and stable "blocking minority".

7.1280 It is important to mention that there is nothing in the record to suggest that the Commission unqualifiedly supported the decision of the Group of Five countries to prevent the final approval of applications pending the adoption of new EC rules on labelling and traceability. To the contrary, the "interim approach" developed by the Commission in July 2000 was intended to allow for the resumption of approvals.[1179] But the record shows that even after July 2000 the Commission failed to make full use of the approval procedures.[1180] In other words, the record supports the conclusion that even after July 2000 there continued to be effective co-operation between the Commission and the Group of Five countries.

7.1281 Based on the foregoing observations, the Panel considers that between June 1999 and August 2003 the Group of Five countries and the Commission did follow a common "plan or course of action".[1181] The relevant "plan" consisted in preventing the final approval of applications pending the adoption of new EC rules on labelling and traceability. The fact that the Commission might have disliked the "plan", or sought to change it, is immaterial as long as the Commission did not actually follow a different "plan". As noted, there is no indication that this was the case.

[1176] For instance, in the case of the approval procedure concerning Falcon oilseed rape.

[1177] For instance, in the case of the approval procedure concerning Bt-11 maize (EC-69).

[1178] There would be no inconsistency even if it were assumed that the Commission initially sought to test the resolve of the Group of Five countries to abide by their June 1999 declaration, by launching votes in the Regulatory Committee. There is no indication in the record that the Commission was the initiator of a moratorium on approvals. The Commission's willingness to implement its effective decision not to complete the approval process with respect to any pending or new application may well have been contingent on the Group of Five countries acting in accordance with their June 1999 declaration.

[1179] For an explanation of the "interim approach", *see supra*, footnote 637.

[1180] *See*, *e.g.*, the approval procedures concerning Bt-531 cotton, RR-1445 cotton , MON809 maize and the Transgenic tomato.

[1181] The Panel is not convinced that the Group of Five countries and the Commission followed a common "plan" prior to June 1999.

7.1282 The European Communities submits, however, that it is not enough for the Group of Five countries and the Commission to have followed a common "plan or course of action". According to the European Communities, the Group of Five countries and the Commission must also have treated their plan of preventing the final approval of applications as *de facto* binding. Otherwise, the European Communities' argument implies, the application of separate decisions by the Group of Five countries and the Commission could not be considered to have produced a new and intended measure, *i.e.*, a general moratorium on approvals.

7.1283 The record does not indicate that either the Group of Five countries or the Commission followed their common plan of preventing the final approval of applications as *de facto* binding. However, there were clear incentives for the common plan to be followed. As we have said earlier, the Group of Five countries could not have imposed the desired general moratorium on approvals without the co-operation of the Commission. And the Commission had grounds for believing that if it did not co-operate with the Group of Five countries, it would have to complete on its own all approval procedures concerning pending applications, due to the "blocking minority" held by the Group of Five countries.

7.1284 At any rate, the European Communities does not explain the basis for its view that the Group of Five countries and the Commission needed to treat their common plan as *de facto* binding. We can see that the question of whether or not the Group of Five countries and the Commission were following their common plan as binding might possibly have an impact on the stability and "lifespan" of the general moratorium on approvals. But we do not consider that, in the case before us, the question of whether the plan at issue was viewed as binding determines whether or not the general moratorium constitutes a measure. We perceive no meaningful difference between a general moratorium on approvals that is applied by the relevant EC entities "voluntarily" and one that is applied pursuant to an enforceable agreement. In neither case, final approvals are granted while the moratorium is being applied. In view of this equivalence of effects, we see no force in the argument that a "binding" moratorium on approvals constitutes a measure for WTO purposes, but that a "voluntary" moratorium on approvals does not. Indeed, were we to accept this argument, Members could evade WTO disciplines governing the application of a moratorium on approvals by applying a "voluntary" rather than a "binding" moratorium.

7.1285 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities applied a general *de facto* moratorium on the approval of biotech products between June 1999 and August 2003.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities applied a general *de facto* moratorium on the approval of biotech products between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities applied a general *de facto* moratorium on the approval of biotech products between June 1999 and August 2003.

3. Whether the Panel may and should make findings on the WTO-consistency of the general *de facto* moratorium on approvals

7.1286 According to the **European Communities**, even if the Panel finds, as it has, that a general *de facto* moratorium on approvals was being applied by the European Communities between June 1999 and August 2003, this would not automatically mean that the Panel may, or should, make findings on the WTO-consistency of the general moratorium. More particularly, the European Communities argues that the Panel may only make findings on the WTO-consistency of the general moratorium if the moratorium is a challengeable measure under the *WTO Agreement*. And even if that is the case, the Panel should not, in the European Communities' view, make findings on the WTO-consistency of the general moratorium if the moratorium ceased to exist after the date of establishment of the Panel. The European Communities considers that in such circumstances the issue of the WTO-consistency of the general moratorium would be moot and the Panel should refrain from making a ruling on the moratorium.

7.1287 The **Panel** considers that the issues raised by the European Communities are pertinent, and it will therefore examine below (i) whether the moratorium on approvals is a challengeable measure, and if so, (ii) whether the Panel should decline to make findings on the WTO-consistency of the moratorium on approvals if subsequent to the establishment of the Panel the moratorium ceased to exist.

(a) Whether the moratorium on approvals is a challengeable measure

7.1288 The European Communities has argued that the general *de facto* moratorium on approvals cannot be challenged under the *WTO Agreement* because, in its view, the Complaining Parties are not challenging a measure, but a practice – a repeated pattern of suspending consideration of individual applications. The Panel has already dealt with this argument, finding that the general d*e facto* moratorium was the result, not of a mere practice by the Group of Five countries and the Commission, but of separate decisions by these same EC entities, which were intended to be generally applicable.

7.1289 Nevertheless, since the issue was put before us by the European Communities, it is still useful to consider whether the moratorium on approvals, when understood as a measure rather than as a practice, is a challengeable measure. By "challengeable measure" we mean a measure which can be the subject of WTO dispute settlement proceedings. In *US – Carbon Steel*, the Appellate Body had this to say about the measures which may be challenged before a WTO panel:

> "In principle, any act or omission attributable to a WTO Member can be a measure of that Member for purposes of dispute settlement proceedings. The acts or omissions that are so attributable are, in the usual case, the acts or omissions of the organs of the state, including those of the executive branch."[1182]

[1182] Appellate Body Report, *US – Carbon Steel*, para. 81 (footnotes omitted).

7.1290 What sets the moratorium on approvals apart from most other measures challenged before WTO panels are two elements: (i) it is a *de facto* measure, *i.e.*, a measure which was not adopted through a formal EC rule- or decision-making process, and (ii) it is the result of the application of separate decisions by the Group of Five countries and the Commission.

7.1291 We first consider the circumstance that the moratorium is a d*e facto* measure. We note in this regard the Appellate Body's reference to "*any* act or omission attributable to a WTO Member" (emphasis added). In our view, the broad phrase "any act or omission" can encompass both *de jure* measures and *de facto* measures. Reinforcing this view is the circumstance that if *de facto* measures could not be challenged, Members could circumvent their WTO disciplines. For they could then achieve through *de facto* measures what they would not be allowed to achieve through *de jure* measures.

7.1292 As noted, the other particularity of the moratorium is the fact that the moratorium is the result of the application of separate decisions by the Group of Five countries and the Commission. In other words, the moratorium is a measure which is the result of other measures (decisions) applied separately by the Group of Five countries and the Commission. The *WTO Agreement* nowhere says that a measure which is the result of several separate measures is not a challengeable measure. Moreover, the GATT panel in *Japan – Semi-Conductors* found that an inconsistency with Article XI:1 of the GATT 1994 could result from a combination of separate measures:

> "All these factors led the Panel to conclude that an administrative structure had been created by the Government of Japan which operated to exert maximum possible pressure on the private sector to cease exporting at prices below company-specific costs. This was exercised through such measures as repeated direct requests by MITI, *combined with* the statutory requirement for exporters to submit information on export prices, the systematic monitoring of company and product-specific costs and export prices and the institution of the supply and demand forecasts mechanism and its utilization in a manner to directly influence the behaviour of private companies. [...] The Panel considered that the *complex of measures* exhibited the rationale as well as the essential elements of a formal system of export control. [...] The Panel concluded that the *complex of measures* constituted a coherent system restricting the sale for export of monitored semi-conductors at prices below company-specific costs to markets other that the United States, inconsistent with Article XI:1."[1183]

7.1293 We therefore consider that the mere fact that the moratorium is the result of the application of separate decisions by the Group of Five countries and the Commission does not prevent it from being a challengeable measure.

7.1294 We recall, however, the Appellate Body's statement in *US – Carbon Steel* that a measure of a Member can only be challenged if the measure is attributable to that Member. Thus, for the general *de facto* moratorium on approvals to qualify as a challengeable EC measure, it must be attributable to the European Communities. We note that both the Commission and the individual member States which are part of the Group of Five from the perspective of public international law are organs of the European Communities. Accordingly, there can be no doubt that the general moratorium, which is the result of the application of separate decisions by these different EC organs, is attributable to the European Communities.

[1183] GATT Panel Report, *Japan – Semi-Conductors*, para. 117 (emphasis added).

7.1295 In the light of the foregoing considerations, we conclude that the general *de facto* moratorium on approvals constitutes a challengeable EC measure.

(b) Whether the Panel should decline to make findings on the WTO-consistency of the moratorium on approvals if subsequent to the establishment of the Panel the moratorium ceased to exist

7.1296 We now turn to examine the European Communities' further argument that even if the Panel may in principle make findings on the WTO-consistency of the moratorium on approvals because it is a challengeable measure, the Panel nevertheless should not do so if subsequent to the establishment of the Panel the moratorium ceased to exist.

7.1297 Specifically, the **European Communities** argues that if the Panel were to find that as of August 2003 the European Communities applied a general *de facto* moratorium on final approvals, the Panel would need to go on to determine whether that measure subsequently ceased to exist. The European Communities submits that if a measure is no longer in existence, any issues which may have been raised in relation to that measure are moot and a panel should not rule on that measure.[1184]

7.1298 The **United States** argues that the concept of mootness is not relevant to the claims related to the general moratorium on approvals. The measure the United States is requesting the Panel to examine and make findings on is the general moratorium as it existed in August 2003. Any issues relating to whether or not steps taken by the European Communities after August 2003 have brought the European Communities into compliance with its WTO obligations are not before the Panel. In any event, according to the United States, this is not a case in which the measure at issue has terminated. The United States does not agree that two token product approvals – the approvals concerning Bt-11 sweet maize (food) and NK603 maize[1185] – suffice to signal that the European Communities has begun to process other outstanding applications without undue delays. The United States points out that all other applications caught up in the moratorium remain unapproved. The United States submits that biotech product approvals remain a controversial political issue in the European Communities, and the recent expansion of the European Communities from 15 to 25 member States has not simplified the situation. In addition, a number of member States believe that yet additional legislation must be adopted before the granting of new biotech product approvals. And the European Communities has yet to approve a single biotech product for planting in the European Communities. Accordingly, the possibility is substantial that the European Communities – once freed from the pressure of this WTO proceeding – would halt all further approvals. In the view of the United States, it is thus of great import that the Panel issue a finding that the politically-based moratorium is not consistent with WTO rules.

7.1299 Like the United States, **Canada** argues that the question of mootness is not relevant to the claims related to the moratorium, as the moratorium has not ceased to exist. Despite recent Commission Decisions authorizing the placing on the market of two products, Bt-11 sweet maize (food) and NK603 maize, the evidence suggests that the approval of biotech products continues to be delayed and thwarted by the European Communities.[1186] In relation to the two products that have been authorized, the Commission has been forced to adopt decisions authorizing these products after

[1184] The European Communities has also argued that the concept of mootness is not relevant to the claims relating to the general moratorium. However, the European Communities said so under the hypothesis that the Panel finds that a general moratorium never existed.

[1185] We recall that the Commission in 2004 approved the application concerning NK603 maize under Directive 2001/18 and the application concerning NK603 maize (food) under Regulation 258/97.

[1186] Canada's third written submission, para. 196.

failures by both the Regulatory Committee and the Council to take decisions. Canada submits that as long as approvals are invariably granted only after products have gone through every conceivable procedural hoop, the moratorium must be considered to remain in effect. In any event, the continued intransigence on the part of member States, coupled with the complicated political and legal relationship between the member States and the Commission, reflect a very real possibility that, even if it could be said that the moratorium has been lifted, the moratorium could be reinstituted in the future.

7.1300 **Argentina** argues that the approval of Bt-11 sweet maize (food) did not imply the end of the *de facto* general moratorium on approvals. Argentina notes that there are in any event no assurances that the moratorium has ended. Argentina points out in this regard that the approval of Bt-11 sweet maize (food) may have occurred solely because of the establishment of this Panel.

7.1301 The **Panel** notes that the question it is mandated to answer is whether on the date of its establishment, that is to say, on 29 August 2003, the European Communities applied a general *de facto* moratorium on approvals. We have answered this question in the affirmative. The European Communities argues, however, that we should not review the WTO-consistency of that measure on the grounds that the measure has since ceased to exist.

7.1302 At the outset, we examine whether the record of this case indicates that the issue raised by the European Communities – whether the measure at issue, *i.e.*, the general *de facto* moratorium on approvals, ceased to exist after 29 August 2003 – is not merely hypothetical. If the case record indicates that this issue is not merely hypothetical, we think further examination of the EC argument would be warranted.

7.1303 The record shows that the applications concerning Bt-11 sweet maize (food) and NK603 maize (food) were definitively approved by the Commission under Regulation 258/97. Thus, it is not in doubt that after the Panel had been established at least two biotech products – Bt-11 sweet maize (food) and NK603 maize (food) – were definitively approved and hence could be placed on the EC market for specified uses.

7.1304 We note that the moratorium on approvals as alleged by the Complaining Parties was one under which applications were not allowed to move to a positive final approval decision. The Complaining Parties have also alleged that the moratorium applied *across-the-board*, *i.e.*, that it was applicable to *any and all* applications pending between October 1998 and August 2003. We further note that the Complaining Parties referred to the *absence of a single* approval between October 1998 and December 2003 as critical evidentiary support for their claim that the European Communities applied a general moratorium on approvals. In our earlier findings, we determined that the record supported these assertions by the Complaining Parties.[1187]

7.1305 In view of the foregoing, we consider that there is indeed an issue whether the general *de facto* moratorium on approvals which we found to have existed in August 2003 ceased to exist as a measure generally applicable to all biotech products with pending applications when the definitive approvals for Bt-11 sweet maize (food) and NK603 maize (food) were granted in 2004. Indeed, the applications concerning Bt-11 sweet maize (food) and NK603 maize (food) were applications which *were* allowed to move to a positive final approval decision. Therefore, a more detailed examination of the EC argument is, in our view, warranted.

[1187] *See supra*, para. 7.1285.

7.1306 We begin our examination by noting the following statement by the panel in *India – Autos*:

> "A WTO Panel is generally competent to consider measures in existence at the time of its establishment. This power is not necessarily adversely affected simply because a measure under review may have been subsequently removed or rendered less effective."[1188]

7.1307 A similar statement was made by a previous panel in *Indonesia – Autos*:

> "[I]n previous GATT/WTO cases, where a measure included in the terms of reference was otherwise terminated or amended after the commencement of the panel proceedings, panels have nevertheless made findings in respect of such a measure."[1189]

7.1308 It follows from these statements that in principle we have the authority to make findings on a measure within our terms of reference even if that measure subsequently ceased to exist. We note that the European Communities does not appear to contest this.[1190]

7.1309 The question which remains to be examined, therefore, is whether we should make use of our authority to review the WTO-consistency of the general moratorium on approvals as it existed in August 2003, if the general moratorium later ceased to exist. We consider that in determining whether to make findings on a measure no longer in existence on the date of establishment of a panel, panels should notably take account of the object and purpose of the dispute settlement system.[1191] Pursuant to Article 3.7 of the DSU, "[t]he aim of the dispute settlement mechanism is to secure a positive solution to a dispute".

7.1310 The Complaining Parties attach considerable importance to our offering findings on the moratorium as it existed in August 2003, even if it later ceased to exist. They note that most of the applications pending as of August 2003 are still awaiting final approval decisions. The United States and Canada also contend that there is a very real possibility that a general moratorium could subsequently be reintroduced. We consider these to be valid arguments. As numerous applications which were pending in August 2003 have not yet reached the stage of final decision-making, the approvals which were granted in 2004 do not fully address the concerns of the Complaining Parties.[1192] Moreover, the three approvals which were granted in 2004 were possible only because the Commission decided to make full use of the relevant EC approval procedures to complete the

---

[1188] Panel Report, *India – Autos*, para. 7.26.

[1189] Panel Report, *Indonesia – Autos*, para. 14.9.

[1190] The European Communities states that the Panel "should" not rule on such a measure, not that it does not have the authority, in principle, to rule on such a measure. EC second written submission, para. 151; EC reply to Panel question No. 7, paras. 26, 28 and 29.

[1191] This approach is consistent with that of the panel in *Chile – Price Band System*. The panel in that case stated that "[a]lthough we do not consider that the termination of a measure before the commencement of panel proceedings deprives a panel of the authority to make findings in respect of that measure, we would only make findings regarding the provisional safeguard measures in this case if we were to consider this necessary in order to 'secure a positive solution' to the dispute." Panel Report, *Chile – Price Band System*, para. 7.115.

[1192] We note, as an additional matter, that the European Communities does not argue that the relevant applications were approved in 2004 in order to address the concerns expressed by the Complaining Parties and, hence, to resolve the dispute in relation to the treatment of the relevant applications. The European Communities argues that the approvals which were granted in 2004 are simply the consequence of these applications having reached the final decision-making stage after being assessed at member State and Community level.

approval process. In all three cases, the relevant Regulatory Committee and the Council failed to achieve the required qualified majority. Also, the votes in all three cases were held after the European Communities adopted new EC rules on labelling and traceability, and in some cases even after these rules had entered into force. Notwithstanding this, some Group of Five countries continued to vote against approvals or abstained. Moreover, the Complaining Parties submit that certain member States stated that there needed to be new rules concerning coexistence and environmental liability before they could approve new applications.[1193]

7.1311 In addition to noting the continuing existence of opposition to approvals amongst member States, we also recall the informal, *de facto* nature of the general moratorium on approvals, which means that it can be re-imposed just as soon as it can be ended. In these circumstances, we agree that that even if the general moratorium ceased to exist after August 2003, if we were to find that the European Communities acted inconsistently with its WTO obligations by applying a general moratorium in August 2003, this could help prevent a WTO-inconsistent general moratorium from being reintroduced and, in this way, secure a positive solution to this dispute.[1194]

7.1312 In the light of the above, we do not agree with the European Communities that we should refrain from making findings on the general *de facto* moratorium on approvals as it existed in August 2003 in the event that it later ceased to exist. For the reasons mentioned, we find it appropriate to offer findings on the WTO-consistency of the general moratorium in effect in August 2003 irrespective of whether that measure subsequently ceased to exist.

7.1313 We now turn to consider the issue raised by the European Communities from the perspective of Article 19.1 of the DSU which states that "where a panel [...] concludes that a measure is inconsistent with a covered agreement, it shall recommend that the Member concerned bring the measure into conformity with that agreement". The United States argues that when a panel finds that a measure is WTO-inconsistent, it must recommend pursuant to Article 19.1 that the responding party bring that measure into conformity with its WTO obligations, regardless of whether the measure has ceased to exist after the panel was established. It should be noted in this connection that in *US – Certain EC Products*, the Appellate Body has stated that "the Panel erred in recommending that the DSB request the United States to bring into conformity a measure which the Panel has found no longer exists".[1195] The United States emphasises that the measure in that case had been terminated shortly before the panel was established. This is correct. But the Appellate Body nowhere suggested that the situation could be different in a case where a measure ceased to exist in the course of panel proceedings.[1196]

7.1314 We further note the panel report on *Canada – Wheat Exports and Grain Imports* wherein the panel refrained from making a recommendation in relation to a WTO-inconsistent measure which had

[1193] *See supra*, para. 7.530. *See also*, Exhibit EC-69/At. 125.

[1194] We note that if we were not to make findings on the general moratorium, there would effectively be a possibility of shielding it from scrutiny by a panel because this type of *de facto* measure could be ended shortly before or during panel proceedings and promptly re-imposed thereafter.

[1195] Appellate Body Report, *US – Certain EC Products*, para. 81. The Appellate Body in *US – Upland Cotton*, referring to its report on *US – Certain EC Products*, stated that "the fact that a measure has expired may affect what recommendation a panel may make". Appellate Body Report, *US – Upland Cotton*, para. 272.

[1196] The Appellate Body stated that "[a]s we have upheld the Panel's finding that [...] the measure at issue in this dispute [...] *is* no longer in existence, we do not make any recommendation to the DSB pursuant to Article 19.1 of the DSU. Appellate Body Report, *US – Certain EC Products*, para. 129 (emphasis added). In our view, if the Appellate Body had intended to distinguish between measures which ceased to exist before a panel was established and measures which ceased to exist in the course of panel proceedings, it would have used a phrase like "the measure at issue in this dispute was no longer in existence when the panel was established".

been amended in the course of the panel proceedings.[1197] Similarly, in *Dominican Republic – Import and Sale of Cigarettes*, the panel did not find it "appropriate" to make a recommendation in relation to a WTO-inconsistent measure concerning the determination of the tax base for cigarettes because that measure was "no longer in force" as a result of amendments which were made after the panel was established.[1198] While these cases concerned amendments, we think the same approach is logically applicable in a situation where a measure ceased to exist in the course of panel proceedings.[1199] Indeed, the panel in *EC – Commercial Vessels* stated that its recommendation to the European Communities that it bring the relevant measures into conformity with its obligations under the DSU did not apply to certain EC member State aid schemes which had expired soon after the panel had been established. However, the panel's recommendation did cover these expired schemes to the extent they continued to be operational.[1200]

7.1315 Finally, we note that the Appellate Body in *Dominican Republic – Import and Sale of Cigarettes* found that a tax stamp requirement maintained by the Dominican Republic was WTO-inconsistent. It also observed that the parties were in agreement that the tax stamp regime as a whole had been altered by a new decree which came into force after the panel had issued its final report to the parties. The Appellate Body then went on to recommend that the tax stamp requirement be brought into conformity with the GATT 1994 "if, and to the extent that, the [...] modifications to the tax stamp regime have not already done so".[1201]

7.1316 The foregoing WTO jurisprudence supports the inference that panels are to avoid making recommendations which would apply to measures that are no longer in existence or have been amended. Therefore, should we find that the general *de facto* moratorium on approvals was WTO-inconsistent as of August 2003, in formulating any recommendations, we would take appropriate account of the issue raised by the European Communities – that the general moratorium which was in existence in August 2003 might subsequently have ceased to exist.

7.1317 We consider that, in the specific circumstances of this case, we could avoid making recommendations which would apply to measures that are no longer in existence by qualifying any recommendations that we would make in relation to the general moratorium. We recall in this regard that the Appellate Body in *Dominican Republic – Import and Sale of Cigarettes* qualified its recommendation by recommending that the Dominican Republic bring the tax stamp requirement into conformity with the GATT 1994 "if, and to the extent that, the [...] modifications to the tax stamp regime have not already done so".[1202] In the present case, if we were to find that the European Communities breached its WTO obligations by applying a general moratorium, we would similarly recommend that the European Communities bring the general moratorium into conformity with the relevant WTO obligation(s), if, and to the extent that, that measure has not already ceased to exist.[1203]

[1197] Panel Report, *Canada – Wheat Exports and Grain Imports*, paras. 6.258-6.259, 7.3 and 7.6.

[1198] Panel Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 7.363.

[1199] Canada appears to agree with this view. Canada's third written submission, para. 195.

[1200] Panel Report, *EC – Commercial Vessels*, para. 8.4.

[1201] Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 129.

[1202] Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 129. We recall that the panel in *EC – Commercial Vessels* also offered a qualified recommendation, stating that its recommendation that the European Communities bring certain EC member State aid schemes into conformity with its obligations under the DSU did not apply to aid schemes which had expired after the establishment of the panel, except to the extent that those expired schemes continued to be operational. Panel Report, *EC – Commercial Vessels*, para. 8.4.

[1203] We recall that the issue raised by the European Communities is whether the general moratorium which we found to have existed in August 2003 has since ceased to exist, and not whether that measure, if it were found to be WTO-inconsistent, has already been brought into conformity with the *WTO Agreement.*

Accordingly, we are of the view that so long as we appropriately qualify our recommendations, there is no need to decide, in the context of the present proceedings, whether the general moratorium which we found to have existed in August 2003 subsequently ceased to exist.

7.1318 In the light of this, even if we were to agree with the European Communities that we may decide whether the general moratorium which we found to have existed in August 2003 subsequently ceased to exist, we are not convinced that it would be necessary to do so in the context of the present proceedings. We are also not convinced, in view of the findings and conclusions offered by us, that a decision on whether the general moratorium ceased to exist would be necessary to enable the DSB to make sufficiently precise recommendations to the European Communities. We consider that in the circumstances of this case a qualified recommendation would safeguard and preserve the rights and interests of all Parties and hence would be consistent with the aim of securing a positive solution to the dispute referred to the Panel.[1204] We also note in this regard that in the interim review phase of these proceedings, Canada and Argentina stated that the Panel should not determine whether the general moratorium which we found to have existed in August 2003 continued to exist after the date of establishment of the Panel. The United States considers that the Panel is not charged, in these proceedings, with determining whether the general moratorium continues to exist.

7.1319 Thus, on the basis of all of the above considerations, we decline the European Communities' request to decide, in the context of the present proceedings, whether the general moratorium on approvals which was in effect in August 2003 subsequently ceased to exist. As a result, we undertake no further examination of this issue.

4. Claims of inconsistency raised by the Complaining Parties

7.1320 The Complaining Parties have each presented a series of claims of inconsistency in relation to the European Communities' general *de facto* moratorium on final approvals.

7.1321 The **United States** claims that the general *de facto* moratorium on final approvals is inconsistent with, or has given rise to inconsistencies with, the following provisions of the *SPS Agreement*:[1205]

(a) Annex C(1)(a) and, consequently, Article 8;

(b) Annex B(1) and, consequently, Article 7;

(c) Annex C(1)(b) and, consequently, Article 8;

(d) Article 5.1 and, consequently, Article 2.2; and

(e) Article 5.5 and, consequently, Article 2.3.

7.1322 **Canada** claims that the general *de facto* moratorium on final approvals is inconsistent with, or has given rise to inconsistencies with, the following provisions of the *SPS Agreement*:[1206]

Furthermore, it is worth clarifying that if there were no issue in this case whether the general moratorium on approvals applied by the European Communities in August 2003 subsequently ceased to exist, there would, in our view, be neither a need nor a sufficient justification for a qualified recommendation.

[1204] For further relevant considerations, *see supra*, paras. 6.80 *et seq*.

[1205] The claims are listed in the order in which they were developed in the first written submission of the United States.

(a) Article 5.1 and, consequently, Article 2.2;

(b) Article 5.6 and, consequently, Article 2.2;

(c) Article 5.5 and, consequently, Article 2.3;[1207]

(d) Annex C(1)(a) and, consequently, Article 8; and

(e) Annex B(1) and, consequently, Article 7.

7.1323 **Argentina** claims the general *de facto* moratorium on final approvals is inconsistent with, or has given rise to inconsistencies with, the following provisions of the *SPS Agreement*:[1208]

(a) Article 5.1 and, consequently, Article 2.2;

(b) Article 5.5 and, consequently, Article 2.3;

(c) Article 7 and Annex B(1); and

(d) Article 10.1.

7.1324 The **European Communities** argues that none of the claims presented by the three Complaining Parties are founded, and that it has not acted inconsistently with any of the provisions of the *SPS Agreement* which are being invoked by the Complaining Parties.

7.1325 Since it is the European Communities' view that all of the Complaining Parties' claims should be dismissed in their entirety, it is clear that the **Panel** needs to assess the merits of those claims. We will first examine the Complaining Parties' substantive claims under Articles 5 and 2 of the *SPS Agreement*, and, if appropriate, will go on to examine the transparency claim under Annex B of the *SPS Agreement*, the procedural claims under Annex C of the *SPS Agreement* and Argentina's claim that it was denied special and differential treatment contrary to the provisions of Article 10 of the *SPS Agreement*.

5. Consistency of the general *de facto* moratorium on approvals with Article 5.1 of the *SPS Agreement*

7.1326 All three Complaining Parties claim that by applying a general *de facto* moratorium on approvals, the European Communities has acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement*.

7.1327 Article 5.1 of the *SPS Agreement* provides:

> "Members shall ensure that their sanitary or phytosanitary measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health, taking into account risk assessment techniques developed by the relevant international organizations."

[1206] The claims are listed in the order in which they were developed in the first written submission of Canada.

[1207] Canada's claim under Article 5.5 is put forth as an alternative to its claim under Article 5.6.

[1208] The claims are listed in the order in which they were developed in the first written submission of Argentina.

7.1328 The **Complaining Parties** submit that the general moratorium on approvals constitutes a "sanitary or phytosanitary measure" (hereafter "SPS measure") because it is applied, in their view, to protect against certain of the risks identified in Annex A of the *SPS Agreement*. They further allege that the European Communities has not put forth a risk assessment in support of the general moratorium and that the general moratorium is, therefore, an SPS measure which is not "based on" a risk assessment as required under Article 5.1.

7.1329 The **European Communities** argues that certain provisions of the *SPS Agreement* relate to the development of SPS measures while others relate to the application of SPS measures.[1209] According to the European Communities, Article 5.1 contains obligations relating to the development of SPS measures, not their application. SPS measures as defined in Annex A(1) of the *SPS Agreement* presuppose the existence of an act. The European Communities submits that the Complaining Parties' assertions about a moratorium are in reality complaints about delay in the completion of approval procedure. Delay of this kind cannot constitute an SPS measure within the meaning of Annex A(1). Delay is a failure to act in a timely manner. A failure to act in a timely manner can be reviewed under the procedural obligations set out in Article 8 and Annex C(1) of the *SPS Agreement* as an issue of the application of an SPS measure (in this case, the EC approval system).[1210]

7.1330 The European Communities submits that the Complaining Parties describe as an SPS measure the very same failure to take final decisions which they challenge as the application of an SPS measure under Article 8 and Annex C(1). Yet as a matter of logic, it is clear that alleged behaviour cannot at the same time constitute an SPS measure and the application of another SPS measure. The European Communities deduces from these considerations that since, in its view, the Complaining Parties are not complaining about an SPS measure, but its application, and since Article 5.1 does not contain obligations relating to the application of an SPS measure, the alleged general moratorium on approvals is not subject to Article 5.1.

7.1331 The **Panel** notes that, by its clear terms, Article 5.1 applies to SPS measures. Accordingly, for a particular measure to be subject to Article 5.1 it must be an SPS measure. The European Communities contests that the general moratorium on approvals constitutes an SPS measure within the meaning of Article 5.1. It is therefore necessary to examine this issue in detail.

(a) "Sanitary or phytosanitary measure"

7.1332 Article 1 of the *SPS Agreement* states that for the purposes of the *SPS Agreement*, "the definitions provided in Annex A shall apply". Annex A(1) of the *SPS Agreement* contains a definition of the term "sanitary or phytosanitary measure". The definition provided reads as follows:

> *Sanitary or phytosanitary measure* - Any measure applied:
>
> (a) to protect animal or plant life or health within the territory of the Member from risks arising from the entry, establishment or spread of pests, diseases, disease-carrying organisms or disease-causing organisms;

[1209] The European Communities bases this view on Article 1.1 of the *SPS Agreement*, the second sentence of which provides that SPS measures "shall be *developed and applied* in accordance with the provisions of this Agreement" (emphasis added).

[1210] For the text of Article 8 and Annex C(1), *see infra*, sections VII.C.11 and VII.C.12.

(b) to protect human or animal life or health within the territory of the Member from risks arising from additives, contaminants, toxins or disease-causing organisms in foods, beverages or feedstuffs;

(c) to protect human life or health within the territory of the Member from risks arising from diseases carried by animals, plants or products thereof, or from the entry, establishment or spread of pests; or

(d) to prevent or limit other damage within the territory of the Member from the entry, establishment or spread of pests.

Sanitary or phytosanitary measures include all relevant laws, decrees, regulations, requirements and procedures including, *inter alia*, end product criteria; processes and production methods; testing, inspection, certification and approval procedures; quarantine treatments including relevant requirements associated with the transport of animals or plants, or with the materials necessary for their survival during transport; provisions on relevant statistical methods, sampling procedures and methods of risk assessment; and packaging and labelling requirements directly related to food safety."

7.1333 It is clear from the above definition that all measures are not SPS measures. In other words, not every measure that qualifies as a measure within the meaning of the DSU constitutes, *ipso facto*, an SPS measure.

7.1334 Whether a particular DSU measure constitutes, at the same time, an SPS measure is to be determined, according to the above definition, by reference to such criteria as the objective of the measure, its form and its nature. Regarding the objective of SPS measures, subparagraphs (a) through (d) indicate that SPS measures must "be applied" to protect against certain enumerated risks. Regarding the form of SPS measures, the second paragraph of the definition provides that SPS measures include "all relevant laws, decrees [and] regulations". This enumeration suggests that the *SPS Agreement* does not prescribe a particular legal form and that SPS measures may in principle take many different legal forms. Finally, in relation to the nature of SPS measures, the second paragraph stipulates that SPS measures include "requirements and procedures". The second paragraph then goes on to mention, by way of example, a number of relevant substantive requirements (prescribed end product criteria, prescribed quarantine treatments, certain packaging and labelling requirements, etc.) and procedures (testing procedures, inspection procedures, certification procedures, approval procedures, etc.). We note that the term "requirements" is broad in scope. For instance, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered "requirements", in that one is effectively a requirement to permit the marketing of a product and the other a requirement to ban the marketing of a product.

7.1335 Still in relation to the reference in the second paragraph of Annex A(1) to "requirements and procedures", we note that no reference is made to the "application" of "requirements and procedures".[1211] This omission suggests that whereas requirements and procedures as such may constitute SPS measures, the application of such requirements and procedures would not, itself, meet the definition of an SPS measure. The provisions of the *SPS Agreement* support the view that the omission of a reference to "application" is deliberate, for there are several provisions which establish

[1211] We agree with the European Communities that Article 1.1 of the *SPS Agreement*, which states that SPS measures shall be "developed and applied" in accordance with the provisions of the *SPS Agreement*, confirms that the distinction between SPS measures as such and the application of SPS measures is a relevant one for the purposes of the *SPS Agreement*.

obligations specifically with regard to the "application" of SPS measures. For instance, Article 2.3, second sentence, states that SPS measures "shall not be applied in a manner which constitute a disguised restriction on international trade". Similarly, Article 10.1 states in relevant part that "[i]n the preparation and application of [SPS] measures, Members shall take account of the special needs of developing country Members". Finally, we note that Article 8 draws a distinction between, on the one hand, the "operation" of procedures and, on the other hand, the "procedures", which, themselves, are defined in Annex A(1) as SPS measures.[1212]

7.1336 It should be added in this context that the term "requirements" as it appears in the second paragraph of Annex A(1) is unqualified and thus is applicable both to requirements which are generally applicable and to requirements which have been imposed on specific products.[1213] In our view, the application of a generally applicable SPS "requirement" (e.g., a pre-marketing approval requirement for biotech products) to a specific product may result in a different, product-specific SPS "requirement" (e.g., a ban on the marketing of a specific biotech product). In other words, there may be cases where the application of an SPS "requirement" and, hence, of an SPS measure, may give rise to a new SPS requirement and, hence, a new SPS measure. Applying these considerations to Article 5.1, it could be argued that a generally applicable SPS requirement as set out, *e.g.*, in a law and a product-specific decision based on that requirement might both constitute SPS measures which must be based on a risk assessment.

7.1337 Before proceeding further, a final point should be made. It is important to keep in mind that Annex A(1) is intended to provide a general definition of the term "SPS measure". This general definition must not be applied in mechanistic fashion. In particular, we note that the mere fact that a measure within the meaning of the DSU meets the definition of an "SPS measure" set out in Annex A(1) does not mean that it is, *ipso facto*, subject to every provision of the *SPS Agreement* which applies to "SPS measures". A good illustration of this point is afforded by the chapeau of Annex C(1)(a) of the *SPS Agreement*, which states that "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of [SPS] *measures*, that such procedures are [...] completed without undue delay" (emphasis added). The definition of "SPS measures" given in Annex A says that "SPS measures" include "procedures". Clearly, however, Annex C cannot be read as meaning that "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of [SPS] *procedures*, that such procedures are [...] completed without undue delay". Rather, the term "SPS measures" in Annex C(1)(a) must be interpreted as meaning substantive "SPS requirements".[1214] It is clear from this example that in interpreting the term "SPS measure(s)", in addition to the Annex A(1) definition, account should also be taken of the specific context within which that term appears.

[1212] Article 8 provides:

> Members shall observe the provisions of Annex C in the *operation* of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their *procedures* are not inconsistent with the provisions of this Agreement (emphasis added).

[1213] We note in this respect that the footnote to Annex B(1) defines "[SPS] regulations" as "[SPS] measures [...] which are applicable generally". It follows, *a contrario*, that there can be SPS measures which are not applicable generally.

[1214] This view draws support from a parallel provision in the *TBT Agreement*. Annex 1(3) of the *TBT Agreement* defines conformity assessment procedures as "[a]ny procedure used, directly or indirectly, to determinate that *requirements* in technical regulations […] are fulfilled" (emphasis added).

(b) Nature of the general *de facto* moratorium on approvals

7.1338 For the purposes of establishing whether the general *de facto* moratorium on approvals constitutes an "SPS measure" within the meaning of Annex A(1) and Article 5.1, it is key, in our view, to determine its nature. More particularly, consistent with the language used in Annex A(1), it must be determined whether the general moratorium is a substantive SPS "requirement", a "procedure" or a measure of a different nature.

(i) Was the decision to apply a general moratorium on approvals a decision to reject all applications or did it predetermine such rejections?

7.1339 To determine the nature of the general moratorium on approvals, it is well to recall our earlier findings. We found, *inter alia*:

(a) that the Group of Five countries decided to use their powers in the approval process so as to prevent any and all new applications from being finally approved, until new EC rules on labelling and traceability were adopted, and

(b) that the Commission responded by not making full use of the relevant procedures to complete the approval process, and that in so doing, it knowingly entered into effective co-operation with the Group of Five countries, and

(c) that, consequently, the Group of Five countries and the Commission followed an inexplicit common "plan or course of action" which consisted in preventing the final approval of applications pending the adoption of new EC rules on labelling and traceability.

7.1340 Based on these findings, and the relevant supporting arguments and evidence, we are of the view that the decisions by the Group of Five countries and the Commission to prevent applications from reaching final approval and thus to apply a general moratorium on approvals were, in essence, decisions to delay final positive approval decisions on individual applications until certain conditions were met.[1215] Consistent with what we have done earlier in our findings, we will hereafter refer, not to decisions by the Group of Five countries and the Commission, but to a decision by the European Communities.

7.1341 In principle, it would also be correct to describe the decision to delay final approval decisions as a decision not to approve individual applications until certain conditions were met. We prefer not to use that description, though. This is because the term "decision not to approve applications" could be understood as referring to a decision to reject all applications. However, as we explain below, the decision to apply a general moratorium was not a substantive decision to reject all applications.

7.1342 By deciding to apply a general moratorium, the European Communities did not give a negative substantive reply to the question "May the biotech products with pending or future applications be marketed in the European Communities?". Rather, the reply the European Communities effectively gave to that question was that certain conditions needed to be met before it could provide positive substantive replies.[1216] In that sense, it can be said that the decision to apply a

[1215] To recall, as of August 2003, relevant conditions (new EC rules on labelling and traceability) had not been met.

[1216] We note that, in the meantime, pending and subsequent applications were subject to a provisional marketing ban. However, as we will explain in detail below, that provisional ban was a consequence, not of the

general moratorium was a procedural decision not to make final and favourable substantive decisions on applications until certain conditions were satisfied.

7.1343 Thus, the decision to apply a general moratorium on approvals did not itself constitute a substantive decision to reject all applications. For completeness, we should examine, in addition, whether the decision to apply a general moratorium on approvals predetermined negative substantive decisions on pending and future applications. The June 1999 declaration by the Group of Five countries said that the relevant member States would take steps to "suspend" new approvals, pending the adoption of EC rules on labelling and traceability. The June 1999 declaration did not imply that once the new EC rules were adopted, the Group of Five countries would seek to complete all pending and new approval procedures with a negative approval decision. We note that there are Group of Five countries which subsequently indicated that additional conditions needed to be met before new approvals could be granted.[1217] However, these additional conditions identified by some Group of Five countries did not predetermine the outcome of approval procedures any more than the conditions set out in the June 1999 declaration. At any rate, there is no evidence to suggest that the Commission's effective decision not to complete approval procedures until the adoption of new EC rules on labelling and traceability predetermined the outcome of individual approval procedures. More particularly, there is no evidence to suggest that the Commission would complete all pending and new approval procedures with a negative decision once the new EC rules were adopted. Accordingly, the decision to apply a general moratorium on approvals cannot be considered to have predetermined negative final decisions on all pending and future applications.

7.1344 Whereas it is clear from the foregoing considerations that we are of the view that the European Communities' decision to apply a general moratorium on approvals can be properly characterized as a decision to delay final positive approval decisions[1218], the Complaining Parties are of the view that this is not the most appropriate legal characterization. In the light of this, we suspend a final conclusion on this issue until after we have examined whether the Complaining Parties have offered a more appropriate legal characterization of the European Communities' decision to apply a general moratorium on approvals. The Complaining Parties have put forward two alternative legal characterizations: (i) that the European Communities' decision to apply a general moratorium on approvals was a decision to impose an effective marketing ban on all biotech products subject to approval, and (ii) that the decision in question established a new procedure or amended the existing EC approval procedure. We first these two characterizations in turn.

(ii) Did the decision to apply a general moratorium on approvals impose an effective marketing ban?

7.1345 The **United States** argues that the general moratorium is, effectively, a marketing ban that affects any and all biotech products. More particularly, the United States submits that a decision to delay completion of approval procedures for biotech products for an indefinite period of time – in this case from late 1998 up through at least August 2003 – is effectively equivalent to a decision to adopt a ban on the marketing of all biotech products subject to the EC approval procedures.

7.1346 **Canada** recalls that the European Communities' own pre-marketing approval requirement effectively imposes a ban on biotech products until they are approved. According to Canada, the

---

European Communities' decision to apply a general moratorium on approvals, but of the EC pre-marketing approval requirement.

[1217] *See supra*, para. 7.530. *See also*, Exhibit EC-69/At. 125.

[1218] In order to avoid verbiage, we will hereafter be using the phrase "a decision to delay final approval decisions" rather than the longer, more complete phrase "a decision to delay final positive approval decisions".

general moratorium is a conscious decision on the part of the European Communities not to approve biotech products for an unspecified period of time. In Canada's view, the general moratorium thus effectively renders inoperative the EC approval procedures, resulting in an indefinite suspension of the placing on the market of biotech products. This indefinite suspension converts the pre-marketing approval requirement established by EC legislation into a complete, rather than conditional, marketing ban.

7.1347 **Argentina** argues that the general moratorium functions as a ban on the marketing of biotech products.

7.1348 The **European Communities** argues that the Complaining Parties are improperly characterizing the alleged general moratorium as a marketing ban. The only ban in place in the European Communities is the prohibition to market biotech products that have not undergone prior assessment in accordance with the requirements of EC law. The fact that biotech products cannot be marketed until approved is an intrinsic feature of EC legislation and, indeed, of any approval system. The WTO-consistency of the applicable EC legislation, the EC approval system and the ban on the marketing of non-approved biotech products is not an issue before the Panel as none of these measures have been identified in the Complaining Parties' requests for the establishment of a panel.

7.1349 The European Communities submits that the acts of which the Complaining Parties are complaining should be characterized as delay – they cannot, therefore, amount to a ban. The Complaining Parties' submissions blur this fundamental point, and they seem to insinuate that the EC approval procedures for biotech products are little more than a façade to prevent the marketing of biotech products. The European Communities rejects any such allegation as EC legislation and policy are not intended to prevent the marketing of biotech products.

7.1350 The **Panel** notes that, according to the Complaining Parties, the European Communities' decision to apply a general moratorium on approvals should be characterized, for the purposes of the Panel's legal analysis, as a decision to adopt an across-the-board marketing ban on biotech products requiring approval. In considering this argument, it is important to bear in mind that the decision to apply a general moratorium on approvals was made in the context of a pre-marketing approval system. Therefore, before addressing the merits of the Complaining Parties' argument, it is useful to recall the main features of the European Communities' pre-marketing approval system. EC legislation does not provide for a blanket ban on the marketing of biotech products. EC legislation provides that the marketing of biotech products is subject to approval, or authorization.[1219] In other words, EC legislation imposes a pre-marketing approval requirement. Like any pre-marketing approval system, the EC pre-marketing approval system for biotech products envisages a case-by-case assessment of the products for which marketing approval is sought. Consistent with this case-by-case approach, the European Communities conducts a risk assessment for each individual biotech product which is submitted for marketing approval.[1220]

7.1351 As a result of the EC pre-marketing approval requirement, a biotech product for which marketing approval is sought cannot be legally marketed in the European Communities until the time a final substantive decision has been made on whether or not to approve the marketing of the product. In other words, the pre-marketing approval requirement imposes a provisional ban on the marketing

[1219] Articles 6, 10, 11 and 13 and preambular paragraphs 17, 18 and 20 of Directive 90/220; Articles 4, 6, 13, 15 and 19, and preambular paragraphs 28 and 47 of Directive 2001/18; Articles 3, 4, 6 and 7 and preambular paragraph 2 of Regulation 258/97.

[1220] Articles 12 and 13 of Directive 90/220; Articles 4, 14 and 18 of Directive 2001/18; and Articles 6 and 7 of Regulation 258/97.

of a biotech product for which marketing approval is sought.[1221] The provisional ban remains in effect until a final approval decision has been made.[1222]

7.1352 While applicable EC legislation imposes some deadlines on EC entities charged with carrying out approval procedures, in our understanding, EC legislation does not provide that if approval procedures are not completed within a specified maximum time-period, the relevant application must, as a matter of law, be accepted or rejected. This means, for example, that a failure by a relevant EC entity to observe deadlines imposed on it, while possibly constituting a breach of EC legislation, will normally translate into a delay in the completion of the relevant approval procedure.[1223] Simply put, it can thus be said that in the European Communities the marketing of biotech products is subject to a provisional ban until such time as a final approval decision has been made, regardless of how long it takes to reach a final approval decision.

7.1353 It is important to note that the Complaining Parties in this case chose not to challenge the EC pre-marketing approval system as such. In other words, they chose not to challenge the fact that the European Communities maintains a pre-marketing approval requirement for biotech products. Thus, for the purposes of these proceedings, we must presume that the pre-marketing approval requirement is WTO-consistent. One of the consequences which flows from the EC pre-marketing approval requirement is the fact that the marketing of biotech products for which approval is sought is provisionally banned until such time as a final approval decision has been made. Since this is a direct and necessary consequence of the EC pre-marketing approval requirement, logic dictates that if the pre-marketing approval requirement must be presumed to be WTO-consistent, the same holds true for the provisional ban.

7.1354 With the foregoing observations in mind, we now turn to address the merits of the Complaining Parties' argument that the European Communities' decision to apply a general moratorium on approvals was effectively a decision to adopt an across-the-board marketing ban. Canada has gone furthest in developing this argument. According to Canada, the European Communities' decision to apply a general moratorium on approvals "converted" the EC pre-marketing approval requirement into a definitive marketing ban.[1224] As we understand it, the core of this argument is that as a result of its decision to apply a general moratorium on approvals, the European Communities no longer operated a pre-marketing approval system, but imposed an outright marketing ban. Canada argues that the decision to apply a general moratorium on approvals essentially rendered the EC approval procedure irrelevant, in the sense that it prevented the biotech products with outstanding applications from being approved regardless of the scientific evidence.

7.1355 As an initial matter, we recall our view that, properly understood, the decision to apply a general moratorium on final approvals was a decision to delay final approval decisions. We found that the Group of Five countries and the Commission followed a common "plan", which consisted in

---

[1221] Instead of saying that the European Communities maintains a pre-marketing approval requirement, one could say with equal justification that the European Communities maintains a conditional marketing ban on biotech products, with the applicable condition being the absence of formal EC marketing approval.

[1222] We use the term "provisional ban" to reflect the fact that this is a provisional measure which is replaced by a final, or definitive, measure upon completion of the approval procedure for the biotech product in question.

[1223] We recall in this context that both at Community and at member State level applicants have the possibility of seeking judicial review of the legality of the actions/inaction by relevant EC entities.

[1224] We note that Canada does not use the term "definitive ban", but instead refers to a "complete, rather than conditional, ban". Canada's reply to Panel question No. 67. We find the term "complete ban" problematic in that it might suggest that the provisional ban effectively imposed by the pre-marketing approval requirement is something other than a complete ban.

preventing the final approval of applications pending the adoption of new EC rules on labelling and traceability. Thus, the "plan" was precisely to prevent final, or definitive, approval decisions. It is consistent with this view that between June 1999 and August 2003 no applications were rejected, and that it was not until after the adoption of the aforementioned EC rules that the Commission approved three applications. In fact, Canada itself acknowledges that the European Communities' decision to apply a general moratorium on final approvals was a "decision not to decide", or a "decision not to approve" applications, and that this type of decision is not the same as a substantive decision definitively to reject any and all applications.[1225] In the light of this, we do not consider that the European Communities' decision to apply a general moratorium on final approvals was designed to convert the pre-marketing approval requirement into a definitive marketing ban.

7.1356 The question thus becomes whether the decision to apply a general moratorium on approvals, while not designed to convert the pre-marketing approval requirement into a definitive marketing ban, nonetheless had the effect of doing so. It is therefore necessary to consider the effect of the decision to apply a general moratorium on approvals. In this regard, we recall once more that the decision we are concerned with in essence was a decision to delay final approval decisions. The decision to delay final approval decisions had the effect of extending the time-period during which non-approved biotech products were subject to the provisional marketing ban flowing from the pre-marketing approval requirement.[1226] For clarity, two observations should be made in relation to this effect. *First*, the effect in question is not an inherent effect of a decision to delay final approvals. If the decision to delay final approval decisions effectively extended the time-period during which the provisional ban was in effect for individual applications, this was because that decision was made in the context of the EC pre-marketing approval system. Had the European Communities opted for a system under which biotech products could be provisionally marketed until a final approval decision was made, a decision to delay final approvals would not have had the effect of extending a provisional marketing ban, but of extending a provisional marketing authorization. *Secondly*, the effect in question is an indirect one. The direct effect of the decision to delay final approval decisions was to delay the completion of individual approval procedures. Under the EC pre-marketing approval system, the marketing of biotech products is banned until it has been approved. Hence, if a decision is made to delay final approvals, this indirectly has an effect, via the principle of "banned until approved", on how long the marketing of the relevant biotech products is provisionally banned.

7.1357 It is clear from the preceding paragraph that the decision to delay final approval decisions and the decision provisionally to ban biotech products are separate and distinct measures. It is also clear that the decision to delay final approval decisions did not impose a new ban. The decision to delay final approval decisions merely had the effect of extending the duration of the provisional ban on the marketing of all non-approved biotech products. That ban was already there, as a consequence of the pre-marketing approval requirement. The provisional marketing ban did not expire prior to the European Communities' decision to delay final approval decisions, and that decision consequently cannot be said to have re-imposed it.

7.1358 It follows from the foregoing considerations that the decision to delay final approval decisions did not have the effect of converting the pre-marketing approval requirement into a definitive

[1225] *See*, *e.g.*, Canada's reply to Panel question No. 172.

[1226] We recall that under the European Communities' general moratorium on final approvals, applications were allowed to make some progress in the approval process. Thus, for all those applications which were not affected by the decision to delay final approvals, there was no effective extension of the provisional marketing ban. In contrast, for all applications which as of August 2003 had been affected by the decision to delay final approvals, there had been an effective extension of the provisional marketing ban, but its duration varied from application to application.

marketing ban in the sense of imposing a new ban. But the decision in question had an effect on an already existing ban, the provisional marketing ban flowing from the pre-marketing approval requirement. Accordingly, we need to examine whether, through its effect on the provisional marketing ban, the European Communities' decision to delay final approval decisions converted the EC pre-marketing approval requirement into a definitive marketing ban. More specifically, we need to examine whether the decision to delay final approval decisions effectively converted the pre-marketing approval requirement into an instrument with the same effect as a definitive marketing ban.

7.1359 We note in this regard that if the provisional marketing ban effectively imposed by the EC pre-marketing approval requirement is applied for three years, the practical effect of this is much the same as that of a definitive marketing ban imposed for three years. In either case, the producer seeking to market the relevant biotech product cannot lawfully do so for a three-year period.[1227] Similarly, if a provisional ban is in effect indefinitely, practically speaking, this is little different from a definitive ban imposed for an indefinite period of time.[1228] Thus, the EC pre-marketing approval requirement inherently produces very similar effects as a definitive marketing ban. The European Communities' decision to delay final approval decisions had an effect on the time-period during which the provisional marketing ban was applicable. But it did not lead to the EC pre-marketing approval requirement producing a different kind of effects. Consequently, it cannot be said that the European Communities' decision to delay final approval decisions "converted" the EC pre-marketing approval requirement into an instrument with the same effect as a definitive marketing ban.

7.1360 We accept that the European Communities' decision to delay final approval decisions for an unspecified period of time had the indirect effect of extending the provisional marketing ban for an unspecified period of time. However, as we have stated, the source of the provisional marketing ban, including of the effectively extended ban, is not the decision to delay, but the EC pre-marketing approval requirement. Or to put it differently, what prevents applicants from marketing their biotech product at a given point in time is the European Communities' substantive decision to ban biotech products until they have been approved. If the Complaining Parties had been of the view that the effective extension of the provisional marketing ban in some instances rendered the imposition of that ban inconsistent with Article 5.1, it was open to them to challenge the imposition of that ban (*i.e.*, the pre-marketing approval requirement as the source of the provisional marketing ban). The Complaining Parties chose not to do so in this case.

7.1361 Instead, the Complaining Parties decided to challenge the European Communities' decision to delay final approval decisions. The fact that this procedural decision had an impact on how long the provisional marketing ban resulting from the EC pre-marketing approval requirement was in effect for each application does not turn that decision into a substantive decision provisionally to ban biotech products. A procedural decision to delay final approval decisions does not cease to be procedural merely because it has a substantive impact. Indeed, procedural decisions virtually always have some substantive impact.

7.1362 Within this context, we need to address another argument put forward by Canada. According to Canada, a decision to delay final approval decisions, if it gives rise, as in the present case, to

[1227] We note that while in the case of the provisional marketing ban, the ultimate approval decision could be positive or negative, in the case of the three-year definitive marketing ban, the relevant product could be lawfully marketed upon expiry of the three-year period, unless the ban was re-imposed.

[1228] We note that an indefinite definitive marketing ban, on the one hand, and an indefinite provisional marketing ban, on the other, may have a different economic impact on producers of biotech products. For example, the adverse effect on long-term investments might be smaller in the case of the provisional ban, provided applicants expect that approval decisions will be resumed at some point in the future.

prolonged delays, may be equated with a substantive decision to ban biotech products on the basis that, at some point, a delay effectively becomes a ban. In support of this argument, Canada points to the fact that numerous applications were withdrawn between June 1999 and August 2003. While this is correct, it should also be noted that almost none of the applicants withdrawing their applications cited undue delays in the processing of their application as a reason for the withdrawal.[1229] Nonetheless, we agree with Canada that the absence of a reference to the moratorium or to undue delays does not necessarily indicate that undue delays did not cause, or contribute to, the withdrawals.

7.1363 Canada notes that some applicants in their letters of withdrawal invoked "commercial reasons" and submits that this is a reference to the limited commercial life of biotech products. Canada contends that the biotech products at issue in this dispute have a short life-cycle, such that if they are not approved within reasonable periods of time, the marketing of these products may no longer be of any commercial interest. While this may well be true for some biotech products, the record does not support the view that this is the case generally. In fact, many applicants maintained their applications despite lengthy delays in their processing.[1230] Furthermore, while numerous applications were withdrawn between June 1999 and August 2003, quite a few others were submitted for approval during the same time-period.[1231] If these applicants did not believe that they would eventually be able to have their applications approved, it is difficult to see why the applicants would spend time and money on these applications. Thus, in our view, the facts do not support the general conclusion that, practically speaking, there is no distinction between the European Communities' procedural decision to delay final approval decisions and a substantive decision definitively to ban all biotech products for which approval had been sought.

7.1364 As we have said, we recognize the possibility that, due to short product life-cycles, prolonged delays in the completion of approval procedures could, in some instances, leave applicants with no choice but to withdraw their applications. However, this potential effect of a procedural decision to delay final approval decisions does not provide sufficient grounds for equating that decision with a substantive decision to ban biotech products. The distinction between substance and procedure is a fundamental legal distinction and we see no justification for disregarding it in this case. Annex C(1)(a) of the *SPS Agreement* specifically requires Members to complete their approval procedures without undue delay. A Member is therefore not allowed to cause prolonged delays in the completion of an approval procedure, unless there is a justification for doing so. And if there is a justification, we do not think it would be appropriate to equate delay with a negative substantive decision based on product life-cycle considerations. Where a Member has legitimate reasons for delaying an approval decision, *e.g.*, in order to obtain scientific information required in order to complete a risk assessment, it should not be deemed to have completed its approval procedure with a negative decision (and thus be exposed to the risk of a successful challenge to that presumed decision based on Article 5.1 of the *SPS Agreement*) merely because the applicant's product is nearing the end of its life-cycle. Provided a Member completes an approval procedure without undue delay, the fact that the time taken significantly diminishes the applicant's market opportunities is of no particular relevance.

7.1365 In conclusion, we note that, for the reasons set out above, we are unable to accept the Complaining Parties' argument that the European Communities' decision to apply a general moratorium on approvals was effectively equivalent to a decision to impose an across-the-board marketing ban.

[1229] The application concerning RR oilseed rape (EC-79) is a notable exception. Exhibit EC-79/At. 30.

[1230] For instance, the application concerning Bt-531 cotton was submitted in December 1996 and was still pending in August 2003 and beyond.

[1231] *See, e.g.*, Exhibits EC-94, EC-95, EC-96, EC-104, EC-106 and EC-107.

(iii) Did the decision to apply a general moratorium on approvals itself establish a procedure or amend the existing EC approval procedures?

7.1366 In addition to asserting that the decision to apply a general moratorium on approvals effectively banned the marketing of all biotech products with pending or future applications, the Complaining Parties present arguments which present the issue of whether that decision could be considered either to have established a new procedure or to have amended the existing EC procedures. As this issue is directly relevant to the legal characterization of the decision to apply a general moratorium on approvals, it is necessary to address it.

7.1367 The **United States** argues that the decision to apply a general moratorium on approvals modified the European Communities' approval regime. More specifically, the United Stats argues that the suspension by the European Communities of the consideration of applications for, or granting of, approval of biotech products is a procedure within the meaning of Annex A(1) of the *SPS Agreem*ent, although an unwritten one. The United States points out in this regard that the *New Shorter Oxford English Dictionary* defines the term "procedure" as a "particular mode or course of action" or a "set of instructions for performing a specific task which may be invoked in the course of a [computer] program".

7.1368 **Canada** does not argue that the decision to apply a general moratorium on approvals established an unwritten procedure. Canada contends, however, that that decision led to a significant departure from the existing EC approval procedure in that it resulted in the European Communities moving from approvals based on risk assessment to no approvals regardless of the scientific evidence. According to Canada, the decision to apply a general moratorium on approvals amounted to a mis- or non-application of the applicable legislation and essentially rendered the approval procedure irrelevant. Canada submits that the moratorium superseded the EC approval procedure as the measure that exerted effective control over applications.

7.1369 Like Canada, **Argentina** does not argue that the decision to apply a general moratorium on approvals established an unwritten procedure. Argentina nevertheless argues that that decision modified the existing EC approval procedures by introducing additional procedural stages not envisaged in the relevant legislation. Specifically, Argentina contends that the inter-service consultations launched and held by the Commission in the context of some individual approval procedures have no legal basis in the legislation.

7.1370 The **Panel** begins by recalling its view that the decision to apply a general moratorium on approvals was a decision to delay final approval decisions. The first issue to be examined in view of the United States' argument is whether the decision to delay final approval decisions laid down a "procedure". Relevant dictionary definitions of the term "procedure" are: "[a] particular mode or course of action"[1232] or "an established or official way of doing something"[1233].

7.1371 In our view, the decision to delay final approval decisions did not itself establish a procedure for approving biotech products or, more to the point, for preventing the final approval of biotech products. To begin with, it did not establish "[a] particular mode or course of action" to be followed by the Group of Five countries and/or the Commission. Nor did it establish an "[un]official way" of approving, or not approving, applications. It is instructive in this regard to recall the June 1999 declaration by the Group of Five countries, which states in relevant part that "in exercising the powers

[1232] *The New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. 2, p. 2363.

[1233] *The Concise Oxford Dictionary*, 10th edn., J. Pearsall (ed.) (Clarendon Press, 1999), p. 1139.

vested in them regarding the growing and placing on the market of genetically modified organisms […] they [the Group of Five countries] will take steps to have any new authorizations for growing and placing on the market suspended".[1234] The declaration itself does not establish a procedure, as it does not specify the steps to be taken to bring about a suspension of approvals. We also recall that the general moratorium on approvals was given effect through various types of action and/or omission by the Group of Five countries and/or the Commission. But the record does not support the conclusion that the relevant acts and/or omissions were a reflection of an established procedure.[1235]

7.1372 It remains to be examined, then, whether the decision to delay final approval decisions effectively amended the relevant EC approval procedures. The relevant approval procedures are set out in Directive 90/220 and its successor, Directive 2001/18, as well as Regulation 258/97. The main elements and similarities of these approval procedures have been described earlier in Section VII.C.

7.1373 We do not consider that the decision to delay final approvals resulted in the European Communities applying a different type of approval procedure between June 1999 and August 2003. Indeed, it can be seen from our earlier findings that applications continued to be assessed in accordance with the procedures set out in Directives 90/220 and 2001/18, as well as Regulation 258/97. Accordingly, applications were still being assessed first at member State level and subsequently at Community level. Lead CAs continued to prepare initial assessment reports. The Commission continued to seek the assistance of EC scientific committees and, at least initially, submitted draft measures to the Regulatory Committee for a vote. While it is correct that the Commission conducted inter-service consultations in the context of some of the approval procedures in question, we have previously found that such consultations were not an additional procedural stage devised by the Commission to prevent the approval of biotech products.[1236]

7.1374 Moreover, it has not been explained to us precisely how the decision to delay final approval decisions would have modified the approval procedures set out in the applicable EC legislation. It is not clear to us what was the particular "mode or course of action" to be followed under the supposedly modified EC approval procedures, or what was the newly established "[un]official way" of approving, or not approving, applications. As we have noted, the June 1999 declaration by the Group of Five countries does not predetermine any particular "mode or course of action" to be followed. The mere fact that some applications did not reach Community level or were not put to a vote in the Regulatory Committee, and that no approval procedure was completed with a final approval decision does not demonstrate that the European Communities applied a different type of approval procedure. In our view, a more appropriate conclusion to be drawn from the absence of final approvals and the delays in the processing of applications is that the European Communities applied its existing approval procedures, but that it intentionally did not make full use of these procedures to complete the approval

[1234] Declaration by the Danish, Greek, French, Italian and Luxembourg delegations concerning the suspension of new GMO authorizations, 2194th Council Meeting - Environment-, Luxembourg, 24/25 June 1999. Exhibits US-76 and 77; Exhibit CDA-3; Exhibit ARG-12.

[1235] We have noted earlier that the Commission's conduct might possibly be considered to reflect an (evolving) implementation practice. *See supra*, para. 7.1277.

[1236] *See supra*, para. 7.1260. We note that these earlier findings concerned inter-service consultations held in the context of an approval procedure conducted pursuant to Directive 90/220. However, the same considerations apply equally to inter-service consultations held in the context of an approval procedures conducted pursuant to Directive 2001/18 and Regulation 258/97.

process.[1237] To our minds, this is a natural and logical way of implementing a decision to delay final approval decisions.

7.1375 Canada argues that the decision to delay final approval decisions led to "a significant departure from the existing EC approval procedure" or "superseded the EC approval procedure as the measure that exerted effective control over applications". As we see it, the decision to delay final approval decisions neither led to a departure from the existing approval procedures nor superseded them. Based on the information on the record, we are of the view that the decision to delay final approval decisions was implemented through, and within the framework of, the existing approval procedures. As pointed out by Canada, this resulted in at least a partial "non-application" of the existing approval procedures. However, non-application of one particular approval procedure does not logically imply application of a different approval procedure.

7.1376 We note, as an additional matter, Canada's contention that "the measure that exerted effective control over applications" was the decision to delay final approval decisions, and not the existing approval procedures. The first observation to be made in relation to this contention is that, legally speaking, applications remained fully subject to the approval procedures in force. However, it is clear that the approval procedures set out in the applicable EC legislation left member States and the Commission a degree of discretion with regard to the application, or operation, of these approval procedures. A decision by a relevant EC entity relating to the application, or operation, of the applicable approval procedures may have – and, indeed, may be intended to have – an impact on the manner and/or speed of assessment of applications. If it does, that decision plainly would exert a degree of "effective control" over applications.

7.1377 In our analysis, the European Communities' decision to delay final approval decisions was such a decision relating to the application, or operation, of the EC approval procedures.[1238] It essentially was a decision to operate the EC approval procedures in such a way that there would be no final approval decisions until certain conditions were met. Moreover, since the objective of that decision was to delay final approval decisions, it is inevitable that it exerted a degree of effective control over individual applications. However, as we have noted above, we do not think that applications were effectively no longer controlled, at all, by the EC approval procedures set out in the legislation. If in practice the decision to delay final approval decisions nonetheless exerted a significant degree of effective control, this was in part a consequence of the objective of that decision, which was to prevent final approval decisions. Quite possibly, the fact that applicants chose not to seek judicial review, either before member State courts or the European Court of Justice, of action taken, or not taken, by lead CAs or the Commission in the context of individual approval procedures was another reason why in practice the decision to delay final approval decisions exerted a significant degree of effective control over individual applications.[1239]

7.1378 In the light of the foregoing, we conclude that the European Communities' decision to apply a general moratorium on approvals did not itself establish a procedure for approving, or not approving, applications, and that it did not effectively amend the existing EC approval procedures either. We

[1237] We recall in this regard the European Communities' argument that the EC legislation which sets out the relevant approval procedures was considered inadequate by some member States and segments of public opinion.

[1238] We recall that the EC approval procedures as such have not been challenged by the Complaining Parties.

[1239] We recall that according to an uncontested statement by the European Communities no complaints were brought before the European Court of Justice in respect of the products subject to these proceedings. Only one case was instituted before a member State court, but that case concerned a member State safeguard measure.

nonetheless consider that the decision to apply a general moratorium on approval was procedural in nature, in that it was a decision relating to the application, or operation, of the existing EC approval procedures.

(iv) Conclusion

7.1379 It is clear from the preceding analysis that we are unable to accept either of the alternative legal characterizations of the general moratorium on approvals which the Complaining Parties have put forward. Accordingly, we confirm the view and conclusion we offered at the beginning of our analysis, namely that the European Communities' decision to apply a general moratorium on approvals should be characterized as a procedural decision to delay final substantive approval decisions. The decision was procedural in nature insofar as it was a decision relating to the application, or operation, of the existing EC approval procedures.

7.1380 We recall that the second paragraph of Annex A(1) of the *SPS Agreement* provides that SPS measures include "requirements and procedures". We have stated above that in order to establish whether the general moratorium on approvals constitutes an "SPS measure" within the meaning of Article 5.1 and Annex A(1), it must be determined whether the general moratorium is a substantive SPS "requirement", a "procedure" or a measure of a different nature. Our findings above on the nature of the general moratorium on approvals enable us to make that determination.

7.1381 We have found above that the decision to apply a general moratorium on approvals did not impose an effective marketing ban. If it had, it could have been considered to impose a substantive "requirement", on the basis that a ban is effectively equivalent to a negative requirement, *i.e.*, a requirement not to permit the marketing of a product. We further found that the decision to apply a general moratorium on approvals neither established nor amended a procedure. If it had established or amended a procedure, it might have been considered to lay down a "procedure".

7.1382 We have characterized the decision to apply a general moratorium on approvals as a procedural decision to delay final substantive approval decisions. In our assessment, this procedural decision did not impose a substantive "requirement" in relation to biotech products with pending or future applications. It neither approved nor rejected applications. Similarly, we are of the view that the decision to delay final substantive approval decisions cannot appropriately be viewed as providing for a "procedure", considering that it did not itself establish a new procedure or amend the existing EC approval procedures. We have said that the decision to delay final approval decisions was procedural in nature insofar as it was a decision relating to the application, or operation, of the existing EC approval procedures. However, the mere fact that the decision in question related to the application, or operation, of procedures does not turn that decision into a procedure for the purposes of Annex A(1).[1240]

7.1383 Based on these considerations, we conclude that the European Communities' decision to apply a general moratorium on approvals was a decision concerning the application, or operation, of procedures. As such, it did not provide for "requirements [or] procedures" within the meaning of Annex A(1).

[1240] We recall in this regard that the second paragraph of Annex A(1) makes no reference to the "application" of "[substantive] requirements and procedures".

(c) Applicability of Article 5.1 to the European Communities' decision to apply a general *de facto* moratorium on approvals

7.1384 Having ascertained the nature of the European Communities' decision to apply a general moratorium on approvals, we can now proceed to determine whether that decision was an "SPS measure" within the meaning of Article 5.1 and Annex A(1). We recall in this regard that for a particular measure to be subject to Article 5.1 it must be an "SPS measure".

7.1385 In relation to the Annex A(1) definition of the term "SPS measure", we note once again that the second paragraph of Annex A(1) of the *SPS Agreement* provides that SPS measures include "requirements and procedures". We have found above that the European Communities' decision to apply a general moratorium on approvals did not provide for "requirements [or] procedures" within the meaning of Annex A(1). We found that the decision in question was a decision concerning the application, or operation, of "procedures".

7.1386 We have observed earlier that the second paragraph of Annex A(1) does not refer to the "application" of "requirements and procedures" and that this omission must be given meaning in view of the distinction made in various provisions of the *SPS Agreement* between SPS measures and their "application", or "operation". We consequently found that although requirements and procedures as such may in accordance with the Annex A(1) definition constitute SPS measures, the application of such requirements and procedures would not, itself, meet the definition of an SPS measure.[1241] Since we determined that the European Communities' decision to apply a general moratorium on approvals was a decision concerning the application, or operation, of the EC approval procedures, it follows from the preceding considerations that that decision does not meet all of the constitutive elements of the definition of the term "SPS measure" as provided in Annex A(1).

7.1387 The Annex A(1) definition is directly applicable to Article 5.1. However, we have stated earlier that in interpreting the term "SPS measure", in addition to the Annex A(1) definition, account should be taken of the specific context within which that term appears. For this reason, we now go on to analyse whether the provisions of Article 5.1 render the provisional conclusion we have reached on the basis of the Annex A(1) definition inappropriate.

7.1388 Article 5.1 requires that an SPS measure applied by a Member be based on a risk assessment. In our view, the term "SPS measure" in Article 5.1 should be taken to refer to a measure applied for achieving the relevant Member's appropriate level of sanitary or phytosanitary protection. We note in this regard that Article 5.3 of the *SPS Agreement* provides in relevant part that "[i]n determining the risk to animal or plant life or health and determining the measure to be applied for achieving the appropriate level of sanitary or phytosanitary protection, Members shall take into account [certain] economic factors". Thus, Article 5.3 establishes a link between the assessment of risk and the determination of "the measure to be applied for achieving the appropriate level of sanitary or phytosanitary protection from *such* risk" (emphasis added). Indeed, as we see it, one of the purposes of a risk assessment is to allow the importing Member to determine "the measure to be applied for achieving the appropriate level of sanitary or phytosanitary protection".[1242] And one of the purposes of the requirement that SPS measures be based on a risk assessment is to ensure that the measure

[1241] We have pointed out, however, that in some circumstances the application of a requirement may result in another requirement.

[1242] We note that Annex A(4) of the *SPS Agreement* defines the term "risk assessment" as meaning an assessment of risk "according to the [SPS] measures which might be applied".

actually applied for achieving the appropriate level of sanitary or phytosanitary protection bears a rational relationship to the risk.[1243]

7.1389 The view that the term "SPS measure" in Article 5.1 should be interpreted to refer to a measure applied for achieving the relevant Member's appropriate level of sanitary or phytosanitary protection draws further support from Article 5.6. Pursuant to Article 5.6, "when establishing or maintaining *[SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection*, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or phytosanitary protection" (emphasis added). We think that Article 5.6 states explicitly what is implied in Article 5.1 and that the two provisions therefore use the term "SPS measures" in the same sense. We note in this regard that Article 5.6 follows Article 5.1 and builds on it, inasmuch as Article 5.6 lays down an obligation that goes beyond the obligation laid down in Article 5.1. Indeed, an SPS measure applied for achieving a Member's appropriate level of protection may be based on a risk assessment, but at the same time may be more trade-restrictive than required to achieve the appropriate level of protection.

7.1390 It follows from the preceding observations that we need to examine whether the European Communities' decision to apply a general moratorium on approvals was a measure applied to achieve the European Communities' appropriate level of sanitary or phytosanitary protection. In addressing this issue, we recall that the European Communities' decision was made in the context of the EC pre-marketing approval system. In our view, the pre-marketing approval requirement which results in a provisional marketing ban may be properly considered a measure that is applied for achieving the European Communities' appropriate level of protection. Moreover, it is not open to doubt that final substantive approval decisions on individual applications are also measures applied for achieving the European Communities' appropriate level of protection.[1244]

7.1391 In contrast, we do not consider that the European Communities' decision to apply a general moratorium on approvals was, as such, a measure applied to achieve the European Communities' appropriate level of protection. We recall in this regard that that decision was a procedural decision to delay final approval decisions. As we explained above, the practical effect of that decision was to extend the time-period during which non-approved biotech products were subject to the provisional marketing ban flowing from the pre-marketing approval requirement. The pre-marketing approval requirement which imposes the provisional marketing ban is a measure applied to achieve the European Communities' level of protection, but that requirement is a separate measure from the decision to delay final approval decisions. By itself, the procedural decision to delay final approval decisions did not achieve or imply a particular level of protection.[1245]

[1243] According to the Appellate Body, the requirement of a risk assessment "was intended as a countervailing factor in respect of the right of Members to set their appropriate level of protection". Appellate Body Report, *EC – Hormones*, para. 177.

[1244] We recall our view that the application of a "requirement" may result in another "requirement" within the meaning of Annex A(1) of the *SPS Agreement*. Specifically, the application of the EC pre-marketing approval requirement to a specific biotech product for which marketing approval has been sought results in a final approval decision on that product which may be considered a "requirement" – either a requirement to permit the marketing of the relevant product or a requirement to prohibit the marketing of the relevant product.

[1245] Had the European Communities opted for a system under which biotech products could be provisionally marketed until a final approval decision was made, a decision to delay final approval decisions would not have had the effect of extending a provisional marketing ban, but of extending a provisional marketing authorization. But in this scenario as well, it would be the decision to grant provisional marketing authorization which achieves a particular level of sanitary or phytosanitary protection, not the decision to delay final approval decisions.

7.1392 As the European Communities' decision to apply a general moratorium on approvals was not, itself, a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection, it cannot, in our view, be considered an "SPS measure" within the meaning of Article 5.1. As a result, the provisions of Article 5.1 do not cast doubt on the provisional conclusion we have reached on the basis of the Annex A(1) definition. Rather, they reinforce our provisional conclusion.

7.1393 Based on the above considerations, we thus determine that the European Communities' decision to apply a general moratorium on approvals was not an "SPS measure" within the meaning of Article 5.1 and Annex A(1). It follows that since only "SPS measures" are subject to the provisions of Article 5.1, the provisions of Article 5.1 are not applicable to the European Communities' decision to apply a general moratorium on approvals.

7.1394 In view of this conclusion, we need not continue our analysis of the Complaining Parties' claim under Article 5.1.

(d) Conclusions

7.1395 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

6. Consistency of the general *de facto* moratorium on approvals with Article 5.6 of the *SPS Agreement*

7.1396 Canada claims that by applying a general *de facto* moratorium on approvals between June 1999 and August 2003, the European Communities has acted inconsistently with its obligations under Article 5.6 of the *SPS Agreement*.

7.1397 Article 5.6 of the *SPS Agreement* provides:

> "Without prejudice to paragraph 2 of Article 3, when establishing or maintaining sanitary or phytosanitary measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or phytosanitary protection, taking into account technical and economic feasibility."(footnote omitted)

7.1398 **Canada** submits that the general moratorium on approvals is more trade-restrictive than required to achieve the European Communities' appropriate level of protection. According to Canada, an obvious alternative measure to the moratorium is for the European Communities to comply with its existing approval legislation and permit biotech products to be considered for, and granted or denied, approval. For the purposes of its claim with respect to Article 5.6, Canada assumes that the European Communities' appropriate level of protection is that which the European Communities has expressed in its approval legislation for biotech products. The EC approval procedures continue to serve as an adequate framework for determining whether biotech products pose risks to human health and the environment. In Canada's view, it is therefore reasonable to conclude that the European Communities' own approval procedure, properly functioning, would achieve its appropriate level of protection. Finally, Canada submits that compliance by the European Communities with its own approval procedures would be significantly less trade-restrictive than the existing moratorium.

7.1399 The **European Communities** argues that certain provisions of the *SPS Agreement* relate to the development of SPS measures while others relate to the application of SPS measures.[1246] According to the European Communities, Article 5.6 contains obligations relating to the development of SPS measures, not their application. SPS measures as defined in Annex A(1) of the *SPS Agreement* presuppose the existence of an act. The European Communities submits that the Complaining Parties' assertions about a moratorium are in reality complaints about delay in the completion of approval procedure. Delay of this kind cannot constitute an SPS measure within the meaning of Annex A(1). Delay is a failure to act in a timely manner. A failure to act in a timely manner can be reviewed under the procedural obligations set out in Article 8 and Annex C(1) of the *SPS Agreement* as an issue of the application of an SPS measure (in this case, the EC approval system).[1247]

7.1400 The European Communities submits that the Complaining Parties describe as an SPS measure the very same failure to take final decisions which they challenge as the application of an SPS measure under Article 8 and Annex C(1). Yet as a matter of logic, it is clear that alleged behaviour cannot at the same time constitute an SPS measure and the application of another SPS measure. The European Communities deduces from these considerations that since, in its view, the Complaining Parties are not complaining about an SPS measure, but its application, and since Article 5.6 does not contain obligations relating to the application of an SPS measure, the alleged general moratorium on approvals is not subject to Article 5.6.

7.1401 The **Panel** notes the European Communities' argument that the European Communities' decision to apply a general moratorium on approvals does not fall to be assessed under Article 5.6. In view of this argument, we must first examine whether the provisions of Article 5.6 are applicable.

[1246] The European Communities bases this view on Article 1.1 of the *SPS Agreement*, the second sentence of which provides that SPS measures "shall be *developed and applied* in accordance with the provisions of this Agreement" (emphasis added).

[1247] For the text of Article 8 and Annex C(1), *see infra*, section VII.C.11 and VII.C.12.

(a) Applicability of Article 5.6 to the European Communities' decision to apply a general *de facto* moratorium on approvals

7.1402 We note that, by its clear terms, Article 5.6 applies to "[SPS] measures". Accordingly, for a particular measure to be subject to Article 5.6 it must be an SPS measure. Pursuant to Article 1 of the *SPS Agreement*, the Annex A(1) definition of the term "SPS measure" is directly applicable to Article 5.6. We have found above that the European Communities' decision to apply a general moratorium on approvals does not meet the definition of the term "SPS measure" as it appears in Annex A(1). However, we also stated that in interpreting the term "SPS measure", in addition to the Annex A(1) definition, account should be taken of the specific context within which that term appears. For this reason, we proceed to analyse whether the provisions of Article 5.6 render the provisional conclusion we have reached on the basis of the Annex A(1) definition inappropriate.

7.1403 When analysing the Complaining Parties' claim under Article 5.1, we have highlighted the fact that Article 5.6 explicitly refers to "[SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection". It is therefore clear that the SPS measures at issue in Article 5.6 are those applied for achieving the appropriate level of protection.

7.1404 We found above that the European Communities' decision to apply a general moratorium on approvals was not, as such, a measure applied to achieve the European Communities' appropriate level of protection.[1248] It follows that that decision cannot be considered an "SPS measure" within the meaning of Article 5.6. Reinforcing this view is the fact that the procedural decision to delay final approval decisions did not itself restrict trade. Trade was restricted as a result of a distinct measure, namely, the pre-marketing approval requirement which imposes a provisional marketing ban on biotech products. Consequently, the provisions of Article 5.6 support rather than undermine the provisional conclusion we have reached on the basis of the Annex A(1) definition.

7.1405 Based on the above considerations, we thus determine that the European Communities' decision to apply a general moratorium on approvals was not an "SPS measure" within the meaning of Article 5.6 and Annex A(1). As only "SPS measures" are subject to the provisions of Article 5.6, we consider that the provisions of Article 5.6 are not applicable to the European Communities' decision to apply a general moratorium on approvals.

7.1406 In view of this conclusion, we need not continue our analysis of Canada's claim under Article 5.6.

(b) Conclusions

7.1407 In the light of the above, the Panel reaches the following conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.6 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

[1248] *See supra*, para. 7.1371.

7. Consistency of the general *de facto* moratorium on approvals with Article 5.5 of the *SPS Agreement*

7.1408 All three Complaining Parties claim that by applying a general *de facto* moratorium on approvals, the European Communities has acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement*.

7.1409 Article 5.5 of the *SPS Agreement* provides:

> "With the objective of achieving consistency in the application of the concept of appropriate level of sanitary or phytosanitary protection against risks to human life or health, or to animal and plant life or health, each Member shall avoid arbitrary or unjustifiable distinctions in the levels it considers to be appropriate in different situations, if such distinctions result in discrimination or a disguised restriction on international trade. Members shall cooperate in the Committee, in accordance with paragraphs 1, 2 and 3 of Article 12, to develop guidelines to further the practical implementation of this provision."

7.1410 The **Complaining Parties** submit that the European Communities has adopted different appropriate levels of protection in three different situations that can be compared. The United States argues that the European Communities has identified a different level of protection for biotech products and products produced with biotech processing aids. Canada and Argentina argue that the European Communities has identified a different level of protection for biotech products that have been stalled as a result of the general moratorium, biotech products that were approved for marketing prior to the imposition of the general moratorium, and novel non-biotech products such as those produced by conventional plant breeding techniques. The Complaining Parties further argue that the identified differences in appropriate levels of protection in comparable situations are "arbitrary or unjustifiable". Finally, the Complaining Parties argue that the general moratorium as the measure embodying the differences in the levels of protection has resulted in discrimination or a disguised restriction on international trade.

7.1411 **Canada** notes that it is making a claim under Article 5.5 in the alternative, in the event that contrary to Canada's assumption, the European Communities' appropriate level of protection is reflected, not in the applicable EC approval legislation, but in the general moratorium itself.

7.1412 The **European Communities** argues that certain provisions of the *SPS Agreement* relate to the development of SPS measures while others relate to the application of SPS measures.[1249] According to the European Communities, Article 5.5 is premised on, and requires, the existence of an SPS measure. It does not refer to the application of an SPS measure. SPS measures as defined in Annex A(1) of the *SPS Agreement* presuppose the existence of an act. The European Communities submits that the Complaining Parties' assertions about a moratorium are in reality complaints about delay in the completion of approval procedure. Delay of this kind cannot constitute an SPS measure within the meaning of Annex A(1). Delay is a failure to act in a timely manner. A failure to act in a timely manner can be reviewed under the procedural obligations set out in Article 8 and Annex C(1)

[1249] The European Communities bases this view on Article 1.1 of the *SPS Agreement*, the second sentence of which provides that SPS measures "shall be *developed and applied* in accordance with the provisions of this Agreement" (emphasis added).

of the *SPS Agreement* as an issue of the application of an SPS measure (in this case, the EC approval system).[1250]

7.1413 The European Communities submits that the Complaining Parties describe as an SPS measure the very same failure to take final decisions which they challenge as the application of an SPS measure under Article 8 and Annex C(1). Yet as a matter of logic, it is clear that alleged behaviour cannot at the same time constitute an SPS measure and the application of another SPS measure. The European Communities deduces from these considerations that since, in its view, the Complaining Parties are not complaining about an SPS measure, but its application, and since Article 5.5 does not refer to the application of an SPS measure, the alleged general moratorium on approvals is not subject to Article 5.5.

7.1414 The **Panel** notes the European Communities' argument that the European Communities' decision to apply a general moratorium on approvals is not subject to the provisions of Article 5.5. In view of this argument, we must first examine whether the provisions of Article 5.5 are applicable.

(a) Applicability of Article 5.5 to the European Communities' decision to apply a general *de facto* moratorium on approvals

7.1415 Article 5.5 contains obligations relating to the application of the concept of the appropriate level of sanitary or phytosanitary protection. However, we note that the "Guidelines to Further the Practical Implementation of Article 5.5", adopted by the SPS Committee in accordance with the second sentence of Article 5.5, state in this regard that "the concept of appropriate level of protection is applied in practice through sanitary or phytosanitary measures".[1251] This statement is consistent with relevant Appellate Body jurisprudence. In *EC – Hormones*, the Appellate Body found that three elements must be demonstrated to establish an inconsistency with Article 5.5:

> "The first element is that the Member imposing the measure complained of has adopted its own appropriate levels of sanitary protection against risks to human life or health in several different situations. The second element to be shown is that those *levels of protection* exhibit arbitrary or unjustifiable differences ('distinctions' in the language of Article 5.5) in their treatment of different situations. The last element requires that the arbitrary or unjustifiable differences result in discrimination or a disguised restriction of international trade. We understand the last element to be referring to the *measure* embodying or implementing a particular level of protection as resulting, in its application, in discrimination or a disguised restriction on international trade."[1252]

7.1416 In the light of this, we consider that although Article 5.5 does not explicitly refer to "SPS measures", implicitly it envisages that the "measure complained of" is an "implementing measure"[1253]. In other words, the measure complained of must be an SPS measure applied for achieving a particular level of sanitary or phytosanitary protection. In this respect, there is therefore no difference between Article 5.5, on the one hand, and Articles 5.1 and 5.6, on the other hand.

7.1417 If, as Appellate Body jurisprudence leads us to believe, Article 5.5 implies a reference to "SPS measures", the general definition of that term set out in Annex A(1) of the *SPS Agreement* must

[1250] For the text of Article 8 and Annex C(1), *see infra*, section VII.C.11 and VII.C.12.
[1251] G/SPS/15, B.1.
[1252] Appellate Body Report, *EC – Hormones*, para. 214 (italics in original; underlining added).
[1253] *Ibid*., para. 215.

be applicable in the context of Article 5.5 as well. We have found above that the European Communities' decision to apply a general moratorium on approvals does not meet the definition of the term "SPS measure" as it appears in Annex A(1). However, we also stated that in interpreting the term "SPS measure", in addition to the Annex A(1) definition, account should be taken of the specific context within which that term appears. For this reason, we proceed to analyse whether the provisions of Article 5.5 render the provisional conclusion we have reached on the basis of the Annex A(1) definition inappropriate.

7.1418 As we have pointed out, the SPS measures at issue in Article 5.5 are those applied for achieving a particular level of protection. We found above that the pre-marketing approval requirement which results in a provisional marketing ban may be properly considered a measure which is applied for achieving the European Communities' appropriate level of protection. Similarly, we found that final substantive approval decisions on individual applications are measures applied for achieving the European Communities' appropriate level of protection. But, most importantly, we found that the European Communities' decision to apply a general moratorium on approvals was not, as such, a measure applied to achieve a particular level of protection, and did not imply a particular level of protection either. That decision cannot, therefore, be considered an "implementing measure". This being so, it is clear that the provisions of Article 5.5 as interpreted by the Appellate Body and the SPS Committee do not undermine, but reinforce the provisional conclusion we have reached on the basis of the Annex A(1) definition.

7.1419 Based on the above considerations, we thus determine that the European Communities' decision to apply a general moratorium on approvals was not an implementing "SPS measure" within the meaning of Annex A(1) and Article 5.5 as interpreted by the Appellate Body. As Article 5.5 implies that the measure complained of is an implementing "SPS measure", we consider that Article 5.5 is not applicable to the European Communities' decision to apply a general moratorium on approvals.

7.1420 In view of this conclusion, we need not continue our analysis of the Complaining Parties' claim under Article 5.5.

(b) Conclusions

7.1421 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

8. Consistency of the general *de facto* moratorium on approvals with Article 2.2 of the *SPS Agreement*

7.1422 All three Complaining Parties claim that by applying a general *de facto* moratorium on approvals between June 1999 and August 2003, the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement*.

7.1423 Article 2.2 of the *SPS Agreement* provides in relevant part:

> "Members shall ensure that any sanitary or phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5."

7.1424 It is apparent from the text of Article 2.2 that this provision contains three separate requirements: (i) the requirement that SPS measures be applied only to the extent necessary to protect human, animal or plant life or health; (ii) the requirement that SPS measures be based on scientific principles; and (iii) the requirement that SPS measures not be maintained without sufficient scientific evidence.

7.1425 The **Complaining Parties** consider that Article 2.2 is applicable to the general moratorium on approvals. The United States submits that the general moratorium is inconsistent with the second and third requirements in Article 2.2, while Canada and Argentina submit that it is inconsistent with all three requirements contained in Article 2.2.

7.1426 The **European Communities** argues that certain provisions of the *SPS Agreement* relate to the development of SPS measures while others relate to the application of SPS measures.[1254] According to the European Communities, Article 2.2 contains obligations concerning the development of SPS measures, not their application. The European Communities submits that by challenging the way in which applications are dealt with under the EC approval system, the Complaining Parties are challenging the application of an SPS measure. The European Communities therefore considers that Article 2.2 is not applicable to the alleged general moratorium on approvals.[1255]

7.1427 The **Panel** will first analyse the claims under the first requirement in Article 2.2. The claims under the second and third requirements will be analysed subsequently, in a joint subsection.

[1254] The European Communities bases this view on Article 1.1 of the *SPS Agreement*, the second sentence of which provides that SPS measures "shall be *developed and applied* in accordance with the provisions of this Agreement" (emphasis added).

[1255] It should be noted that the European Communities initially remarked that one could argue on whether Article 2.2 contains obligations relating to the application of an SPS measure rather than to its development. The European Communities submitted that the question could be left open in this case.

(a) First requirement in Article 2.2

7.1428 **Canada** argues that there is a relationship between the first requirement in Article 2.2 and Article 5.6. Canada notes that the panel in *Australia – Salmon* stated that "Article 5.6 should, in particular, be read in light of Article 2.2".[1256] Canada also submits that Article 5.6 is a more specific expression of the general obligation found in Article 2.2 that SPS measures may be applied only to the extent necessary to protect human, animal or plant life or health. Canada considers, therefore, that an SPS measure found to be in violation of Article 5.6 must be presumed to violate the first requirement in Article 2.2. As previously noted, in Canada's view the general moratorium on approvals is inconsistent with Article 5.6. Canada concludes from this that the general moratorium must also be presumed to be contrary to the first requirement in Article 2.2.

7.1429 **Argentina** considers that the requirement that SPS measures be applied only "to the extent necessary" applies to the imposition of an SPS measure and is valid for any SPS measure. Regarding the general *de facto* moratorium on approvals, Argentina notes that it has been implemented generally, that is to the extent of all biotech products. Argentina argues that the general moratorium is therefore an SPS measure which has been applied to an unjustifiably broad extent. Argentina points out in this regard that the applicable EC legislation itself states that the safety of biotech products must be assessed on a case-by-case basis. In Argentina's view, the unjustifiably broad application of the general moratorium is contrary to the first requirement set out in Article 2.2.

7.1430 The **Panel** begins its analysis with Canada's claim. Canada's claim based on the first requirement in Article 2.2 is in the nature of a consequential claim. Canada submits that an inconsistency with the first requirement in Article 2.2 follows by implication from a demonstrated inconsistency with Article 5.6. We begin our consideration of Canada's claim by recalling our earlier finding that Article 5.6 is not applicable to the European Communities' decision to apply a general moratorium on approvals and that, consequently, the European Communities has not acted inconsistently with its obligations under Article 5.6 by applying a general *de facto* moratorium on approvals between June 1999 and August 2003. Since the European Communities has not acted inconsistently with Article 5.6, and since Canada's claim under the first requirement in Article 2.2 is premised on the existence of a breach of Article 5.6 by the European Communities, Canada's claim under the first requirement in Article 2.2 cannot succeed.

7.1431 We now turn to consider Argentina's claim. Argentina claims that the European Communities' general *de facto* moratorium on approvals is a measure that has been applied to an unjustifiably broad extent, and that this is contrary to the first requirement in Article 2.2. More specifically, Argentina argues that the moratorium should not have been applied to all biotech products in respect of which applications were pending during the relevant time period, given that the EC approval legislation states that the safety of biotech products should be assessed on a case-by-case basis.

7.1432 Argentina argues that for the purposes of its claim under the first requirement in Article 2.2 the general *de facto* moratorium on approvals should be considered as an "SPS measure". However, based on the Annex A(1) definition of the term "SPS measures", we have found earlier that the European Communities' decision to apply a general *de facto* moratorium on approvals was a decision relating to the application, or operation, of the existing EC approval procedures and that, as such, it

[1256] Panel Report, *Australia – Salmon*, para. 8.165.

did not constitute an "SPS measure" within the meaning of Annex A(1).[1257] This view seems to us to be appropriate also in the specific context of the first requirement in Article 2.2.

7.1433 We note in this regard that the panel in *EC - Hormones* stated that Article 5.1 may be viewed as a specific application of the basic obligations contained in Article 2.2.[1258] Furthermore, the panel in *Japan – Agricultural Products II* stated that the more specific language of Article 5.6 should be read in the light of the more general language in the first requirement of Article 2.2.[1259] If, as the aforementioned panels suggested, Article 2.2 and Article 5.6 are to be read together, and if Article 5.6 is a specific application of the first obligation provided for in Article 2.2, then our previous considerations as to why we believe the provisions of Article 5.6 are not applicable to the European Communities' decision to apply a moratorium are relevant also in the context of the first requirement of Article 2.2. Therefore, as is the case with Article 5.6, we are of the view that the first requirement in Article 2.2 is applicable to measures applied for achieving a Member's appropriate level of sanitary or phytosanitary protection.[1260]

7.1434 We have already found that the European Communities' procedural decision to delay final approval decisions did not itself constitute a measure which is applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. Accordingly, we consider that that decision does not constitute an SPS measure within the meaning of Article 2.2. It follows that the particular claim presented by Argentina under the first requirement of Article 2.2 cannot succeed.

(b) Second and third requirements in Article 2.2

7.1435 The **United States** and **Canada** note that the Appellate Body in *Australia – Salmon* agreed with the panel in that case that "in the event a sanitary measure is not based on a risk assessment as required in Articles 5.1 and 5.2, this measure can be presumed, more generally, not to be based on scientific principles or to be maintained without sufficient scientific evidence".[1261] As previously noted, in the United States' and Canada's view the general moratorium on approvals is inconsistent with Article 5.1. The United States and Canada conclude from this that the general moratorium must also be presumed not to be based on scientific principles and to be maintained without sufficient scientific evidence, contrary to Article 2.2.

7.1436 **Argentina** argues that the European Communities has no scientific basis for maintaining a general moratorium on approvals. Argentina submits that there is no known scientific evidence that might support the moratorium. In Argentina's view, the lack of any scientific basis means that the general moratorium is inconsistent with Article 2.2. Argentina further argues that according to the Appellate Body there must be a reasonable relationship between the SPS measure at issue and the scientific evidence.[1262] Argentina argues that the general moratorium has been maintained for a period of more than five years (1998 – 2004) without sufficient scientific evidence. Argentina considers that this demonstrates the lack of the required reasonable relationship.

[1257] We recall that in accordance with Article 1.1 of the *SPS Agreement* the definitions provided in Annex A are applicable to Article 2.2.

[1258] Panel Report, *EC – Hormones* (*Canada*), para. 8.96.

[1259] Panel Report, *Japan – Agricultural Products II*, para. 8.71.

[1260] We note that Argentina is not arguing that for the purposes of its claim under the first requirement in Article 2.2 the EC approval procedures are the relevant SPS measures. Therefore, we need not, and do not, determine whether approval procedures as such can be subject to the first requirement in Article 2.2.

[1261] Appellate Body Report, *Australia – Salmon*, paras. 137-138.

[1262] Argentina refers to Appellate Body Report, *Japan – Agricultural Products II*, para. 73.

7.1437 The **Panel** first considers the United States' and Canada's claim based on the second and third requirements in Article 2.2. This claim is in the nature of a consequential claim. The United States and Canada submit that an inconsistency with the second and third requirements in Article 2.2 follows by implication from a demonstrated inconsistency with Article 5.1. It is correct that the Appellate Body in *Australia – Salmon* found that by maintaining an SPS measure in violation of Article 5.1, Australia as the responding party in that case, by implication, also acted inconsistently with the second and third requirements in Article 2.2.[1263] However, we have determined above that Article 5.1 is not applicable to the European Communities' decision to apply a general moratorium on approvals and that, consequently, the European Communities has not acted inconsistently with its obligations under Article 5.1 by applying a general *de facto* moratorium on approvals between June 1999 and August 2003. Since the European Communities has not acted inconsistently with Article 5.1, and since the United States' and Canada's claim under the second and third requirements in Article 2.2 is premised on the existence of a breach of Article 5.1 by the European Communities, the United States' and Canada's claim under the second and third requirements in Article 2.2 cannot succeed.

7.1438 Argentina claims that the European Communities maintained its general *de facto* moratorium on approvals without sufficient scientific evidence, contrary to the third requirement in Article 2.2. Under this claim, the general *de facto* moratorium on approvals is considered as an "SPS measure". Based on the Annex A(1) definition of the term "SPS measures", we have found earlier that the European Communities' decision to apply a general *de facto* moratorium on approvals was a decision relating to the application, or operation, of the existing EC approval procedures and that, as such, it did not constitute an "SPS measure" within the meaning of Annex A(1).[1264] This view seems to us to be appropriate also in the specific context of the second and third requirement in Article 2.2.

7.1439 We note in this regard that in *EC - Hormones* the Appellate Body agreed with a statement by the panel in that case that Article 5.1 may be viewed as a specific application of the basic obligations contained in Article 2.2 and that Articles 2.2 and 5.1 should "constantly be read together".[1265] If Article 2.2 and Article 5.1 must be read together, and if Article 5.1 is a specific application of the second and third obligations provided for in Article 2.2, then our earlier considerations as to why we believe the provisions of Article 5.1 are not applicable to the European Communities' decision to apply a moratorium on approvals are relevant also in the context of the second and third requirements of Article 2.2. Therefore, we are of the view that the second and third requirements in Article 2.2 are applicable to measures applied for achieving a Member's appropriate level of sanitary or phytosanitary protection.[1266]

7.1440 We have already found that the European Communities' procedural decision to delay final approval decisions did not itself constitute a measure which is applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. Accordingly, we consider that that decision does not constitute an SPS measure within the meaning of Article 2.2. It follows that the particular claim presented by Argentina under the second and third requirements of Article 2.2 cannot succeed.

[1263] *Ibid*., para. 138.

[1264] We recall that in accordance with Article 1.1 of the *SPS Agreement* the definitions provided in Annex A are applicable to Article 10.1.

[1265] Appellate Body Report, *EC – Hormones*, para. 180. *See also* Appellate Body Report, *Japan – Agricultural Products II*, para. 82.

[1266] We note that Argentina is not arguing that for the purposes of its claim under the second and third requirements in Article 2.2 the relevant SPS measures are the EC approval procedures. Therefore, we need not, and do not, determine whether approval procedures as such can be subject to the second and third requirements in Article 2.2.

(c) Conclusions

7.1441 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the United States has not established that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that Canada has not established that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

9. Consistency of the general *de facto* moratorium on approvals with Article 2.3 of the *SPS Agreement*

7.1442 All three Complaining Parties claim that by applying a general *de facto* moratorium on approvals, the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement*.

7.1443 Article 2.3 of the *SPS Agreement* provides in relevant part:

> "Members shall ensure that their sanitary and phytosanitary measures do not arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, including between their own territory and that of other Members. Sanitary and phytosanitary measures shall not be applied in a manner which would constitute a disguised restriction on international trade."

7.1444 The **Complaining Parties** note that, according to the Appellate Body, in cases where all three elements under Article 5.5 of the *SPS Agreement* have been fulfilled, and, therefore, Article 5.5 has been violated, the relevant SPS measure, by implication, necessarily violates the more general obligations set out in Article 2.3.[1267] The Complaining Parties recall their view that the European Communities has, by maintaining the general *de facto* moratorium on approvals, acted inconsistently

[1267] The Complaining Parties refer to Appellate Body Report, *Australia – Salmon*, paras. 248-252.

with its obligations under Article 5.5. The Complaining Parties submit that, in the light of this, the European Communities has, by implication, also acted inconsistently with its obligations under Article 2.3.

7.1445 The **European Communities** argues that certain provisions of the *SPS Agreement* relate to the development of SPS measures while others relate to the application of SPS measures.[1268] According to the European Communities, Article 2.3 contains obligations concerning the development of SPS measures, not their application. The European Communities submits that by challenging the way in which applications are dealt with under the EC approval system, the Complaining Parties are challenging the application of an SPS measure. The European Communities therefore considers that Article 2.3 is not applicable to the alleged general moratorium on approvals.[1269]

(a) Evaluation

7.1446 The **Panel** notes that the Complaining Parties' claim under Article 2.3 is in the nature of a consequential claim. The Complaining Parties submit that an inconsistency with Article 2.3 follows by implication from a demonstrated inconsistency with Article 5.5. We note that this argument draws support from Appellate Body jurisprudence, for in *Australia – Salmon*, the Appellate Body observed that "a finding of violation of Article 5.5 will necessarily imply a violation of Article 2.3, first sentence, or Article 2.3, second sentence".[1270]

7.1447 We have determined above that Article 5.5 is not applicable to the European Communities' decision to apply a general moratorium on approvals and that, consequently, the European Communities has not acted inconsistently with its obligations under Article 5.5 by applying a general *de facto* moratorium on approvals between June 1999 and August 2003. Since the European Communities has not acted inconsistently with Article 5.5, and since the Complaining Parties' claim under Article 2.3 is premised on the existence of a breach of Article 5.5 by the European Communities, the Complaining Parties' claim under Article 2.3 cannot succeed.

(b) Conclusions

7.1448 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the United States has not established that the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

[1268] The European Communities bases this view on Article 1.1 of the *SPS Agreement*, the second sentence of which provides that SPS measures "shall be *developed and applied* in accordance with the provisions of this Agreement" (emphasis added).

[1269] It should be noted that the European Communities initially remarked that one could argue on whether Article 2.3 contains obligations relating to the application of an SPS measure rather than to its development. The European Communities submitted that the question could be left open in this case.

[1270] Appellate Body Report, *Australia – Salmon*, para. 252.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that Canada has not established that the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

10. Consistency of the general *de facto* moratorium on approvals with Article 7 and Annex B(1) of the *SPS Agreement*

7.1449 All three Complaining Parties claim that the European Communities has failed to publish the existence of the general *de facto* moratorium on approvals and that it has thereby acted inconsistently with its obligations under Article 7 and Annex B(1) of the *SPS Agreement*.

7.1450 Article 7 of the *SPS Agreement* provides:

> "Members shall notify changes in their sanitary or phytosanitary measures and shall provide information on their sanitary or phytosanitary measures in accordance with the provisions of Annex B."

7.1451 Annex B(1) of the *SPS Agreement* provides:

> "Members shall ensure that all sanitary and phytosanitary regulations[1271] which have been adopted are published promptly in such a manner as to enable interested Members to become acquainted with them."

7.1452 The **Complaining Parties** submit that the general moratorium on approvals is subject to the publication requirement in Annex B(1). *First*, the general moratorium is an "adopted" measure as it has existed since October 1998 and remains in effect. *Secondly*, the general moratorium is "applicable generally", in that it has applied to all new biotech products subject to the EC approval procedures. *Thirdly*, the general moratorium constitutes a "sanitary or phytosanitary regulation". The Complaining Parties recall in this regard that, in their view, the *de facto* general moratorium is an "SPS measure" and has a similar effect as a law, decree or ordinance. The Complaining Parties further contend that the existence of the general moratorium has not been published, let alone "promptly". The Complaining Parties argue that by failing to publish promptly the existence of the general moratorium, the European Communities has acted inconsistently with its obligations under Annex B(1) and Article 7.

[1271] (*original footnote*) Sanitary and phytosanitary measures such as laws, decrees or ordinances which are applicable generally.

7.1453 The **European Communities** argues that Article 7 contains procedural obligations (publication) regarding an SPS measure. Thus, the applicability of Article 7 is premised on the existence of an SPS measure. SPS measures as defined in Annex A(1) of the *SPS Agreement* presuppose the existence of an act. The European Communities submits that the Complaining Parties' assertions about a moratorium are in reality complaints about delay in the completion of approval procedures. Delay of this kind cannot constitute an SPS measure within the meaning of Annex A(1). Delay is a failure to act in a timely manner. The European Communities deduces from these considerations that the alleged general moratorium on approvals is not subject to Article 7.

7.1454 The **Panel** notes that the Complaining Parties allege an inconsistency of the general *de facto* moratorium on approvals with Annex B(1) and use the alleged inconsistency with Annex B(1) to make a consequential claim of inconsistency under Article 7. Accordingly, we will begin our analysis with the Complaining Parties' claim under Annex B(1).

(a) "Sanitary and phytosanitary regulations"

7.1455 Annex B(1) applies to "sanitary and phytosanitary regulations" (hereafter "SPS regulations") which have been "adopted". An explanatory footnote to Annex B(1) indicates that the term "SPS regulations" should be understood as meaning "[s]anitary and phytosanitary measures such as laws, decrees or ordinances which are applicable generally". That SPS regulations are "SPS measures" is confirmed by Article 7 which states that Members must notify changes in their "SPS measures" and provide information on their "SPS measures" "in accordance with the provisions of Annex B". It can be inferred from this that the "SPS regulations" at issue in Annex B(1) are a sub-category of "SPS measures". Regarding the meaning of the term "SPS measures", we recall Article 1 of the *SPS Agreement*. It states that for the purposes of the *SPS Agreement*, "the definitions provided in Annex A shall apply". We further note that Article 1.3 of the *SPS Agreement* states that the annexes to the *SPS Agreement* – which include Annex B – are an integral part of the *SPS Agreement*. This means that the reference in the footnote to Annex B(1) to "SPS measures" must be interpreted in accordance with the Annex A(1) definition of the term "SPS measures".

7.1456 It follows from the foregoing that a threshold issue before us is whether the general *de facto* moratorium on approvals was a generally applicable "SPS measure" which had been adopted. It is clear from our earlier findings that the moratorium on final approvals was applicable generally inasmuch as it was applicable to all applications which were pending between June 1999 and August 2003.

7.1457 Our earlier findings have also addressed in detail the question of whether the general *de facto* moratorium on approvals met the definition of an "SPS measure" set out in Annex A(1). We found that it was a measure relating to the application, or operation, of the existing EC approval procedures and that such a measure did not constitute an "SPS measure" within the meaning of Annex A(1). However, we also stated that in interpreting the term "SPS measure", in addition to the Annex A(1) definition, account should be taken of the specific context within which that term appears. For this reason, we now go on to analyse whether the provisions of Annex B(1) render the conclusion we have reached on the basis of the Annex A(1) definition inappropriate.

7.1458 Annex B(1) read in conjunction with the accompanying footnote provides that a generally applicable "SPS measure" which has been adopted must be published promptly. We recall that according to Annex A(1) the term "SPS measures" includes "requirements and procedures". It can be deduced from this that a generally applicable measure imposing a substantive SPS requirement or establishing an SPS procedure is to be published, since such a measure would itself be an "SPS measure". In contrast, neither Annex B(1) nor its accompanying footnote suggests that a generally

applicable measure concerning the administration, or operation, of an SPS measure – such as a measure providing for a particular operation of an SPS approval procedure – is, also, to be published.

7.1459 Article 7 supports this view. It requires Members to notify changes in their "SPS measures" and provide information on their "SPS measures". It does not require Members to notify changes in the administration of SPS measures and provide information on the administration of their SPS measures.

7.1460 We attach meaning to the absence in the text of Annex B(1) and Article 7 of any reference to the administration, or operation, of SPS measures. We find instructive in this regard the provisions of Article 18.5 of the *Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994*, which parallel those of Article 7. Article 18.5 provides that "[e]ach Member shall inform the [Anti-dumping] Committee of any changes in its laws and regulations relevant to this Agreement and in the *administration* of such laws and regulations" (emphasis added). In view of the provisions of Article 18.5, it has to be assumed that where the publication requirement was intended to extend to the administration of generally applicable measures, this was made explicit in the text of the relevant WTO provision.[1272]

7.1461 The Appellate Body in *Japan – Agricultural Products II* stated that the scope of application of the publication requirement of Annex B(1) "should be interpreted in the light of [its] object and purpose".[1273] According to the Appellate Body, "[t]he object and purpose of paragraph 1 of Annex B is 'to enable interested Members to become acquainted with' the sanitary and phytosanitary regulations adopted or maintained by other Members and thus to enhance transparency regarding these measures".[1274] We would agree that extending the publication requirement contained in Annex B(1) to measures concerning the administration, or operation, of SPS regulations would serve the purpose of enhancing transparency. But the object and purpose of Annex B(1) does not entitle us to expand the scope of the publication requirement negotiated by Members, even if we were to consider that it might in principle be desirable to do so.[1275] At any rate, the Appellate Body has made it clear that the principles of treaty interpretation set out in Article 31 of the *Vienna Convention* "neither require nor condone the imputation into a treaty of words that are not there".[1276] As we have said, neither the text of Annex B(1) nor that of Article 7 refers to the administration, or operation, of SPS regulations or SPS measures.

7.1462 In view of the above considerations, we find our earlier conclusion – that the general *de facto* moratorium on approvals was not an "SPS measure" within the meaning of Annex A(1) – to be appropriate also in the specific context of Annex B(1) and Article 7. We thus determine that the general *de facto* moratorium on approvals was not an "SPS measure" within the meaning of the footnote to Annex B(1). Consequently, we also find that the general *de facto* moratorium on approvals was not an "SPS regulation" within the meaning of Annex B(1). This finding in turn makes it unnecessary for us to consider whether the general *de facto* moratorium on approvals had been "adopted" within the meaning of Annex B(1). Since the provisions of Annex B(1) apply only to "SPS regulations", and since the European Communities' general *de facto* moratorium on approvals was not

[1272] We note that the text of Article 32.6 of the *Agreement on Subsidies and Countervailing Measures* is identical to that of Article 18.5 of the *Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994*.

[1273] Appellate Body Report, *Japan – Agricultural Products II*, para. 106.

[1274] *Ibid*., para. 106.

[1275] Pursuant to Article 19.2 of the DSU, panels cannot add to the obligations provided in the covered agreements.

[1276] Appellate Body Report, *India – Patents (US)*, para. 45.

an "SPS regulation", it follows that the provisions of Annex B(1) are not applicable to the general moratorium.

7.1463 We recall that the Complaining Parties seek to establish an inconsistency with Article 7 on the basis of an alleged inconsistency with Annex B(1). As we have found that the provisions of Annex B(1) are not applicable to the general *de facto* moratorium on approvals, there can be no inconsistency with these provisions. Under the approach followed by the Complaining Parties, there can then logically be no inconsistency with Article 7 either, even assuming that Article 7 is applicable to the general moratorium.

7.1464 In connection with the preceding findings, it is well to point out that Annex C(1) of the *SPS Agreement* contains additional transparency requirements which apply specifically to the operation of approval procedures. In particular, Annex C(1)(b) provides that "upon request, the applicant [must be] informed of the stage of the procedure, with any delay being explained". Thus, to the extent the application by the European Communities of a general *de facto* moratorium on approvals led to delays, the European Communities was under an obligation to explain, upon request from an applicant, that these delays were the consequence of a general moratorium. Accordingly, the European Communities was required to provide information on the general moratorium to those directly affected by it. We note that only the United States has alleged that the European Communities has acted inconsistently with the aforementioned transparency requirement of Annex C(1)(b) by applying a general *de facto* moratorium on approvals.[1277]

(b) Conclusions

7.1465 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Annex B(1) and Article 7 of the *SPS Agreement* in respect of the general *de facto* moratorium on approvals which it applied between June 1999 and August 2003.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Annex B(1) and Article 7 of the *SPS Agreement* in respect of the general *de facto* moratorium on approvals which it applied between June 1999 and August 2003.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Annex B(1) and Article 7 of the *SPS Agreement* in respect of the general *de facto* moratorium on approvals which it applied between June 1999 and August 2003.

[1277] *See infra*, para. 7.1571.

11. Consistency of the general *de facto* moratorium on approvals with Article 8 and Annex C(1)(a), first clause, of the *SPS Agreement*

7.1466 The United States and Canada, but not Argentina, claim that the general *de facto* moratorium on approvals has led to a failure by the European Communities to comply with the requirements of Article 8 and Annex C(1)(a), first clause, of the *SPS Agreement*.

7.1467 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.1468 Annex C(1)(a), first clause, of the *SPS Agreement* provides:

> "1. Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> (a) such procedures are undertaken and completed without undue delay [...]."

7.1469 The **United States** argues that the European Communities' approval procedures for biotech products must comply with Article 8 and Annex C(1)(a), which refers to "undue delay". The United States notes that the ordinary meaning of "undue" is "inappropriate, unsuitable, improper; unrightful; unjustifiable[;] [g]oing beyond what is warranted or natural; excessive; disproportionate".[1278] The United States further notes that the ordinary meaning of "delay" is "hindrance to progress; (a period of) time lost by inaction or inability to proceed".[1279] Thus, in the United States' view, the ordinary meaning of "undue delay" under Annex C(1)(a) is the "unjustifiable" and "excessive" "hindrance" in undertaking or completing an approval procedure. According to the United States, the ordinary meaning of "undue delay" suggests that both the reason for the delay and its duration are relevant considerations in determining whether the delay is "undue".

7.1470 The United States argues that although it may be difficult in particular cases to decide whether approval procedures are undertaken without undue delay, an across-the-board suspension of final approvals must be considered an "undue delay" under Annex C(1)(a). The United States submits that it has been recognized by EC officials that there was no scientific basis for the failure to move forward under the procedures and timelines provided in the European Communities' own legislation.[1280] The United States also notes that many of the biotech products caught up in the general moratorium on approvals have been subject to positive assessments by the lead CA and the European Communities' own scientific committees.

7.1471 The United States considers that where the European Communities' own legislation provides procedures and timelines for the approval of biotech products, an indefinite suspension of that

[1278] The *New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. II, p. 3480.

[1279] *Ibid*., Vol. I, p. 623.

[1280] The United States refers to the above-mentioned October 2001 news report about a statement attributed to Environment Commissioner Wallström.

approval procedures, without any scientific justification, must be considered "undue delay" under Annex C(1)(a). In the light of this, the United States submits that the imposition of a general moratorium on approvals has resulted in the European Communities breaching Annex C(1)(a) and, as a consequence, Article 8.

7.1472 **Canada** argues that the EC approval procedures suspended by the general moratorium on approvals are "approval procedures" to "check and ensure the fulfilment of sanitary or phytosanitary measures" and that the European Communities must therefore comply with Annex C(1)(a). Canada notes that Annex C(1)(a) requires that the European Communities both "undertake" and "complete" the approval procedures without "undue delay". Regarding the term "undertake", Canada submits that that term should be interpreted in the light of the steps that WTO Members are obligated to take in processing an approval application outlined in Annex C(1)(b). Annex C(1)(b) provides that Members shall ensure that:

> "[T]he standard processing period of each procedure is published or that the anticipated processing period is communicated to the applicant upon request; when receiving an application, the competent body promptly examines the completeness of the documentation and informs the applicant in a precise and complete manner of all deficiencies; the competent body transmits as soon as possible the results of the procedure in a precise and complete manner to the applicant so that corrective action may be taken if necessary; even when the application has deficiencies, the competent body proceeds as far as practicable with the procedure if the applicant so requests; and that upon request, the applicant is informed of the stage of the procedure, with any delay being explained."

7.1473 Thus, in Canada's view, in undertaking an approval procedure, the European Communities is obligated to take the steps outlined in Annex C(1)(b) in the processing of applications under that procedure. In respect of the approval of biotech products, the European Communities is obligated to ensure that an application is examined and that the applicant is informed promptly of deficiencies identified in the application that may hinder progress through the procedure. Canada notes that the European Communities is also obligated to "complete" the approval procedures for biotech products. According to Canada, "complete" in the sense used in Annex C(1)(a) means to take a decision as to whether or not the biotech product in question will be permitted to be placed on the market.

7.1474 Regarding the term "undue delay", like the United States, Canada considers that the ordinary meaning of "undue delay" under Annex C(1)(a) is the "unjustifiable" and "excessive" "hindrance" in undertaking or completing an approval procedure. Canada considers that this interpretation suggests that both the reason for the delay and its duration are relevant considerations in determining whether the delay is "undue".

7.1475 Canada is of the view that the requirements of Annex C(1)(b) are relevant to determining whether a delay is excessive. Canada notes that Annex C(1)(b) obligates Members to ensure: that standard processing times are published; that the competent body *promptly* examines the applications for completeness and informs the applicant of deficiencies; that the competent body transmits the results of the procedures *as soon as possible*; that where there are deficiencies the competent body proceeds as far as practicable with the procedure; and that any delay is *explained* to the applicant. According to Canada, the purpose of Annex C(1)(b) is to ensure that the processing of an application proceeds as promptly as possible in the circumstances. Thus, the competent body reviewing the application is obligated to undertake the specific steps outlined in Annex C(1)(b) to process the application, in particular, the obligation to explain any delay. Canada notes that, to its knowledge, the

European Communities has failed to provide applicants for biotech products with a justifiable explanation for the delay in processing biotech approvals.[1281]

7.1476 Canada further submits that in the context of Annex C(1), the justification for a delay must be consistent with the provisions of the *SPS Agreement*, namely, that SPS measures must be based on scientific evidence. Article 2.2 of the *SPS Agreement* specifically requires that all SPS measures be "based on scientific principles" and not "maintained without sufficient scientific evidence". Thus, a delay in undertaking and completing an approval procedure is "unjustified" if the delay is caused by a measure that is not based on scientific evidence.

7.1477 According to Canada, there is no sound justification for the European Communities' failure to undertake and complete the approval procedures for biotech products. Canada considers that there is no scientific evidence upon which the general moratorium on approvals is based. Rather, the moratorium undermines the scientific inquiry required as a part of the approval procedures. Canada submits that not only is there no scientific evidence to justify the across-the-board moratorium, for many of the pending applications there is scientific evidence from the European Communities' own experts which support the approval of the product in question. Thus, in Canada's view, the delay, resulting from the moratorium, in undertaking and completing the approval procedures for biotech products is "unjustified" and "excessive". Canada considers that the fact that the general moratorium has been in place for more than five years compounds the excessiveness of the delay.

7.1478 Canada submits that, in the case of the general moratorium, the delay in undertaking and completing the approval procedures for biotech products was caused by a general suspension of those procedures. According to Canada, the *SPS Agreement* does not permit a Member to suspend existing SPS approval procedures, thereby effectively banning products with pending applications, every time that Member seeks to update its legislation. Canada considers that a suspension of an approval regime may be warranted in some circumstances, for example, if there was credible scientific evidence that the continued processing of applications under the existing regime would give rise to actual risks to human health or the environment. However, in Canada's view, this is not the case here. Canada submits that the legislative amendments, for the most part, were to implement measures to identify the occurrence of hypothetical adverse effects or to facilitate the removal of a product from the marketplace in the unlikely event of a hypothetical risk materializing, *e.g.*, monitoring for unanticipated adverse effects.

7.1479 For these reasons, Canada is of the view that, as a result of the general moratorium, the European Communities has failed to undertake and complete its approval procedures for biotech products without undue delay in violation of Annex C(1)(a). Canada further submits that as Article 8 of the *SPS Agreement* requires Members to observe the provisions of Annex C, the failure by the European Communities to adhere to the requirements of Annex C(1)(a) to undertake and complete the approval procedures for biotech product without undue delay violates Article 8.

7.1480 The **European Communities** accepts that, to the extent it addresses risks coming under Annex A(1) of the *SPS Agreement*, the approval system set up under the relevant EC legislation is a "procedure to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1). Regarding the meaning of the term "undue delay", the European Communities argues that out of the rather lengthy list of meanings of the words "undue" and "delay" as offered by the *New Shorter Oxford English Dictionary*, the United States and Canada arbitrarily

[1281] Canada notes that the unjustifiable delay to which it refers does not include the time necessary for the applicant to respond to *bona fide* questions from the competent authority or bodies responsible for the approval procedure.

settle on the choice of "an unjustifiable and excessive hindrance". While not objecting to the choice of "unjustifiable", the European Communities does not see the necessity of adding "excessive", nor does it agree with the choice of "hindrance" as opposed to, for example, "period of time lost by inaction or inability to proceed". It does, however, agree that both the reason for the delay and its duration are relevant considerations in determining whether any delay is "undue".

7.1481 Regarding Canada's argument based on Annex C(1)(b), the European Communities argues that the purpose of Annex C(1)(b) is one of transparency and is not linked in any way to the concept of "undue" in Annex C(1)(a). Annex C(1)(b) only requires Members to publish the "standard", *i.e.*, average or indicative, processing period, or to communicate to the applicant the anticipated processing period. The European Communities notes that nowhere does it say that Members must always abide by the standard processing periods foreseen in their legislation.

7.1482 The European Communities also rejects the United States' argument that an "undue delay" exists when and because the procedural deadlines set forth in the EC legislation have been exceeded. The European Communities considers it clear from a plain reading of Annex C(1)(a) that the meaning of the words "undue delay" is not to be inferred from the domestic legislation of the Members. Had the drafters of the *SPS Agreement* intended to give the words "undue delay" meaning by reference to domestic law, they would have used different wording. The European Communities submits that it is not the purpose of the *SPS Agreement* to elevate national legislation to the level of international law. Equally, it is not the role of the dispute settlement organs (but that of national courts) to enforce that legislation.

7.1483 The European Communities believes that the question of when a period of time becomes a delay is a matter of fact to be established on a case-by-case basis. In particular, in the case of approval procedures for novel products, each specific product presents characteristics and specificities that are peculiar to it. These also vary according to the specific habitat/environment in which the product is to be produced and/or marketed. In the European Communities' view, the question of time cannot, therefore, be separated from the scientific issues associated with an individual product. For the European Communities, this also confirms that any time-limits provided for in legislation setting up an approval procedure cannot be but "standard".

7.1484 The European Communities rejects the United States' and Canada's assertion that a delay is "unjustified" if it is caused by a measure that is not based on scientific evidence. The European Communities submits that delays may occur for reasons completely outside the realm of science. The European Communities offers the example of a case of *force majeure*: an earthquake destroying the building of a competent authority including all archives containing the pending applications. In the European Communities' view, any delays in re-constituting the application files would not be considered "undue" or "unjustifiable". The European Communities argues that, for the same reason, other causes for delay of a non-scientific nature, such as legislative changes or lack of resources, need to be assessed on their own merits.

7.1485 The European Communities further submits that delays caused by legitimate requests for additional information are justified and therefore not "undue". In the European Communities' view, it is legitimate to request additional information necessary for the completion of a risk assessment and/or the compliance with certain standards of risk management and risk communication which have been established by a regulator and which apply to the product in question. According to the European Communities, this applies *a fortiori* when the product at issue is based on a new technology which is generally untried and untested and which is recognised by the international community to have characteristics which inherently require prudence and caution. The European Communities

submits in this regard that the precautionary principle is to be taken into account when assessing "undueness" under Annex C(1)(a).

7.1486 In relation to the United States' and Canada's assertions that an unjustified general suspension of an approval procedure is on its face an "undue delay" within the meaning of Annex C(1)(a), the European Communities submits that, in the present case, no "undue delays" have occurred in any of the pending applications. More specifically, none of the relevant applications for the approval of biotech products has been subject to a "general suspension", and none were stalled in the approval process. In all cases, there have been scientifically valid reasons to delay the approval procedure.

7.1487 The European Communities argues that what has happened in many of these applications is that, at different stages of the procedure, requests for additional information have been put to the applicants. The European Communities submits that all of these requests were related to issues of risk assessment, risk management and sometimes risk communication concerning the individual product in question. Those requests were justified on the basis of standards of risk assessment, risk management and risk communication which not only the European Communities, but the international community has endorsed.[1282] Some of the requests focussed on risk issues falling outside the scope, others on risk issues coming within the scope of Annex A(1) of the *SPS Agreement*. Some requests were based on existing legislation, others on (stricter) requirements as set out in the European Communities' new legislation. Where requests were based on new legislation at a time where that legislation had not yet entered into force, they were conditioned on the applicant's voluntary agreement or were slightly delayed to await the entry into force of that legislation.[1283] According to the European Communities, there is nothing unusual about such an approach, which is common to many legal systems facing transitional arrangements where one set of rules is to be replaced by another.

7.1488 Moreover, the European Communities contends that to the extent there were delays, sometimes this was for reasons lying in the sphere of the applicant. In the European Communities' view, delays caused by the applicant would be justified. Where delays were caused by requests for additional information, the European Communities considers that only those delays which were caused by requests focussing on risk issues falling within the scope of Annex A(1) of the *SPS Agreement* can be reviewed by the Panel in the light of Annex C(1)(a).

[1282] The European Communities refers to the example of Codex Alimentarius, *Principles for the risk analysis of foods derived from modern biotechnology* (Exhibit EC-44). The European Communities notes that these Principles provide (i) that "a pre-market safety assessment should be undertaken following a structured and integrated approach and be performed on a case-by-case basis. The data and information, based on sound science, obtained using appropriate methods and analysed using appropriate statistical techniques, should be of a quality and, as appropriate, of a quantity that would withstand scientific peer review" (paragraph 12); (ii) that "risk management measures may include, as appropriate, food labelling, conditions for marketing approvals and post-market monitoring" (paragraph 19); and (iii) that "specific tools may be needed to facilitate the implementation and enforcement of risk management measures. These may include appropriate analytical methods; reference materials" (paragraph 21). The European Communities submits that it is clear from the detailed chronologies submitted by the European Communities that the delays – if any – in the processing of applications for the authorization of GM food under Regulation 258/97 in most, if not all, cases result either from the failure or time taken by the applicant in supplying either the qualitatively or quantitatively appropriate data for the purpose of the safety assessment, and/or the reference materials, and/or the analytical methods required for the purpose of risk management measures.

[1283] In the European Communities' view, the question of whether or not such requests could be made under the existing legislation is a question of EC law and, as such, a matter for courts in the European Communities. The European Communities submits that for the Panel, the question is whether such requests are legitimate under the standards of the *SPS Agreement*.

7.1489 Further, the European Communities submits that even if any "undue delays" may have occurred in the past, which the European Communities denies, no such "undue delays" are occurring under the new EC legislative framework.

7.1490 The **Panel** notes that the claims by the United States and Canada under Article 8 are in the nature of consequential claims. The United States and Canada claim that the European Communities has failed to observe the provisions of Annex C(1)(a), first clause, and that, as a consequence, the European Communities has also acted inconsistently with the provisions of Article 8. Therefore, the Panel will begin its analysis with the claims under Annex C(1)(a).

(a) Annex C(1)(a), first clause

7.1491 Annex C(1) establishes obligations "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have determined earlier that Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it seeks to prevent novel foods from being a danger for the consumer) are SPS measures within the meaning of Annex A(1). We have also determined that Directives 90/220 and 2001/18 as well as Regulation 258/97 set out procedures to check and ensure the fulfilment of one or more SPS requirements the satisfaction of which is a prerequisite for the approval to place a product on the market. It follows from these previous findings that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures "to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1). As such, they are subject to the provisions of Annex C(1), and notably those of Annex C(1)(a), first clause. Therefore, in accordance with the provisions of Annex C(1)(a), the European Communities was required during the relevant time-period (June 1999 to August 2003) to "undertake and complete" the approval procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) "without undue delay".

7.1492 We understand the United States and Canada to claim that the European Communities has failed to undertake and complete its approval procedures for biotech products without undue delay, as a result of the adoption and application of the general *de facto* moratorium on approvals. Thus, the measure being challenged is the general *de facto* moratorium on approvals, since the United States and Canada allege that the general moratorium has been the cause of undue delays in the processing of applications under the relevant EC approval legislation.

7.1493 Before evaluating the merits of the claim put forward by the United States and Canada under Annex C(1)(a), first clause, we address a number of interpretative issues.

(i) Interpretation

7.1494 Annex C(1)(a), first clause, requires Members to ensure that approval procedures are "undertaken and completed without undue delay". We first consider the meaning of the phrase "undertake and complete". The verb "undertake" makes clear that Members are required to begin, or start, approval procedures after receiving an application for approval.[1284] The verb "complete", on the

[1284] The dictionary meanings of the verb "undertake" include "[t]ake on (an obligation, duty, task, etc.); commit oneself to perform; begin (an undertaking, enterprise, etc.)". The *New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. II, p. 3476. The French and Spanish versions of Annex C(1)(a), first clause, also support this reading. The French version uses the verb "engager", the Spanish version the verb "iniciar". We also note that Annex C(1)(b) requires Members to ensure, *inter alia*, that "when receiving an application, the competent body promptly examines the completeness of the documentation and

other hand, indicates that approval procedures are not only to be undertaken, but are also to be finished, or concluded.[1285] Thus, in our view, the phrase "undertake and complete" covers all stages of approval procedures and should be taken as meaning that, once an application has been received, approval procedures must be started and then carried out from beginning to end.

7.1495 It is clear from the text of Annex C(1)(a), first clause, that not every delay in the undertaking or completion of approval procedures which is caused by a Member is contrary to the provisions of Annex C(1)(a), first clause. Only "undue" delay is.[1286] Regarding the meaning of the phrase " undue delay", we consider that of the dictionary meanings of the term "delay" which have been identified by the United States, there is one which fits naturally with the provisions of Annex C(1)(a), first clause, namely, "(a period of) time lost by inaction or inability to proceed"[1287]. So far as concerns the term "undue", of the dictionary meanings referred to by the United States we find two to be particularly relevant in the specific context of Annex C(1)(a), first clause – "[g]oing beyond what is warranted […]" and "unjustifiable". We note that the United States, Canada and the European Communities have all identified "unjustifiable" as a relevant meaning of "undue". This view is supported also by the French version of Annex C(1)(a), first clause, which refers to "retard injustifié". Thus, based on the ordinary meaning of the phrase "without undue delay", we consider that Annex C(1)(a), first clause, requires that approval procedures be undertaken and completed with no unjustifiable loss of time.

7.1496 According to the United States, Canada and the European Communities, both the reason for a delay and its duration are relevant considerations in determining whether a delay is "undue". We recall in this regard that, in our view, Annex C(1)(a), first clause, requires that there not be any unjustifiable loss of time. Thus, what matters is whether there is a legitimate reason, or justification, for a given delay, not the length of a delay as such. Accordingly, if a Member causes a relatively short, but unjustifiable delay, we do not consider that the mere fact that the delay is relatively short would, or should, preclude a panel from finding that it is "undue".[1288] Similarly, we do not consider that a demonstration that a particular approval procedure has been delayed by, say, two years would always and necessarily be sufficient to establish that the relevant procedure has been "unduly" delayed. Having said this, we note that a lengthy delay for which no adequate explanation is provided might in some circumstances permit the inference that the delay is "undue".

7.1497 In our view, a determination of whether a particular approval procedure has been undertaken and/or completed "without undue delay" must be made on a case-by-case basis, taking account of relevant facts and circumstances. We therefore consider that it would be neither possible nor useful to attempt to define the reasons which would render a given delay "undue", and those which would not render it "undue". Nevertheless, it may be noted that a Member is not legally responsible for delays

---

informs the applicant in a precise and complete manner of all deficiencies". Thus, it is clear that approval procedures are "undertaken" upon receipt of an application from an applicant.

[1285] The dictionary meanings of the verb "complete" include "[b]ring to an end, finish, conclude". The *New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. I, p. 460. The French and Spanish versions of Annex C(1)(a), first clause, also support this reading. The French version uses the verb "achever", the Spanish version the verb "ultimar".

[1286] Indeed, if this had been the intended result, the text of Annex C(1)(a), first clause, would have stated that approval procedures must be undertaken and completed "without any delay".

[1287] We note that the phrase "inability to proceed" may refer to an objective inability to proceed or a perceived inability to proceed.

[1288] Indeed, we consider that where there is no justification for a delay, the provisions of Annex C(1)(a), first clause, do not permit a Member deliberately to proceed at a delayed pace, even if this is done for only a short period of time. In addition, we note that the cumulative effect of a series of short, but unjustifiable delays could be equally prejudicial to the interests of applicants as the effect of a single, long delay.

which are not attributable to it. Hence, delays attributable to action, or inaction, of an applicant must not be held against a Member when a determination is made regarding whether that Member has undertaken or completed approval procedures "without undue delay".

7.1498 Furthermore, it is pertinent to call attention to the introductory paragraph of Annex C(1). It indicates that approval procedures serve to "check and ensure the fulfilment of [SPS] measures". We consider that if approval procedures serve to check and ensure the fulfilment of SPS requirements, then Members applying such procedures must in principle be allowed to take the time that is reasonably needed to determine with adequate confidence whether their relevant SPS requirements are fulfilled, at least if these requirements are WTO-consistent. Put another way, we view Annex C(1)(a), first clause, essentially as a good faith obligation requiring Members to proceed with their approval procedures as promptly as possible, taking account of the need to check and ensure the fulfilment of their relevant SPS requirements. Consequently, delays which are justified in their entirety by the need to check and ensure the fulfilment of a Member's WTO-consistent SPS requirements should not, in our view, be considered "undue". To offer an example, if new or additional information becomes available at a late stage in an approval procedure and that information may appropriately be considered to have a potential impact on a Member's determination on whether an application fulfils that Member's relevant SPS requirements, it might be justifiable for the Member concerned to delay the completion of the procedure and give itself the additional time needed to assess the information.

7.1499 On the other hand, to offer another example, if the time taken by a Member to complete an approval procedure, or a particular stage thereof, exceeds the time that is reasonably needed to check and ensure the fulfilment of its relevant SPS requirements, for instance because the Member concerned did not proceed as expeditiously as could be expected of it in the circumstances, the delay caused in this way would, in our view, be "undue". This interpretation of Annex C(1)(a) is supported by the object and purpose of the *SPS Agreement*. The fourth preambular paragraph of the *SPS Agreement* states that one particular object and purpose of the *SPS Agreement* is "the establishment of a multilateral framework of rules and disciplines to guide the […] enforcement of sanitary and phytosanitary measures in order to minimize their negative effects on trade". Annex C(1)(a), first clause, establishes disciplines concerning the "enforcement" of SPS measures, namely, approval procedures. If Annex C(1)(a), first clause, were interpreted to mean that Members need not undertake and complete their approval procedures as soon as possible under the circumstances, we think the object and purpose of minimizing negative trade effects of approval procedures could not be achieved.

7.1500 Canada argues that a delay in undertaking and completing an approval procedure must be considered "undue" if the delay is caused by a measure which is not based on scientific evidence. We would agree that delays caused by measures which are not based on scientific evidence may in some cases be considered "undue".[1289] However, we do not agree that such delays must in all cases be considered "undue". A delay in undertaking and completing an approval procedure may be caused by a temporary government shutdown in the wake of a natural disaster or civil unrest. Likewise, if a Member is confronting an unforeseeable and sharp increase in the number of products submitted for approval, this could cause a short delay in the processing of some or all pending applications, due to the need for that Member to reallocate existing resources, or to obtain additional resources, to deal

[1289] This could be the case, for example, if a delay is caused by a request for additional information which has nothing to do with the issue of whether the relevant product meets the SPS requirements concerned.

with the new situation.[1290] In both examples provided, the delay would be caused by government action, or inaction, which is not supported by scientific evidence. Yet, in our view, there is a convincing argument to be made that the delay would be needed for the Member to be able to check and ensure the fulfilment of relevant SPS requirements. Therefore, we consider that, in both cases, the delay in undertaking and completing approval procedures could properly be viewed as not "undue" and hence not inconsistent with Annex C(1)(a), first clause.

7.1501 There is one additional aspect of Annex C(1)(a), first clause, which it is appropriate to address before examining the merits of the claims before us. The phrase "without undue delay" follows the phrase "undertake and complete". We consider that the phrase "without undue delay" relates, not just to the immediately preceding verb "complete", but to both elements of the phrase "undertake and complete". In other words, we consider that Annex C(1)(a), first clause, should be read as requiring that Members must "undertake" approval procedures "without undue delay" and, subsequently, "complete" them "without undue delay". Were it otherwise, a Member could easily circumvent the requirement to complete approval procedures without undue delay by causing undue delay in the undertaking of approval procedures.

7.1502 The view that the phrase "without undue delay" relates to both elements of the phrase "undertake and complete" implies that if a Member causes undue delay at any stage in an approval procedure, this would constitute a breach of the provisions of Annex C(1)(a), first clause. In our view, there would be a breach of Annex C(1)(a) even if the Member concerned completed one or more previous stages of the approval procedure sooner than could be expected. If, contrary to our view, a Member could balance undue delay in the completion of a particular procedural stage against a period of time "saved" at an earlier stage in the approval procedure, the implication would be that in some cases a Member could temporarily delay the completion of an approval procedure even though there is no need to do so. We consider that such an interpretation of Annex C(1)(a), first clause, would not be supported by the object and purpose of the *SPS Agreement.* In particular, we consider that interpreting Annex C(1)(a), first clause, as permitting a Member temporarily to delay the completion of an approval procedure even when there is no need for a delay would not be consistent with the previously mentioned object and purpose of minimizing negative trade effects of approval procedures.

(ii) Application

7.1503 We now proceed to examine the claims of "undue delay" presented by the United States and Canada. As we have observed earlier, we understand the United States and Canada to claim that, as a result of the general *de facto* moratorium on approvals, the European Communities has failed to undertake and complete its approval procedures for biotech products without undue delay and therefore has acted inconsistently with the requirements of Annex C(1)(a), first clause. As we have also pointed out, the United States and Canada are challenging the general moratorium because they view it as a measure which has caused undue delay in the processing of applications under the relevant EC approval legislation. We recall that, for the purposes of the present dispute, the relevant EC approval legislation consists of Directives 90/220 and 2001/18 as well as Regulation 258/97.

7.1504 We consider that for the United States' and Canada's claims to succeed, the United States and Canada need not establish that each and every approval procedure which was pending at some point between June 1999 and August 2003 (the time-period for which we accepted the Complaining Parties'

[1290] Needless to say, it is Members' responsibility to allocate sufficient resources to their competent authorities so that they are in a position to discharge the obligations they have assumed under the *WTO Agreement.*

assertion about EC application of a general *de facto* moratorium on approvals) had been unduly delayed as a result of the general *de facto* moratorium on approvals. In our view, for the purposes of establishing that the European Communities has acted inconsistently with its obligations under Annex C(1)(a), first clause, it is sufficient for the United States and Canada to establish that the general *de facto* moratorium on approvals caused undue delay in at least one instance, that is to say, that it caused undue delay in the undertaking or completion of at least one approval procedure conducted in respect of a biotech product at issue in this dispute.

7.1505 We will begin our analysis by examining whether the United States and Canada have established that at least one approval procedure conducted under Directive 90/220 and/or 2001/18 was unduly delayed. If this were the case, it would have been established that, as a result of applying a general *de facto* moratorium on approvals, the European Communities acted inconsistently with its obligations under Annex C(1)(a), first clause, and we would end our inquiry under Annex C(1)(a), first clause. Otherwise, we would go on to examine, in addition, whether the United States and Canada have established that at least one approval procedure conducted under Regulation 258/97 was unduly delayed.[1291]

7.1506 Before turning to examine a particular approval procedure, however, it is well to consider whether the European Communities' reason for applying a general moratorium on final approvals could provide a justification for any delays which may have occurred in individual approval procedures as a result of the application of the moratorium.

Reason for general EC moratorium as a justification for delay

7.1507 Initially, we recall that the European Communities categorically denied that it applied a general *de facto* moratorium on approvals between June 1999 and August 2003.

7.1508 In determining the reason behind the application of the general EC moratorium, we find instructive the June 1999 declaration by the Group of Five countries. As noted by us previously, the Declaration states that, pending the adoption of new EC rules ensuring labelling and traceability of GMOs and GMO-derived products, in accordance with preventive and precautionary principles, the Group of Five countries will take steps to have any new authorizations for growing and placing on the market suspended. We infer from this that the Group of Five countries perceived the EC approval legislation in force at the time as inadequate and considered that in these circumstances prudence and caution warranted the suspension of new final approvals.[1292] Regarding the Commission, we recall our view that there is nothing to suggest that it unqualifiedly supported the decision of the Group of Five countries to prevent the final approval of applications pending the adoption of new EC rules on labelling and traceability, but that it nonetheless effectively (*de facto*) co-operated with the Group of Five countries by not making full use of the relevant, mandatory procedures to complete the approval process.

7.1509 Furthermore, we note the European Communities' assertion before this Panel that during the relevant time period (June 1999 to August 2003) relevant science was evolving and in a state of flux,

[1291] It is useful to recall that regardless of the number of approval procedures we need to examine in order to reach a conclusion on whether the application of the general EC moratorium on approvals has led to a breach of the provisions of Annex C(1)(a), first clause, there are numerous approval procedures which we are required to address in the light of the provisions of Annex C(1)(a), first clause, as part of our evaluation of the Complaining Parties' product-specific claims. *See infra*, Section VII.E.

[1292] We recall our view that the June 1999 declaration by the Group of Five countries was intended to also apply to applications concerning biotech products submitted for approval under Regulation 258/97.

and that the European Communities therefore applied a prudent and precautionary approach to identifying, assessing and managing risks to human health and the environment arising from biotech products for which marketing approval had been sought.

7.1510 In view of these elements, we will address below whether (i) the perceived inadequacy of then-existing EC approval legislation and (ii) evolving science and the application of a prudent and precautionary approach would provide a justification for delays which might have occurred as a result of the application of the general EC moratorium on final approvals.

Perceived inadequacy of EC approval legislation in force between June 1999 to August 2003

7.1511 We turn first to address the perceived inadequacy of the EC approval legislation in force between June 1999 to August 2003. As is clear from the June 1999 declaration by the Group of Five countries, the perceived inadequacy of the then-existing EC approval legislation related to the absence of EC-level legislation ensuring labelling and traceability of GMOs and GMO-derived products.[1293] The concern appears to have been that under the existing EC approval legislation it was not possible for the European Communities to impose, as a condition attached to the granting of marketing approval for GMOs and GMO-derived products, adequate requirements regarding the labelling and traceability of these products.

7.1512 Thus, the issue presented is whether it was justifiable for the European Communities to delay the completion of its approval procedures until the date of adoption of the new EC legislation ensuring labelling and traceability of GMOs and GMO-derived products.[1294] In addressing this issue, we note at the outset that, during the relevant time period (June 1999 to August 2003), approval legislation was in force in the European Communities. As the European Communities has repeatedly stated, the application of the approval legislation in question had never been suspended by a formal EC decision, *e.g.*, by the Commission or the Council and European Parliament. Nor had the granting of final approvals ever been suspended by a formal EC decision.

7.1513 We have stated above that in principle the European Communities was entitled, in conducting approval procedures concerning the biotech products at issue in this dispute, to take the time reasonably needed to determine with adequate confidence whether its relevant SPS requirements were fulfilled. However, given that the new legislation on labelling and traceability was not adopted until September 2003, any requirements set out therein were not EC requirements the fulfilment of which the European Communities could have checked during the relevant time period (June 1999 to August 2003).[1295] Furthermore, the lack of EC-level legislation ensuring labelling and traceability did not affect the European Communities' ability to *check* the fulfilment of its existing SPS requirements. Finally, even if the European Communities considered that new and additional requirements relating to labelling and traceability needed to be imposed as conditions attached to approval decisions, to *ensure* the fulfilment of existing SPS requirements (*e.g.*, the requirement to avoid long-term adverse

[1293] We recall that both Directives 90/220 (and subsequently Directive 2001/18) and Regulation 258/97 contained labelling provisions, and that Directive 2001/18 imposed a traceability obligation on member States. However, these provisions were considered inadequate.

[1294] We recall that the new legislation in question was not adopted until September 2003.

[1295] We note that Annex C(1)(h) of the *SPS Agreement* refers to "applicable" SPS regulations with which compliance is to be ensured. We further note that the European Communities did not claim that it effectively imposed the requirements later included in the new EC legislation. Rather, the European Communities stated that it sought voluntary commitments from applicants which would have ensured the labelling and traceability of GMOs and GMO-derived products.

effects on the environment), there is no reason for believing that the need for, and modalities of, such conditions could only be established in September 2003.

7.1514 Thus, we are of the view that delays in the completion of approval procedures which might have occurred as a result of the lack of EC-level legislation ensuring labelling and traceability of GMOs and GMO-derived products would not have been delays which were justified by the need to check and ensure the fulfilment of the European Communities' relevant SPS requirements.

7.1515 If the European Communities considered that it was important not to grant final approvals without imposing additional requirements of the type set out in the new EC legislation ensuring labelling and traceability of GMOs and GMO-derived products, it was open to it to try to obtain from applicants either voluntary commitments or a request for suspension of the relevant approval procedure pending the adoption of the new EC legislation.[1296] Alternatively, it could have imposed such requirements as conditions attached to approval decisions, provided the imposition of such requirements was WTO-consistent. We note the possibility that the existing EC approval legislation did not provide a clear or sufficient legal basis for imposing such new and additional requirements relating to labelling and traceability of GMOs and GMO-derived products, and that imposing such requirements might have exposed the European Communities to the risk of a domestic legal challenge. However, the European Communities has repeatedly told this Panel that it should not enforce EC law, and that the issue of compliance of certain EC action, or inaction, with EC law was a matter for EC courts to address, not this Panel. We agree and consider that following the same logic we should not make our determination of EC compliance with the requirements of Annex C(1)(a), first clause, turn on whether or not EC law permitted the European Communities to impose the new and additional requirements regarding labelling and traceability prior to the entry into force of the new legislation. The constraints imposed by EC law would not provide a justification for delays which might have occurred for this reason in the completion of approval procedures.

7.1516 Two further considerations militate in favour of our view that the lack of legislation ensuring labelling and traceability of GMOs and GMO-derived products would not have provided an *eo ipso* justification for delays which might have occurred for this reason in the completion of approval procedures. To begin with, putting in place new legislation is by nature a time-consuming process which not infrequently takes one or more years to complete.[1297] The European Communities itself stated that completing and updating its legislation "inevitably took quite some time to be completed in the light of the serious social and political debate on the issues linked to GMOs and GM food production".[1298] We also note the EC statement that legislation concerning GMOs and GMO-derived products needs to keep pace with the "constant evolution of the scientific and regulatory debate"[1299] on these products, which suggests that a need for regular adjustment and amendment of relevant legislation is to be expected. The evolution of relevant EC legislation would appear to support this statement. In these circumstances, we are concerned that if a Member could suspend and, consequently, delay the granting of final approvals essentially every time it completes and updates its approval legislation, there might be frequent and long periods of time during which final approval decisions are suspended. Incidentally, given the time required to revise legislation, a need for further revision and updating might in some cases be identified even before the previous revision has made its way through the legislative process.

[1296] The record shows that the European Communities did so in a number of approval procedures.

[1297] We note that proposals for new legislation need to be elaborated, the legislation needs to be passed by the legislature and, in some countries, there may also be a need for a popular vote on the legislation before it can be finally adopted.

[1298] EC first written submission, para. 195.

[1299] *Ibid*.

7.1517 The other consideration to be noted relates to the use of procedural delay as an instrument to manage or control risks. It is useful to illustrate this using an example. For instance, if the European Communities delayed the completion of a particular approval procedure because existing legislation precluded it from imposing a traceability requirement for a GMO which would facilitate the withdrawal of the product in the event of unforeseen adverse effects on human health or the environment, the European Communities would effectively use procedural delay as a substitute for a substantive risk management measure (the traceability requirement) that would not be imposable under existing approval legislation. In our view, however, the pursuit of a risk management objective would not justify a delay in the completion of an approval procedure and hence would be inconsistent with Annex C(1)(a), first clause. If procedural delay could be used, directly or indirectly, as an instrument to manage or control risks, then Members could evade the obligations to be observed in respect of substantive SPS measures, such as Article 5.1, which requires that SPS measures be based on a risk assessment. Clearly, we cannot interpret Annex C(1)(a), first clause, in a manner which would nullify or impair the usefulness and intended effect of other provisions of the *SPS Agreement*. Indeed, as we see it, a central purpose of Annex C(1)(a), first clause, is precisely to prevent a situation where Members avoid the substantive disciplines which Articles 2 and 5 of the *SPS Agreement* impose with respect to substantive SPS decisions by not reaching final substantive decisions on applications for marketing approval.

7.1518 In the light of the above, we conclude that the lack of EC legislation ensuring labelling and traceability of GMOs and GMO-derived products would not have provided a justification for delays which might have occurred for this reason between June 1999 and August 2003 in the completion of approval procedures.

Evolving science and application of a prudent and precautionary approach

7.1519 We now turn to consider whether evolving science and the consequent application by the European Communities of a prudent and precautionary approach would provide a justification for delays which may have occurred due to the European Communities' general suspension of final approvals between June 1999 and August 2003.

7.1520 According to the European Communities, GMOs are characterized by scientific complexity and uncertainty. The European Communities contends that during recent years scientific understanding of, and knowledge about, risks potentially arising from GMOs and GMO-derived products has evolved, but remains incomplete. The European Communities notes that many questions remain unanswered, and that there is limited experience with GMOs in terms of time and quality. The European Communities points out in this regard that only very few systematic studies have so far been conducted on indirect and long-term effects of large-scale cultivation of GMOs.

7.1521 The European Communities observes that, in view of the fact that the underlying science is still in a great state of flux, it has chosen to apply a prudent and precautionary approach to identifying, assessing and managing risks to human health and the environment arising from GMOs and GMO-derived products for which marketing approval has been sought.

7.1522 As an initial matter, we note that, in our view, Annex C(1)(a), first clause, does not preclude the application of a prudent and precautionary approach to identifying, assessing and managing risks to human health and the environment arising from GMOs and GMO-derived products. As we have said, we consider that Annex C(1)(a), first clause, allows a Member to take the time that is reasonably needed to determine with adequate confidence whether its relevant SPS requirements are fulfilled. Consistent with this, we consider that a Member which finds it appropriate to follow a prudent and precautionary approach in assessing and approving applications concerning GMOs and GMO-derived

products, might, for instance, be justified in requesting further information or clarification of an applicant in a situation where another Member considers that the information available is sufficient to carry out its assessment and reach a decision on an application.[1300] Whether a particular request is a reflection of genuine caution and prudence or whether it is a pretext to delay the completion of an approval procedure would need to be determined in the light of all relevant facts and circumstances.

7.1523 It is apparent from the foregoing observations that we perceive no inherent tension between the obligation set out in Annex C(1)(a), first clause, to complete approval procedures without undue delay and the application of a prudent and precautionary approach to assessing and approving GMOs or GMO-derived products. Nevertheless, it is clear that application of a prudent and precautionary approach is, and must be, subject to reasonable limits, lest the precautionary approach swallow the discipline imposed by Annex C(1)(a), first clause. Indeed, if a Member could endlessly defer substantive decisions on the grounds of a perceived need for caution and prudence in the assessment of applications, Annex C(1)(a), first clause, would be devoid of any meaning or effect. In applying the provisions of Annex C(1)(a), first clause, it is therefore important always to bear in mind that Annex C(1)(a), first clause, implies as a core obligation the obligation to come to a decision on an application.

7.1524 The European Communities argues that in the case of applications concerning GMOs and GMO-derived products it is difficult to come to a decision, in view of evolving science and a body of available scientific information and data that is still limited. Even if we were to accept this as an accurate description of the situation as it prevailed between June 1999 and August 2003, we consider that in the light of the provisions of Annex C(1)(a), first clause, this situation in and of itself would not warrant delays in the completion of approval procedures.

7.1525 We note in this regard that if relevant scientific evidence were insufficient to perform a risk assessment as defined in Annex A(1) of the *SPS Agreement* and as required by Article 5.1 of the *SPS Agreement*, pursuant to Article 5.7 of the *SPS Agreement*, a Member may provisionally adopt an SPS measure on the basis of available pertinent information.[1301] Contrariwise, in situations where relevant scientific evidence is sufficient to perform a risk assessment, a Member must base its SPS measure on a risk assessment. Of course, the mere fact that relevant scientific evidence is sufficient to perform a risk assessment does not mean that the result and conclusion of the risk assessment are free from uncertainties (*e.g.*, uncertainties linked to certain assumptions made in the course of the performance of a risk assessment). Indeed, we consider that such uncertainties may be legitimately taken into account by a Member when determining the SPS measure, if any, to be taken.[1302] In view of these uncertainties, a given risk assessment may well support a range of possible measures. Within this range, a Member is at liberty to choose the one which provides the best protection of human health and/or the environment, taking account of its appropriate level of protection, provided that the measure chosen is reasonably supported by the risk assessment and not inconsistent with other applicable provisions of the *SPS Agreement*, such as Article 5.6.

7.1526 As is clear from the preceding paragraph, evolving science, scientific complexity and uncertainty, and limited available scientific information or data are not, in and of themselves, grounds for delaying substantive approval decisions, and that the *SPS Agreement* does not envisage that Members in such cases defer making substantive SPS decisions. Indeed, even in cases where relevant scientific evidence does not permit the performance of a risk assessment, the *SPS Agreement*

[1300] We recall that pursuant to Annex C(1)(c) of the *SPS Agreement* information requirements must be limited to what is necessary for appropriate approval procedures.

[1301] For further analysis and explanation of the provisions of Article 5.7, *see infra*, Section VII.F.

[1302] For further analysis and explanation of the provisions of Article 5.1, *see infra*, Section VII.F.

envisages that Members take substantive SPS decisions. Certainly, such factors as evolving science and limited availability of scientific evidence affect the confidence which Members can have in the results of their assessments. But they do not inherently affect a Member's ability to reach substantive decisions on an application, particularly since a Member may take account of such factors in reaching substantive decisions.

7.1527 It is quite possible that in the situation described by the European Communities where science evolves and there is limited available scientific evidence, a deferral of substantive decisions might allow for better decisions at a later point in time, provided that appropriate analyses and research are undertaken. However, we do not consider that Annex C(1)(a), first clause, can or should be interpreted to allow Members to go into a sort of holding pattern while they or other entities undertake research with a view to obtaining additional scientific information and data. As we have stated earlier, the core obligation implied by Annex C(1)(a), first clause, is for Members to come to a substantive decision. This view is entirely consistent, and fits well with the aforementioned provisions of Article 5.1 and Article 5.7.[1303] It is important to note in this regard that the *SPS Agreement* nowhere states that substantive decisions on applications need to give a straight yes or no answer to applicants. Members may in principle grant time-limited approvals or approvals subject to other appropriate conditions. Alternatively, they may in principle decide to reject an application subject to the possibility of a review of that decision if and when relevant circumstances change. Relevant circumstances could include the state of scientific knowledge. Thus, there is no reason to consider that our interpretation of Annex C(1)(a), first clause, would prejudice Members' ability to take differentiated, proportionate action to protect human health and/or the environment from potential risks arising from GMOs or GMO-derived products.

7.1528 The European Communities argues that it did not go as far as certain other States (or parts of States) which actually adopted outright bans on trade in, and cultivation of, GMOs and/or GMO-derived products. We accept that in certain circumstances an applicant might conceivably prefer it if instead of making a prompt, but negative final approval decision, the European Communities held off on making a final approval decision and undertook further analysis, etc., which might lead to a positive approval decision. However, in our view, this does not provide a justification for delays which might have occurred as a result of the European Communities' decision unilaterally to suspend all final approval decisions. If a Member considers that a delay in the completion of an approval procedure might allow for a positive decision, it can communicate this assessment to the applicant which can then decide whether to accept a delay and ask for a suspension of the approval procedure.

7.1529 In view of the foregoing considerations, we do not consider that the mere fact that science may have been evolving during the relevant time period (June 1999 to August 2003) and the consequent adoption by the European Communities of a prudent and precautionary approach would provide a justification for delaying the completion of approval procedures by imposing a general EC moratorium on final approvals.

Conclusion

7.1530 We have concluded that (i) the perceived inadequacy of the existing EC approval legislation and (ii) evolving science and the application of a prudent and precautionary approach would not

[1303] Indeed, if a Member could delay a final approval decision on the grounds that available scientific evidence is insufficient, that Member could avoid the disciplines imposed by Article 5.7, including the requirement to seek to obtain additional information and to conduct a review of a provisional measure within a reasonable period of time.

provide a justification for delays which might have occurred as a result of the application of the general EC moratorium on final approvals.

7.1531 This conclusion does not imply, however, that the general EC moratorium on final approvals led to undue delay in the undertaking or completion of particular approval procedures. Therefore, our conclusion above does not dispense with the need to go on to examine whether the general EC moratorium led to undue delay in the undertaking or completion of at least one approval procedure conducted under Directive 90/220 and/or 2001/18.

7.1532 Before undertaking this task, we wish to note that our conclusion above should not be construed to mean that it would under no circumstances be justifiable, in the light of the provisions of Annex C(1)(a), first clause, to delay the completion of approval procedures by imposing a general moratorium on final approvals of biotech products. We consider that there may conceivably be circumstances where this could be justifiable. For instance, if new scientific evidence comes to light which conflicts with available scientific evidence and which is directly relevant to all biotech products subject to a pre-marketing approval requirement, we think that it might, depending on the circumstances, be justifiable to suspend all final approvals pending an appropriate assessment of the new evidence. The resulting delay in the completion of approval procedures might then be considered not "undue".

Approval procedure concerning MS8/RF3 oilseed rape

7.1533 We now turn to examine whether the United States and Canada have established that the general *de facto* moratorium on approvals led to undue delay in the undertaking or completion of a particular approval procedure conducted under Directive 90/220 and/or 2001/18. The United States and Canada did not express a view on which of the many relevant approval procedures conducted under Directive 90/220 and 2001/18 we should examine first. For the sake of efficiency, we have decided to begin our examination with the approval procedure concerning MS8/RF3 oilseed rape, since both the United States and Canada have also presented a product-specific claim that the completion of this particular approval procedure has been unduly delayed, contrary to the requirements of Annex C(1)(a), first clause. We will analyse these product-specific claims in Section VII.E below, when we address the various product-specific measures being challenged by the Complaining Parties.

Relationship of the approval procedure conducted under Directive 90/220 and that conducted under Directive 2001/18

7.1534 Prior to considering whether the approval procedure concerning MS8/RF3 oilseed rape has been unduly delayed as a result of the general *de facto* moratorium, we need to address the fact that like many other approval procedures, the approval procedure concerning MS8/RF3 oilseed rape was begun under Directive 90/220 but not completed by the date of repeal of Directive 90/220 (17 October 2002). To recall, applications which were pending on the date of repeal of Directive 90/220 (17 October 2002) became subject to Directive 2001/18 and therefore had to be "complemented" by the applicant in the light of the provisions of Directive 2001/18. If the applicant did so by a specified deadline (17 January 2003), approval procedures were to be undertaken in accordance with the

provisions of Directive 2001/18.[1304] In the case of MS8/RF3 oilseed rape, approval procedures were undertaken under Directive 2001/18 after the applicant had complemented its application.[1305]

7.1535 The question arises whether approval procedures undertaken under Directive 2001/18 in respect of applications which had previously been assessed under Directive 90/220 should be viewed as new approval procedures or as a continuation of the approval procedures which were not completed under Directive 90/220. In considering this issue, we find instructive that applications which were pending on the date of repeal of Directive 90/220 had to be "complemented" in accordance with Directive 2001/18. According to the European Communities, this means that applicants had to provide certain additional information as required under Directive 2001/18. They did not need to re-submit their applications in their entirety. This contention is consistent with the ordinary meaning of the term "complement". The European Communities further told the Panel that in principle a new assessment under Directive 2001/18 was required only for the additional information submitted in accordance with Directive 2001/18. Based on these elements, we consider that approval procedures undertaken under Directive 2001/18 in respect of applications which had previously been assessed under Directive 90/220 were a continuation of the approval procedures previously conducted under Directive 90/220.

7.1536 The factual determination that an approval procedure not completed under Directive 90/220 was continued under Directive 2001/18 if the applicant complemented its application leads us to the view that, for the purposes of Annex C(1)(a), first clause, an approval procedure begun under Directive 90/220 and continued under Directive 2001/18 constitutes one single approval procedure. It follows that for the purposes of our inquiry under Annex C(1)(a), first clause, it is not necessary to distinguish between undue delays which may have occurred in the processing of an application under Directive 90/220 and undue delays which may have occurred when the procedure was continued under Directive 2001/18. In either case, the relevant approval procedure would have been unduly delayed. Accordingly, we consider that in the case of the approval procedure concerning MS8/RF3 oilseed rape, a failure to observe the provisions of Annex C(1)(a), first clause, can be established on the basis of the impact of the general moratorium on that approval procedure when it was conducted pursuant to the provisions of Directive 90/220. Likewise, a failure to observe the provisions of Annex C(1)(a), first clause, can be established on the basis of the impact of the general moratorium on the approval procedure concerning MS8/RF3 oilseed rape when it was conducted pursuant to the provisions of Directive 2001/18.

Adoption of Directive 2001/18 as a justification for delay

7.1537 An additional issue relating to the revision of Directive 90/220 which we briefly need to consider is whether the adoption in March 2001 of Directive 2001/18 could have justified delaying the completion of approval procedures conducted under Directive 90/220 so that as of October 2002 they would become subject to the new provisions of Directive 2001/18.

7.1538 We note that this issue is similar to the one we have already examined above concerning the lack of EC-level legislation ensuring labelling and traceability of GMOs and GMO-derived products, and we therefore offer only a few additional observations.

[1304] Article 35 of Directive 2001/18. None of the Complaining Parties questioned the WTO-consistency of Article 35.

[1305] It should be noted, however, that in the case of MS8/RF3 the applicant had voluntarily updated its Directive 90/220 application to comply with requirements set out in Directive 2001/18 even before the entry into force of Directive 2001/18.

7.1539 We have stated above that in principle the European Communities was entitled, in conducting approval procedures concerning the biotech products at issue in this dispute, to take the time reasonably needed to determine with adequate confidence whether its relevant SPS requirements were fulfilled. However, given that Directive 2001/18 did not enter into force until October 2002, any requirements set out therein were not, in our view, EC requirements the fulfilment of which the European Communities needed to check and ensure as of March 2001 in order to complete approval procedures pending under Directive 90/220, the Directive in force at the time.[1306] We further note that the European Communities did not claim that it effectively imposed the requirements of Directive 2001/18 as of the time of their adoption in March 2001.[1307] Rather, the European Communities stated that it sought voluntary commitments from applicants.

7.1540 Thus, we consider that the adoption in March 2001 of Directive 2001/18 could not have justified delaying the completion of approval procedures conducted under Directive 90/220 so that as of October 2002 they would become subject to the new provisions of Directive 2001/18, given that such delay would not have been needed to check and ensure the fulfilment of the European Communities' relevant SPS requirements. However, we consider that in those cases where approval procedures could not be completed while Directive 90/220 was still in force, delays in the completion of these procedures might have been justifiable.

Examination of the approval procedure concerning MS8/RF3 oilseed rape

7.1541 With the preceding observations in mind, we now turn to examine whether the approval procedure concerning MS8/RF3 oilseed rape has been unduly delayed, and if so, whether this was as a result of the application of the general *de facto* moratorium, as the United States and Canada claim.

7.1542 The **United States** initially argued that the progress of the application concerning MS8/RF3 oilseed rape stalled when the Commission refused to submit a draft measure to the Regulatory Committee as required by the approval process. Later, the United States argued that the Regulatory Committee twice failed to vote on a draft measure, and that after the second attempt the Commission never submitted a draft measure to the Regulatory Committee again. The United States submits that the resulting delay was undue.

7.1543 The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years. In contrast, the application concerning MS8/RF3 oilseed rape had been pending for almost seven years on the date this Panel was established. The United States contends that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning MS8/RF3 oilseed rape is undue.

[1306] We note that Annex C(1)(h) of the *SPS Agreement* refers to "applicable" SPS regulations with which compliance is to be ensured. We further note that the European Communities did not claim that it effectively imposed the requirements later included in the new EC legislation. Rather, the European Communities stated that it sought voluntary commitments from applicants which would have ensured the labelling and traceability of GMOs and GMO-derived products. Finally, we note that if the European Communities effectively imposed such requirements, then compliance would these requirements should have resulted in the completion of relevant approval procedures. However, the record does not indicate that this was the case.

[1307] We note that if the European Communities had effectively imposed such requirements, then compliance would these requirements should have resulted in the completion of relevant approval procedures. However, the record does not indicate that this was the case, even though there were applicants which voluntarily complied with requirements set out in Directive 2001/18.

7.1544 **Canada** submits that the applicant proposed and continuously revised its risk management measures in response to concerns expressed by member States, the SCP and the Commission. Regardless of these efforts by the applicant, the processing of the application has been delayed, which Canada believes demonstrates that the European Communities was and is intent on blocking the approval of this product for cultivation and is intent on imposing such onerous and unnecessary conditions as to make the importation of the product for processing uneconomical.

7.1545 Canada argues that since the application went to the Community level, member States took approximately 12 months to put forth their objections to the application, and after the SCP issued its positive opinion on the application, the European Communities took another 12 months to address recommendations contained in the SCP opinion, including a monitoring plan. Although the application was discussed at the Regulatory Committee in the summer of 1999, no vote was taken. Canada notes that in August 1999 the applicant proposed to voluntarily agree to meet the requirements of the Council's June 1999 Common Position. On the basis of these commitments, the Commission invited the applicant to present its proposal to the Regulatory Committee in October 1999. However, while the Regulatory Committee again considered the proposal, it failed to hold a vote. Subsequently, the applicant made further proposals as a further attempt to address concerns expressed by member States. However, although the matter went yet again before the Regulatory Committee in March 2000, it failed to hold a vote.

7.1546 Canada also claims that any delay in the completion of the approval procedure following the failure of the Regulatory Committee to adopt the draft measure approving MS8/RF3 oilseed rape in March 2000 should be considered "undue". Canada notes in this regard the efforts made by the applicant to respond to further requests by the lead CA. Canada observes that while the lead CA finally accepted the applicant's proposed post-marketing monitoring plan and agricultural guidelines in May 2002, the European Communities provided no information to explain the delay between May 2002 and early January 2003, when the applicant submitted a further updated dossier under Article 35 of Directive 2001/18.

7.1547 Finally, Canada observes that more than eight years after the application was initially submitted for approval to the lead CA in 1996 and more than six years after the SCP issued its opinion in May 1998, MS8/RF3 oilseed rape remains unapproved either for import and processing or cultivation, despite reasonably available risk management measures. Canada submits that by any reasonable standard, the extraordinary length of time to process this application constitutes "undue delay".

7.1548 The **European Communities** argues that the United States is mistaken in saying that the Commission failed to submit a draft measure to the Regulatory Committee. The Commission launched a voting procedure in the Regulatory Committee in June 1999, and the Regulatory Committee met twice on the matter. According to the European Communities, the Regulatory Committee did not vote on 9 March 2000 because Italy raised scientific issues regarding the effects of the product in question on biogeochemical cycles and on food chains and the likelihood of spreading. The European Communities also states that in May 2001, the applicant modified the scope of its application, and that after that, the application proceeded with further submissions by the applicant of additional information.

7.1549 **Canada** notes that Italy's questions had already been addressed in the application dossier and by the SCP. Further, the attempts to raise concerns about impacts of herbicide use on farmland biodiversity inappropriately linked concerns related to herbicide use to approval of a seed variety. Canada notes that: 1) for all other seed varieties, seed approval legislation is distinct from the pesticide approval legislation; 2) herbicide use is one of many factors that may have an impact on

farmland biodiversity; and 3) EC member States have actually authorized the use of glufosinate-ammonium for general use as well as for specific use on genetically modified herbicide-tolerant crops. Canada also counters that the European Communities fails to point out that the submission of further information by the applicant was necessary because the information requirements were either unclear or changing.

7.1550 The **Panel** begins its analysis by addressing the United States' and Canada's arguments concerning the Commission's failure to re-convene the Regulatory Committee for a further meeting.

7.1551 We recall in this regard that the Regulatory Committee met twice, on 29 October 1999 and on 9 March 2000, to consider a draft measure submitted by the Commission. No vote was taken on the draft measure at either meeting and the Regulatory Committee did not meet again for another attempt at taking a vote on the application.

7.1552 The record does not indicate why the Regulatory Committee did not proceed to a vote on MS8/RF3 oilseed rape at the March 2000 meeting.[1308] One reason may have been a request for information from the Italian CA. Italy transmitted its request to the lead CA on 14 March 2000, and the lead CA then forwarded it to the applicant.[1309] In November 2000 the applicant provided the lead CA with answers to the questions raised by Italy indicating that all the issues raised had been previously addressed by the SCP as well as the update of the application provided by the applicant in November 1999. This communication was also circulated to the other CAs and the Commission.[1310]

7.1553 It should further be noted that in June 2001 the applicant sent a letter to the lead CA which clarified certain aspects of the application, including its scope. There is no indication that this clarification had been requested. However, the applicant's letter noted that following the March 2000 meeting of the Regulatory Committee the clarification appeared necessary.[1311] In a separate letter of the same date, "following the revision of Directive 90/220/EEC", the applicant also submitted updated information to the lead CA, including an updated environmental risk assessment, a post-market monitoring plan, agricultural guidelines, additional information regarding identification and labelling and information for the public concerning the product in question.[1312] The letter stated that this information confirmed that the application was already "in line with the main provisions" of Directive 2001/18, which had been adopted in March 2001. The letter requested the lead CA to inform the other member States about the new set of documents at the next Regulatory Committee meeting.[1313] There is no indication that the lead CA ever forwarded the new documents to the other member States and the Commission. A meeting of CAs was held two weeks after the applicant submitted the additional information, but the Panel has no information about what was discussed at that meeting. It is clear from the record, however, that the lead CA confirmed receipt of the new documents only in July 2001. The lead CA informed the applicant that it had forwarded the documents to the relevant scientific committee of the Belgian Biosafety Council (hereafter the "BBC") for an opinion.[1314] No reason was given for why an opinion had been requested.

[1308] The record contains a summary of the conclusions for the October 1999 Regulatory Committee meeting, but not for the March 2000 meeting.
[1309] Exhibit EC-63/At. 87. This fax of 14 March 2000 from the Italian CA to the lead CA specifically "refer[s] to the conclusion of the last meeting of the Regulatory Committee meeting".
[1310] Exhibit EC-63/At. 89 and 90.
[1311] Exhibit EC-63/At. 92.
[1312] Exhibit EC-63/At. 91.
[1313] *Ibid*.
[1314] Exhibit EC-63/At. 93.

7.1554 The Panel notes that after the March 2000 meeting of the Regulatory Committee, it was incumbent on the Commission to take action. Specifically, Article 21 of Directive 90/220 indicates that the action to be taken by the Commission was to convene another meeting with a view to obtaining a vote on its draft measure. The question thus arises whether the Commission was justified in not convening another meeting at any point prior to the repeal of Directive 90/220 in October 2002.

7.1555 In approaching this question, the Panel takes note of the following elements. In November 2000 the applicant had met all requests for information conveyed to it following the March 2000 Regulatory Committee. The additional information was circulated to all CAs and the Commission in December 2000. As noted, however, in June 2001 the applicant provided additional clarification and updated information to the lead CA. The record does not indicate that the Commission was made aware of the existence of the June 2001 information. At the same time, there is nothing in the record to suggest that the Commission was "waiting" for the June 2001 information.

7.1556 Regarding the clarification provided by the applicant in June 2001, we note that if the Commission was not waiting for that clarification, then that clarification could not provide a justification for the Commission's failure to re-convene the Regulatory Committee sometime between December 2000 and June 2001. On the other hand, if the Commission had been waiting for clarification from the applicant, it should have inquired with the lead CA whether the applicant had provided clarification. There is no evidence that the Commission did so.

7.1557 Regarding the updated information also provided by the applicant in June 2001, it is important to remember that the applicant provided that information, not pursuant to a requirement flowing from the provisions of Directive 90/220, but in an effort to convince member States to vote in favour of approving its application. Also, the lead CA had not been requested to offer an assessment of that additional information before transmitting it to the other member States and the Commission. Notwithstanding this, the lead CA requested an opinion of the BBC. However, it seems that for the BBC, it was not obvious that an opinion was needed. In November 2001, the BBC discussed the information in question. According to the minutes of the internal discussion, "no opinion on the part of the Biosafety Advisory Council was necessary prior to the forwarding of these documents to the European Commission; and in the past such additional information had already been sent straight to the Commission on several occasions."[1315] However, as this was the first time a company had submitted a monitoring plan, agricultural guidelines and public dossier, the BBC "thought it advisable to ask the Biosafety Advisory Council to discuss these documents before forwarding them to the European Commission."[1316] It was noted that in this way the relevant experts would have an opportunity to gain experience in the evaluation of such documents.[1317]

7.1558 We are not convinced that a lead CA assessment of the updated information was required before that information could be transmitted to the Commission and the other CAs, and that the Commission therefore needed to wait for the lead CA's assessment before re-convening the Regulatory Committee. Indeed, we note that in a parallel situation, a different lead CA did not find it necessary to make an assessment of additional information submitted by an applicant to demonstrate that its application was already in line with the main provisions of Directive 2001/18.[1318]

[1315] Exhibit EC-63/At. 102.
[1316] *Ibid*.
[1317] *Ibid*.
[1318] *See* our earlier analysis in Section VII.D of the approval procedure concerning Falcon oilseed rape.

7.1559 In any event, in the approval procedure concerning MS8/RF3 oilseed rape, the applicant replied to the last pending question of the BBC in early May 2002.[1319] The record shows no further developments in this approval procedure until October 2002, when Directive 90/220 was repealed. Thus, there is no indication that the BBC ever provided its opinion on the June 2001 information to the lead CA. Even assuming that the Commission knew about the updated information of June 2001, and even assuming that it was justifiable in principle for the Commission to let the lead CA undertake some assessment of the information, it remained the Commission's responsibility to seek a vote by the Regulatory Committee on its draft measure. Yet even as the date of repeal of Directive 90/220 was approaching, the Commission apparently did not request the lead CA promptly to finish its assessment of the updated information and to circulate it together with that information so that a further attempt at completing the approval procedure under Directive 90/220 could be made.[1320]

7.1560 In view of these elements, we consider that if the Commission had sought the circulation of the additional information once the applicant had replied to the last pending question in May 2002, it should have been possible for the information to be circulated promptly and for a Regulatory Committee meeting to be held in the summer of 2002 at the latest. As Directive 90/220 was not repealed until mid-October 2002, we think this would have left enough time for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee and for the lead CA to give its written consent.[1321]

7.1561 In earlier findings, the Panel observed that the Commission could have considered that some member States simply did not wish to see the Commission call another vote on its draft measure, or that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not have achieved the required qualified majority, with the consequence that the Commission would have to complete the procedure by adopting its own draft measure. In the Panel's view, neither consideration would provide a justification for the Commission's failure to re-convene the Regulatory Committee for a third meeting.

7.1562 Anticipated member State opposition might well have been a concern for the Commission in view of the consequences it could have had for the legitimacy and acceptability of an eventual decision by the Commission to approve its own draft measure. However, this would not have justified the Commission in suspending the approval process until it was confident that its draft

[1319] Exhibit EC-63/At. 108. The applicant also indicated readiness to follow a suggestion by the BBC regarding information to the public, subject to further clarification by the BBC. *Ibid.*

[1320] If the Commission did not know about the updated information submitted by the applicant in June 2001, then the existence of that information could not provide a justification for the Commission's failure to re-convene the Regulatory Committee after December 2000.

[1321] The Commission might have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. Even assuming that in this scenario there was not enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force, the Panel does not consider that this would have justified the Commission's failure to re-convene the Regulatory Committee for a vote. The Commission might have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. As pointed out above, there is no indication that the June 1999 declaration was intended to bind the Governments of the Group of Five countries *vis-à-vis* other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, the Commission could not have legitimately invoked the June 1999 declaration as a justification for not re-convening the Regulatory Committee.

measure would achieve a qualified majority in the Regulatory Committee.[1322] Were it otherwise, the obligation to complete approval procedures without undue delay would impose no real discipline as the Commission could then suspend approval procedures every time it anticipates significant member State opposition and regardless of whether there are valid reasons for such opposition.

7.1563 Regarding the possibility that certain member States might have been reluctant to proceed to a vote on the Commission's draft measure, it should also be noted that if the Commission was aware of the existence of the updated information of June 2001, then that information would have provided it with additional arguments for seeking a vote on its draft measure in the Regulatory Committee. To recall, the applicant submitted the June 2001 information to demonstrate that the application concerning MS8/RF3 was already in accordance with the main provisions of the new Directive 2001/18.

7.1564 Based on the above considerations, the Panel is of the view that at the very latest in the summer of 2002 the Commission should have re-convened the Regulatory Committee for a vote on the application concerning MS8/RF3 oilseed rape. Accordingly, the Panel concludes that the time actually taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was held between March 2000 and October 2002 – was unjustifiably long.

7.1565 Turning now to the reason for the Commission's failure to act, we recall the United States' and Canada's claim that the approval procedure concerning MS8/RF3 oilseed rape was delayed as a result of the application by the European Communities of the general *de facto* moratorium on approvals. We recall in this respect our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to re-convene the Regulatory Committee for a vote on the application concerning MS8/RF3 oilseed rape after November 2001 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States and Canada that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1566 In view of our conclusion with regard to the Commission's failure to re-convene the Regulatory Committee for a vote on a draft measure, we do not go on to address other arguments put forward by the United States and Canada in support of their assertion that the approval procedure concerning MS8/RF3 oilseed rape was unduly delayed as a result of the application of a general *de facto* moratorium on approvals.

Conclusions

7.1567 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals.

[1322] The record does not indicate, and the European Communities did not argue, that the Commission after the March 2000 meeting of the Regulatory Committee launched inter-service consultations to reconsider the relevant draft measure.

Based on these findings, the Panel accepts the United States' contention that the application by the European Communities of a general *de facto* moratorium on approvals led to "undue delay" in the completion of the approval procedure concerning MS8/RF3 oilseed rape and, consequently, to a breach of the European Communities' obligations under Annex C(1)(a), first clause, of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, the Panel recalls its findings that the time taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts Canada's contention that the application by the European Communities of a general *de facto* moratorium on approvals led to "undue delay" in the completion of the approval procedure concerning MS8/RF3 oilseed rape and, consequently, to a breach of the European Communities' obligations under Annex C(1)(a), first clause, of the *SPS Agreement*.

7.1568 Since we have concluded that the general *de facto* moratorium on approvals led to undue delay in the completion of at least one approval procedure conducted in respect of a biotech product at issue in this dispute, we need not, and thus do not, proceed to examine whether the general *de facto* moratorium on approvals led to undue delay in the undertaking or completion of other individual approval procedures conducted under either Directives 90/220 and 2001/18 or Regulation 258/97.

(b) Article 8

7.1569 We recall that the United States and Canada seek to establish an inconsistency with Article 8 of the *SPS Agreement* on the basis of an inconsistency with Annex C(1)(a). Article 8 requires, *inter alia*, that Members observe the provisions of Annex C in the operation of their approval procedures. It follows that a failure to observe the provisions of Annex C(1)(a) implies a breach of Article 8. We have determined above that, as a result of the general *de facto* moratorium on approvals, the European Communities has failed, in at least one approval procedure conducted under Directives 90/220 and 2001/18, to observe the provisions of Annex C(1)(a), first clause. Accordingly, we conclude that in respect of the aforementioned approval procedure, the European Communities has, by implication, also acted inconsistently with the provisions of Article 8.

(c) Overall conclusions

7.1570 The foregoing findings and conclusions lead the Panel to the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that as a result of the application of a general *de facto* moratorium on approvals between June 1999 and August 2003 the European Communities has failed to observe the provisions of Annex C(1)(a), first clause, of the *SPS Agreement* and, consequently, has also acted inconsistently with its obligations under Article 8 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that as a result of applying a general *de facto* moratorium on approvals between June 1999 and August 2003 the European Communities has failed to observe the provisions of Annex C(1)(a), first clause, of the *SPS Agreement* and, consequently, has also acted inconsistently with its obligations under Article 8 of the *SPS Agreement*.

12. Consistency of the general *de facto* moratorium on approvals with Article 8 and Annex C(1)(b) of the *SPS Agreement*

7.1571 Only the United States claims that by applying a general *de facto* moratorium on approvals, the European Communities has acted inconsistently with its obligations under Article 8 and Annex C(1)(b) of the *SPS Agreement*.

7.1572 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.1573 Annex C(1)(b) of the *SPS Agreement* provides:

> "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> [...]
>
> (b) the standard processing period of each procedure is published or that the anticipated processing period is communicated to the applicant upon request; when receiving an application, the competent body promptly examines the completeness of the documentation and informs the applicant in a precise and complete manner of all deficiencies; the competent body transmits as soon as possible the results of the procedure in a precise and complete manner to the applicant so that corrective action may be taken if necessary; even when the application has deficiencies, the competent body proceeds as far as practicable with the procedure if the applicant so requests; and that upon request, the applicant is informed of the stage of the procedure, with any delay being explained [...]."

7.1574 Annex C(1)(b) essentially sets out five separate, but related, obligations to be observed by Members in the operation of approval procedures. These obligations relate to:

(i) the publication or communication to applicants of the processing period of each procedure;

(ii) the examination of the completeness of the documentation and the communication to applicants of deficiencies;

(iii) the transmission of the results of the procedure;

(iv) the processing of applications which have deficiencies; and

(v) the provision of information about the stage of a procedure and the provision of an explanation of any delay.

7.1575 The **United States** argues that the general moratorium on approvals is an unpublished, non-transparent measure under which the European Communities does not allow its approval procedures to proceed to conclusion. As such, the general moratorium is inconsistent, in the United States' view, with each of the related procedural obligations in Annex C(1)(b) and, consequently, with Article 8 as well.

7.1576 Regarding the *first obligation* (publication or communication of processing period), the United States submits that although the applicable EC approval legislation contain processing periods, under the general moratorium on approvals those processing periods are not followed. Instead, the European Communities has imposed an indefinite delay. However, since the European Communities does not acknowledge the moratorium, the standard processing period is not published, and the anticipated processing period is not communicated to the applicant.

7.1577 Regarding the *second obligation* (completeness of documentation), the United States argues that under the general moratorium on approvals the European Communities does not promptly examine documentation and inform the applicant of all deficiencies. To the contrary, applications under the applicable EC legislation are stalled, without explanation.

7.1578 Regarding the *third obligation* (transmission of results), the United States argues that under the general moratorium on approvals results of procedures are not promptly communicated to applicants so that corrective action may be taken. Instead, applications are stalled in the approval process without explanation.

7.1579 Regarding the *fourth obligation* (processing of deficient applications), the United States argues that under the general moratorium on approvals the European Communities does not proceed as far as practicable in the approval process. Instead, applications are stalled in the approval process.

7.1580 Regarding the *fifth obligation* (explanation of delay), the United States argues that under the general moratorium on approvals delays are not explained. To the contrary, the European Communities does not even inform applicants of the existence of the general moratorium.

7.1581 The **European Communities** submits that the United States has offered a mere assertion that the European Communities has not done what it is required to do under the different obligations contained in Annex C(1)(b). The United States considers it sufficient simply to allege that applications were stalled in the approval process and gives no explanations. However, it is a complaining party's burden to establish a prima facie case. In any event, in the European Communities' view, the detailed chronologies of individual approval procedures and other documents submitted by the European Communities demonstrate that the allegations of the United States are unfounded.

7.1582 The **Panel** notes that in accordance with the lead-in to Annex C(1) the provisions of Annex C(1)(b) apply "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have previously found that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures

"to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1) and, as such, are subject to the provisions of Annex C(1), which include those of Annex C(1)(b).

7.1583 The measure being challenged by the United States is the European Communities' general *de facto* moratorium on approvals. We understand the United States to claim that the adoption and application of the general *de facto* moratorium on approvals has resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(b).

7.1584 We also note that the United States relies on the alleged breach of the provisions of Annex C(1)(b) to make a consequential claim of inconsistency under Article 8. Accordingly, we will begin our analysis with the United States' claims under Annex C(1)(b).

(a) First obligation in Annex C(1)(b) (publication or communication of processing period)

7.1585 In relation to the first obligation contained in Annex C(1)(b) (publication or communication of processing period), the United States puts forward two main arguments. The first argument is that as a result of the general moratorium on approvals, the European Communities did not follow the standard processing periods which are published in the applicable EC approval legislation. The United States appears to infer from this that the effective standard processing periods have not been published.

7.1586 We understand the United States to argue that the failure by the European Communities to consider a particular application for final approval meant that it was not following the published standard processing period for the relevant type of procedure and that the effective standard processing period for the relevant type of procedure was no longer published.

7.1587 Even if we were to accept that what has to be published in accordance with the first obligation in Annex C(1)(b) is the "effective" standard processing period, and that the general moratorium on approvals effectively modified the European Communities' published standard processing periods, the fact that they were unpublished would not be a consequence of the measure at issue, *i.e.*, the general moratorium. Rather, it would be a consequence of a separate and independent failure by the European Communities to publish the new standard processing periods. This is confirmed by the fact that the European Communities could apply the general moratorium on approvals and at the same time publish any new standard processing periods.

7.1588 In the light of this, we conclude that the United States has failed to establish its claim under the first obligation contained in Annex C(1)(b), insofar as that claim is based on the requirement to publish standard processing periods.

7.1589 The United States' second argument in support of its claim under Annex C(1)(b) is that since the European Communities does not acknowledge the moratorium, the anticipated processing period is not communicated to the applicant. We note that pursuant to Annex C(1)(b) the anticipated processing period is to be communicated to the applicant "upon request". The United States has provided no evidence to show (i) that an applicant requested that the anticipated processing period be communicated to it, (ii) that the request was denied by a relevant EC entity, and (iii) that this was because of the general moratorium on approvals. Moreover, we do not think that the general moratorium on approvals necessarily resulted in the European Communities not communicating the anticipated processing periods to applicants upon request. The European Communities could apply the general moratorium on approvals and at the same communicate to applicants the anticipated processing periods upon request.

7.1590 In the light of this, we conclude that the United States has failed to establish its claim under the first obligation contained in Annex C(1)(b), insofar as that claim is based on the requirement to communicate to applicants anticipated processing periods.

(b) Second obligation in Annex C(1)(b) (completeness of documentation)

7.1591 Concerning the second obligation contained in Annex C(1)(b), the United States argues that because of the general moratorium on approvals the European Communities did not promptly examine the completeness of documentation and inform applicants of any deficiencies.

7.1592 We note that the United States has identified no concrete evidence to support this assertion.[1323] Moreover, we do not think that the general moratorium on approvals necessarily resulted in the European Communities not examining promptly the completeness of documentation and not informing applicants of any deficiencies. The European Communities could apply the general moratorium on approvals and at the same time examine the completeness of documentation and inform applicants of deficiencies in the documentation submitted.[1324]

7.1593 In the light of this, we conclude that the United States has failed to establish its claim under the second obligation contained in Annex C(1)(b).

(c) Third obligation in Annex C(1)(b) (transmission of results)

7.1594 With regard to the third obligation contained in Annex C(1)(b), the United States argues that under the general moratorium results of procedures were not promptly communicated to applicants so that corrective action could be taken.

7.1595 We note that the United States has not identified any results of procedures which were not transmitted to an applicant as soon as possible and in a precise and complete manner. Moreover, we do not think that the general moratorium on approvals necessarily resulted in the European Communities not transmitting as soon as possible, and in a precise and complete manner, the results of approval procedures. Furthermore, it should be recalled that under the general moratorium, the European Communities prevented final results from being achieved. Thus, there were no final results which could have been communicated to applicants.

7.1596 In the light of this, we conclude that the United States has failed to establish its claim under the third obligation contained in Annex C(1)(b).

(d) Fourth obligation in Annex C(1)(b) (processing of deficient applications)

7.1597 In relation to the fourth obligation contained in Annex C(1)(b), the United States argues that under the general moratorium the European Communities did not proceed as far as practicable in the approval process.

[1323] It is well to recall in this context that it is not incumbent on us to search the record for evidence which would assist the United States in establishing a prima facie case of inconsistency with one or more of the obligations contained in Annex C(1)(b).

[1324] It is well to recall that the United States itself has stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process. Certain progress in the process, short of final decision, is not the least bit inconsistent with a moratorium on final approvals". US second written submission, para. 51 (emphasis in original).

7.1598 We note that pursuant to Annex C(1)(b) the competent body is to proceed as far as practicable with the procedure "if the applicant so requests". The United States has provided no evidence of an applicant making such a request and of a relevant EC entity denying that request because of the general moratorium. Moreover, we do not think that the general moratorium on approvals necessarily resulted in the European Communities not proceeding as far as practicable with procedures if applicants so requested. The European Communities could apply the general moratorium on approvals and at the same time proceed as far as practicable with procedures upon request.[1325]

7.1599 In the light of this, we conclude that the United States has failed to establish its claim under the fourth obligation contained in Annex C(1)(b).

(e) Fifth obligation in Annex C(1)(b) (explanation of delay)

7.1600 Regarding the fifth obligation contained in Annex C(1)(b), the United States argues that under the general moratorium delays were not explained.

7.1601 The fifth obligation states that "upon request" the applicant is to be informed of the stage of the procedure, with any delay being explained. The United States has provided no evidence of an applicant making such a request and of a relevant EC entity denying an explanation of any delay because of the general moratorium. Moreover, we do not think that the general moratorium on approvals necessarily resulted in the European Communities not informing applicants of the stage of procedures and not explaining any delays, if applicants so requested. The European Communities could apply the general moratorium on approvals and at the same time inform applicants of the stage of procedures and explain any delays.

7.1602 In the light of this, we conclude that the United States has failed to establish its claim under the fifth obligation contained in Annex C(1)(b).

(f) Article 8

7.1603 Turning now to the United States' claim under Article 8, we recall that the United States seeks to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(b). We have determined that the United States has failed to establish its claims under Annex C(1)(b). Under the approach followed by the United States, this means that the consequential claim under Article 8 has not been established either.

(g) Overall conclusion

7.1604 In the light of the above, the Panel reaches the following conclusion:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the United States has not established that the European Communities has acted inconsistently with its obligations under Annex C(1)(b) of the *SPS Agreement* and,

[1325] Here again, it is useful to recall that the United States itself has stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process. Certain progress in the process, short of final decision, is not the least bit inconsistent with a moratorium on final approvals". US second written submission, para. 51 (emphasis in original).

consequently, with its obligations under Article 8 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

13. Consistency of the general *de facto* moratorium on approvals with Article 10.1 of the *SPS Agreement*

7.1605 Argentina claims that the general *de facto* moratorium on approvals applied by the European Communities has failed to take account of Argentina's special needs as a developing country Member and thus is inconsistent with Article 10.1 of the *SPS Agreement*.

7.1606 Article 10.1 provides:

> "In the preparation and application of sanitary or phytosanitary measures, Members shall take account of the special needs of developing country Members, and in particular of the least-developed country Members."

7.1607 **Argentina** argues that Article 10.1 required the European Communities to take positive action in favour of developing countries. According to Argentina, in preparing and applying a general *de facto* moratorium on approvals, the European Communities should have provided preferential market access for developing country products or implemented its obligations in a manner beneficial, or less detrimental, to the interests of developing country Members. Argentina argues that the general moratorium on approvals had the effect of preventing Argentina's biotech products from having access to the EC market. According to Argentina, this had implications particularly for Argentina's economic development as Argentina is: (i) highly dependent on agricultural exports, (ii) the world's second-largest producer of biotech products, (iii) the world's leading developing country producer of biotech products. Argentina further points out that the EC market is an integrated market consisting of twenty-five member State markets and that the EC market is therefore of great importance for Argentina. Argentina considers that the fact that the general moratorium on approvals prevented its biotech products from having access to the EC market demonstrates that the European Communities has not taken account of the special needs of Argentina.

7.1608 The **European Communities** states that it bears in mind the provisions concerning special and differential treatment of developing country Members when developing and applying its legislation, including, where relevant, its approval legislation for biotech products. The European Communities notes that Argentina's argument seems to be that since the European Communities, in Argentina's view, has violated other WTO provisions and this affects Argentina as a developing country, the European Communities has consequently also failed to comply with Article 10.1. Furthermore, the European Communities does not accept the factual assertion of Argentina that the measure it is complaining about restricts exports of developing country Members to the European Communities. Trade statistics show that imports from developing countries that produce agricultural biotech products have not decreased. On the contrary, imports into the European Communities from Argentina or Brazil of commodities likely to contain genetically modified organisms have steadily increased since 1995/96.

7.1609 **Argentina** does not agree that Article 10.1 needs to be observed only "where relevant". It does not give Members the discretion to take account of the needs of developing country Members or not. Argentina further argues that the European Communities has not provided any evidence proving that it has taken into account Argentina's special needs as a developing country Member when preparing and applying its legislation. The legislation does not contain any reference to the special needs of developing country Members. Moreover, for the entire period of application of the general *de facto* moratorium on approvals, Argentina cannot identify any evidence which would permit the

conclusion that the European Communities has taken account of Argentina's special needs in the context of the approval procedures of interest to Argentina. In addition, the European Communities is incorrect when it suggests that Argentina is making a consequential claim under Article 10.1. Finally, Argentina notes that the trade statistics referred to by the European Communities have not been submitted to the Panel. In any event, those statistics cannot relate to trade in agricultural biotech products after 1998 as no such products have been approved since that date. Argentina further submits that WTO rules protect competitive expectations, not volumes of trade.

7.1610 The **Panel** notes that it is less than clear precisely what Argentina's claim is. We must, therefore, address this issue before we analyse whether the European Communities has breached Article 10.1.

(a) Argentina's claim

7.1611 Article 10.1 applies to the "preparation and application of [SPS] measures". Argentina's submissions do not indicate clearly what, in Argentina's view, is the SPS measure at issue. On the one hand, Argentina argues that the European Communities has failed to comply with Article 10.1 because of the way it has prepared and applied the general *de facto* moratorium on approvals.[1326] This suggests that, as far as Argentina is concerned, the SPS measure at issue is the general *de facto* moratorium on approvals. On the other hand, Argentina appears to argue that the European Communities has failed to comply with Article 10.1 because of the way it has applied the relevant EC approval legislation.[1327] This suggests that the SPS measure at issue is the relevant EC approval legislation.[1328] We think that both ways of framing a claim under Article 10.1 are possible.

7.1612 Judging by the entirety of Argentina's submissions, we think that Argentina intended to claim that the general *de facto* moratorium on approvals constitutes the relevant "SPS measure". We will examine that claim below. In view of the fact that Argentina's submissions on this issue are less than fully clear and that Article 10.1 is a provision on differential and more favourable treatment for

[1326] Argentina's first written submission, paras. 182 (referring to the "ordering and applying a general moratorium") and 189 (referring to "the decision and subsequent application of the 'de facto' moratorium"); Argentina's first oral statement, para. 77 (referring to the "deciding on and applying the 'de facto' moratorium"); Argentina's second written submission, para. 123 (referring to "the application of the 'de facto' moratorium").

[1327] Argentina's second written submission, paras. 116 (referring to the time of "elaborating and applying its legislation related to agricultural biotech products") and 125 (asserting that there is no evidence that "during the proceedings [*i.e.*, individual approval procedures] the EC has effectively taken into account Argentina's special needs").

[1328] It is pertinent to note that in the context of its challenge to various product-specific measures Argentina makes similar claims under Article 12.3 of the *TBT Agreement.* Article 12.3 provides:

> Members shall, in the preparation and application of technical regulations, standards and conformity assessment procedures, take account of the special development, financial and trade needs of developing country Members, with a view to ensuring that such technical regulations, standards and conformity assessment procedures do not create unnecessary obstacles to exports from developing country Members.

It is clear from Argentina's submissions that Argentina's claims under Article 12.3 are in respect of the application by the European Communities of its approval legislation, which Argentina says may be considered as laying down "conformity assessment procedures" within the meaning of Article 12.3. Argentina's first written submission, p. 144 (heading) and paras. 445 and 450. However, as indicated, Argentina's claims under Article 12.3 relate to the product-specific measures, whereas we are concerned here with a claim concerning the general *de facto* moratorium on approvals.

developing country Members, we will, however, offer alternative findings. For the purposes of these alternative findings, we will assume that Argentina intended to make the additional claim that the EC approval legislation also constitutes a relevant "SPS measure".

(b) General *de facto* moratorium on approvals as "SPS measure"

7.1613 As indicated, we first examine Argentina's claim that the European Communities has acted inconsistently with Article 10.1 because of the way it has prepared and applied the general *de facto* moratorium on approvals. Under this claim, the general *de facto* moratorium on approvals is considered as an "SPS measure".

7.1614 We have found earlier that the European Communities' decision to apply a general *de facto* moratorium on approvals was a decision relating to the application, or operation, of the existing EC approval procedures and that, as such, it did not constitute an "SPS measure" within the meaning of Annex A(1).[1329] However, as we have done in other cases, we also consider the specific provisions of Article 10.1 before reaching a definitive conclusion on whether the general *de facto* moratorium on approvals was an "SPS measure".

7.1615 Article 10.1 provides that in the "preparation and application of [SPS] measures" Members must take account of the special needs of developing country Members. According to Annex A(1), the term "SPS measures" includes "requirements and procedures". It makes sense to say that in the "preparation and application" of "requirements and procedures" Members must take account of developing country Members' needs. In contrast, if the application, or operation, of approval procedures were considered to be an "SPS measure" within the meaning of Article 10.1, Article 10.1 would impose an obligation on Members with regard to the "application" of the "application of an approval procedure". Clearly, such a reading of Article 10.1 would be unreasonable and contrary to logic.[1330] It is no answer to say that in cases where the measure is the "application of an approval procedure", the separate reference in Article 10.1 to the "application" of SPS measures is unnecessary. It is well established in WTO jurisprudence that a treaty interpreter must give meaning and effect to all the terms used in a treaty provision and must avoid interpretations which render treaty terms redundant.[1331]

7.1616 In view of the above considerations, we find our earlier conclusion that the general *de facto* moratorium on approvals was not an "SPS measure" within the meaning of Annex A(1) appropriate in the specific context of Article 10.1. We thus determine that the general *de facto* moratorium on approvals was not an "SPS measure" within the meaning of Article 10.1. Since the claim we are considering is based on the premise that the general *de facto* moratorium was an "SPS measure", it is clear that this claim cannot succeed.

7.1617 Accordingly, we find that Argentina has failed to establish its claim that the European Communities has acted inconsistently with Article 10.1 because of the way it has prepared and applied the general *de facto* moratorium on approvals.

[1329] We recall that in accordance with Article 1.1 of the *SPS Agreement* the definitions provided in Annex A are applicable to Article 10.1.

[1330] It is instructive to note in this regard that the equivalent provision of the *TBT Agreement*, Article 12.3, refers to the "preparation and application" of "conformity assessment procedures". This supports our reading of Article 10.1 of the *SPS Agreement*.

[1331] Appellate Body Report, *US – Gasoline*, p. 23.

(c) EC approval legislation as "SPS measure"

7.1618 As indicated above, we will offer alternative findings on the assumption that Argentina intended to make the additional claim that the EC approval legislation also constitutes a relevant "SPS measure". Thus, for the purposes of our alternative inquiry, we understand Argentina to claim, in addition, that by adopting and applying a general *de facto* moratorium on approvals, the European Communities has failed to apply its approval legislation in a manner which takes account of developing country Members' needs.

7.1619 Argentina argues that some of the products affected by the European Communities' general moratorium on approvals are of particular export interest to Argentina as a major developing country exporter of those products. Argentina considers that the European Communities should have provided preferential market access for its and other developing countries' products, or implemented its approval legislation in a manner beneficial, or less detrimental, to the trade interests of developing country Members.

7.1620 Argentina's argument implies that when an importing Member applies a measure which (i) treats exports originating in the territory of developing country Members in the same way as exports originating in the territory of developed country Members and (ii) has a significant adverse effect on the developing countries' exports, the importing Member is acting inconsistently with its obligation under Article 10.1. Argentina suggests that in such situations the exports of developing country Members are entitled under Article 10.1 to special and differential treatment *vis-à-vis* the exports of developed country Members. However, the obligation laid down in Article 10.1 is for the importing Member to "take account" of developing country Members' needs. The dictionary defines the expression "take account of" as "consider along with other factors before reaching a decision".[1332] Consistent with this, Article 10.1 does not prescribe a specific result to be achieved. Notably, Article 10.1 does not provide that the importing Member must invariably accord special and differential treatment in a case where a measure has lead, or may lead, to a decrease, or a slower increase, in developing country exports.

7.1621 The fact that there is no indication that between June 1999 and August 2003 the European Communities accorded Argentina special and differential treatment – *e.g.*, by approving the marketing of biotech products exported from Argentina – does not in and of itself constitute prima facie evidence that the European Communities has failed to "take account" of Argentina's needs. While the European Communities must take account of the interests of developing country Members in applying its approval legislation, the European Communities may at the same time take account of other legitimate interests, including those of its own consumers, its environment, etc. There is nothing in Article 10.1 to suggest that in weighing and balancing the various interests at stake, the European Communities must necessarily give priority to the needs of Argentina as a developing country. We therefore think it is conceivable that the European Communities "took account" of Argentina's needs when adopting and applying its general *de facto* moratorium on approvals, but ultimately determined that applications concerning products of export interest to Argentina warranted no special and differential treatment.[1333] Accordingly, we consider that the fact that the European Communities did not accord Argentina special and differential treatment *vis-à-vis* other developed country exporters does not demonstrate, by itself, an inconsistency with Article 10.1.

[1332] *The Concise Oxford Dictionary*, 10th edn., J. Pearsall (ed.) (Clarendon Press, 1999), p. 8.

[1333] We recall Argentina's statement that its claim under Article 10.1 is not a consequential claim, but an autonomous claim. Thus, for the purposes of our analysis of Argentina's claim under Article 10.1, we must assume that, but for a possible inconsistency with Article 10.1, the general de facto moratorium on approvals is WTO-consistent.

7.1622 Argentina argues that the European Communities has not provided any evidence which would prove that it has taken into account Argentina's special needs as a developing country Member. This argument lacks merit, for it is incumbent on Argentina as the Complaining Party to adduce evidence and argument sufficient to raise a presumption that the European Communities has failed to take into account Argentina's special needs as a developing country Member.[1334]

7.1623 Argentina also contends that there is no reference in the EC approval legislation to the special needs of developing country Members. However, the absence of a reference to developing country needs in the text of the EC approval legislation does not demonstrate that that legislation itself fails to take account of these needs[1335], or that the European Communities is precluded from taking account, or has not taken account, of these needs when applying that legislation. We therefore consider that it is not sufficient, for the purposes of establishing a claim under Article 10.1, to point to the absence in the EC approval legislation of a reference to the needs of developing country Members.

7.1624 Argentina further argues that for the entire period of application of the general *de facto* moratorium on approvals it could not identify any evidence supporting the conclusion that the European Communities has taken account of Argentina's special needs. We note that Argentina has merely asserted the absence of relevant evidence, without specifying what efforts it has undertaken to collect such evidence. Moreover, we note that Article 10.1 does not specifically require the importing Member to document how it has complied with Article 10.1. In these circumstances, we do not consider that Argentina's argument provides a sufficient basis for us to find that Argentina has met its burden of establishing an inconsistency with Article 10.1.

7.1625 Even considering all of Argentina's arguments together, we are not satisfied that Argentina has met its burden. We recognize that Argentina may not have ready access to information about whether and to what extent the European Communities "took account" of Argentina's needs as a developing country Member. However, there is no evidence on record to show that Argentina ever approached the European Communities and sought information on how the European Communities complied with its obligation under Article 10.1 when applying its approval legislation to applications concerning biotech products of export interest to Argentina. We do not mean to suggest that it is Argentina's duty specifically to request the European Communities to take account of Argentina's needs as a developing country Member. But under well-established rules on burden of proof it is for Argentina to prove its claim that the European Communities did not take account of developing country Members' needs.

7.1626 In the light of the above considerations, we find, in the alternative, that Argentina has failed to establish its claim that the European Communities has acted inconsistently with Article 10.1 because of the way it has applied its approval legislation between October 1998 and August 2003.

[1334] It is worth noting in this context that Argentina has not explained how the European Communities would in the present case have known that a particular application concerned a biotech product of export interest to Argentina. As far as we are able to determine, in none of the many approval procedures affected by the general moratorium was the applicant an Argentinean company or individual. Typically, the applicant was a biotech company of a developed country nationality. While such applicants may have provided information on actual or potential exporting countries as part of the information submitted with their applications, neither Argentina nor the European Communities has confirmed that they were required to do so, or if not, that they have consistently done so.

[1335] We note, however, that Directive 2001/18 in its 13th preambular paragraph states that the content of the Directive "duly takes into account" the European Communities' "international trade commitments". Argentina did not acknowledge this paragraph.

(d) Overall conclusion

7.1627 In the light of the above, the Panel reaches the following conclusion:

(i) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the European Communities has acted inconsistently with its obligations under Article 10.1 of the *SPS Agreement* by applying a general *de facto* moratorium on approvals between June 1999 and August 2003.

E. PRODUCT-SPECIFIC MEASURES

1. Measures at issue

7.1628 In addition to the general *de facto* moratorium on approvals, the Complaining Parties are also challenging a number of product-specific measures. The Panel begins its analysis by setting out the Complaining Parties' general descriptions of the measures at issue and the European Communities' comments in response.

(a) General

7.1629 The **United States** notes that it is challenging the failure by the Commission and the member States to consider for approval certain applications specified in its request for the establishment of a panel. The United States refers to these product-specific measures as "product-specific moratoria". According to the United States, these product-specific moratoria are separate measures from the general moratorium affecting all applications. The United States also notes, however, that they are similar measures in that both refer to the European Communities' failure to consider applications for approval. Also, since the general moratorium applied to all applications, a necessary corollary is that the European Communities also adopted product-specific moratoria on each of the relevant applications specified in the United States' panel request. Accordingly, the evidence and arguments the United States adduced in support of the existence of a general moratorium also establish the existence of the product-specific moratoria, and that the European Communities did not undertake and complete its approval procedures for each individual application without undue delay.

7.1630 **Canada** states that it is challenging the failure by the European Communities to consider or approve, without undue delay, certain applications specified in its request for the establishment of a panel. Canada refers to the failure by the European Communities in this regard as the product-specific marketing bans. Canada contends that the general moratorium and the product-specific marketing bans are closely related, though distinct, measures. The product-specific marketing bans are a direct consequence of the moratorium as applied to individual applications. They are the manifestation of the moratorium in the context of the approval procedures of the four specific products of concern to Canada. Canada's arguments in relation to product-specific marketing bans are intended to focus on the direct and detrimental impact of the moratorium on specific applications.

7.1631 **Argentina** states that it is challenging (i) the suspension by the European Communities of consideration of specified applications for approval, or the failure to consider specified applications for approval as well as (ii) the undue delays in completing the consideration and processing of specified applications. Argentina argues that the product-specific suspension of processing or failure

to consider as well as the undue delay are effects of the application of the *de facto* moratorium to specific applications for approval.

7.1632 The **European Communities** notes that it has considerable difficulty in understanding the difference between the first group of claims by the Complaining Parties relating to the alleged moratorium on approvals and the second group of claims relating to alleged failures to consider for approval specific applications. According to the European Communities, the Complaining Parties' assertions about a "suspension of procedures" or any "failure to consider applications" are assertions about delay.

7.1633 The **Panel** notes that, according to the Complaining Parties, the product-specific measures they are challenging are distinct from the general *de facto* moratorium on approvals. At the same time all three Complaining Parties point out that the product-specific measures are related to the general moratorium on approvals. Based on these statements and the Complaining Parties' arguments, it is our understanding that the product-specific measures are, or arise from:

- specified acts and/or omissions through which the relevant EC entities were giving effect, in the context of particular approval procedures, to their decisions to impose a general moratorium on approvals, or
- specified acts and/or omissions through which relevant EC entities chose to respond, again in the context of particular approval procedures, to the circumstance that other EC entities were imposing a general moratorium on approvals.

7.1634 It should be noted, however, that in their requests for the establishment of a panel, the Complaining Parties have described the product-specific measures in more general terms. Moreover, each Complaining Party has used a somewhat different description. It is therefore useful to address these different descriptions one by one.

7.1635 The United States in its panel request says that the measure at issue is the failure by the European Communities to consider particular applications for approval. It is clear to us that the United States does not contend that the European Communities has not considered the relevant applications at all. In our view, the United States contends that the European Communities has failed to consider the relevant applications for *final* approval. We understand this to be essentially a contention that the consideration of these applications was affected by the general moratorium on final approvals, in the sense that their consideration was either effectively suspended at some point in the approval process or continued at a delayed pace. This understanding would appear to be supported by the fact that when referring to the product-specific measures, the United States speaks of the "product-specific moratoria".

7.1636 Canada in its panel request says that the measure at issue is the failure by the European Communities to consider or approve, without undue delay, the applications mentioned in its request. Thus, unlike the United States, Canada explicitly includes an allegation of undue delays in the consideration and approval of the relevant applications in the definition of the measures being challenged. At the same time, Canada refers to the alleged failure to consider or approve the relevant applications without undue delay as the product-specific marketing bans. Canada claims in this regard that at some point in the approval process each of the relevant applications was subjected by the European Communities to an effective marketing ban. The validity of this claim will be discussed further below. At this stage, it is sufficient to note that we will conduct our examination based on the description of the product-specific measures set out in Canada's panel request.

7.1637 Argentina distinguishes two types of product-specific measures. The first type of product-specific measure is described in Argentina's panel request as the suspension of consideration of, or the failure to consider, particular applications for approval. In our understanding, this type of measure is conceptually the same as the product-specific measures referred to in the United States' panel request. The second type of product-specific measure identified in Argentina's panel request concerns undue delays in finalizing consideration of particular applications for approval. Accordingly, like Canada, Argentina explicitly includes an allegation of undue delays in the consideration of the relevant applications in the definition of the measures being challenged.

(b) Relevant applications

7.1638 As noted above, each of the product-specific measures challenged by a particular Complaining Party relates to a particular application. Below it is indicated (i) how many applications were specified by each Complaining Party and (ii) on how many of these applications the Panel has been requested to offer product-specific findings.

(i) DS291 (United States)

7.1639 The United States in its request for the establishment of a panel stated that the relevant applications are mentioned in Annexes I and II to its request. These two Annexes list a total of forty-one applications. As all forty-one applications are within the terms of reference of this Panel, there are, in principle, forty-one product-specific measures which the United States could seek to challenge. However, in its first written submission, the United States indicated that it is making claims in respect of only twenty-seven applications.[1336] We conclude from this that the United States has abandoned its product-specific claims in respect of the remaining fourteen applications.[1337]

7.1640 According to the United States' first written submission, the twenty-seven applications in respect of which it is pursuing product-specific claims include eighteen which were submitted under Directive 90/220 and were pending under Directive 2001/18 on the date of establishment of this Panel as well as nine applications pending under Regulation 258/97.[1338] Among the nine applications the United States claims were pending under Regulation 258/97, there are two applications which were withdrawn before the Panel was established. They are Transgenic red-hearted chicory (food) and Transgenic green-hearted chicory (food). Evidence provided by the European Communities shows that both were withdrawn by the applicant in May 2003.[1339] We note in this respect that, in a submission made subsequent to its first written submission, the United States stated that it is not requesting findings on applications that were withdrawn prior to the establishment of the Panel.[1340] In the light of this categorical statement, we consider we need not, and hence do not, make findings in respect of the two aforementioned applications concerning transgenic chicory. This means that there are in total twenty-five applications on which the Panel is expected to offer product-specific findings

[1336] US first written submission, paras. 67, 131, 137-138.

[1337] It should be noted that the United States discussed the applications concerning MS1/RF2 oilseed rape and MS1/RF1 oilseed rape (EC-89) under the heading "product-specific moratoria". US second written submission, para. 53. However, the United States also presented arguments relating to its general moratorium claim under that heading. US second written submission, paras. 52-53. Accordingly, we do not understand the United States to have increased the number of measures in respect of which it is making product-specific claims.

[1338] The eighteen applications pending under Directive 2001/18 are identified at paras. 49-51 of the US first written submission; the nine applications pending under Regulation 258/97 are identified at paras. 54-55 of the US first written submission.

[1339] Exhibits EC-97/At. 32 and EC-98/At. 42. The United States also acknowledges this fact. US second written submission, footnote 76.

[1340] US reply to Panel question No. 197, footnote 26.

– eighteen which were pending under Directive 2001/18 and seven which were pending under Regulation 258/97.

7.1641 The eighteen applications which were pending under Directive 2001/18 as of August 2003 comprise those concerning:

- Bt-531 cotton
- RR-1445 cotton
- Falcon oilseed rape
- MS8/RF3 oilseed rape
- RR fodder beet
- Transgenic potato
- Liberator oilseed rape
- Bt-11 maize (EC-69)
- GA21 maize (EC-78) (withdrawn in September 2003)
- MON810 x GA21 maize (withdrawn in September 2003)
- LL soybeans (EC-71) (withdrawn in June 2004)
- LL oilseed rape
- BXN cotton[1341]
- Bt-1507 maize (EC-74)
- Bt-1507 maize (EC-75)
- NK603 maize (approved by Commission in July 2004)
- RR oilseed rape (EC-70) (approved by Commission in August 2005[1342])
- RR sugar beet (withdrawn in April 2004)

7.1642 The seven applications which were pending under Regulation 258/97 as of August 2003 are those concerning:

- GA21 maize (food)
- Bt-11 sweet maize (food) (approved by Commission in May 2004)
- NK603 maize (food) (approved by Commission in October 2004)
- LL soybeans (food) (withdrawn in July 2004)
- Bt-1507 maize (food)
- RR sugar beet (food) (withdrawn in April 2004)
- MON810 x GA21 maize (food)

(ii) DS292 (Canada)

7.1643 Canada's request for the establishment of a panel identifies four applications. They were all submitted under Directive 90/220. As of August 2003, they were either pending under Directive 2001/18 or awaiting the lead CA's written consent to the placing on the market. Canada requests product-specific findings on all four applications. The applications at issue are those concerning:

[1341] According to the European Communities, the application concerning BXN cotton was withdrawn by the applicant after the establishment of the Panel. However, the European Communities has provided no support for this assertion.

[1342] We recall that after the second substantive meeting, on 1 September 2005, the Panel received a letter from the European Communities stating that the Commission had approved the application concerning RR oilseed rape (EC-70) under Directive 2001/18.

- MS1/RF1 oilseed rape (EC-89) (awaiting the lead CA's written consent)
- MS1/RF2 oilseed rape (awaiting the lead CA's written consent)
- MS8/RF3 oilseed rape
- RR oilseed rape (EC-70) (approved by Commission in September 2005[1343])

(iii) DS293 (Argentina)

7.1644 Argentina's request for the establishment of a panel contains an attachment, Annex I, which identifies seventeen applications. It appears that Annex I is intended to illustrate the impact of the general *de facto* moratorium on specific applications as well as to specify the applications in respect of which Argentina is making product-specific claims. Among the seventeen applications referred to in Annex I, there are two which are mentioned twice.[1344] There are four additional applications in respect of which Argentina makes no claims in its submissions.[1345] The eleven remaining applications are the applications on which we think we are requested to make product-specific findings. Of these eleven applications, six were submitted under Directive 90/220. With one exception[1346], they were pending under Directive 2001/18 on the date of establishment of this Panel. Argentina claims that the other five applications were all submitted under Regulation 258/97.

7.1645 The six applications submitted under Directive 90/220 comprise those concerning:

- Bt-531 cotton
- RR-1445 cotton
- GA21 maize (EC-78) (withdrawn in September 2003)
- GA21 maize (EC-85) (withdrawn in June 2001)
- NK603 maize (approved by Commission in July 2004)
- LL soybeans (EC-71) (withdrawn in June 2004)

7.1646 The five applications which Argentina says were submitted under Regulation 258/97 are those concerning:

- Bt-531 cotton
- RR-1445 cotton
- GA21 maize (food)

[1343] We recall that after the second substantive meeting, on 1 September 2005 the Panel received a letter from the European Communities stating that the application concerning RR oilseed rape (EC-70) was approved by the Commission in September 2005. We further note that in the context of presenting its product-specific claims in respect of the application concerning RR oilseed rape (EC-70), Canada also presented arguments on RR oilseed rape (EC-79). *E.g.*, Canada's first written submission, paras. 86-87 and 295. *See also* Canada's reply to Panel question No. 60. The application concerning RR oilseed rape (EC-79) was submitted to France. However, Annex I to Canada's panel request refers only to the application submitted to the Netherlands, which is that concerning RR oilseed rape (EC-70). Accordingly, we will not entertain Canada's product-specific claims in respect of the application concerning RR oilseed rape (EC-79) submitted to France. We consequently offer no product-specific findings on that application.

[1344] This is the case of the applications concerning GA21 maize (food) and LL soybeans (EC-71). Argentina in its submissions to the Panel does not argue that the applications which we consider are mentioned twice are in fact different applications.

[1345] This is the case of the applications concerning GA21 maize (EC-78) (alleged procedure under Regulation 258/97), T14 maize (procedure under Directive 90/220 and alleged procedure under Regulation 258/97) and LL soybeans (EC-81). T14 maize is mentioned in footnote 188 of Argentina's first written submission, but no claim is raised there.

[1346] The application concerning GA21 maize (EC-85) was withdrawn in June 2001.

– NK603 maize (food) (approved by Commission in October 2004)
– LL soybeans (food) (withdrawn in July 2004)

(c) Withdrawn and approved applications

7.1647 The above analysis shows that among the applications in respect of which the Panel is requested to make product-specific findings are applications which were withdrawn either before or after the Panel was established. There also are applications which were approved by the Commission in the course of the Panel proceedings. The European Communities argues that the Panel should not make findings with regard to withdrawn or approved applications. Accordingly, we must decide whether it is appropriate to assess the WTO-consistency of the relevant product-specific measures.

(i) Applications withdrawn before the establishment of the Panel

7.1648 We note at the outset that if an application is withdrawn, this means that the product-specific measure complained of no longer exists. In the case of the application concerning GA21 maize (EC-85), the product-specific measure complained of by Argentina is the alleged "undue delay in finalizing consideration of that application". Once that application was withdrawn, this meant that there no longer was an undue delay in finalizing consideration of that application.

7.1649 As we pointed out earlier, the product-specific measure which relates to the application concerning GA21 maize (EC-85) is within the terms of reference of DS293 (Argentina). Notwithstanding this, the European Communities submits that claims concerning applications withdrawn before the Panel was established are without object and, hence, inadmissible ab initio. In our view, the mere fact that the product-specific measure concerning GA21 maize (EC-85) no longer existed as of the date of establishment of the Panel does not, *ipso facto*, deprive us of our authority to make findings on a measure that is within our terms of reference.[1347]

7.1650 This is also clear from the Appellate Body report in *US – Certain EC Products*. That dispute concerned a measure which was withdrawn almost two months before a panel was established.[1348] The panel considered the measure, offered findings on it and recommended that it be brought into conformity with WTO rules.[1349] The Appellate Body found that the panel should not have made a recommendation regarding a measure that no longer existed.[1350] But the Appellate Body nowhere suggested that the panel erred in making findings regarding that measure.[1351] We recognize that in our case the application concerning GA21 maize (EC-85) was withdrawn more than two years before the Panel was established. However, there is nothing in the DSU to suggest that our jurisdiction, which is established by our terms of reference[1352], is affected by such considerations of time.

7.1651 Having said this, past jurisprudence shows that a panel is not necessarily required to make use of its authority to make findings in respect of measures which were no longer in existence on the date of establishment of a panel. In *Argentina – Textiles and Apparel*, the panel decided not to make

[1347] A different issue (which we do not reach) is whether we have the authority to make recommendations in relation to the product-specific measure in question.

[1348] The panel in that case was established on 16 June 1999, while the measure at issue (the "3 March Measure") ceased to exist on 19 April 1999 when a new measure (the "19 April Action") was adopted.

[1349] Panel Report, *US – Certain EC Products*, para. 7.3.

[1350] Appellate Body Report, *US – Certain EC Products*, para. 81. The Appellate Body in *US – Upland Cotton*, referring to its report on *US – Certain EC Products*, stated that "the fact that a measure has expired may affect what recommendation a panel may make". Appellate Body Report, *US – Upland Cotton*, para. 272.

[1351] *Ibid*., para. 271.

[1352] Appellate Body Report, *Brazil – Desiccated Coconut*, p. 22.

findings on the WTO-consistency of a measure which had been revoked eleven days before the panel was established.[1353] Moreover, as noted by the panel in *US – Gasoline*, "it had not been the usual practice of a panel established under the General Agreement [on Tariffs and Trade 1947] to rule on measures that, at the time the panel's terms of reference were fixed, were not and would not become effective".[1354]

7.1652 We consider that in determining whether to make findings on a measure no longer in existence on the date of establishment of a panel, panels should notably take account of the object and purpose of the dispute settlement system.[1355] Pursuant to Article 3.7 of the DSU, "[t]he aim of the dispute settlement mechanism is to secure a positive solution to a dispute".

7.1653 In the case of the application concerning GA21 maize (EC-85), we are not persuaded that making product-specific findings with regard to that application is necessary to "secure a positive solution to [the] dispute" between Argentina and the European Communities. We note in this regard that there is no agreement between the Parties that it would be useful for us to make findings on the product-specific measure concerning the application in question. Moreover, the application was withdrawn more than two years prior to the establishment of the Panel. Thus, unlike in the *US – Certain EC Products* case where the measure at issue was in force for just over a month, this is a case where Argentina could have presented its claims while the application was still pending.[1356] Finally, we note that the applicant resubmitted the application to another member State and that the resubmitted application – the application concerning GA21 maize (EC-78) – was still pending on the date of establishment of this Panel. We will make findings on the resubmitted application. As a result, we are resolving the dispute between Argentina and the European Communities insofar as it relates to GA21 maize.

7.1654 In the light of these considerations, we will neither examine nor make product-specific findings on the application concerning GA21 maize (EC-85).

(ii) Applications withdrawn after the establishment of the Panel

7.1655 In relation to applications which were withdrawn after the Panel was established, we note that only the United States and Argentina are seeking product-specific findings on applications falling within this category.

7.1656 The **European Communities** argues that the Panel should not address product-specific measures concerning applications which were withdrawn after the Panel was established. According to the European Communities, the issue has become moot and the relevant claims must be considered inadmissible. The European Communities bases its argument on three provisions of the DSU. *First*, Article 3.3 of the DSU states that the basic aim of the dispute settlement system is "the prompt settlement of situations in which a Member considers that any benefits accruing to it directly or indirectly under the covered agreements *are being* impaired by measures taken by another Member" (emphasis added). This shows that the purpose of dispute settlement is to address and redress situations that are in actual existence. *Secondly*, Article 3.4 of the DSU provides that

[1353] Panel Report, *Argentina – Textiles and Apparel*, para. 6.15.
[1354] Panel Report, *US – Gasoline*, para. 6.19.
[1355] This approach is consistent with that of the panel in *Chile – Price Band System*, which stated that "[a]lthough we do not consider that the termination of a measure before the commencement of panel proceedings deprives a panel of the authority to make findings in respect of that measure, we would only make findings regarding the provisional safeguard measures in this case if we were to consider this necessary in order to 'secure a positive solution' to the dispute." Panel Report, *Chile – Price Band System*, para. 7.115.
[1356] We note that the application was first submitted in December 1997.

"recommendations or rulings by the DSB shall be aimed at achieving a satisfactory settlement of the matter". This cannot be the case if there is no matter to settle (i.e., if no measure is being applied). *Thirdly*, Article 3.7 of the DSU provides that "before bringing a case a Member shall exercise its judgment as to whether action under these procedures would be fruitful. The aim of the dispute settlement mechanism is to secure a positive solution to a dispute". A case on a measure that is not in existence any longer would be devoid of any purpose and not fruitful. The European Communities also points out that it is a legal principle recognized in jurisdictions around the world and commonly applied by international tribunals, including the International Court of Justice (the "ICJ"), that a tribunal should not rule on a measure no longer in existence.[1357]

7.1657 The **United States** argues that the concept of mootness is of no relevance, since the product-specific measures existed in August 2003, when the terms of reference were set. The United States refers to the panel report on *India – Autos*, which states that "[a] WTO Panel is generally competent to consider measures in existence at the time of its establishment. This power is not necessarily adversely affected simply because a measure under review may have been subsequently removed or rendered less effective".[1358] Regarding the European Communities' argument with regard to a "legal principle" concerning mootness, the United States notes that the European Communities failed to mention that GATT and WTO panels in the past considered terminated measures, and that the European Communities failed to explain how such a principle would be consistent with the text of the DSU.

7.1658 **Argentina** argues that the European Communities' statement on mootness is not supported by WTO jurisprudence. Argentina refers to the panel report on *Chile – Price Band System*, wherein the panel stated that "Article 19.1 of DSU does not prevent us from making findings regarding the consistency of an expired provisional safeguard measure".[1359] Argentina also refers to the above-quoted passage from the panel report on *India – Autos*.

7.1659 Subsequently, the **European Communities** clarified its position. It notes that it is not its position that the Panel may not consider product-specific measures concerning applications which were withdrawn after the Panel was established.[1360] But the European Communities remains of the view that such measures are "*sans objet*", and that there is no longer any utility in considering such measures because there does not exist, in respect of such measures, a dispute between the Parties.

7.1660 The **Panel** notes that there is no disagreement among the Parties that the product-specific measures which relate to applications withdrawn after the establishment of the Panel are within the Panel's terms of reference. There also is no disagreement among the Parties that the Panel in principle has the authority to consider measures which ceased to exist after the establishment of the Panel. We agree with both points. In relation to the second point – the authority of panels to consider measures which ceased to exist after the establishment of a panel – we note that the panel in *India – Autos* observed that:

[1357] The European Communities refers to the following ICJ judgments: *Questions of Interpretation and Application of the 1971 Montreal Convention raising from the Aerial Incident at Lockerbie* (Libyan Arab Jamahiriya v. United States of America), Judgment, ICJ Reports 1998, at 131, para 45; *Nuclear Tests* (Australia v. France), Judgment, ICJ Reports 1974, p.272, para 62; and *Border and Transborder Armed Actions* (Nicaragua v. Honduras), Jurisdiction and Admissibility, Judgment, ICJ Reports 1988, p.95, para. 66.

[1358] Panel Report, *India – Autos*, para. 7.26.

[1359] Panel Report, *Chile – Price Band System*, para. 7.124.

[1360] The European Communities nonetheless notes that the Panel should not issue recommendations in respect of such measures.

> "A WTO Panel is generally competent to consider measures in existence at the time of its establishment. This power is not necessarily adversely affected simply because a measure under review may have been subsequently removed or rendered less effective."[1361]

7.1661 The Parties disagree on whether the Panel should make use of its authority to make findings on the product-specific measures concerning the withdrawn applications. The European Communities argues that it is no longer useful for the Panel to consider the relevant product-specific measures, and that the Panel should therefore refrain from ruling on these measures. According to the European Communities, this would be consistent with international practice, including that of the International Court of Justice.

7.1662 In considering this issue, we note that previous panels have addressed measures which ceased to exist after the establishment of the panel. The panel in *Indonesia – Autos* stated in this regard that:

> "[I]n previous GATT/WTO cases, where a measure included in the terms of reference was otherwise terminated or amended after the commencement of the panel proceedings, panels have nevertheless made findings in respect of such a measure."[1362]

7.1663 We would agree with the European Communities that it may be appropriate for panels to look to the practice of international tribunals for inspiration, particularly in situations where the WTO agreements, GATT/WTO jurisprudence or practice provide no useful guidance. But we do not find ourselves in a situation of this kind. As is clear from the above remarks, there is specific GATT/WTO jurisprudence and practice to guide us. In these circumstances, we see no need to draw on the jurisprudence of the International Court of Justice.

7.1664 We do not consider that Articles 3.3 or 3.4 of the DSU support the view that we should refrain from making findings on the relevant product-specific measures. In relation to Article 3.3, the European Communities appears to argue that if benefits are no longer "being" impaired by a measure, because the measure has ceased to exist, the Panel should not make findings on it. However, the main objective of Article 3.3 is to emphasise the importance of the *prompt* settlement of situations in which benefits are being impaired by a measure. In our view, it cannot be deduced from this that in situations where benefits are no longer being impaired by a measure, a panel should refrain from making findings on it. We note that pursuant to Article 3.2 of the DSU the dispute settlement system also serves "to preserve the rights and obligations of Members under the covered agreements". We think that it is consistent with this function of the dispute settlement system for a panel to make findings on the WTO-consistency of a measure which has ceased to exist, especially if so requested by one of the parties.

7.1665 Turning to Article 3.4, we note that that provision states that recommendations or rulings by the DSB must be aimed at achieving a satisfactory settlement of the "matter". The European Communities suggests that if a measure has ceased to exist, there is no longer a "matter" to be settled. However, the "matter" to be settled is the matter referred to the DSB for settlement. As is clear from Article 7.1 of the DSU and the Appellate Body report in *Guatemala – Cement I*[1363], the matter referred to the DSB is the matter described by a Complaining Party in its request for the establishment of a panel. Pursuant to Article 6.2 of the DSU, the request for establishment of a panel must identify the

[1361] Panel Report, *India – Autos*, para. 7.26.
[1362] Panel Report, *Indonesia – Autos*, para. 14.9.
[1363] Appellate Body Report, *Guatemala – Cement I*, para. 72.

specific measures at issue. Applying these considerations to the present case, it is clear that the "matter" to be settled by the DSB in a satisfactory manner includes the product-specific measures identified by the United States and Argentina in their respective panel requests. Therefore, we do not agree that once the relevant product-specific measures ceased to exist, there was, to that extent, no longer a "matter" which could be settled by the DSB.

7.1666 Regarding whether it is useful for the Panel to address the product-specific measures concerning the withdrawn applications, we recall our view that in making that determination, account should notably be taken of the object and purpose of the dispute settlement system, which is to secure a positive solution to a dispute. We note in this regard that there is no agreement between the Parties that it would be useful for us to make findings on the product-specific measures concerning the applications in question. However, the United States and Argentina as Complaining Parties did not say that in view of the withdrawal of the applications in question, they were no longer seeking findings on the product-specific measures concerning these applications. On the contrary, Argentina, for instance, explicitly requested the Panel to offer such findings. Moreover, unlike in the case of the application concerning GA21 maize (EC-85), our findings on other product-specific measures do not resolve the dispute relating to the relevant biotech products. Finally, we note that the applications were withdrawn by the applicants. It is clear, therefore, that this is not a case where the relevant measures were terminated by the responding party in the course of panel proceedings in a good faith effort to resolve the underlying dispute. Thus, we do not consider that if we make findings on the product-specific measures at issue, we would be frustrating efforts undertaken to reach a positive solution to the dispute. In these circumstances, we are unable to agree with the European Communities that it is no longer useful for us to offer findings on the product-specific measures at issue.

7.1667 In the light of the above, the Panel will make findings on the product-specific measures concerning those applications which were withdrawn after the Panel was established.

(iii) Applications approved after the establishment of the Panel

7.1668 The last category of applications to be addressed concerns applications which were approved by the Commission in the course of the Panel proceedings. All three Complaining Parties are seeking product-specific findings on such applications. In our view, applications which were *definitively* approved[1364] in the course of the Panel proceedings may be assimilated, for the purposes of the present inquiry, to applications which were withdrawn in the course of the Panel proceedings. Both categories of applications have in common the fact that the underlying approval procedures were pending on the date of establishment of the Panel, but were subsequently discontinued. The only difference is that in the case of a definitively approved application, the relevant approval procedure was discontinued as a result of action directly attributable to the European Communities. We do not consider that this difference, by itself, warrants a different approach by the Panel. We note in this regard that the European Communities does not argue that the Commission approved applications in order to resolve its dispute with the Complaining Parties in relation to the relevant applications.[1365]

[1364] We use the phrase "definitively approved" to refer to a situation where according to information on our record the applicant may proceed with the placing on the market of the biotech product which is the subject of the approved application.

[1365] The European Communities argues that the approvals of the relevant applications are simply the consequence of these applications having reached the final decision-making stage after being assessed at member State and Community level. EC comments on the Complaining Parties' replies to Panel questions, paras. 62-63.

7.1669 In the light of this, the Panel will make findings also with regard to those product-specific measures that concern applications which were definitively approved in the course of the Panel proceedings. The evidence on record supports the conclusion that two applications – namely, the application concerning Bt-11 sweet maize (food) and the application concerning NK603 maize (food) – were definitively approved in the course of the Panel proceedings. For the other relevant applications approved by the Commission in the course of the Panel proceedings, the record does not allow us to determine whether these applications have been definitively approved, such that they may be placed on the market.[1366] In any event, it is clear from the foregoing that we would offer findings on product-specific measures concerning such applications even if they had been definitively approved after the date of the establishment of the Panel.

(iv) Conclusion

7.1670 In the light of the foregoing considerations, we will offer no findings on the product-specific measure concerning GA21 maize (EC-85) (DS293), but we will make findings on product-specific measures concerning applications which were withdrawn after the Panel was established as well as on the product-specific measure concerning Bt-11 sweet maize (food) (DS291), an application which was definitively approved in the course of the Panel proceedings. However, we will not make any recommendations in the event that we find that the product-specific measures concerning applications which were withdrawn after the Panel was established, or the product-specific measure concerning Bt-11 sweet maize (food) (DS291), are WTO-inconsistent.

2. Claims of inconsistency raised by the Complaining Parties

7.1671 The Complaining Parties have each presented a series of claims of inconsistency in relation to the European Communities' product-specific EC measures they are challenging

7.1672 The **United States** claims that the product-specific EC measures it is challenging are inconsistent with, or have given rise to inconsistencies with, the following WTO provisions:[1367]

(a) Annex C(1)(a) and, consequently, Article 8 of the *SPS Agreement*;

(b) Annex B(1) and, consequently, Article 7 of the *SPS Agreement*;

(c) Annex C(1)(b) and, consequently, Article 8 of the *SPS Agreement*;

(d) Article 5.1 and, consequently, Article 2.2 of the *SPS Agreement*;

(e) Article 5.5 of the *SPS Agreement*.

7.1673 **Canada** claims that the product-specific EC measures it is challenging are inconsistent with, or have given rise to inconsistencies with, the following WTO provisions:[1368]

[1366] We note in this regard that in relation to the applications concerning NK603 maize (for animal feed use) and RR oilseed rape (EC-70) the record contains no evidence that the relevant lead CA has given its written consent for the placing on the market of these products after they were approved by the Commission under Directive 2001/18.

[1367] The claims are listed in the order in which they were developed in the first written submission of the United States.

[1368] The claims are listed in the order in which they were developed in the first written submission of Canada.

(a) Article 5.1 and, consequently, Article 2.2 of the *SPS Agreement*;

(b) Article 5.6 and, consequently, Article 2.2 of the *SPS Agreement*;

(c) Article 5.5 and, consequently, Article 2.3 of the *SPS Agreement*;[1369]

(d) Annex C(1)(a) and, consequently, Article 8 of the *SPS Agreement*;

(e) Article III:4 of the GATT 1994;

(f) Articles 2.1, 2.2, 5.1.2 and 5.2.1, first part, of the *TBT Agreement*.

7.1674 With regard to Canada's claims under the *TBT Agreement*, Canada explained that, if the Panel determines that parts of the relevant product-specific measures are covered by the *TBT Agreement* in addition to the *SPS Agreement*, its claims under the *TBT Agreement* are to be considered cumulative rather than alternative.

7.1675 **Argentina** claims that the product-specific EC measures are inconsistent with, or have given rise to inconsistencies with, the following WTO provisions:[1370]

(a) Article 5.1 and, consequently, Article 2.2 of the *SPS Agreement*;

(b) Articles 5.5 and 5.6 of the *SPS Agreement*;

(c) Annex C(1)(a), (b), (c) and (e) and, consequently, Article 8 of the *SPS Agreement*;

(d) Article III:4 of the GATT 1994;

(e) Articles 2.1, 2.2, 5.1.1, 5.1.2, 5.2.1, 5.2.2 and 12 of the *TBT Agreement*.

7.1676 As previously indicated, the Panel will make findings in relation to ten product-specific EC measures challenged by Argentina. However, Argentina's claims under Article 8 and Annex C(1) of the *SPS Agreement* and those under Article 5.2 of the *TBT Agreement* concern only eight of the ten "relevant product-specific measures". The two measures which are not the subject of a claim under these provisions are the measures affecting the approval of Bt-531 cotton and RR-1445 cotton under Regulation 258/97.

7.1677 We further note that Argentina's claims under the *TBT Agreement* are put forth as alternatives to its claims under the *SPS Agreement*.

7.1678 The **European Communities** argues that none of the product-specific claims presented by the three Complaining Parties is founded, and that it has not acted inconsistently with any of the WTO provisions which are being invoked by the Complaining Parties in respect of any of the product-specific measures.

7.1679 In view of the European Communities' view that all of the Complaining Parties' product-specific claims should be dismissed in their entirety, it is clear that the **Panel** needs to assess the merits of those claims. We will first examine the Complaining Parties' substantive claims under

[1369] Canada's claim under Article 5.5 is put forth as an alternative to its claim under Article 5.6.

[1370] The claims are listed in the order in which they were developed in the first written submission of Argentina.

Articles 5 and 2 of the *SPS Agreement*, and, if appropriate, will go on to examine the transparency claim under Annex B of the *SPS Agreement* and the procedural claims under Annex C of the *SPS Agreement*. Finally, to the extent it is necessary to do so, we will also examine Canada's and Argentina's claims under the GATT 1994 and under the *TBT Agreement*.

3. Consistency of the product-specific measures with Article 5.1 of the *SPS Agreement*

7.1680 All three Complaining Parties claim that the European Communities has acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* in respect of the product-specific measures they are challenging.

7.1681 Article 5.1 of the *SPS Agreement* provides:

> "Members shall ensure that their sanitary or phytosanitary measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health, taking into account risk assessment techniques developed by the relevant international organizations."

7.1682 The **United States** argues that like the general moratorium, to the extent the product-specific measures – the product-specific moratoria – are preventing the sale or marketing of biotech products, each failure by the European Communities to consider for approval a pending application of a biotech product is an "SPS measure" that is not "based on a risk assessment" as required by Article 5.1. The United States considers that the product-specific moratoria, which, in effect, ban the relevant biotech products from the EC market, are "SPS measures" as defined in Annex A(1) of the *SPS Agreement*. The EC approval regime, including that part of the regime modified by the product-specific moratoria, are plainly "sanitary or phytosanitary" measures. Similarly, the product-specific moratoria, although unwritten, are "measures" under the *SPS Agreement*, just as the general moratorium affecting all products is a "measure" under the *SPS Agreement*. Regarding the requirement that SPS measures be based on a risk assessment, the United States submits that with respect to fourteen of the pending applications, the European Communities has not put forth any risk assessment whatsoever. As for the remaining thirteen applications, the European Communities has undertaken risk assessments but the product-specific moratoria are not based on these assessments.

7.1683 **Canada** argues that the failure of the European Communities to consider or approve, without undue delay, the four applications of specific interest to Canada is an SPS measure as defined in Annex A(1). According to Canada, the failure to consider and approve these applications, which Canada refers to as the "product-specific marketing bans", is not "based on" risk assessments contrary to Article 5.1. While the European Communities has completed risk assessments for each of the four applications, it has failed to base its failure to consider, and approve, these applications on these assessments.

7.1684 **Argentina** argues that the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina constitutes an SPS measure and is contrary to the requirements of Article 5.1 because it is not based on any risk assessments. Argentina points out that there are applications that have not been approved in spite of the fact that member States or the EC scientific committees have conducted risk assessments and the assessments were favourable. In these cases, the requirements of Article 5.1 have not been met because the favourable risk assessment has not been taken into consideration. Other applications have had their processing suspended without any risk assessment having been conducted either by member States or EC scientific committees. In these cases, the requirements of Article 5.1 have not been met because no risk assessment was

performed on account of the suspension of consideration of, or failure to consider, the relevant applications.

7.1685 The **European Communities** argues that the delays (or failure to act within a specific timeframe) in the approval process alleged by the Complaining Parties can be reviewed under the *SPS Agreement* as an issue of *application* of an SPS measure and more specifically, of the approval system set up under the EC GMO legislation, and that the delays of the kind alleged by the Complaining Parties here thus cannot constitute an SPS measure in the sense of Annex A(1). As a matter of logic, it is clear that alleged behaviour by a Member cannot be an SPS measure itself as well as the application of another SPS measure. As the delays of the kind alleged by the Complaining Parties do not fall within the definition of an SPS measure defined by Annex A(1), the European Communities considers that Article 5.1 is not applicable to these delays.

7.1686 The **Panel** notes that, by its clear terms, Article 5.1 applies to SPS measures. Accordingly, for a particular product-specific measure to be subject to Article 5.1, it must be an SPS measure. The European Communities contests that the product-specific measures constitute SPS measures within the meaning of Article 5.1. It is therefore necessary to consider this issue.

7.1687 We recall that the Complaining Parties have stated that the product-specific measures they are challenging are related to the general moratorium on approvals. We have observed that based on these statements we understand that the product-specific measures are, or arise from:

- specified acts and/or omissions through which the relevant EC entities were giving effect, in the context of particular approval procedures, to their decisions to impose a general moratorium on approvals, or
- specified acts and/or omissions through which relevant EC entities chose to respond, again in the context of particular approval procedures, to the circumstance that other EC entities were imposing a general moratorium on approvals.

7.1688 In relation to the general moratorium on approvals, we have found earlier that the European Communities' decision to apply a general moratorium on approvals was not a decision effectively imposing an across-the-board definitive marketing ban, but a decision concerning the application, or operation, of approval procedures. We also found that the decision in question was not, itself, a measure applied to achieve the European Communities' appropriate level of protection. These findings led us to conclude that the European Communities' decision to apply a general moratorium on approvals was not an "SPS measure" within the meaning of Annex A(1) and Article 5.1.

7.1689 If, as we believe, the European Communities' decision to apply a general moratorium on approvals was not an "SPS measure", logic suggests that the same should be true for the product-specific measures, considering that, in our understanding, they essentially are acts and/or omissions through which relevant EC entities were giving effect to the decision to apply a general moratorium on approvals, or through which they were reacting to the circumstance that other EC entities were imposing a general moratorium.[1371] Notwithstanding the fact that there is a logical link between the general moratorium and the product-specific measures, it is appropriate to examine in more detail whether the latter measures constitute SPS measures within the meaning of Annex A(1) and Article 5.1. As the Complaining Parties have provided slightly different descriptions of the product-

[1371] We recall that in relation to the second category of acts and/or omissions, the Complaining Parties essentially allege that applications were processed at a delayed pace in view of the existence of a general moratorium on final approvals until certain conditions were met.

specific measures of which they are complaining, we examine this issue separately for each Complaining Party.[1372]

(a) DS291 (United States)

7.1690 As we have previously noted, the United States is challenging the alleged failure by the European Communities to consider particular applications for final approval. We recall that for a particular measure to be subject to Article 5.1 it must be an "SPS measure". To determine whether the European Communities' alleged failure to consider a particular application for final approval constitutes an "SPS measure", we first look to the definition of that term set out in Annex A(1) of the *SPS Agreement*. According to Annex A(1), SPS measures include "requirements and procedures".

7.1691 Regarding "requirements", we note that failure to consider a particular application for final approval, even if intentional, is not the same thing as a negative final approval decision on that application. Nor does failure to consider for final approval necessarily lead to, or predetermine, a negative final approval decision. Consequently, we are of the view that the European Communities' alleged failure to consider a particular application for final approval would not have imposed a substantive SPS "requirement" within the meaning of the Annex A(1) definition of the term "SPS measure".

7.1692 The United States argues, however, that, in effect, the European Communities' alleged failure to consider particular applications for final approval banned the relevant biotech products from the EC market. We would agree that failure to consider a particular application for final approval would ordinarily result in delays in the completion of the relevant approval procedure. In turn, these delays would have the effect of extending the time-period during which the biotech product in question was subject to the provisional marketing ban flowing from the EC pre-marketing approval requirement. But a failure to consider a particular application for final approval would not have imposed a new ban; a ban was already in place, as a consequence of the pre-marketing approval requirement. In other words, the origin of the provisional marketing ban, including of the effectively extended ban, would not have been the failure to consider the relevant application for final approval, but the EC pre-marketing approval requirement, *i.e.*, the European Communities' substantive decision to ban biotech products until they have been approved.

7.1693 Consistent with the foregoing, we agree that failure to consider a particular application for final approval would have had an impact on how long the provisional marketing ban was in place for the relevant biotech product. Yet we are unable to agree that a failure to consider an application for final approval effectively would have imposed a new marketing ban, and, hence, a negative "requirement", on the biotech product concerned. If the United States had been of the view that the aforementioned impact on the provisional marketing ban resulted in that ban being applied inconsistently with Article 5.1, it was open to it to challenge that ban (*i.e.*, the pre-marketing approval requirement) as the source of the provisional marketing ban. The United States chose not to do so in this case.

7.1694 Regarding "procedures", we note the United States' argument that the European Communities' alleged failure to consider particular applications for final approval "modified" part of the EC approval regime. Since the alleged product-specific measures in question would not, in our view, have imposed any new substantive requirement, we do not think that they would have modified any substantive requirement which is part of the EC approval regime. What remains to be examined, then,

[1372] *See also* our discussion of the Complaining Parties' Article 5.1 claim in Section VII.D.5 above.

is whether the product-specific measures would have modified the relevant EC approval procedures.[1373]

7.1695 Clearly, the European Communities' alleged failure to consider a particular application for final approval would not itself have constituted, or established, a procedure for approving the relevant biotech product or, more to the point, for preventing the final approval of this biotech product. The failure to consider a particular application for final approval also would not have effectively amended the relevant EC approval procedure for the specific biotech product in question. As we have explained in earlier findings on the general moratorium on approvals, the European Communities did not apply a different type of approval procedure. The applications in question continued to be assessed in accordance with the procedure set out in Directives 90/220 and 2001/18, as well as Regulation 258/97. Therefore, we are not persuaded that the alleged failure to consider a particular application for final approval would have "modified" the relevant EC approval procedure. In our assessment, the foregoing also leads to the conclusion that the alleged failure to consider a particular application for final approval cannot be considered a "procedure" within the meaning of Annex A(1).

7.1696 Thus far, we have found that the European Communities' alleged failure to consider a particular application for final approval qualifies neither as a "requirement" nor as a "procedure" within the meaning of Annex A(1). But we have not yet determined in positive terms what is the legal nature of the failure in question. We think the United States' reference to the failure by the European Communities to consider a particular application for final approval should be understood, and makes sense, as a reference to the application by the European Communities of a particular way of operating the relevant EC approval procedure – a way which reflected the intention, or the anticipation, that there would be no final approval decision on the application in question until certain conditions were met. In other words, we think that, in essence, the United States is complaining of a particular manner of operating the EC approval procedures in specific cases.

7.1697 In terms of Annex A(1), this means that we are concerned with the application, or operation, of "procedures". As we have said in our earlier findings, while "procedures" as such may according to the Annex A(1) definition constitute SPS measures, the application, or operation, of such procedures does not, itself, constitute an SPS measure within the meaning of Annex A(1). Accordingly, we come to the conclusion that the European Communities' alleged failure to consider a particular application for final approval does not meet all of the constituent elements of the definition of the term "SPS measure" as provided in Annex A(1).

7.1698 Turning now to Article 5.1, we recall our earlier finding that the term "SPS measure" in Article 5.1 should be interpreted to refer to a measure applied for achieving the relevant Member's appropriate level of sanitary or phytosanitary protection. In our view, the European Communities' alleged failure to consider a particular application for final approval would not, itself, have been a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. Rather, as we have said, it would have been the application of a particular way of operating the relevant EC approval procedure. As we explained above, the practical effect of the alleged failure to consider a particular application for final approval would have been to extend the time-period during which the relevant biotech product was subject to the provisional marketing ban flowing from the pre-marketing approval requirement. The pre-marketing approval requirement which imposes the provisional marketing ban is a measure applied to achieve the European Communities' level of protection, but that requirement is a separate measure from the European Communities' alleged failure to consider a particular application for final approval. By itself, the

[1373] The relevant approval procedures are set out in Directive 90/220 and its successor, Directive 2001/18, as well as Regulation 258/97.

alleged failure to consider a particular application for final approval would not have achieved or implied a particular level of protection.

7.1699 As the European Communities' alleged failure to consider a particular application for final approval would not, itself, have been a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection, it cannot, in our view, be considered an "SPS measure" within the meaning of Article 5.1.

7.1700 Based on the above considerations, we thus determine that the European Communities' alleged failure to consider a particular application for final approval cannot be considered an "SPS measure" within the meaning of Article 5.1 and Annex A(1). As only "SPS measures" are subject to the provisions of Article 5.1, it follows that the provisions of Article 5.1 are not applicable to the European Communities' alleged failure to consider particular applications for final approval. In view of this conclusion, we need not continue our analysis of the United States' claim under Article 5.1.

(b) DS292 (Canada)

7.1701 In relation to DS292, we have noted above that Canada is challenging the alleged failure by the European Communities to consider or approve, without undue delay, particular applications of specific interest to Canada. Canada also refers to this failure to consider or approve applications as an effective "product-specific marketing ban".

7.1702 Regarding Canada's reference to an effective product-specific marketing ban, we note that we have already addressed a similar argument of the United States. Thus, we need only recall that we agree that the alleged failure by the European Communities to consider or approve a particular application would have had an impact on how long the provisional marketing ban resulting from the EC pre-marketing approval requirement was in place for the relevant biotech product. But we are unable to agree that the alleged failure to consider or approve an application effectively would have imposed a new marketing ban, and, hence, a negative "requirement", on the biotech product concerned.

7.1703 Instead, similar to what we have said of the measures challenged by the United States, we consider that Canada's reference to the failure by the European Communities to consider or approve a particular application should be understood, and makes sense, as a reference to the application by the European Communities of a particular way of operating the relevant EC approval procedure – a way which reflected the intention, or the anticipation, that there would be no final approval decision on the application in question until certain conditions were met. Thus, we think that, in essence, Canada is complaining of a particular manner of operating the EC approval procedures in specific cases.

7.1704 For the same reasons as those we have given in the context of our analysis of the measures challenged by the United States, the type of measure Canada is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection and hence cannot be considered an "SPS measure" within the meaning of Article 5.1.

7.1705 As only "SPS measures" are subject to the provisions of Article 5.1, it follows that the provisions of Article 5.1 are not applicable to the European Communities' alleged failure to consider or approve particular applications. In view of this conclusion, we need not continue our analysis of Canada's claim under Article 5.1.

(c) DS293 (Argentina)

7.1706 In relation to DS293, we note that Argentina makes claims under Article 5 of the *SPS Agreement* regarding all ten applications in respect of which the Panel has decided to offer product-specific findings. We first address the applications concerning Bt-531 cotton and RR-1445 cotton which Argentina says have yet to be approved under Regulation 258/97.

(i) Product-specific measures affecting the approval of Bt-531 cotton and RR-1445 cotton under Regulation 258/97

7.1707 Argentina challenges under Article 5.1 the suspension of consideration of, or failure to consider, applications concerning Bt-531 cotton and RR-1445 cotton which were allegedly submitted for "approval"[1374] under Regulation 258/97.

7.1708 Argentina has provided no evidence of the existence of applications concerning Bt-531 cotton and RR-1445 cotton which were submitted for "approval" under Regulation 258/97. The only evidence provided by Argentina in support of its claim relates to cottonseed oil derived from Bt-531 cottonseed or RR-1445 cottonseed. These products were subject to the simplified procedure set out in Article 5 of Regulation 258/97. As indicated by us earlier, under the simplified procedure, there are no "applications" for the placing on the market of subject products which are then "approved" by member State assessment bodies. Moreover, in its request for the establishment of a panel, Argentina identifies Bt-531 cotton and RR-1445 cotton as a relevant biotech product, but not cottonseed oil derived from Bt-531 cottonseed or RR-1445 cottonseed. Thus, cottonseed oil derived from Bt-531 cottonseed or RR-1445 cottonseed is outside the terms of reference of DS293 (Argentina).

7.1709 In view of the fact that we have seen no evidence that applications concerning Bt-531 cotton and RR-1445 cotton were submitted for approval under Regulation 258/97, we find that Argentina has failed to meet its burden of demonstrating the existence of a suspension of consideration of, or failure to consider, Bt-531 cotton and RR-1445 cotton for approval under Regulation 258/97. As the existence of these product-specific measures has not been demonstrated, we cannot but reject Argentina's claim that the European Communities has acted inconsistently with its obligations under Article 5.1 in relation to these alleged measures.

(ii) Other product-specific measures challenged by Argentina

7.1710 We now turn to address the remaining eight product-specific measures in respect of which the Panel has decided to make findings. As noted, Argentina describes the product-specific measures it is challenging under Article 5.1 as the suspension by the European Communities of consideration of, or the failure to consider, particular applications of interest to Argentina.

7.1711 As with the measures challenged by the United States, we are of the view that the measures challenged by Argentina qualify neither as "requirements" nor as "procedures" within the meaning of Annex A(1). Instead, we think Argentina's reference to the suspension of consideration of, or failure to consider, a particular application should be understood, and makes sense, as a reference to the application by the European Communities of a particular way of operating the relevant EC approval procedure – a way which reflected the intention, or the anticipation, that there would be no final approval decision on the application in question until certain conditions were met. In other words, we think that, in essence, Argentina is complaining of a particular manner of operating the EC approval procedures in specific cases.

[1374] Argentina's first written submission, paras. 201-202.

7.1712 For the same reasons as those we have given in the context of our analysis of the measures challenged by the United States, the type of measure Argentina is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection and hence cannot be considered an "SPS measure" within the meaning of Article 5.1.

7.1713 As only "SPS measures" are subject to the provisions of Article 5.1, it follows that the provisions of Article 5.1 are not applicable to the European Communities' alleged suspension of consideration of, or failure to consider, particular applications. In view of this conclusion, we need not continue our analysis of Argentina's claim under Article 5.1.

(d) Conclusions

7.1714 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* in respect of any of the relevant product-specific measures.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.1 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

4. Consistency of the product-specific measures with Article 5.6 of the *SPS Agreement*

7.1715 Canada and Argentina claim that the European Communities has acted inconsistently with its obligations under Article 5.6 of the *SPS Agreement* in respect of the product-specific measures they are challenging.

7.1716 Article 5.6 of the *SPS Agreement* provides:

> "Without prejudice to paragraph 2 of Article 3, when establishing or maintaining sanitary or phytosanitary measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or

phytosanitary protection, taking into account technical and economic feasibility." (footnote omitted)

7.1717 **Canada** argues that the failure of the European Communities to consider or approve, without undue delay, the four applications of specific interest to Canada is an SPS measure as defined in Annex A(1). The failure to consider and approve these applications, which Canada refers to as the "product-specific marketing bans", is "more trade restrictive than required", contrary to Article 5.6. This is because there is another SPS measure that is reasonably available, taking into account technical or economic feasibility; achieves the European Communities' appropriate level of sanitary and phytosanitary protection; and is significantly less restrictive to trade than the contested SPS measure.

7.1718 **Argentina** argues that the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina constitutes an SPS measure and is contrary to the requirements of Article 5.6. This violation of Article 5.6 results from the fact that there exists another SPS measure that: (1) is reasonably available taking into account technical and economic feasibility; (2) achieves the European Communities' appropriate level of sanitary and phytosanitary protection; and (3) is significantly less restrictive to trade than the contested SPS measure.

7.1719 The **European Communities** argues that the delays (or failure to act within a specific timeframe) in the approval process alleged by the Complaining Parties can be reviewed under the *SPS Agreement* as an issue of *application* of an SPS measure and more specifically, of the approval system set up under the EC GMO legislation, and that the delays of the kind alleged by the Complaining Parties thus cannot constitute an SPS measure in the sense of Annex A(1). As a matter of logic, it is clear that alleged behaviour by a Member cannot be an SPS measure itself as well as the application of another SPS measure. As the delays of the kind alleged by the Complaining Parties do not fall within the definition of an SPS measure defined by Annex A(1), the European Communities considers that Article 5.6 is not applicable to these delays.

7.1720 The **Panel** will analyse Canada's and Argentina's claim separately.[1375]

(a) DS292 (Canada)

7.1721 In relation to DS292, we note that for a particular measure to be subject to Article 5.6 it must be an SPS measure. We also note that Article 5.6 explicitly refers to "[SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection". Furthermore, we recall that in the context of our earlier analysis of Canada's claim under Article 5.1 we found that the type of measure Canada is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. It follows from these elements that the alleged failure by the European Communities to consider or approve a particular application cannot be considered an "SPS measure" within the meaning of Article 5.6.

7.1722 As only "SPS measures" are subject to the provisions of Article 5.6, the provisions of Article 5.6 are not applicable to the European Communities' alleged failure to consider or approve particular applications. In view of this conclusion, we need not continue our analysis of Canada's claim under Article 5.6.

[1375] *See also* our discussion of Canada's and Argentina's Article 5.6 claim in Section VII.D.6 above.

(b) DS293 (Argentina)

7.1723 In relation to DS293, we begin our analysis with the applications concerning Bt-531 cotton and RR-1445 cotton which Argentina says have yet to be approved under Regulation 258/97.

(i) Product-specific measures affecting the approval of Bt-531 cotton and RR-1445 cotton under Regulation 258/97

7.1724 Argentina challenges under Article 5.6 the suspension of consideration of, or failure to consider, applications concerning Bt-531 cotton and RR-1445 cotton which were allegedly submitted for "approval"[1376] under Regulation 258/97.

7.1725 We recall that in respect of the same alleged product-specific measures Argentina presented a claim under Article 5.1 of the *SPS Agreement*. In the context of our analysis of that claim, we have pointed out that we have seen no evidence that applications concerning Bt-531 cotton and RR-1445 cotton were submitted for approval under Regulation 258/97, and we therefore found that Argentina has failed to meet its burden of demonstrating the existence of a suspension of consideration of, or failure to consider, Bt-531 cotton and RR-1445 cotton for approval under Regulation 258/97. As the existence of these product-specific measures has not been demonstrated, we cannot but reject Argentina's claim that the European Communities has acted inconsistently with its obligations under Article 5.6 in relation to these alleged measures.

(ii) Other product-specific measures challenged by Argentina

7.1726 We now turn to address the remaining eight product-specific measures in respect of which the Panel has decided to make findings.

7.1727 We recall that for a particular measure to be subject to Article 5.6 it must be an SPS measure. We also recall that Article 5.6 explicitly refers to "[SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection". Furthermore, we recall that in the context of our earlier analysis of Argentina's claim under Article 5.1 we found that the type of measure Argentina is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. It follows from these elements that the European Communities' alleged suspension of consideration of, or failure to consider, a particular application cannot be considered an "SPS measure" within the meaning of Article 5.6.

7.1728 As only "SPS measures" are subject to the provisions of Article 5.6, the provisions of Article 5.6 are not applicable to the European Communities' alleged suspension of consideration of, or failure to consider, particular applications. In view of this conclusion, we need not continue our analysis of Argentina's claim under Article 5.6.

[1376] Argentina's first written submission, paras. 201-202

(c) Conclusions

7.1729 In the light of the above, the Panel reaches the following conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.6 of the *SPS Agreement* in respect of any of the relevant product-specific measures.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.6 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

5. Consistency of the product-specific measures with Article 5.5 of the *SPS Agreement*

7.1730 All three Complaining Parties claim that the European Communities has acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* in respect of the product-specific measures they are challenging.

7.1731 Article 5.5 of the *SPS Agreement* provides:

> "With the objective of achieving consistency in the application of the concept of appropriate level of sanitary or phytosanitary protection against risks to human life or health, or to animal and plant life or health, each Member shall avoid arbitrary or unjustifiable distinctions in the levels it considers to be appropriate in different situations, if such distinctions result in discrimination or a disguised restriction on international trade.[....]"

7.1732 The **United States** argues that the product-specific moratoria, which, in effect, ban the relevant biotech products from the EC market, are "SPS measures" as defined in Annex A(1) of the *SPS Agreement*. The United States argues that like the general moratorium, the product-specific moratoria meet all three elements that are required to establish a violation of Article 5.5. *First*, the European Communities has set forth distinct levels of sanitary protection in "different situations": products produced with biotech processing aids and other biotech products. *Second*, those levels of protection exhibit differences that are "arbitrary or unjustifiable." *Third*, the product-specific moratoria result in "discrimination or a disguised restriction on international trade."

7.1733 **Canada** puts forth its claim under Article 5.5 as an alternative to its claim under Article 5.6. In putting forth the Article 5.6 claim, Canada assumed that the European Communities' appropriate level of protection is a "high level of protection", but not a zero-risk level. However, if this assumption is not correct and the European Communities' appropriate level of protection for the four applications of specific interest to Canada at issue is that reflected by the product-specific marketing bans, namely a zero-risk level, then Canada is of the view that the European Communities has violated Article 5.5 of the *SPS Agreement*.

7.1734 Canada argues that the failure of the European Communities to consider or approve, without undue delay, the four applications of specific interest to Canada is an SPS measure as defined in Annex A(1). Canada claims that the failure to consider and approve these applications, which Canada refers to as the "product-specific marketing bans" meet all three elements that are required to establish a violation of Article 5.5. *First*, the European Communities has adopted different appropriate levels of sanitary and phytosanitary protection in "different situations" that are comparable. *Second*, those different appropriate levels of protection are "arbitrary or unjustifiable." *Third*, the measures embodying those differences, the product-specific marketing bans, result in "discrimination or a disguised restriction on international trade".

7.1735 According to Canada, the "comparable" situations above are of the following two kinds: (i) the biotech products whose applications have been stalled as a result of the product-specific marketing bans on the one hand and the biotech products that were approved for commercialization prior to the imposition of the moratorium on the other; (ii) the biotech products whose applications have been stalled as a result of the product-specific marketing bans on the one hand and novel non-biotech products such as those produced by conventional plant breeding techniques on the other.

7.1736 **Argentina** argues that the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina constitutes an SPS measure and is contrary to the requirements of Article 5.5. This is because the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina meets the three distinct and cumulative elements which are required to be demonstrated in support of a claim under Article 5.5: (i) The Member that imposes the measure that is the subject of the complaint must have adopted its own levels of sanitary protection against risks to human, animal or plant life or health in various different situations, which are comparable; (ii) these levels of protection exhibit arbitrary or unjustifiable differences in the treatment of different situations; and (iii) these arbitrary or unjustifiable differences must result in discrimination or a restriction of international trade.

7.1737 According to Argentina, the "comparable" situations are of the following two kinds: (1) biotech products introduced before and after the moratorium; (2) new "non-biotech" products and new biotech products.

7.1738 The **European Communities** argues that the delays (or failure to act within a specific timeframe) in the approval process alleged by the Complaining Parties can be reviewed under the *SPS Agreement* as an issue of *application* of an SPS measure and more specifically, of the approval system set up under the EC GMO legislation, and that the delays of the kind alleged by the Complaining Parties thus cannot constitute an SPS measure in the sense of Annex A(1). As a matter of logic, it is clear that alleged behaviour by a Member cannot be an SPS measure itself as well as the application of another SPS measure. As the delays of the kind alleged by the Complaining Parties do not fall within the definition of an SPS measure defined by Annex A(1), the European Communities considers that Article 5.6 is not applicable to these delays.

7.1739 The **Panel** will analyse separately the claim presented by each Complaining Party.[1377]

(a) DS291 (United States)

7.1740 In relation to DS291, we recall that we have determined in the context of our analysis of the challenge to the general EC moratorium that Article 5.5 implies a reference to "SPS measures" and that the SPS measures at issue in Article 5.5 are those which are applied for achieving a particular

[1377] *See also* our discussion of the Complaining Parties' Article 5.5 claim in Section VII.D.7 above.

level of sanitary or phytosanitary protection (*i.e.*, measures implementing a particular level of protection). Accordingly, Article 5.5 implies that the measure complained of is an implementing "SPS measure". We recall that in the context of our earlier analysis of the United States' product-specific claim under Article 5.1 we found that the type of measure the United States is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. It follows from these elements that the alleged failure by the European Communities to consider a particular application for final approval cannot be considered an "SPS measure" within the meaning of Annex A(1) and Article 5.5 as interpreted by the Appellate Body.

7.1741 As Article 5.5 in our view implies that the measures complained of are implementing "SPS measures", we consider that the provisions of Article 5.5 are not applicable to the European Communities' alleged failure to consider particular applications for final approval. In view of this conclusion, we need not continue our analysis of the United States' claim under Article 5.5.

(b) DS292 (Canada)

7.1742 In relation to DS292, we recall that we have determined in the context of our analysis of the challenge to the general EC moratorium that Article 5.5 implies a reference to "SPS measures" and that the SPS measures at issue in Article 5.5 are those which are applied for achieving a particular level of sanitary or phytosanitary protection (*i.e.*, measures implementing a particular level of protection). Accordingly, Article 5.5 implies that the measure complained of is an implementing "SPS measure". We recall that in the context of our earlier analysis of Canada's product-specific claim under Article 5.1 we found that the type of measure Canada is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. It follows from these elements that the alleged failure by the European Communities to consider or approve a particular application cannot be considered an "SPS measure" within the meaning of Annex A(1) and Article 5.5 as interpreted by the Appellate Body.

7.1743 As Article 5.5 in our view implies that the measure complained of is an implementing "SPS measure", we consider that the provisions of Article 5.5 are not applicable to the European Communities' alleged failure to consider or approve particular applications. In view of this conclusion, we need not continue our analysis of Canada's claim under Article 5.5.

(c) DS293 (Argentina)

7.1744 In relation to DS293, we begin our analysis with the applications concerning Bt-531 cotton and RR-1445 cotton which Argentina says have yet to be approved under Regulation 258/97.

(i) Product-specific measures affecting the approval of Bt-531 cotton and RR-1445 cotton under Regulation 258/97

7.1745 Argentina challenges under Article 5.5 the suspension of consideration of, or failure to consider, applications concerning Bt-531 cotton and RR-1445 cotton which were allegedly submitted for "approval"[1378] under Regulation 258/97.

7.1746 We recall that in respect of the same alleged product-specific measures Argentina presented a claim under Article 5.1 of the *SPS Agreement*. In the context of our analysis of that claim, we have

[1378] Argentina's first written submission, paras. 201-202.

pointed out that we have seen no evidence that applications concerning Bt-531 cotton and RR-1445 cotton were submitted for approval under Regulation 258/97, and we therefore found that Argentina has failed to meet its burden of demonstrating the existence of a suspension of consideration of, or failure to consider, Bt-531 cotton and RR-1445 cotton for approval under Regulation 258/97. As the existence of these product-specific measures has not been demonstrated, we cannot but reject Argentina's claim that the European Communities has acted inconsistently with its obligations under Article 5.5 in relation to these alleged measures.

(ii) Other product-specific measures challenged by Argentina

7.1747 We now turn to address the remaining eight product-specific measures in respect of which the Panel has decided to make findings.

7.1748 We recall that we have determined in the context of our analysis of the challenge to the general EC moratorium that Article 5.5 implies a reference to "SPS measures" and that the SPS measures at issue in Article 5.5 are those which are applied for achieving a particular level of sanitary or phytosanitary protection (*i.e.*, measures implementing a particular level of protection). Accordingly, Article 5.5 implies that the measure complained of is an implementing "SPS measure". We recall that in the context of our earlier analysis of Argentina's product-specific claim under Article 5.1 we found that the type of measure Argentina is challenging in our view (i) does not itself constitute an SPS measure within the meaning of Annex A(1) and (ii) is not a measure applied for achieving the European Communities' appropriate level of sanitary or phytosanitary protection. It follows from these elements that the alleged suspension by the European Communities of consideration of, or the failure to consider, a particular application cannot be considered an "SPS measure" within the meaning of Annex A(1) and Article 5.5 as interpreted by the Appellate Body.

7.1749 As Article 5.5 in our view implies that the measures complained of are implementing "SPS measures", we consider that the provisions of Article 5.5 are not applicable to the European Communities' alleged suspension of consideration of, or the failure to consider, particular applications. In view of this conclusion, we need not continue our analysis of Argentina's claim under Article 5.5.

(d) Conclusions

7.1750 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* in respect of any of the relevant product-specific measures.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Article 5.5 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

6. Consistency of the product-specific measures with Article 2.2 of the *SPS Agreement*

7.1751 All three Complaining Parties claim that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* in respect of the product-specific measures they are challenging.

7.1752 Article 2.2 of the *SPS Agreement* provides:

> "Members shall ensure that any sanitary or phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5."

7.1753 **The United States** claims that, as the basic obligations provided in Article 2.2 have been viewed as being specifically applied in Article 5.1, the product-specific measures – the product-specific moratoria – are also inconsistent with Article 2.2, because they are not based on risk assessments as required by Article 5.1 and Annex A, paragraph 4.

7.1754 **Canada** argues that Articles 5.1 and 5.6 can be viewed as a specific application of the basic obligation contained in Article 2.2, and a violation of Articles 5.1 and 5.6 can be thus presumed to imply a violation of the more general provision of Article 2.2. Canada is of the view that, as it has already demonstrated that the product-specific marketing bans are not "based on" risk assessments and are therefore inconsistent with Articles 5.1 and 5.6, it can therefore be presumed that the product-specific marketing bans also violate the requirements of Article 2.2.

7.1755 **Argentina** argues that since it has demonstrated that the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina is not "based on a risk assessment", it has duly proven that the said suspension does not meet the requirements of Article 2.2.

7.1756 The **European Communities** argues that the delays (or failure to act within a specific timeframe) in the approval process alleged by the Complaining Parties can be reviewed under the *SPS Agreement* as an issue of *application* of an SPS measure and more specifically, of the approval system set up under the EC GMO legislation, and that the delays of the kind alleged by the Complaining Parties here thus cannot constitute an SPS measure in the sense of Annex A(1). As a matter of logic, it is clear that alleged behaviour by a Member cannot be an SPS measure itself as well as the application of another SPS measure. As the delays of the kind alleged by the Complaining Parties do not fall within the definition of an SPS measure defined by Annex A(1), the European Communities considers that Article 2.2 is not applicable to these delays.

(a) Evaluation

7.1757 The **Panel** notes that the Complaining Parties' claim under Article 2.2[1379] is in the nature of a consequential claim. The Complaining Parties submit that an inconsistency with Article 2.2 follows by implication from a demonstrated inconsistency with Article 5.1. However, we have determined above that Article 5.1 is not applicable to the product-specific measures as defined by the Complaining Parties and that, consequently, the European Communities has not acted inconsistently with its obligations under Article 5.1 in respect of the relevant product-specific measures. Since the European Communities has not acted inconsistently with Article 5.1, and since the Complaining Parties' claim under Article 2.2 is premised on the existence of a breach of Article 5.1 by the European Communities, the Complaining Parties' claim under Article 2.2 in our view cannot succeed.

7.1758 In relation to DS292, we note that Canada argues in addition that an inconsistency with Article 2.2 also follows by implication from a demonstrated inconsistency with Article 5.6. However, we have reached the same conclusion on Canada's claim under Article 5.6 as we have on Canada's claim under Article 5.1. Accordingly, our reasoning in the preceding paragraph *mutatis mutandis* also applies to Canada's argument based on the alleged inconsistency of the relevant product-specific measures with Article 5.6.

7.1759 In relation to DS293, we recall, in addition, our earlier finding that Argentina has failed to meet its burden of demonstrating the existence of a suspension of consideration of, or failure to consider, Bt-531 cotton and RR-1445 cotton for approval under Regulation 258/97. As the existence of these product-specific measures has not been demonstrated, we cannot but reject Argentina's claim that the European Communities has acted inconsistently with its obligations under Article 2.2 in relation to these alleged measures.

(b) Conclusions

7.1760 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the United States has failed to establish that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that Canada has failed to establish that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* in respect of any of the relevant product-specific measures.

[1379] *See also* our discussion of the Complaining Parties' Article 2.2 claim in Section VII.D.8 above.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has failed to establish that the European Communities has acted inconsistently with its obligations under Article 2.2 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

7. Consistency of the product-specific measures with Article 2.3 of the *SPS Agreement*

7.1761 Canada claims that the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement* in respect of the product-specific measures it is challenging.

7.1762 Article 2.3 of the *SPS Agreement* provides:

> "Members shall ensure that their sanitary and phytosanitary measures do not arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, including between their own territory and that of other Members. Sanitary and phytosanitary measures shall not be applied in a manner which would constitute a disguised restriction on international trade."

7.1763 **Canada** argues that, as the product-specific marketing bans are inconsistent with the European Communities' obligations under Article 5.5, they are, by implication, also inconsistent with the European Communities' obligations under Article 2.3, in accordance with the jurisprudence established by the Appellate Body.

7.1764 The **European Communities** argues that the delays (or failure to act within a specific timeframe) in the approval process alleged by the Complaining Parties can be reviewed under the *SPS Agreement* as an issue of *application* of an SPS measure and more specifically, of the approval system set up under the EC GMO legislation, and that the delays of the kind alleged by the Complaining Parties thus cannot constitute an SPS measure in the sense of Annex A(1). As a matter of logic, it is clear that alleged behaviour by a Member cannot be an SPS measure itself as well as the application of another SPS measure. As the delays of the kind alleged by the Complaining Parties do not fall within the definition of an SPS measure defined by Annex A(1), the European Communities considers that Article 2.3 is not applicable to these delays.

(a) DS292 (Canada)

7.1765 The **Panel** notes that Canada's claim under Article 2.3[1380] is in the nature of a consequential claim. Canada submits that an inconsistency with Article 2.3 follows by implication from a demonstrated inconsistency with Article 5.5. However, we have determined above that Article 5.5 is not applicable to the product-specific measures as defined by Canada and that, consequently, the European Communities has not acted inconsistently with its obligations under Article 5.5 in respect of the relevant product-specific measures. Since the European Communities has not acted inconsistently with Article 5.1, and since Canada's claim under Article 2.3 is premised on the existence of a breach of Article 5.5 by the European Communities, Canada's claim under Article 2.3 in our view cannot succeed.

[1380] *See also* our discussion of Canada's Article 2.3 claim in Section VII.D.9 above.

(b) Conclusion

7.1766 In the light of the above, the Panel reaches the following conclusion:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence submitted by Canada and the European Communities, the Panel concludes that Canada has failed to establish that the European Communities has acted inconsistently with its obligations under Article 2.3 of the *SPS Agreement* in respect of any of the relevant product-specific measures.

8. Consistency of the product-specific measures with Article 7 and Annex B(1) of the *SPS Agreement*

7.1767 The United States claims that the European Communities has failed to publish promptly the existence of the product-specific measures the United States is challenging and that the European Communities has thereby acted inconsistently with its obligations under Article 7 and Annex B(1) of the *SPS Agreement*.

7.1768 Article 7 of the *SPS Agreement* provides:

> "Members shall notify changes in their sanitary or phytosanitary measures and shall provide information on their sanitary or phytosanitary measures in accordance with the provisions of Annex B."

7.1769 Annex B(1) of the *SPS Agreement* provides:

> "Members shall ensure that all sanitary and phytosanitary regulations[1381] which have been adopted are published promptly in such a manner as to enable interested Members to become acquainted with them."

7.1770 The **United States** submits that the product-specific measures it is challenging – the product-specific moratoria – are subject to the publication requirement in Annex B(1). The United States argues that this is for the same reasons which it has provided to establish the applicability of Annex B(1) to the general moratorium. The United States considers that because the European Communities has failed to publish, and, therefore, to publish promptly, the existence of the product-specific moratoria, the European Communities has acted inconsistently with its obligations under Annex B(1) and Article 7.

7.1771 The **European Communities** argues that Article 7 contains procedural obligations (publication) regarding an SPS measure. Thus, the applicability of Article 7 is premised on the existence of an SPS measure. SPS measures as defined in Annex A(1) of the *SPS Agreement* presuppose the existence of an act. The European Communities submits that the measures challenged by the United States are alleged failures to act within a particular timeframe. Thus, the United States is in reality complaining about delay in the completion of specified individual approval procedures. In the European Communities' view, delay of this kind cannot constitute an SPS measure within the

[1381] Sanitary and phytosanitary measures such as laws, decrees or ordinances which are applicable generally.

meaning of Annex A(1). Delay is a failure to act in a timely manner. The European Communities deduces from these considerations that the alleged measures are not subject to Article 7.

7.1772 The **Panel** notes that the United States alleges an inconsistency of the product-specific measures identified by it with Annex B(1). The United States uses the alleged inconsistency with Annex B(1) as a basis for a consequential claim of inconsistency under Article 7. Accordingly, we will begin our analysis with the United States' claim under Annex B(1).

(a) "Sanitary and phytosanitary regulations"

7.1773 As we have stated earlier, Annex B(1) applies to "sanitary and phytosanitary regulations" (hereafter "SPS regulations") which have been "adopted". An explanatory footnote to Annex B(1) indicates that the term "SPS regulations" should be understood as meaning "[s]anitary and phytosanitary measures such as laws, decrees or ordinances which are applicable generally".

7.1774 It follows from the foregoing that a threshold issue before us is whether the product-specific measures challenged by the United States constitute generally applicable SPS measures which have been adopted. We first examine whether the relevant product-specific measures are "generally applicable".

7.1775 We recall that what the United States is challenging in the case of each of the product-specific measures is an alleged failure by the European Communities to consider a specified application for final approval. As is already clear from our own description of these measures, these measures are product-specific. In other words, each of these measures affects an application concerning a specific biotech product. None of these measures is applicable to all biotech products generally, or at least to all biotech products which fall within the scope of the relevant EC approval procedures and require approval. To that extent, there is thus a clear difference between the product-specific measures identified by the United States and the general moratorium on approvals, which we found was generally applicable inasmuch as it was applicable to all applications which were pending between June 1999 and August 2003.

7.1776 In the light of this, we are unable to agree with the United States that each of the product-specific measures it is challenging is a measure which is "applicable generally". As general applicability is a necessary definitional element of the term "SPS regulations", it is not necessary for us to examine whether the relevant product-specific measures are "SPS measures" and whether they have been "adopted". We therefore find that none of the product-specific measures challenged by the United States is an "SPS regulation" within the meaning of Annex B(1). It follows that the provisions of Annex B(1) are not applicable to these measures.

7.1777 We recall that the United States seeks to establish an inconsistency with Article 7 on the basis of an alleged inconsistency with Annex B(1). As we have found that the provisions of Annex B(1) are not applicable to the product-specific measures challenged by the United States, these measures cannot be inconsistent with these provisions. Under the approach followed by the United States, there can then logically be no inconsistency with Article 7 either, even assuming that Article 7 is applicable to these measures.

(b) Conclusion

7.1778 In the light of the above, the Panel reaches the following conclusion:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the European Communities has not acted inconsistently with its obligations under Annex B(1) and Article 7 of the *SPS Agreement* in respect of any of the product-specific measures on which the Panel is offering findings.

9. Consistency of the product-specific measures with Article 8 and Annex C(1)(a), first clause, of the *SPS Agreement*

(a) General

7.1779 All three Complaining Parties claim that the European Communities has acted inconsistently with its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement* in respect of the product-specific measures they are challenging.

7.1780 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.1781 Annex C(1)(a), first clause, of the *SPS Agreement* provides:

> "1. Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> (a) such procedures are undertaken and completed without undue delay [...]."

7.1782 The Complaining Parties seek to establish an inconsistency with Article 8 on the basis of an inconsistency with Annex C(1)(a), first clause. Article 8 requires, *inter alia*, that Members observe the provisions of Annex C in the operation of their approval procedures. It follows that a failure to observe the provisions of Annex C(1)(a) implies a breach of Article 8. Accordingly, should we conclude that the European Communities has failed to observe the provisions of Annex C(1)(a), first clause, in respect of any of the product-specific measures on which we make findings, we will also conclude that the European Communities has, by implication, also acted inconsistently with the provisions of Article 8.

7.1783 In relation to Annex C(1)(a), first clause, we note that we have addressed the interpretation of this provision in Section VII.D.11 above.[1382] We further note that in accordance with the lead-in to

[1382] We note that like the other Parties, Argentina has addressed the meaning of Annex C(1)(a), first clause. However, Argentina's relevant arguments do not lead us to an interpretation of Annex C(1)(a), first clause, which is different from the one we set out earlier.

Annex C(1) the provisions of Annex C(1)(a) apply "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have previously found that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures "to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1) and, as such, are subject to the provisions of Annex C(1), which include those of Annex C(1)(a). Therefore, the European Communities was and is required under the provisions of Annex C(1)(a) to "undertake and complete" the approval procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) "without undue delay".

7.1784 We recall that the United States is challenging the alleged failure by the European Communities to consider particular applications for final approval, while Canada is challenging the alleged failure by the European Communities to consider or approve, without undue delay, particular applications. We have observed in this regard that these are essentially challenges to the application by the European Communities of a particular way of operating the relevant EC approval procedures. We also recall that Argentina is challenging alleged undue delays in completing the consideration and processing of specified applications.

7.1785 It is clear to us, therefore, that the type of measure challenged by each of the Complaining Parties could in principle constitute, or lead to, a breach of the European Communities' obligations under Annex C(1)(a), first clause, and that this type of measure can therefore be examined in the light of the provisions of Annex C(1)(a), first clause. Since the Complaining Parties seek to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(a), first clause, this conclusion applies also to Article 8.

(b) Deliberate Release – Applications submitted under Directive 90/220 and/or Directive 2001/18

7.1786 We now begin our examination of the approval procedures which were conducted under Directives 90/220 and 2001/18 for the applications identified by the Complaining Parties. Before going further, however, we should briefly address certain issues presented by the application of Annex C(1)(a), first clause, to approval procedures conducted under the aforementioned Directives.

(i) Application of Annex C(1)(a), first clause, to approval procedures begun under Directives 90/220 and continued under 2001/18

7.1787 Each of the relevant approval procedures on which the Panel is making findings was begun under Directive 90/220 but not completed by the date of repeal of Directive 90/220 (17 October 2002). Pursuant to the provisions of Directive 2001/18, applications which were pending on the date of repeal of Directive 90/220 (17 October 2002) became subject to Directive 2001/18 and therefore had to be "complemented" by the applicant in the light of the provisions of Directive 2001/18. If the applicant did so by a specified deadline (17 January 2003), approval procedures were to be undertaken in accordance with the provisions of Directive 2001/18.[1383] For each of the approval procedures here at issue, approval procedures were undertaken under Directive 2001/18 after the applicant had complemented its application.

7.1788 This presents the question whether approval procedures undertaken under Directive 2001/18 in respect of applications which had previously been assessed under Directive 90/220 should be viewed as new approval procedures or as a continuation of the approval procedures which were not

[1383] Article 35 of Directive 2001/18. None of the Complaining Parties questioned the WTO-consistency of Article 35.

completed under Directive 90/220. We have already examined this question in the context of our analysis of the general EC moratorium on approvals.[1384] It is therefore sufficient at this juncture to recall our conclusion that (i) approval procedures undertaken under Directive 2001/18 in respect of applications which had previously been assessed under Directive 90/220 were a continuation of the approval procedures previously conducted under Directive 90/220, and that (ii) an approval procedure begun under Directive 90/220 and continued under Directive 2001/18 constitutes one single approval procedure for the purposes of Annex C(1)(a), first clause.

7.1789 It follows from this conclusion that there is no need, in the context of our inquiry under Annex C(1)(a), first clause, to distinguish between undue delays which may have occurred in the processing of an application under Directive 90/220 and undue delays which may have occurred when the procedure for the same application was continued under Directive 2001/18. Notably, our conclusion means that a failure to observe the provisions of Annex C(1)(a), first clause, can be established on the basis of undue delays which occurred while Directive 90/220 was in force. Likewise, a failure to observe the provisions of Annex C(1)(a), first clause, can also be established on the basis of undue delays which occurred after the entry into force of Directive 2001/18. In either case, the relevant approval procedure would have been unduly delayed, contrary to the requirements of Annex C(1)(a), first clause.

7.1790 Finally, we recall that in Section VII.D we have addressed whether the reason for the general EC moratorium on final approvals could have provided a justification for delays which might have occurred as a result of that moratorium. We have also addressed whether the adoption of Directive 2001/18 could have justified delaying the completion of approval procedures conducted under Directive 90/220 so that as of October 2002 they would become subject to the new provisions of Directive 2001/18. These earlier observations are relevant and applicable also to our examination of the Directive 90/220 (and 2001/18) approval procedures identified by the Complaining Parties.

7.1791 With these general observations in mind, we now proceed with the examination of the individual product-specific measures complained against.

(ii) Falcon oilseed rape (EC-62)

7.1792 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Falcon oilseed rape has been unduly delayed.

7.1793 The **United States** initially argued that the Commission in this procedure did not submit a draft measure to the Regulatory Committee. Later, the United States argued that the Regulatory Committee twice failed to vote on a draft measure and that after the second attempt, the Commission never submitted a draft measure to the Regulatory Committee again. The United States also submits that under the applicable EC legislation, in the absence of action by the Regulatory Committee, the Commission was required to submit a draft measure, whether favourable or negative, to the Council. The United States recalls in this respect that the *SPS Agreement* requires that the European Communities make a decision without undue delay. In this case, the Commission failed to forward a decision to the Council.

7.1794 The United States submits, in addition, that the application concerning Falcon oilseed rape is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that

[1384] *See supra*, paras. 7.1535-7.1536.

although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Falcon oilseed rape is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1795 The **European Communities** argues that the United States is mistaken in saying that the Commission failed to submit a draft measure to the Regulatory Committee. The Commission launched a voting procedure in June 1999, and the Regulatory Committee met twice on the matter. The Regulatory Committee did not vote on 9 March 2000 because it came to the conclusion that further information was needed on the assessment of the effect of the newly expressed protein on the biogeochemical cycle and the food chain as well as the likelihood of spreading. The European Communities also states that in May 2001, the applicant modified the scope of its application, and that after that, the application proceeded with further submissions by the applicant of additional information.

7.1796 The **United States** responds that the only information that could have been requested at the March 2000 Regulatory Committee meeting was the information requested by Italy concerning the effect of the transgenic product on the biogeochemical cycles and on the food chain and on the spreading of the gene due to the possibility of crossing between the PGM and wild species. The United States points out in this respect that the applicant responded to Italy's request on 30 November 2000 even though, in the Untied States' view, Italy's request was not scientifically justified.

7.1797 The **Panel** begins its analysis by addressing the US argument concerning the Commission's failure to re-convene the Regulatory Committee for a vote on the Commission's draft measure.

Failure by the Commission to re-convene the Regulatory Committee for a vote on a draft measure

7.1798 The Panel recalls that the Regulatory Committee met twice, on 29 October 1999 and on 9 March 2000, to consider a draft measure submitted by the Commission. At neither meeting was there a vote on the draft measure, and the Regulatory Committee did not meet again for another attempt at taking a vote on the application.

7.1799 The Panel also recalls that in November 2000 the applicant provided the additional information which had been requested by Italy. In late May 2001, following a request by the lead CA of April 2000, the applicant clarified certain aspects of its application. According to the lead CA, uncertainty as to these aspects had prevented the Regulatory Committee from voting on the application in March 2000.

7.1800 When the applicant clarified certain aspects of its application in late May 2001, it also submitted additional and updated information to the lead CA. The applicant apparently did so of its own motion. It stated that this information confirmed that the application was already "in line with the main provisions" of Directive 2001/18, which had been adopted in March 2001. The applicant requested the lead CA to inform the other member States about the new set of documents at the next Regulatory Committee meeting.[1385] However, the lead CA did not forward the documents to the other member States and the Commission because it considered that further clarification was necessary.[1386]

[1385] Exhibit EC-62/At. 98.
[1386] Exhibit EC-62/At. 101.

The applicant provided the requested clarification on 30 October 2001.[1387] Towards the end of November 2001, the applicant wrote to the Commission, drawing attention to the additional information and indicating its desire to present the information to the other member States at a meeting of the "working group on herbicide-tolerant crops" scheduled for early December 2001.[1388] The record does not indicate whether this meeting took place.

7.1801 The Panel has previously stated its view that after the March 2000 meeting of the Regulatory Committee, it was incumbent on the Commission to convene another meeting with a view to obtaining a vote on its draft measure. The question thus arises whether the Commission was justified in not convening another meeting at any point prior to the repeal of Directive 90/220 in October 2002.

7.1802 In approaching this question, the Panel takes note of the following elements. To begin with, by the end of May 2001 the applicant had met all requests for information and clarification conveyed to it in the wake of the March 2000 Regulatory Committee meeting. As noted, however, at the end of May 2001 the applicant also provided additional and updated information to the lead CA. That information was apparently never forwarded by the lead CA to the other member States and the Commission. Nevertheless, the record indicates that the Commission was made aware of its existence in June 2001[1389], inquired about it in September 2001[1390], and also in September 2001 was told by the lead CA that it would be informed about when the applicant would provide the clarification sought by the lead CA[1391]. In November 2001, the Commission was told directly by the applicant that the applicant had provided the clarification requested by the lead CA at the end of October 2001.

7.1803 Furthermore, it is important to remember that the applicant provided the additional information, not pursuant to a requirement flowing from the provisions of Directive 90/220, but in an effort to convince member States to vote in favour of approving its application. Also, the lead CA had not been requested to offer an assessment of the additional information before transmitting it to the other member States and the Commission. Indeed, the lead CA did not purport to undertake an assessment, for it merely asked the applicant for clarification and made suggestions for modifications, to avoid questions from other member States or to "further acceptance" by other member States.[1392]

7.1804 In view of these elements, the Panel considers that at the latest at the end of November 2001, after the applicant had clarified and revised the additional information first submitted in May 2001 and directly approached the Commission in this regard, the Commission could have stepped in and requested the lead CA to forward the additional information to other member States and itself.[1393] At least, the Commission could have done so if, as is likely, it wanted member States to have access to the additional information before re-convening the Regulatory Committee.

7.1805 The Panel notes that in its November 2001 letter to the Commission, the applicant made known its desire to present the additional information to the other member States at a meeting of the

[1387] Exhibit EC-62/At. 105.
[1388] *Ibid*.
[1389] Exhibit EC-62/At. 101.
[1390] Exhibit EC-62/At. 102 (e-mail from lead CA to applicant).
[1391] Exhibit EC-62/At. 101.
[1392] Exhibit EC-62/At. 98.
[1393] It should be noted that more than five months after the applicant had provided the clarification requested by the lead CA, the latter sought further modifications and additional information. Exhibit EC-62/At. 106. However, as the lead CA was not required to make an assessment of the clarification provided by the applicant before transmitting the new documents to other member States and the Commission, there is no reason to consider that the Commission could not have sought the transmission of these documents to itself and other member States in November 2001.

"working group on herbicide-tolerant crops" scheduled for early December 2001. The European Communities has not explained the mandate of the "working group on herbicide-tolerant crops". There is no indication that this working group played a part in the lead-up to the October 1999 and March 2000 meetings of the Regulatory Committee. At any rate, the fact that the applicant wished to "present" the additional information to the working group does not imply that the applicant did not want the information to be distributed to the other member States until after its presentation.

7.1806 Had the Commission requested the lead CA to forward the additional information towards the end of November 2001, it could have scheduled a meeting of the Regulatory Committee for early 2002, thus giving other member States and itself time to review the additional information. As well, since Directive 90/220 was not repealed until mid-October 2002, there was enough time for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee and for the lead CA to give its written consent.[1394]

7.1807 In earlier findings, we observed that the Commission could have considered that some member States simply did not wish to see the Commission call another vote on its draft measure, or that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority, with the consequence that the Commission would have to complete the procedure by adopting its own draft measure. In our view, neither consideration would provide a justification for the Commission's failure to re-convene a Regulatory Committee meeting in early 2002.

7.1808 Anticipated member State opposition might well have been a concern for the Commission in view of the consequences it could have had for the legitimacy and acceptability of an eventual decision by the Commission to approve its own draft measure. However, this would not have justified the Commission in suspending the approval process until it was confident that its draft measure would achieve a qualified majority in the Regulatory Committee.[1395] Were it otherwise, the obligation to complete approval procedures without undue delay would impose no real discipline as the Commission could then suspend approval procedures every time it anticipates significant member State opposition and regardless of whether there are valid reasons for such opposition.

7.1809 Regarding the possibility that certain member States might have been reluctant to proceed to a vote on the Commission's draft measure, it may also be noted that the applicant strengthened the Commission's position by supplying new information which it said confirmed that its application was

[1394] In earlier findings on the application concerning Falcon oilseed rape, we noted that the Commission could have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. Even assuming that in this scenario there was not enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force, the Panel does not consider that this would have justified the Commission's failure to re-convene the Regulatory Committee for a vote. The Commission would have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. As pointed out above, there is no indication that the June 1999 declaration was intended to bind the Governments of the Group of Five countries vis-à-vis other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, the Commission could not have legitimately invoked the June 1999 declaration as a justification for not re-convening the Regulatory Committee in early 2002.

[1395] To recall, the record does not indicate, and the European Communities did not argue, that the Commission after the March 2000 meeting of the Regulatory Committee launched inter-service consultations to reconsider the relevant draft measure.

already in accordance with the main provisions of the new Directive 2001/18.[1396] Certainly as of the end of November 2001, after the applicant had clarified and revised the additional information first submitted in May 2001, the Commission therefore had additional arguments for seeking a vote on its draft measure in the Regulatory Committee.

7.1810 Based on the above considerations, the Panel is of the view that at the latest in early 2002 the Commission should have re-convened the Regulatory Committee meeting for a vote on the application concerning Falcon oilseed rape. Accordingly, the Panel concludes that the time actually taken by the Commission to convene a further Regulatory Committee meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long.

7.1811 In addition, we recall that the United States claims that the approval procedure concerning Falcon oilseed rape was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to re-convene the Regulatory Committee for a vote on the application concerning Falcon oilseed rape after May 2001 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1812 In view of our conclusion with regard to the Commission's failure to re-convene the Regulatory Committee for a vote on a draft measure, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.1813 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to convene a further Regulatory Committee meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Falcon oilseed rape for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Falcon oilseed rape, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

[1396] It should also be recalled that in November 2000 the applicant provided the additional information which had been requested by Italy. In addition, in late May 2001, following a request by the lead CA of April 2000, the applicant clarified certain aspects of its application.

(iii) MS8/RF3 oilseed rape (EC-63)

7.1814 Two Complaining Parties, the United States and Canada, claim that the completion of the approval procedure concerning MS8/RF3 oilseed rape has been unduly delayed.

7.1815 The **United States** initially argued that the progress of the application concerning MS8/RF3 oilseed rape stalled when the Commission refused to submit a draft measure to the Regulatory Committee as required by the approval process. Later, the United States argued that the Regulatory Committee twice failed to vote on a draft measure, and that after the second attempt the Commission never submitted a draft measure to the Regulatory Committee again. The United States submits that the resulting delay was undue.

7.1816 The United States submits, in addition, that the application concerning MS8/RF3 oilseed rape is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning MS8/RF3 oilseed rape is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1817 **Canada** submits that the applicant proposed and continuously revised its risk management measures in response to concerns expressed by member States, the SCP and the Commission. Regardless of these attempts by the applicant, the processing of the application has been delayed, which Canada believes demonstrates that the European Communities was and is intent on blocking the approval of this product for cultivation and is intent on imposing such onerous and unnecessary conditions as to make the importation of the product for processing uneconomical.

7.1818 Canada argues that since the application went to the Community level, member States took approximately 12 months to put forth their objections to the application, and after the SCP issued its positive opinion on the application, the European Communities took another 12 months to address recommendations contained in the SCP opinion, including a monitoring plan. Although the application was discussed at the Regulatory Committee in the summer of 1999, no vote was taken. Canada notes that in August 1999 the applicant proposed to voluntarily agree to meet the requirements of the Council's June 1999 Common Position. On the basis of these commitments, the Commission invited the applicant to present its proposal to the Regulatory Committee in October 1999. However, while the Regulatory Committee again considered the proposal, it failed to hold a vote. Subsequently, the applicant made further proposals as a further attempt to address concerns expressed by member States. However, although the matter went yet again before the Regulatory Committee in March 2000, it failed to hold a vote.

7.1819 Canada also claims that any delay in the completion of the approval procedure following the failure of the Regulatory Committee to adopt the draft measure approving MS8/RF3 oilseed rape in March 2000 should be considered "undue". Canada notes in this regard the efforts made by the applicant to respond to further requests by the lead CA. Canada observes that while the lead CA finally accepted the applicant's proposed post-marketing monitoring plan and agricultural guidelines in May 2002, the European Communities provided no information to explain the delay between May 2002 and early January 2003, when the applicant submitted a further updated dossier under Article 35 of Directive 2001/18.

7.1820 Finally, Canada observes that more than eight years after the application was initially submitted for approval to the lead CA in 1996 and more than six years after the SCP issued its opinion in May 1998, MS8/RF3 oilseed rape remains unapproved either for import and processing or cultivation, despite reasonably available risk management measures. Canada submits that by any reasonable standard, the extraordinary length of time to process this application constitutes "undue delay".

7.1821 The **European Communities** argues that the United States is mistaken in saying that the Commission failed to submit a draft measure to the Regulatory Committee. The Commission launched a voting procedure in the Regulatory Committee in June 1999, and the Regulatory Committee met twice on the matter. According to the European Communities, the Regulatory Committee did not vote on 9 March 2000 because Italy raised scientific issues regarding the effects of the product in question on biogeochemical cycles and on food chains and the likelihood of spreading. The European Communities also states that in May 2001, the applicant modified the scope of its application, and that after that, the application proceeded with further submissions by the applicant of additional information.

7.1822 **Canada** notes that Italy's questions had already been addressed in the application dossier and by the SCP. Further, the attempts to raise concerns about impacts of herbicide use on farmland biodiversity inappropriately linked concerns related to herbicide use to approval of a seed variety. Canada notes that: 1) for all other seed varieties, seed approval legislation is distinct from the pesticide approval legislation; 2) herbicide use is one of many factors that may have an impact on farmland biodiversity; and 3) EC member States have actually authorized the use of glufosinate-ammonium for general use as well as for specific use on genetically modified herbicide-tolerant crops. Canada also counters that the European Communities fails to point out that the submission of further information by the applicant was necessary because the information requirements were either unclear or changing.

7.1823 The **Panel** begins its analysis by addressing the United States' and Canada's arguments concerning the Commission's failure to re-convene the Regulatory Committee for a further meeting.

Failure by the Commission to re-convene the Regulatory Committee for a vote on a draft measure

7.1824 The Panel recalls that the Regulatory Committee met twice, on 29 October 1999 and on 9 March 2000, to consider a draft measure submitted by the Commission. No vote was taken on the draft measure at either meeting and the Regulatory Committee did not meet again for another attempt at taking a vote on the application.

7.1825 The record does not indicate why the Regulatory Committee did not proceed to a vote on MS8/RF3 oilseed rape at the March 2000 meeting.[1397] One reason may have been a request for information from the Italian CA. Italy transmitted its request to the lead CA on 14 March 2000, and the lead CA then forwarded it to the applicant.[1398] In November 2000 the applicant provided the lead CA with answers to the questions raised by Italy indicating that all the issues raised had been

[1397] The record contains a summary of the conclusions for the October 1999 Regulatory Committee meeting, but not for the March 2000 meeting.

[1398] Exhibit EC-63/At. 87. This fax of 14 March 2000 from the Italian CA to the lead CA specifically "refer[s] to the conclusion of the last meeting of the Regulatory Committee meeting".

previously addressed by the SCP as well as the update of the application provided by the applicant in November 1999. This communication was also circulated to the other CAs and the Commission.[1399]

7.1826 It should further be noted that in June 2001 the applicant sent a letter to the lead CA which clarified certain aspects of the application, including its scope. There is no indication that this clarification had been requested. However, the applicant's letter noted that following the March 2000 meeting of the Regulatory Committee the clarification appeared necessary.[1400] In a separate letter of the same date, "following the revision of Directive 90/220/EEC", the applicant also submitted updated information to the lead CA, including an updated environmental risk assessment, a post-market monitoring plan, agricultural guidelines, additional information regarding identification and labelling and information for the public concerning the product in question.[1401] The letter stated that this information confirmed that the application was already "in line with the main provisions" of Directive 2001/18, which had been adopted in March 2001. The letter requested the lead CA to inform the other member States about the new set of documents at the next Regulatory Committee meeting.[1402] There is no indication that the lead CA ever forwarded the new documents to the other member States and the Commission. A meeting of CAs was held two weeks after the applicant submitted the additional information, but the Panel has no information about what was discussed at that meeting. It is clear from the record, however, that the lead CA confirmed receipt of the new documents only in July 2001. The lead CA informed the applicant that it had forwarded the documents to the relevant scientific committee of the Belgian Biosafety Council (hereafter the "BBC") for an opinion.[1403] No reason was given for why an opinion had been requested.

7.1827 The Panel has previously stated its view that after the March 2000 meeting of the Regulatory Committee, it was incumbent on the Commission to convene another meeting with a view to obtaining a vote on its draft measure. The question thus arises whether the Commission was justified in not convening another meeting at any point prior to the repeal of Directive 90/220 in October 2002.

7.1828 In approaching this question, the Panel takes note of the following elements. In November 2000 the applicant had met all requests for information conveyed to it following the March 2000 Regulatory Committee. The additional information was circulated to all CAs and the Commission in December 2000. As noted, however, in June 2001 the applicant provided additional clarification and updated information to the lead CA. The record does not indicate that the Commission was made aware of the existence of the June 2001 information. At the same time, there is nothing in the record to suggest that the Commission was "waiting" for the June 2001 information.

7.1829 Regarding the clarification provided by the applicant in June 2001, we note that if the Commission was not waiting for that clarification, then that clarification could not provide a justification for the Commission's failure to re-convene the Regulatory Committee sometime between December 2000 and June 2001. On the other hand, if the Commission had been waiting for clarification from the applicant, it should have inquired with the lead CA whether the applicant had provided clarification. There is no evidence that the Commission did so.

7.1830 Regarding the updated information also provided by the applicant in June 2001, it is important to remember that the applicant provided that information, not pursuant to a requirement flowing form the provisions of Directive 90/220, but in an effort to convince member States to vote in

[1399] Exhibit EC-63/At. 89 and 90.
[1400] Exhibit EC-63/At. 92.
[1401] Exhibit EC-63/At. 91.
[1402] *Ibid*.
[1403] Exhibit EC-63/At. 93.

favour of approving its application. Also, the lead CA had not been requested to offer an assessment of that additional information before transmitting it to the other member States and the Commission. Notwithstanding this, the lead CA requested an opinion of the BBC. However, it seems that for the BBC, it was not obvious that an opinion was needed. In November 2001, the BBC discussed the information in question. According to the minutes of the internal discussion, "no opinion on the part of the Biosafety Advisory Council was necessary prior to the forwarding of these documents to the European Commission; and in the past such additional information had already been sent straight to the Commission on several occasions."[1404] However, as this was the first time a company had submitted a monitoring plan, agricultural guidelines and public dossier, the BBC "thought it advisable to ask the Biosafety Advisory Council to discuss these documents before forwarding them to the European Commission."[1405] It was noted that in this way the relevant experts would have an opportunity to gain experience in the evaluation of such documents.[1406]

7.1831 We are not convinced that a lead CA assessment of the updated information was required before that information could be transmitted to the Commission and the other CAs, and that the Commission therefore needed to wait for the lead CA's assessment before re-convening the Regulatory Committee. Indeed, we note that in a parallel situation, a different lead CA did not find it necessary to make an assessment of additional information submitted by an applicant to demonstrate that its application was already in line with the main provisions of Directive 2001/18.[1407]

7.1832 In any event, in the approval procedure concerning MS8/RF3 oilseed rape, the applicant replied to the last pending question of the BBC in early May 2002.[1408] The record shows no further developments in this approval procedure until October 2002, when Directive 90/220 was repealed. Thus, there is no indication that the BBC ever provided its opinion on the June 2001 information to the lead CA. Even assuming that the Commission knew about the updated information of June 2001, and even assuming that it was justifiable in principle for the Commission to let the lead CA undertake some assessment of the information, it remained the Commission's responsibility to seek a vote by the Regulatory Committee on its draft measure. Yet even as the date of repeal of Directive 90/220 was approaching, the Commission apparently did not request the lead CA promptly to finish its assessment of the updated information and to circulate it together with that information so that a further attempt at completing the approval procedure under Directive 90/220 could be made.[1409]

7.1833 In view of these elements, we consider that if the Commission had sought the circulation of the additional information once the applicant had replied to the last pending question in May 2002, it should have been possible for the information to be circulated promptly and for a Regulatory Committee meeting to be held in the summer of 2002 at the latest. As Directive 90/220 was not repealed until mid-October 2002, we think this would have left enough time for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee and for the lead CA to give its written consent.[1410]

[1404] Exhibit EC-63/At. 102.

[1405] *Ibid*.

[1406] *Ibid*.

[1407] *See* our earlier analysis of the approval procedure concerning Falcon oilseed rape.

[1408] Exhibit EC-63/At. 108. The applicant also indicated readiness to follow a suggestion by the BBC regarding information to the public, subject to further clarification by the BBC. *Ibid*.

[1409] If the Commission did not know about the updated information submitted by the applicant in June 2001, then the existence of that information could not provide a justification for the Commission's failure to re-convene the Regulatory Committee after December 2000.

[1410] The Commission might have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the

7.1834 In earlier findings, the Panel observed that the Commission could have considered that some member States simply did not wish to see the Commission call another vote on its draft measure, or that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not have achieved the required qualified majority, with the consequence that the Commission would have to complete the procedure by adopting its own draft measure. In the Panel's view, neither consideration would provide a justification for the Commission's failure to re-convene the Regulatory Committee for a third meeting.

7.1835 Anticipated member State opposition might well have been a concern for the Commission in view of the consequences it could have had for the legitimacy and acceptability of an eventual decision by the Commission to approve its own draft measure. However, this would not have justified the Commission in suspending the approval process until it was confident that its draft measure would achieve a qualified majority in the Regulatory Committee.[1411] Were it otherwise, the obligation to complete approval procedures without undue delay would impose no real discipline as the Commission could then suspend approval procedures every time it anticipates significant member State opposition and regardless of whether there are valid reasons for such opposition.

7.1836 Regarding the possibility that certain member States might have been reluctant to proceed to a vote on the Commission's draft measure, it should also be noted that if the Commission was aware of the existence of the updated information of June 2001, then that information would have provided it with additional arguments for seeking a vote on its draft measure in the Regulatory Committee. To recall, the applicant submitted the June 2001 information to demonstrate that the application concerning MS8/RF3 was already in accordance with the main provisions of the new Directive 2001/18.

7.1837 Based on the above considerations, the Panel is of the view that at the very latest in the summer of 2002 the Commission should have re-convened the Regulatory Committee for a vote on the application concerning MS8/RF3 oilseed rape. Accordingly, the Panel concludes that the time actually taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was held between March 2000 and October 2002 – was unjustifiably long.

7.1838 In relation to DS291, we recall that the United States claims that the approval procedure concerning MS8/RF3 oilseed rape was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to re-convene the Regulatory Committee for a vote on the application concerning MS8/RF3 oilseed rape after November 2001 is consistent with the application of such a measure. In the light of this, and in

---

required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. Even assuming that in this scenario there was not enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force, the Panel does not consider that this would have justified the Commission's failure to re-convene the Regulatory Committee for a vote. The Commission would have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. As pointed out above, there is no indication that the June 1999 declaration was intended to bind the Governments of the Group of Five countries *vis-à-vis* other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, the Commission could not have legitimately invoked the June 1999 declaration as a justification for not re-convening the Regulatory Committee.

[1411] The record does not indicate, and the European Communities did not argue, that the Commission after the March 2000 meeting of the Regulatory Committee launched inter-service consultations to reconsider the relevant draft measure.

the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1839 In view of our conclusion with regard to the Commission's failure to re-convene the Regulatory Committee for a vote on a draft measure, we do not go on to examine other arguments put forward by the United States and Canada in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.1840 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning MS8/RF3 oilseed rape for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning MS8/RF3 oilseed rape, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, the Panel recalls its finding that the time taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long. Based on this finding, the Panel accepts Canada's contention that the European Communities failed to "consider or approve, without undue delay", the application concerning MS8/RF3 oilseed rape, and that it consequently did not complete the relevant approval procedure without "undue delay". Accordingly, the Panel concludes that in respect of the approval procedure concerning MS8/RF3 oilseed rape, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(iv) RR fodder beet (EC-64)

7.1841 One Complaining Party, the United States, claims that the completion of the approval procedure concerning the RR fodder beet has been unduly delayed.

7.1842 The **United States** initially argued that the Commission in this procedure did not submit a draft measure to the Regulatory Committee. Later, the United States argued that the Regulatory Committee twice failed to vote on a draft measure and that after the second attempt, the Commission never submitted a draft measure to the Regulatory Committee again. The United States also submits that under the applicable EC legislation, in the absence of action by the Regulatory Committee, the

Commission was required to submit a draft measure, whether favourable or negative, to the Council. The United States recalls in this respect that the *SPS Agreement* requires that the European Communities make a decision without undue delay. In this case, the Commission failed to forward a decision to the Council.

7.1843 The United States submits, in addition, that the application concerning RR fodder beet is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning RR fodder beet is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1844 The **European Communities** argues that contrary to the US argument, the Commission launched a voting procedure in June 1999, and the Regulatory Committee met twice on the matter – first on 29 October 1999 and then on 9 March 2000. The Regulatory Committee did not vote on 29 October 1999 due to outstanding requests for information.

7.1845 The **United States** responds that contrary to the European Communities' assertion that there were outstanding requests for information, the applicants had voluntarily provided additional information in an attempt to remove any possible remaining obstacle to a Regulatory Committee vote during the one and a half years between when the SCP issued its opinion and when the Regulatory Committee finally met. The United States also notes that when the applicants attempted to get a resolution of this matter on 12 July 2000, stating that they had fully addressed all objections raised by member States and requesting the lead CA "to inform all member States that the application was complete and subject to a Community decision"[1412], the European Communities ignored, for six months, the applicant's request.

7.1846 The **Panel** begins its analysis by addressing the US argument concerning the Commission's failure to re-convene the Regulatory Committee for a vote on the Commission's draft measure.

Failure by the Commission to re-convene the Regulatory Committee for a vote on a draft measure

7.1847 The Panel recalls that, after the SCP issued its favourable opinion with regard to this application on 23 June 1998, the Regulatory Committee met twice, on 29 October 1999 and on 9 March 2000, to consider a draft measure submitted by the Commission. No vote was taken on the draft measure at either meeting, and the Regulatory Committee did not meet again for another attempt at taking a vote on the application.

7.1848 We also recall that in July 2000 the applicant provided the additional information requested by the Italian CA, as well as data on molecular characterization which were apparently generated at the request of the United Kingdom's CA. The conclusion of the July 2000 letter states that, in the applicant's view, all objections raised by the CAs within the 60-day period provided for in Directive 90/220 had now been fully addressed. We further recall that the lead CA did not forward the new documents to the other CAs. As also noted earlier, the Commission received a copy of the applicant's July 2000 letter.

[1412] Exhibit EC-64/At. 119.

7.1849 The Panel has previously stated its view that after the March 2000 meeting of the Regulatory Committee, it was incumbent on the Commission to convene another meeting with a view to obtaining a vote on its draft measure. The question thus arises whether the Commission was justified in not convening another meeting at any point prior to the repeal of Directive 90/220 in October 2002.

7.1850 In approaching this question, the Panel takes note of the following elements. To begin with, by mid-July 2000 the applicant had apparently addressed all objections raised by the CAs within the 60-day period provided for in Directive 90/220 and conveyed to the applicant. That information was never forwarded by the lead CA to the other CAs. However, it should be recalled in this respect that in February 2001 the applicant suggested to the lead CA, in view of the "very volatile" EC regulatory context, that it forward the documents after the adoption of Directive 2001/18 (which came in March 2001) and the circulation of a Commission proposal on new EC rules concerning labelling and traceability (which came in July 2001).[1413] The lead CA did not follow the applicant's suggestion.

7.1851 Furthermore, as noted, the Commission received a copy of the applicant's July 2000 letter. It is likely that the Commission wanted the other CAs to have access to the additional information provided in July 2000 before re-convening the Regulatory Committee. Yet even as the date of repeal of Directive 90/220 was approaching, the Commission apparently did not request the lead CA promptly to circulate the additional information provided by the applicant in July 2000 so that a further attempt at completing the approval procedure under Directive 90/220 could be made.

7.1852 In view of these elements, we consider that after July 2000, once the applicant had provided the additional information sought by the Italian CA, or at the latest in the summer of 2001, when the Commission circulated its proposal for new EC rules on labelling and traceability, the Commission could have re-convened the Regulatory Committee for a vote on the application concerning RR fodder beet. Directive 90/220 was not repealed until 17 October 2002. In our view, there was thus enough time for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee and for the lead CA to give its written consent.

7.1853 In earlier findings, we observed that the Commission could have considered that some member States simply did not wish to see the Commission call another vote on its draft measure, or that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority, with the consequence that the Commission would have to complete the procedure by adopting its own draft measure. In our view, neither consideration would provide a justification for the Commission's failure to re-convene the Regulatory Committee for a vote prior to the repeal of Directive 90/220.

7.1854 Anticipated member State opposition might well have been a concern for the Commission in view of the consequences it could have had for the legitimacy and acceptability of an eventual decision by the Commission to approve its own draft measure. However, this would not have justified the Commission's suspension of the approval process until it was confident that its draft measure would achieve a qualified majority in the Regulatory Committee.[1414] Were it otherwise, the obligation to complete approval procedures without undue delay would impose no real discipline as the Commission could then suspend approval procedures every time it anticipated significant member State opposition and regardless of whether there were valid reasons for such opposition.

[1413] *Ibid*.

[1414] To recall, the record does not indicate, and the European Communities did not argue, that the Commission after the March 2000 meeting of the Regulatory Committee launched inter-service consultations to reconsider the relevant draft measure.

7.1855 Regarding the possibility that certain member States might have been reluctant to proceed to a vote on the Commission's draft measure, it may also be noted that the applicant strengthened the Commission's position by supplying supplementary information addressing objections raised by other CAs.

7.1856 Based on the above considerations, the Panel is of the view that at the latest in the summer of 2001 the Commission should have re-convened the Regulatory Committee for a vote on the application concerning RR fodder beet. Accordingly, the Panel concludes that the time actually taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long.

7.1857 In addition, we recall that the United States claims that the approval procedure concerning RR fodder beet was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to re-convene the Regulatory Committee for a vote on the application concerning RR fodder beet after July 2000 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1858 In view of our conclusion with regard to the Commission's failure to re-convene the Regulatory Committee for a vote on its draft measure, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.1859 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to convene the Regulatory Committee for a further meeting – no meeting was convened between March 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning RR fodder beet for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning RR fodder beet, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(v) Bt-531 cotton (EC-65)

7.1860 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning Bt-531 cotton has been unduly delayed.

7.1861 The **United States** submits that the application concerning Bt-531 cotton under Directive 90/220 suffered a three-and-a-half-year period of inactivity by EC regulators. From 7 May 1999, after the launch of inter-service consultations on a draft measure to be submitted to the Council, until 12 February 2003, when the lead CA finally circulated the updated application to the Commission, the application was totally ignored by the Commission and lead CA. The United States considers this lengthy delay to be unwarranted and thus undue.

7.1862 The United States points out in this respect that the application in question had received a favourable scientific assessment by the European Community's own scientific committee, the SCP. That certain member States objected in the Regulatory Committee does not justify the Commission's refusal to act on the application. The United States submits that those objections which were explained in statements, notably those by Austria and the United Kingdom, were the subject of detailed scientific consideration in the SCP's positive opinion in July 1998. The United States also notes that there is at any rate nothing to indicate that the Commission undertook any process whatsoever to resolve the member State concerns. Moreover, nothing in the record indicates that the applicant was ever requested to submit additional information to address the member State objections, nor that the basis of these objections was ever even notified to the applicant. The United States is therefore of the view that the delay in question was not caused, as the European Communities claims, by a pending request to the applicant for additional information.

7.1863 The United States notes in addition that the EC legislative framework provides a specific avenue for further action where the Regulatory Committee is unable to come to a decision: the Commission is to forward the application to the Council "without delay" for a decision. The United States considers that where the European Communities' own legislation provides timelines, a suspension of the approval procedure without any scientific justification must be considered undue delay.

7.1864 The United States submits, finally, that the application concerning Bt-531 cotton is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-531 cotton is undue. The United States also argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1865 **Argentina** argues that after the Regulatory Committee in February 1999 failed to achieve a qualified majority in favour of approving the application concerning Bt-531 cotton, the Commission refused to submit a draft measure to the Council until the application had to be resubmitted under Directive 2001/18. Argentina submits that this was not due to any action or omission on the part of the applicant. According to Argentina, there notably are no EC documents which specifically requested the applicant to provide additional information. Argentina considers that the delay which it says was caused by the Commission is undue. Argentina argues in this respect that the requirements of legislation not yet in force do not provide grounds for a prolonged failure to process an application. In particular, the application concerning Bt-531 cotton should not have been forced to start the procedure again under the new Directive 2001/18 when the procedure under the old Directive 90/220 had already been in progress for three years. Furthermore, Argentina asserts that there is no scientific evidence to justify the delay after the Regulatory Committee vote. Those member States which in the Regulatory Committee voted against approving Bt-531 cotton ignored the positive scientific opinion of the SCP of July 1998. Moreover, Argentina contests the scientific validity of the statements

offered by some member States in support of their votes inasmuch as these statements do not refute the positive opinion of the SCP.[1415]

7.1866 Argentina singles out another instance of delay which it considers undue. Argentina asserts that although the applicant in January 2003 submitted an updated application in accordance with the requirements of Directive 2001/18, the application did not progress. Argentina submits that, as a result, as of the date of its first written submission – April 2004 – the application concerning Bt-531 cotton had been inactive for an additional period of 1 year and 3 months.

7.1867 Finally, Argentina submits that the total time consumed by the procedures under Directives 90/220 and 2001/18, from the time the application was first submitted until April 2004, the date of Argentina's first written submission, has been 7 years and 4 months. In Argentina's view, this delay can in no way be justified in the light of the deadlines stipulated in the relevant EC legislation. Argentina contends that the procedure under Directive 90/220 should normally have been completed within 240 days, which does not include the time during which a CA or the Commission may be awaiting additional information it may have requested or the time needed by an EC scientific committee to issue an opinion ("clock-stop"). Similarly, Argentina contends that under Directive 2001/18, a procedure should be completed within 285 days if no objections to the lead CA's initial assessment are made, and 450 days if objections are made. Again, this does not include the time spent waiting for additional information or for a scientific committee opinion. Argentina asserts that the delay affecting the approval procedure concerning Bt-531 cotton cannot be justified by such "clock-stops".

7.1868 The **European Communities** argues that the Regulatory Committee in February 1999 failed to reach a qualified majority because a number of member States raised scientific concerns which had not been addressed in any of the applicant's previous submissions. The European Communities submits that long after the vote in the Regulatory Committee, on 25 July 2001, the applicant provided the requested additional information, and that the translation of this material was not made available until February 2002. According to the European Communities, if there was a three-year delay after the Regulatory Committee vote, it was because of the time taken by the applicant to provide the requested additional information.

7.1869 Regarding the requirement contained in Article 21 of Directive 90/220 that the Commission "shall, without delay, submit to the Council a proposal relating to the measures to be taken", the European Communities points out that in the *Pharos* case[1416], the European Court of Justice examined an identical requirement to submit a proposal to the Council "without delay" in the context of legislation on the setting of maximum residue limits of veterinary medicinal products in foodstuffs of animal origin (Regulation 2377/90). The Court stated that nothing in the wording of the relevant provision "suggests any conclusion regarding the length of time indicated by the expression 'without delay', other than that, while a certain degree of rapidity is required, the Commission is not required to act within a precise period of time nor at once, contrary to the appellant's submission".[1417] The Court then went on to point out that the Commission was free to modify its proposal before submitting it to the Council and found that "if the Commission has the right to amend the proposal relating to the measures to be taken which it submits to the Council, it must have sufficient time to consider the various courses of action open to it".[1418] On that basis, the Court found that the Commission, which had taken over eleven months before forwarding a proposal to the Council, had not breached its

[1415] Exhibit ARG-54, p. 3.
[1416] European Court of Justice, Case C-151/98, *Pharos against Commission [1999]* ECR I-8157.
[1417] *Ibid.*, para. 20.
[1418] *Ibid.*, para. 24.

obligation to act "without delay".[1419] The Court pointed to the fact that the matter with which the Commission was confronted was "highly complex and sensitive".[1420] The Court also made it clear that the Commission could not be criticised for having sought additional advice from an EC scientific committee in an effort to prevent its proposal from being rejected by the Council.[1421]

7.1870 Concerning the case at hand, the European Communities argues that the concerns raised by certain member States were all legitimate and scientifically sound. They could not be ignored or brushed off by the Commission without detailed consideration. Moreover, according to the European Communities, in the light of the impending legislative changes, further reflection was necessary before proceeding further. The European Communities submits that this is in line with the jurisprudence of the European Court of Justice.

7.1871 In relation to the delay which occurred after the application was resubmitted under Directive 2001/18, the European Communities submits that the application contained an incomplete monitoring plan. According to the European Communities, the lead CA is awaiting additional information on the post-marketing monitoring plan that it has requested with letters of August and October 2003. The European Communities argues that it cannot be responsible for the lack of diligence or failings of an individual applicant.

7.1872 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Council

7.1873 The Panel begins its analysis by addressing the delay allegedly caused by the Commission. The Panel recalls that on 7 May 1999, the Commission launched inter-service consultations on a draft measure to be submitted to the Council. But at no point prior to 17 October 2002, the date of repeal of Directive 90/220, did the Commission submit a draft measure to the Council. The United States and Argentina argue that the Commission should have completed its inter-service consultations and submitted a draft measure to the Council before October 2002.

7.1874 It is clear that the preparation by the Commission of a draft measure and its submission to the Council is not a process which necessarily takes more than three years. To begin with, in other approval procedures, the Commission was able to prepare and submit draft measures to the Council within a few months, despite the fact that in those procedures some member States also voted against the Commission's draft measure in the Regulatory Committee, and that some made written statements.[1422] Moreover, as the Panel understands it, the preparation by the Commission of a draft measure to be submitted to the Council is not a process that is fundamentally different from the preparation by the Commission of a draft measure to be submitted to the Regulatory Committee. In the approval procedure here at issue, the Commission prepared a draft measure and launched a vote in

[1419] The Panel notes that the judgement indicates that during the eleven-month period, the Commission initially reconsidered the file for six months and then sought a second scientific opinion. *Ibid*., para. 32.

[1420] *Ibid*., para. 26.

[1421] *Ibid*., para. 27.

[1422] In the approval procedure concerning NK603 maize (Exhibit EC-76) and conducted under Directive 2001/18, the Commission submitted a draft measure to the Council little over one month after the Regulatory Committee had failed to reach a qualified majority. At that meeting, Austria made a statement in support of its negative vote. Exhibit EC-76/At. 72. In the approval procedure concerning Bt-11 sweet maize (food) and conducted under Regulation 258/97, the Commission adopted a draft measure and referred it to the Council less than two months after the Regulatory Committee had failed to reach a qualified majority. At that meeting, several member States made statements in support of their votes. Exhibit EC-92/At. 70.

the Regulatory Committee in less than three months.[1423] It may be inferred from these examples that the Commission could in principle have completed its task well before October 2002.

7.1875 The issue thus becomes whether in the specific circumstances of this case the Commission could in fact have completed its task before October 2002. The European Communities argues that the Commission did not need to forward a draft measure to the Council because the applicant took too long to provide information which had been requested of it. The European Communities notes that the applicant did not provide that information until 25 July 2001, and that the translation of this material was made available only in February 2002. However, in its earlier analysis of the approval procedure in question, the Panel found that there is no evidence to suggest that the Commission was waiting for the additional information provided by the applicant in July 2001. The Panel pointed out that even after the applicant had provided the information, the Commission did not forward a draft measure to the Council, although Directive 90/220 remained in force for another seventeen months, until October 2002. Accordingly, the information provided by the applicant in July 2001 does not justify the Commission's failure to forward a draft measure to the Council.

7.1876 Another argument put forward by the European Communities to justify the Commission's failure to forward a draft measure to the Council relates to the fact that the Regulatory Committee failed to achieve the necessary qualified majority to approve the application concerning Bt-531 cotton and that Austria, Sweden and the United Kingdom, in written statements supporting their votes, expressed certain concerns. The European Communities submits that these concerns were scientifically sound and had not been previously addressed by the applicant, and that they could not, therefore, be ignored or brushed off by the Commission without detailed consideration.

7.1877 As no qualified majority was reached in the Regulatory Committee, the Panel considers that, as a general matter, it was justifiable for the Commission to take some time, as part of its inter-service consultations, to analyse the reasons for the outcome of the vote in the Regulatory Committee and to determine, in the light of the results of such an analysis, whether it would be appropriate to modify the Commission's draft measure before it was sent on to the Council, and if so, how.

7.1878 The Panel recognizes that, as a matter of EC law, the Commission's draft measure did not need to obtain a qualified majority in the Council to complete the approval procedure. If the Council had failed to reach a favourable qualified majority, the Commission would have had to adopt its draft measure and hence approve the application concerning Bt-531 cotton.[1424] However, it must be borne in mind that an EC decision to approve the application concerning Bt-531 cotton would have authorized the applicant to market its product in all EC member States. In the light of this, the Commission had good reasons, in the Panel's view, to seek a qualified majority in the Council as this would have enhanced the legitimacy and acceptability of an EC decision to approve the application concerning Bt-531 cotton.[1425] This means that the Commission could take a reasonable period of time to explore ways of modifying its draft measure with a view to increasing the measure's chances of

[1423] Exhibit EC-65/Ats. 48 and 51. The Panel does not express a view as to whether this three-month period was necessary in the circumstances to complete the relevant procedural stage.

[1424] Article 21 of Directive 90/220. If the Council had reached a qualified majority against approving the application, then the application would, however, have had to be rejected.

[1425] It should also be recalled that the Complaining Parties did not question the design of the approval procedure set out in Directive 90/220 (or its successor, Directive 2001/18), and in particular the fact that member States vote on applications. If the Commission were obliged to press on immediately, preventing it from taking into account the votes and views expressed by member States, it would undermine the European Communities' ability to operate its approval procedure as designed.

being accepted by the Council by a qualified majority.[1426] It does not mean that the Commission could simply wait for the majorities in the Council to change enough to allow the Commission's original draft measure to be accepted by a qualified majority. The obligation imposed on the European Communities is to complete its approval procedures without undue delay. This obligation may at times require the Commission to complete an approval procedure even if it does not have the (qualified) majority support of the Council.

7.1879 How much time is to be accorded to the Commission for the purpose of reconsidering a draft measure which did not obtain a qualified majority in the Regulatory Committee can only be determined in the light of the circumstances of each case.

7.1880 Turning, then, to the circumstances of this case, the European Communities asserts that the concerns identified in the written statements by Austria, Sweden and the United Kingdom had not been addressed by the applicant before. The Panel is unable to agree with this assertion. As pointed out by the United States, the concerns referred to in the statements by the three member States were addressed in the SCP opinion of July 1998.[1427] At any rate, the record does not indicate that after the Regulatory Committee vote, the Commission or the lead CA sought additional information from the applicant in an effort to allay these concerns.

7.1881 Even if it were assumed that during its inter-service consultations the Commission was undertaking its own assessment of the scientific validity of the specific concerns expressed with a view to supporting its draft measure with scientific arguments[1428], it is well to recall that the SCP was able to undertake a comprehensive scientific assessment of the application concerning Bt-531 cotton in little over three months' time.[1429] The Panel also notes that the European Communities does not assert that the concerns raised by the member States in question presented either new or particularly complex scientific problems.

7.1882 Another circumstance invoked by the European Communities is the fact that Directive 90/220 was being revised at the time. According to the European Communities, a period of time for reflection was therefore needed before proceeding further. To recall, the Commission in this case launched its inter-service consultations on a draft measure to be submitted to the Council in May 1999. At the end of June 1999, the Council reached a political agreement – the Common Position – on the proposal to amend Directive 90/220, but Directive 2001/18, the Directive amending Directive 90/220, was not adopted until March 2001 and did not enter into force until October 2002. Thus, the Commission started its inter-service consultations almost three-and-a-half years before the entry into force of Directive 2001/18. In the light of this, even accepting that the Commission could take some time to reconsider its draft measure, the Commission's failure to forward a draft measure to the Council cannot be excused on the grounds that there was not enough time to complete the approval procedure while Directive 90/220 was still in force.[1430]

[1426] The Panel recalls once more that in other approval procedures the Commission was able to prepare and submit draft measures to the Council within a few months, despite the fact that in those procedures some member States also voted against the Commission's draft measure in the Regulatory Committee.

[1427] Exhibit EC-65/At. 47, paras. 6.2.1 and 6.3.3-6.3.4. The Panel notes that Sweden voted in favour of the Commission's draft measure and that Sweden's statement suggests that its concerns were met.

[1428] The European Communities did not specifically assert that it was undertaking a scientific assessment of the concerns in question; it merely implied that the Commission embarked on a "detailed consideration" of these concerns.

[1429] Exhibit EC-65/Ats. 43 and 47.

[1430] In its earlier findings on the application concerning Bt-531 cotton, the Panel noted that the Commission had reason to believe that due to the "blocking minority" of the Group of Five countries in the

7.1883 Furthermore, the fact that some member States and segments of public opinion may have considered that Directive 90/220 was no longer adequate and may have voiced opposition to further approvals under that Directive 90/220 did not, in the Panel's view, provide a justification for the Commission to delay the approval procedure in question until new legislation had been put in place. The EC legislator allowed Directive 90/220 to remain in force and hence applicable until October 2002. Moreover, if the Commission saw a need to respond to concerns about perceived inadequacies inherent in Directive 90/220, there were other courses of action open to it. Thus, the Commission could in the first instance have sought voluntary commitments from the applicant. Alternatively, it could have proposed that the application be approved subject to conditions. In this respect, it is worth noting that Directive 90/220 provided additional safeguards if new information on risks of Bt-531 cotton had become available after its EC-wide approval.[1431] In such an event, a member State could, pursuant to Article 16, provisionally restrict or prohibit the marketing of Bt-531 cotton. Finally, if in fact the Commission had been of the view that the risks arising from the marketing of Bt-531 cotton could not be adequately assessed or managed under Directive 90/220, it could arguably have sought the rejection of the application, subject to the right of the applicant to submit the application for reconsideration under the revised Directive, once it entered into force.[1432]

7.1884 Based on the above considerations, the Panel is of the view that in the specific circumstances of this procedure, the time actually taken by the Commission to prepare and forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long.

7.1885 Regarding DS291, we recall that the United States claims that the approval procedure concerning Bt-531 cotton was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure concerning Bt-531 cotton to the Council is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1886 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Council, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Council, it would have to adopt the draft measure it submitted to the Council. In the Panel's view, even in this scenario, there was enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force.

[1431] The Commission usually made this point in its decisions approving applications. *See, e.g.*, Exhibit ARG-35 ("[w]hereas Article 11(6) and Article 16(1) of Directive 90/220/EEC provide additional safeguards if new information on risks of the product becomes available").

[1432] The fact that such a final decision might possibly have been challenged by the applicant before an EC court would obviously not have been a legitimate reason for not completing the approval procedure.

Conclusions

7.1887 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-531 cotton for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-531 cotton, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the Commission to forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning Bt-531 cotton without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(vi) RR-1445 Cotton (EC-66)

7.1888 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning RR-1445 cotton has been unduly delayed.

7.1889 The **United States** submits that the application concerning RR-1445 cotton was delayed for nearly four years under Directive 90/220 by EC regulators. The United States submits that from 22 February 1999, after the failure of the Regulatory Committee to reach a decision, and despite the launch of inter-service consultations on a draft measure to be submitted to the Council starting 7 May 1999, the application was totally ignored by the Commission and lead CA until is was re-submitted under Directive 2001/18 on 16 January 2003. The United States considers this lengthy delay to be unwarranted and thus undue.

7.1890 The United States points out in this respect that the application in question had received a favourable scientific assessment by the SCP. In the United States' view, the fact that certain member States objected in the Regulatory Committee does not justify the Commission's refusal to act on the application. The United States submits that those objections which were explained in statements, notably those by Austria, Sweden and the United Kingdom, were the subject of detailed scientific consideration in the SCP's positive opinion in July 1998. None of the member States objecting at the Regulatory Committee stage offered any competing risk assessment or scientific evidence for their objections, nor did they identify any specific inadequacies in the SCP review. The United States also notes that there is at any rate nothing to indicate that the Commission undertook any process

whatsoever to resolve the member State concerns. Moreover, nothing in the record indicates that the applicant was ever requested to submit additional information to address the member State objections, nor that the basis of these objections was ever even notified to the applicant. The United States is therefore of the view that the delay in question was not caused, as the European Communities claims, by a pending request to the applicant for additional information.

7.1891 The United States notes in addition that the EC legislative framework provides a specific avenue for further action where the Regulatory Committee is unable to come to a decision: the Commission is to forward the application to the Council "without delay" for a decision. The United States considers that where the European Communities' own legislation provides timelines, a suspension of the approval procedure without any scientific justification must be considered undue delay.

7.1892 The United States submits, finally, that the application concerning RR-1445 cotton is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning RR-1445 cotton is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years

7.1893 **Argentina** argues that after the Regulatory Committee in February 1999 failed to achieve a qualified majority in favour of approving the application concerning RR-1445 cotton, the Commission refused to submit a draft measure to the Council until the application had to be resubmitted under Directive 2001/18. Argentina submits that this was not due to any action or omission on the part of the applicant. According to Argentina, there notably are no EC documents which specifically requested the applicant to provide additional information. Argentina considers that the delay which it says was caused by the Commission is undue. Argentina argues in this respect that the requirements of legislation not yet in force do not provide grounds for a prolonged failure to process an application. In particular, the application concerning RR-1445 cotton should not have been forced to start the procedure again under the new Directive 2001/18 when the procedure under the old Directive 90/220 had already been in progress for three years. Furthermore, Argentina asserts that there is no scientific evidence to justify the delay after the Regulatory Committee vote. Those member States which in the Regulatory Committee voted against approving RR-1445 cotton ignored the positive scientific opinion of the SCP of July 1998. Moreover, Argentina contests the scientific validity of the statements offered by some member States in support of their votes inasmuch as these statements do not refute the positive opinion of the SCP.

7.1894 Argentina identified another instance of delay which it considers undue. Argentina asserts that although the applicant in January 2003 submitted an updated application in accordance with the requirements of Directive 2001/18, the application did not progress. Argentina submits that, as a result, as of the date of its first written submission – April 2004 – the application concerning RR-1445 cotton had been inactive for an additional period of 1 year and 3 months.

7.1895 Finally, Argentina submits that the total time consumed by the procedures under Directives 90/220 and 2001/18, from the time the application was first submitted until April 2004, the date of Argentina's first written submission, has been 6 years and 9 months. In Argentina's view, this delay can in no way be justified in the light of the deadlines stipulated in the relevant EC legislation. Argentina contends that the procedure under Directive 90/220 should normally have been completed

within 240 days, which does not include the time during which a lead CA or the Commission may be awaiting additional information it may have requested or the time needed by an EC scientific committee to issue an opinion. Similarly, Argentina contends that under Directive 2001/18, a procedure should be completed within 285 days if no objections to the lead CA's initial assessment are made, and 450 days if objections are made. Again, this does not include the time spent waiting for additional information or for a scientific committee opinion. Argentina asserts that the delay affecting the approval procedure concerning RR-1445 cotton cannot be justified by such "clock-stops".

7.1896 The **European Communities** argues that the Regulatory Committee in February 1999 failed to reach a qualified majority because a number of member States raised scientific concerns which had not been addressed in any of the applicant's previous submissions. These related in particular to the long-term effects of herbicide tolerant crops on the environment, to the presence of an antibiotic resistance marker gene, residue-limit levels and to the effects on biodiversity of changes in crop management.

7.1897 Regarding the requirement contained in Article 21 of Directive 90/220 that the Commission "shall, without delay, submit to the Council a proposal relating to the measures to be taken", the European Communities points out that in the *Pharos* case[1433], the European Court of Justice examined an identical requirement to submit a proposal to the Council "without delay" in the context of legislation on the setting of maximum residue limits of veterinary medicinal products in foodstuffs of animal origin (Regulation 2377/90). The Court stated that nothing in the wording of the relevant provision "suggests any conclusion regarding the length of time indicated by the expression 'without delay', other than that, while a certain degree of rapidity is required, the Commission is not required to act within a precise period of time nor at once, contrary to the appellant's submission".[1434] The Court then went on to point out that the Commission was free to modify its proposal before submitting it to the Council and found that "if the Commission has the right to amend the proposal relating to the measures to be taken which it submits to the Council, it must have sufficient time to consider the various courses of action open to it".[1435] On that basis, the Court found that the Commission, which had taken over eleven months before forwarding a proposal to the Council, had not breached its obligation to act "without delay".[1436] The Court pointed to the fact that the matter with which the Commission was confronted was "highly complex and sensitive".[1437] The Court also made it clear that the Commission could not be criticised for having sought additional advice from an EC scientific committee in an effort to prevent its proposal from being rejected by the Council.[1438]

7.1898 Concerning the case at hand, the European Communities argues that the concerns raised by certain member States were legitimate and scientifically sound. They could not be ignored or brushed off by the Commission without detailed consideration. Moreover, according to the European Communities, in the light of the impending legislative changes, further reflection was necessary before proceeding further. The European Communities submits that this is in line with the jurisprudence of the European Court of Justice.

7.1899 In relation to the delay which occurred after the application was resubmitted under Directive 2001/18, the European Communities submits that the application contained an incomplete

monitoring plan. According to the European Communities, the lead CA was awaiting additional information on the post-marketing monitoring plan that it had requested with letters of August and October 2003. The European Communities argues that it cannot be responsible for the lack of diligence or failings of an individual applicant.

7.1900 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Council

7.1901 The Panel recalls that, following the failure of the Regulatory Committee to reach a decision, on 7 May 1999 the Commission launched inter-service consultations on a draft measure to be submitted to the Council. But at no point prior to 17 October 2002, the date of repeal of Directive 90/220, did the Commission submit a draft measure to the Council. The United States and Argentina argue that the Commission should have completed its inter-service consultations and submitted a draft measure to the Council before October 2002.

7.1902 It is clear that the preparation by the Commission of a draft measure and its submission to the Council is not a process which inherently takes more than three years. To begin with, in other approval procedures, the Commission was able to prepare and submit draft measures to the Council within a few months, despite the fact that in those procedures some member States also voted against the Commission's draft measure in the Regulatory Committee, and that some made written statements.[1439] Moreover, as the Panel understands it, the preparation by the Commission of a draft measure to be submitted to the Council is not a process that is fundamentally different from the preparation by the Commission of a draft measure to be submitted to the Regulatory Committee. In the approval procedure here at issue, the Commission prepared a draft measure and launched a vote in the Regulatory Committee in four months after receipt of the SCP opinion.[1440] It may be inferred from these examples that the Commission could in principle have completed its task well before October 2002.

7.1903 The issue thus becomes whether in the specific circumstances of this case the Commission could in fact have completed its task before October 2002. The European Communities argues that the Commission was not able to forward a draft measure to the Council because the applicant took too long to provide information which had been requested of it. The European Communities notes that the applicant did not provide that information until 25 July 2001, and that the translation of this material was made available only in February 2002. However, in our earlier analysis of the approval procedure concerning RR-1445 cotton, we found that there is no evidence to suggest that the Commission was waiting for the additional information provided by the applicant in July 2001. We pointed out that even after the applicant had provided the information, the Commission did not forward a draft measure to the Council, although Directive 90/220 remained in force for another seventeen months. Accordingly, the information provided by the applicant in July 2001 in our view does not justify the Commission's failure to forward a draft measure to the Council.

[1439] In the approval procedure concerning NK603 maize (Exhibit EC-76) and conducted under Directive 2001/18, the Commission submitted a draft measure to the Council little over one month after the Regulatory Committee had failed to reach a qualified majority. At that meeting, Austria made a statement in support of its negative vote. Exhibit EC-76/At. 72. In the approval procedure concerning Bt-11 sweet maize (food) and conducted under Regulation 258/97, the Commission adopted a draft measure and referred it to the Council less than two months after the Regulatory Committee had failed to reach a qualified majority. At that meeting, several member States made statements in support of their votes. Exhibit EC-92/At. 70.

[1440] Exhibit EC-66/Ats. 44 and 46. The Panel does not express a view as to whether this four-month period was necessary in the circumstances to complete the relevant procedural stage.

7.1904 Another argument put forward by the European Communities to justify the Commission's failure to forward a draft measure to the Council relates to the fact that the Regulatory Committee failed to achieve the necessary qualified majority to approve the application concerning RR-1445 cotton and that Austria, Italy, Sweden and the United Kingdom, in written statements supporting their votes, expressed certain concerns. The European Communities submits that these concerns were scientifically sound and had not been previously addressed by the applicant, and that they could not, therefore, be ignored or brushed off by the Commission without detailed consideration.

7.1905 As no qualified majority was reached in the Regulatory Committee, the Panel considers that, as a general matter, it was justifiable for the Commission to take some time, as part of its inter-service consultations, to analyse the reasons for the outcome of the vote in the Regulatory Committee and to determine, in the light of the results of such an analysis, whether it would be appropriate to modify the Commission's draft measure before it was sent on to the Council, and if so, how.

7.1906 The Panel recognizes that, as a matter of EC law, the Commission's draft measure did not need to obtain a qualified majority in the Council to complete the approval procedure. If the Council had failed to reach a favourable qualified majority, the Commission would have had to adopt its draft measure and hence approve the application concerning RR-1445 cotton.[1441] However, it must be borne in mind that an EC decision to approve the application concerning RR-1445 cotton would have authorized the applicant to market its product in all EC member States. In the light of this, the Commission was entitled, in the Panel's view, to try to obtain a qualified majority in the Council as this would have enhanced the legitimacy and acceptability of an EC decision to approve the application concerning RR-1445 cotton.[1442] This means that the Commission could take a reasonable period of time to explore ways of modifying its draft measure with a view to increasing the measure's chances of being accepted by the Council by a qualified majority.[1443] But the Commission could not simply wait for the majorities in the Council to change enough to allow the Commission's original draft measure to be accepted by a qualified majority. The obligation imposed on the European Communities is to complete its approval procedures without undue delay. This obligation may at times require the Commission to complete an approval procedure even if it does not have the (qualified) majority support of the Council.

7.1907 How much time is to be accorded to the Commission for the purpose of reconsidering a draft measure which did not obtain a qualified majority in the Regulatory Committee can only be determined in the light of the circumstances of each case.

7.1908 Turning, then, to the circumstances of this case, the European Communities asserts that the concerns identified in the written statements by Austria, Italy, Sweden and the United Kingdom had not been addressed by the applicant before.[1444] The Panel is unable to agree with this assertion. Austria and the United Kingdom expressed concerns arising from the antibiotic resistance marker

[1441] Article 21 of Directive 90/220. If the Council had reached a qualified majority against approving the application, then the application would, however, have had to be rejected.

[1442] It should also be recalled that the Complaining Parties did not question the design of the approval procedure set out in Directive 90/220 (or its successor, Directive 2001/18), and in particular the fact that member States vote on applications. It is arguable that if the Panel effectively were to require the Commission to press on immediately, preventing it from taking into account the votes and views expressed by member States, it would undermine the European Communities' ability to operate its approval procedure as designed.

[1443] The Panel recalls once more that in other approval procedures the Commission was able to prepare and submit draft measures to the Council within a few months, despite the fact that in those procedures some member States also voted against the Commission's draft measure in the Regulatory Committee

[1444] The statements are provided in Exhibit EC-66/At. 57. Italy voted in favour of the Commission's draft measure in the Regulatory Committee.

gene, which according to Dr. Squire had been explicitly addressed in the SCP assessment.[1445] The concern identified by Italy was to ensure that the herbicide residues were within the limits established by other EC legislation, which according to the Panel's understanding is not a concern related to the safety of RR-1445 cotton *per se*. Only the general concerns raised by Sweden and the United Kingdom regarding long-term effects of herbicide tolerant crops on the environment were not, according to Dr. Andow fully addressed by the SCP with regard to RR-1445 cotton.[1446] However, Dr. Andow indicated that the long-term experiments suggested by Sweden were not feasible and that the concerns identified could best be addressed in a monitoring plan, but that the necessity of a monitoring plan could not be determined from the objections as submitted. At any rate, the record does not indicate that after the Regulatory Committee vote, the Commission or the lead CA sought additional information from the applicant in an effort to allay these concerns.

7.1909 Even if it were assumed that during its inter-service consultations the Commission was undertaking its own assessment of the scientific validity of the specific concerns expressed with a view to supporting its draft measure with scientific arguments[1447], it is well to recall that the SCP was able to undertake a comprehensive scientific assessment of the application concerning RR-1445 cotton in little over three months' time.[1448] The Panel also notes that the European Communities does not assert that the concerns raised by the member States in question presented either new or particularly complex scientific problems.

7.1910 Another circumstance invoked by the European Communities is the fact that Directive 90/220 was being revised at the time. According to the European Communities, a period of time for reflection was therefore needed before proceeding further. To recall, the Commission in this case launched its inter-service consultations on a draft measure to be submitted to the Council in May 1999. At the end of June 1999, the Council reached a political agreement – the Common Position – on the proposal to amend Directive 90/220, but Directive 2001/18, the Directive amending Directive 90/220, was not adopted until March 2001 and did not enter into force until October 2002. Thus, the Commission started its inter-service consultations almost three-and-a-half years before the entry into force of Directive 2001/18. In the light of this, even accepting that the Commission could take some time to reconsider its draft measure, the Commission's failure to forward a draft measure to the Council cannot be excused on the grounds that there was not enough time to complete the approval procedure while Directive 90/220 was still in force.[1449]

7.1911 Furthermore, the fact that some member States and segments of public opinion may have considered that Directive 90/220 was no longer adequate and may have voiced opposition to further approvals under that Directive 90/220 did not, in the Panel's view, provide a justification for the Commission to delay the approval procedure in question until new legislation had been put in place. The EC legislator allowed Directive 90/220 to remain in force and hence applicable until October 2002. Moreover, if the Commission saw a need to respond to concerns about perceived inadequacies inherent in Directive 90/220, there were other courses of action open to it. Thus, the Commission

[1445] Annex H, para. 468.

[1446] Annex H, paras. 443-448.

[1447] The European Communities did not specifically assert that it was undertaking a scientific assessment of the concerns in question; it merely implied that the Commission embarked on a "detailed consideration" of these concerns.

[1448] Exhibit EC-66/Ats. 40 and 43.

[1449] In its earlier findings on the application concerning RR-1445 cotton, the Panel noted that the Commission had reason to believe that due to the "blocking minority" of the Group of Five countries in the Council, it would have to adopt the draft measure it submitted to the Council. In the Panel's view, even in this scenario, there was enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force.

could in the first instance have sought voluntary commitments from the applicant. Alternatively, it could have proposed that the application be approved subject to conditions. In this respect, it is worth noting that Directive 90/220 provided additional safeguards if new information on risks of RR-1445 cotton had become available after its EC-wide approval.[1450] In such an event, a member State could, pursuant to Article 16 of Directive 90/220, provisionally restrict or prohibit the marketing of RR-1445 cotton. Finally, if in fact the Commission had been of the view that the risks arising from the marketing of RR-1445 cotton could not be adequately assessed or managed under Directive 90/220, it could arguably have sought the rejection of the application, subject, perhaps, to the right of the applicant to submit the application for reconsideration under the revised Directive, once it entered into force.[1451]

7.1912 Based on the above considerations, the Panel is of the view that in the specific circumstances of this procedure, the time actually taken by the Commission to prepare and forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long.

7.1913 Regarding DS291, we recall that the United States claims that the approval procedure concerning RR-1445 cotton was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure concerning RR-1445 cotton to the Council is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1914 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Council, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.1915 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning RR-1445 cotton for final approval, and that this resulted in "undue delay"

[1450] The Commission usually made this point in its decisions approving applications. *See, e.g.*, Exhibit ARG-35 ("[w]hereas Article 11(6) and Article 16(1) of Directive 90/220/EEC provide additional safeguards if new information on risks of the product becomes available").

[1451] The fact that such a final decision might possibly have been challenged by the applicant before an EC court would obviously not have been a legitimate reason for not completing the approval procedure.

in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning RR-1445 cotton, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the Commission to forward a draft measure to the Council – no draft measure was forwarded between June 1999 and October 2002 – was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning RR-1445 cotton without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(vii) Transgenic potato (EC-67)

7.1916 Only one Complaining Party, the United States, claims that the completion of the approval procedure concerning the Transgenic potato has been unduly delayed.

7.1917 The **United States** argues that after the Transgenic potato received a favourable opinion from the SCP, the Commission failed to submit a draft measure to the Regulatory Committee, with the consequence that the consideration of this application was suspended until the application was resubmitted under Directive 2001/18.

7.1918 The United States submits, in addition, that the application concerning the Transgenic potato is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning the Transgenic potato is excessive and unjustified and, hence, undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1919 The **European Communities** points out that the SCP in this procedure took more than three and a half years to assess the Transgenic potato. The European Communities submits that when the SCP issued its opinion in July 2002, Directive 2001/18 was about to enter into force and it was clear that the application had to be updated in the light of the new Directive.

7.1920 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.1921 The Panel recalls that the SCP issued a favourable opinion on 18 July 2002. Following the issuance of the SCP opinion, the Commission did not submit a draft measure to the Regulatory Committee. In fact, it seems that unlike in other approval procedures[1452], the Commission in this procedure did not even launch inter-service consultations on a draft measure. In October 2002,

[1452] *See, e.g.*, Exhibits EC-62/At. 76; EC-65/At. 48.

Directive 90/220 was repealed. The United States argues that the Commission should have submitted a draft measure to the Regulatory Committee before October 2002.

7.1922 The preparation by the Commission of a draft measure and its submission to the Regulatory Committee is not a process which inherently takes very long. In some approval procedures, the Commission was able to prepare and submit draft measures to the Regulatory Committee within a matter of a few months. For example, in the procedure concerning Bt-531 cotton, the Commission prepared a draft measure and launched a vote in the Regulatory Committee in slightly less than three months.[1453] Likewise, in the procedure concerning NK603 maize, the Regulatory Committee voted on the application a little less than three months after EFSA issued its opinion.[1454]

7.1923 In the case of the approval procedure concerning the Transgenic potato, the SCP issued its opinion almost exactly three months before Directive 90/220 was repealed. The Panel understands the European Communities to argue that in these circumstances, the Commission did not need to submit a draft measure to the Regulatory Committee. This argument presents the issue whether the Commission could justifiably have reached the conclusion that three months would be insufficient to approve the application concerning the Transgenic potato.

7.1924 In its earlier findings, the Panel found that before the Transgenic potato could be approved, a number of procedural steps remained to be undertaken and completed. The Commission had to prepare a draft measure and submit it to the Regulatory Committee; the Regulatory Committee had to meet and vote on the draft measure; in the event of a favourable vote in the Regulatory Committee, the Commission had to adopt its draft measure; and finally, the lead CA had to give its written consent so that the product could be placed on the market. Directive 90/220 does not stipulate specific deadlines for any of these procedural steps.

7.1925 As pointed out above, the record shows that in one particular approval procedure, the Commission was able to obtain a Regulatory Committee vote less than three months after EFSA issued its opinion. If in the approval procedure concerning the Transgenic potato the Commission had proceeded with a sense of urgency, it might thus have succeeded in obtaining a Regulatory Committee vote in slightly less than three months.[1455] If the Commission's draft measure had achieved a qualified majority, the approval procedure would then have had to be completed within a matter of a few days.

7.1926 The record does not provide confirmation that this would have been possible. Regarding the adoption by the Commission of its own draft measure, the approval procedure concerning Bt-11 sweet maize is of interest, although that procedure was conducted under Regulation 258/97. In that procedure, the Commission took close to a month to adopt its own draft measure after the Council failed to achieve a qualified majority.[1456] Regarding the written consent to be given by the lead CA, the Panel finds informative the provisions of Article 18(2) of Directive 2001/18 according to which the lead CA must give its written consent, transmit it to the applicant and inform the other member States and the Commission thereof "within 30 days following the publication or notification of the [Commission's] decision [to adopt its draft measure]". While, as noted, Directive 90/220 stipulates no such deadline, the aforementioned steps were also to be completed under that Directive.[1457] It is

[1453] The Commission launched inter-service consultations on 4 September 1998 and launched a vote in the Regulatory Committee on 26 November 1998. Exhibit EC-65/Ats. 48 and 51.

[1454] EFSA issued its opinion on 25 November 2003 and the Regulatory Committee voted on the Commission's draft measure on 18 February 2004. Exhibit EC-76/Ats. 70 and 72.

[1455] The United States has submitted no evidence or argument to show that the Commission could have completed this task in substantially less time.

[1456] Exhibit EC-92/At. 81.

[1457] Article 13(4) of Directive 90/220.

reasonable to infer from the thirty-day deadline set out in Article 18(2) that the relevant steps could not invariably be completed in just a few days. Notwithstanding the foregoing, it may be assumed that if both the Commission and the lead CA had proceeded on an urgency basis in view of the exceptional circumstance of the imminent repeal of Directive 90/220, they might well have been able to complete their respective procedural steps in less than a month each. However, the evidence before the Panel is insufficient to support the conclusion that the procedural steps to be completed by the Commission and the lead CA should altogether have taken no more than a few days.

7.1927 In conclusion, based on the evidence on the record, the Panel is not convinced that the approval procedure concerning the Transgenic potato could have been completed in the three-month period preceding the date of repeal of Directive 90/220, and that the Commission should therefore have launched inter-service consultations on a draft measure to be submitted to the Regulatory Committee. Accordingly, the Panel finds that it has not been established that the time actually taken by the Commission to prepare and forward a draft measure – no draft measure was prepared and forwarded between July 2002 and October 2002 – was unjustifiably long.

Total amount of time taken since submission of application

7.1928 The United States also puts forward the argument that the total amount of time during which the application concerning the Transgenic potato was pending is excessive and unjustified and, hence, undue. The application concerning the Transgenic potato was first submitted for approval under Directive 90/220 in August 1996. This means that as of the end of August 2003, the approval procedure had been pending for more than seven years.

7.1929 The Panel agrees with the United States that, in absolute terms, this is a long period of time. However, the mere identification of the total amount of time during which an application has been pending does not demonstrate, in and of itself, that the time taken was unjustifiably long. Indeed, certain delays might be attributable, not to the European Communities, but to the applicant. Other delays might be attributable to the European Communities, but they might be justifiable. In the case of applications which were submitted under Directive 90/220 – and the application concerning the Transgenic potato is one of these – it must also be remembered that in accordance with Article 35 of Directive 2001/18, applications submitted under Directive 90/220, but not approved by October 2002 became subject to Directive 2002/18 and had to be re-assessed by the lead CA. As a necessary consequence, applications which had progressed to an advanced stage in the approval process under Directive 90/220 and then were resubmitted to the lead CA under Directive 2001/18 were pending for long periods of time. Yet despite the fact that Article 35 of Directive 2001/18 resulted in certain approval procedures – including that concerning the Transgenic potato – being delayed, the United States did not question the provisions of Article 35. In these circumstances, it would be incongruous not to take account of the fact that some of the total time taken to assess a relevant application was a direct consequence of the operation of Article 35.

7.1930 Moreover, even if the United States were correct in asserting that before there was an EC moratorium, approval procedures used to be completed in less than three years, it must be remembered that the European Communities assesses applications on a case-by-case basis. Thus, the fact that the approval procedure concerning the Transgenic potato was not completed in less than

three years in our view does not demonstrate that it was not justifiable for the European Communities to take more time to process the application concerning the Transgenic potato.[1458]

7.1931 The United States further argues that in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, the fact that the application in question had been pending for more than seven years demonstrates the existence of undue delay. We recall in this respect our finding that the record supports the conclusion that the European Communities applied a *de facto* moratorium on approvals as of June 1999. At that time, the application concerning the Transgenic potato had already been pending for more than two years and ten months. Thus, some of the total time taken cannot be explained by the moratorium. Moreover, the mere fact that a general moratorium was in effect does not necessarily imply that a particular application was affected by it. The United States itself has repeatedly stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process" and that "certain progress in the process, short of a final decision, is not the least bit inconsistent with a moratorium on final approvals".[1459] Therefore, by itself, the fact that a moratorium on approvals was in effect between June 1999 and August 2003 is not sufficient to demonstrate that the period of time during which the application concerning the Transgenic potato was pending as of August 2003 reflects a failure on the part of the lead CA to complete the relevant approval procedure without undue delay.

7.1932 Accordingly, the Panel is unable to accept the United States' assertion that the total period of time during which the application concerning the Transgenic potato had been pending as of August 2003 demonstrates that the time taken was unjustifiably long.

Conclusion

7.1933 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that it has not been established that the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee once the SCP had issued its opinion – no draft measure was forwarded between late July 2002 and October 2002 – was unjustifiably long, or that the total amount of time taken by the European Communities up to August 2003 was unjustifiably long. Based on these findings, the Panel is unable to accept the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning the Transgenic potato for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning the Transgenic potato, the United States has failed to establish that the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

[1458] It is worth recalling, more generally, that the approval procedures which were completed before there was a moratorium on approvals were not affected by the special circumstance that Directive 90/220 was repealed in 2002.

[1459] *See, e.g.*, US second written submission, para. 51 (emphasis in original).

(viii) Liberator oilseed rape (EC-68)

7.1934 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Liberator oilseed rape has been unduly delayed.

7.1935 The **United States** argues that after Liberator oilseed rape received a favourable opinion from the SCP the Commission failed to submit a draft measure to the Regulatory Committee. The United States notes that this resulted in a two-year delay, since no action was taken on the application until November 2002 when the applicant was requested to provide an update in light of the entry into force of Directive 2001/18. The United States submits that there is no indication of any problem with the application during the two-year gap, nor of any additional information needed for final approval. According to the United States, the two-year delay was therefore undue.

7.1936 The United States submits, in addition, that the application concerning Liberator oilseed rape is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Liberator oilseed rape is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1937 The **European Communities** argues that the SCP opinion on Liberator oilseed rape recommended "an agreed code of practice for field management of the particular modified crop involving the active participation of the applicant to promote best practice by farmers".[1460] The European Communities submits that contrary to what it had done in the parallel dossier on Falcon oilseed rape, the applicant did not present any proposal for a code of practice following the opinion of the SCP and that it did not manifest itself with the lead CA at all until the lead CA in November 2002 sent the applicant a letter reminding it of the need to up-date the application by January 2003. The European Communities submits that it cannot be held responsible for delays that are caused by the lack of diligence or the failings of an applicant.

7.1938 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.1939 The Panel recalls that the SCP issued a favourable opinion on 30 November 2000. Following the issuance of the SCP opinion, the Commission did not submit a draft measure to the Regulatory Committee until Directive 90/220 was repealed in October 2002. After the repeal of Directive 90/220, on 5 November 2002, the lead CA contacted the applicant to remind it of the need to update the application so that it could be further considered under Directive 2001/18. The United States argues that the Commission should have submitted a draft measure to the Regulatory Committee before October 2002.

7.1940 The preparation by the Commission of a draft measure and its submission to the Regulatory Committee is not a process which inherently takes more than twenty-two months. In other approval procedures, the Commission was able to prepare and submit draft measures to the Regulatory Committee within a matter of a few months. For example, in the procedure concerning Bt-531 cotton,

[1460] Exhibit EC-68/At. 88.

the Commission prepared a draft measure and launched a vote in the Regulatory Committee in less than three months.[1461] Likewise, in the procedure concerning NK603 maize, the Regulatory Committee voted on the application less than three months after EFSA issued its opinion.[1462] It may be inferred from these examples that the Commission could in principle have submitted a draft measure to the Regulatory Committee well before October 2002.

7.1941 The fact that the Commission could in principle have submitted a draft measure to the Regulatory Committee before October 2002 does not necessarily mean that the Commission could have done so in the specific circumstances of this case. The European Communities essentially asserts that its failure to do so is justified in view of the applicant's failure to present a code of practice for the field management of Liberator oilseed rape once the SCP had issued its opinion. However, in its earlier analysis of the approval procedure in question, the Panel found that it was not persuaded that the applicant was supposed to present a proposal for a code of practice, nor that the Commission failed to submit a draft measure to the Regulatory Committee because it was waiting for the applicant to propose a code of practice. The Panel further found that, in any event, the Commission in this case did not launch inter-service consultations on a draft measure to be submitted to the Regulatory Committee, and that the fact that the applicant did not present a proposal was not an obstacle to the Commission launching such consultations.[1463] Accordingly, the Panel is unable to agree with the European Communities that the applicant's failure to present a code of practice justified the Commission's failure to forward a draft measure to the Regulatory Committee before October 2002.

7.1942 Separately, it should be noted that the SCP opinion in this procedure dates from November 2000. Directive 90/220 was not repealed until almost two years later. There was thus enough time for the Commission to launch and complete inter-service consultations on a draft measure to be submitted to the Regulatory Committee and for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee. In the Panel's assessment, the Commission's inaction cannot, therefore, be excused on the grounds that the approval procedure concerning Liberator oilseed rape could not be completed while Directive 90/220 was still in force.

7.1943 In its earlier findings on the application concerning Liberator oilseed rape, the Panel noted that the Commission could have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. In the Panel's view, even in this scenario, there was enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force. But even if it the Commission considered it doubtful that there would be enough time in view of anticipated member State opposition, the Panel does not consider that this would have justified the Commission's failure to forward a draft measure to the Regulatory Committee. The Commission would have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. As pointed out above, there is no indication that the June 1999 declaration was intended to legally bind the Governments of the Group of Five countries *vis-à-vis* other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, we think the Commission could not have legitimately invoked the June 1999 declaration as a justification for not submitting a draft measure to the Regulatory Committee prior to October 2002.

[1461] Exhibit EC-65/Ats. 48 and 51.
[1462] Exhibit EC-76/Ats. 70 and 72.
[1463] *See supra*, para. 7.687.

7.1944 Based on the above considerations, the Panel is of the view that, in the specific circumstances of this procedure, the time actually taken by the Commission to prepare and forward a draft measure to the Regulatory Committee – no draft measure was forwarded between late November 2000 and October 2002 – was unjustifiably long.

7.1945 In addition, we recall that the United States claims that the approval procedure concerning Liberator oilseed rape was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure to the Regulatory Committee following the issuance of the SCP's opinion is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1946 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Regulatory Committee, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.1947 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee once the SCP had issued its opinion – no draft measure was forwarded between late November 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Liberator oilseed rape for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Liberator oilseed rape, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ix) Bt-11 maize (EC-69)

7.1948 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Bt-11 maize (EC-69) has been unduly delayed.

7.1949 The **United States** argues that after the application concerning Bt-11 maize (EC-69) received a favourable opinion from the SCP in November 2000, the Commission failed to submit a draft measure to the Regulatory Committee. The United States notes that, under the EC approval system, the next step after the SCP favourable opinion should have been to submit the application for approval by the Regulatory Committee. According to the United States, however, there was no action on the application for two years after the SCP opinion and instead the next entry in the chronology provided by the European Communities is an "evaluation of updates by the lead CA" in October 2002, which is

unexplained and unsupported by any exhibit or attachment. According to the United States, the lengthy delay after the SCP opinion was issued provides compelling evidence of the existence of a general moratorium.

7.1950 The United States submits, in addition, that the application concerning Bt-11 maize (EC-69) maize is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-11 maize (EC-69) is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1951 The **European Communities** argues that, after the SCP opinion, further discussions were held between the lead CA, the applicant and the Commission, and they went on until well into 2002. The European Communities notes in this respect that the SCP recommended a monitoring plan, and that the issue of the monitoring plan remained unsettled. The European Communities further points out that in May 2002 the applicant submitted additional information, including supplementary sequence information on the molecular characterization of the Bt-11 line, taking into account the provisions of the new Directive, *inter alia* on monitoring, traceability and labelling.

7.1952 The **United States** responds that the monitoring plan referred to in the SCP opinion is an "Insect Resistance Management" (IRM) plan, and that the SCP never recommended any changes to the applicant's proposed IRM plan. The United States also notes that the only other mention of monitoring was with respect to changes in field populations of non-target insects, but that the SCP did not request a monitoring plan on non-target insects, or note any deficiency in the application. Moreover, the United States argues that nothing in the record indicates that EC regulators ever approached the applicant either to identify a problem or to request additions to the application.

7.1953 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.1954 The Panel recalls that in the approval procedure concerning Bt-11 maize (EC-69), the SCP issued a favourable opinion on 30 November 2000. Following the issuance of the SCP opinion, the Commission did not submit a draft measure to the Regulatory Committee. In October 2002, Directive 90/220 was repealed. The United States argues that the Commission should have submitted a draft measure to the Regulatory Committee before October 2002.

7.1955 The preparation by the Commission of a draft measure and its submission to the Regulatory Committee is not a process which inherently takes more than twenty-two months. In other approval procedures, the Commission was able to prepare and submit draft measures to the Regulatory Committee within a matter of a few months. For example, in the procedure concerning Bt-531 cotton, the Commission prepared a draft measure and launched a vote in the Regulatory Committee in less than three months.[1464] Likewise, in the procedure concerning NK603 maize, the Regulatory Committee voted on the application less than three months after EFSA issued its opinion.[1465] It may

[1464] Exhibit EC-65/Ats. 48 and 51.
[1465] Exhibits EC-76/At. 70-72.

be inferred from these examples that the Commission could in principle have submitted a draft measure to the Regulatory Committee well before October 2002.

7.1956 The fact that the Commission could in principle have submitted a draft measure to the Regulatory Committee before October 2002 does not necessarily mean that the Commission could have done so in the specific circumstances of this case. The Panel understands the European Communities to assert that the Commission did not send a draft measure to the Regulatory Committee because, after the SCP opinion, the lead CA, the applicant and the Commission continued discussions on a monitoring plan well into 2002. The Panel also understands the European Communities to assert that the applicant submitted additional information in May 2002, just before the new Directive entered into force.

7.1957 Regarding the monitoring plan, we stated in earlier findings on this approval procedure that we are not persuaded by the European Communities' assertion that the Commission did not submit a draft measure to the Regulatory Committee because the SCP recommended a monitoring plan and the issue remained unsettled. We further found that, in any event, the Commission in this case did not launch inter-service consultations on a draft measure to be submitted to the Regulatory Committee, and that the fact that the SCP stated that monitoring should be carried out was not an obstacle to the Commission launching inter-service consultations on a draft measure. Accordingly, we are unable to agree with the European Communities that the fact that the SCP recommended a monitoring plan justified the Commission's failure to forward a draft measure to the Regulatory Committee before October 2002.

7.1958 Regarding the additional information submitted by the applicant in May 2002, we have already observed earlier that this information was apparently voluntarily submitted with a view to updating the application in anticipation of the entry into force of the new requirements contained in Directive 2001/18. There is no evidence that this additional information was submitted at the request of the Commission or the lead CA. In other words, there is no reason to believe that the Commission was waiting for this information. In our view, therefore, the May 2002 information does not justify the Commission's failure to submit a draft measure to the Regulatory Committee between November 2000 and May 2002.

7.1959 Separately, it should be noted that the SCP opinion in this procedure dates from November 2000. Directive 90/220 was not repealed until almost two years later. In our assessment, there was thus enough time for the Commission to launch and complete inter-service consultations on a draft measure to be submitted to the Regulatory Committee and for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee.[1466] In our assessment, the Commission's inaction cannot, therefore, be excused on the grounds that the approval procedure concerning Bt-11 maize (EC-69) could not be completed while Directive 90/220 was still in force.

7.1960 In our earlier findings on the application concerning Bt-11 maize (EC-69), we noted that the Commission could have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. In our view, even in this scenario, there was enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force. But even if it the Commission considered it doubtful that there would be enough time in view of

[1466] We note, by way of example, that in the procedure concerning NK603 maize, the Regulatory Committee voted on the application less than three months after the SCP issued its opinion. Exhibit EC-76/At. 72.

anticipated member State opposition, the Panel does not consider that this would have justified the Commission's failure to forward a draft measure to the Regulatory Committee. On the other hand, the Commission could have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. Yet, as pointed out above, there is no indication that the June 1999 declaration was intended to bind the Governments of the Group of Five countries *vis-à-vis* other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, we think the Commission could not have invoked the June 1999 declaration as a justification for not submitting a draft measure to the Regulatory Committee prior to October 2002.

7.1961 Based on the above considerations, the Panel is of the view that, in the specific circumstances of this procedure, the time actually taken by the Commission to prepare and forward a draft measure to the Regulatory Committee – no draft measure was forwarded between late November 2000 and October 2002 – was unjustifiably long.

7.1962 In addition, we recall that the United States claims that the approval procedure concerning Bt-11 maize (EC-69) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure to the Regulatory Committee following the issuance of the SCP's opinion is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.1963 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Regulatory Committee, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.1964 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee once the SCP had issued its opinion – no draft measure was forwarded between late November 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-11 maize (EC-69) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-11 maize (EC-69), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(x) RR oilseed rape (EC-70)

7.1965 Two Complaining Parties, the United States and Canada, claim that the completion of the approval procedure concerning RR oilseed rape (EC-70) has been unduly delayed.

7.1966 The **United States** argues that this application was delayed at the member State level for more than four years. The United States submits that although the applicant in this procedure provided answers to all of the questions raised by the lead CA, the lead CA failed to approve the product under Directive 90/220. More specifically, the United States argues that the total time taken at the member State level for the initial review was 54 months (7 July 1998 to 22 January 2003), of which 12 months were taken by the applicant to respond to questions. The United States asserts that an additional 10 months of the total time taken were spent resolving confidentiality issues in relation to detection methods. Thus, according to the United States, the lead CA in this procedure took 32 months for its review instead of the 90 days referred to in Article 12 of Directive 90/220. The United States considers this delay in completing the approval procedure concerning RR oilseed rape (EC-70) to be undue.

7.1967 The United States notes, in addition, that Denmark, Italy, Belgium, Austria, France and Germany all objected to the lead CA's favourable initial assessment on the grounds that new EC rules concerning the traceability and labelling of biotech products needed to be in place before they could support the approval of any application. The United States submits that this shows an unwillingness to acknowledge the strength of the scientific conclusions reached by the lead CA and opposition to approval regardless of the merits of the application in question. The United States notes, in addition, that Austria and Denmark also objected because in their view issues concerning liability and coexistence remained to be resolved. The United States submits that a desire for rules addressing these issues cannot justify delay. Otherwise, a Member could always say it would like a better regulatory regime in aspects unrelated to the environment, human or animal health and delay approvals indefinitely, rendering the "no undue delay" discipline meaningless.

7.1968 The United States also points out that the application concerning RR oilseed rape (EC-70) is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning RR oilseed rape (EC-70) is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1969 **Canada** notes that in February 2000, the Dutch State Institute for Quality Control of Agricultural Products (RIKILT-DLO), which is responsible for providing scientific opinions relating to feed safety, issued a favourable assessment of RR oilseed rape (EC-70). On 10 January 2001, the Dutch Committee on Genetic Modification (COGEM), which is responsible for providing scientific advice relating to human health and the environment, concluded its assessment with a favourable conclusion. In January 2003, the Netherlands CA published a favourable overall assessment report. Canada submits that the two-year delay by the Netherlands CA in completing its overall assessment report and forwarding it to the Commission is unjustified and excessive.

7.1970 Canada also argues that the total time taken by the Netherlands to review this file was 54 months (7 July 1998 to 22 January 2003). Out of these 54 months, the applicant took a total of 12 months to respond to questions. Another 10 months were used for discussions of the confidentiality status of certain information submitted by the applicant beyond the legal requirements of the approval

legislation then in force. Canada submits that even if the latter period of time were not taken into account in this calculation, the remaining 32 months are in stark contrast to the 90 days foreseen in Directive 90/220 for this procedural step. In Canada's view, it is reasonable to infer from this that in the light of the moratorium, the Dutch authorities were taking a decidedly go-slow approach.

7.1971 Regarding the delay caused by the issue of confidentiality, Canada notes that Annex C(1)(d) of the *SPS Agreement* states that WTO Members shall ensure "the confidentiality of information about imported products arising from or supplied in connection with control, inspection and approval is respected […] in such a manner that legitimate commercial interests are protected". Under Article 25 of Directive 2001/18, an applicant is entitled to request that commercially sensitive information be protected, which the applicant in this case did in March 2001. Canada is therefore of the view that delays arising from an applicant seeking to ensure the fulfilment of obligations, both under the *SPS Agreement* and domestic law, relating to the protection of legitimate commercial interests should not be attributed to the applicant.

7.1972 In addition to the foregoing, Canada submits that the failure by the European Communities to approve this product under Directive 2001/18 compounds the already unjustified and excessive delay. Canada submits that repeated, unjustified "road-blocks" that have been imposed by member States resulting in excessive delays – unjustified objections to the lead CA's favourable initial assessment in March 2003, the failure of the Regulatory Committee to obtain a qualified majority at its meeting of 16 June 2004 – demonstrate that the European Communities has violated its obligations under Annex C(1) of the *SPS Agreement*.

7.1973 Regarding member State objections, Canada notes that Denmark, Italy, France, Austria and Belgium raised objections, not on the basis of safety concerns, but on the grounds that approval of the application in question should be suspended pending the adoption of new EC legislation on traceability and labelling. Canada further contends that Denmark (in relation to transport of RR oilseed rape (EC-70)) and Italy (in relation to herbicide use) raised objections outside the scope of the assessment foreseen by Directive 2001/18. Finally, Canada argues that objections were raised which were irrelevant in the light of the scope of the requested approval (*i.e.* for import and processing). Denmark requested that a monitoring plan should include observations on dispersal and gene transfer to oilseed rape and wild relatives.[1467] Likewise, Italy, the United Kingdom, Spain and Austria objected on the basis that a post-market monitoring plan needed to be proposed to assess seed spillage. Canada submits that the European Communities' scientific committee has confirmed repeatedly, and in particular for oilseed rape, that the mere fact of potential dispersal of seeds and gene transfer among domesticated or wild relatives is not *per se* negative for human health or the environment. Moreover, Canada points out that the scope of the approval was for import only, as opposed to planting – a fact that does not normally attract attention to seed spillage, because the imported grain is processed at the port of entry where spillage is controlled in compliance with statutory standards and to avoid economic loss.

7.1974 Canada also argues that the total time for member State review of the lead CA's initial assessment was eight months (22 January 2003 to 6 October 2003) instead of 105 days, the time-period envisaged in Article 15 of Directive 2001/18.

7.1975 Regarding the failure of the Regulatory Committee to obtain a qualified majority at its meeting of 16 June 2004, Canada notes that prior to the vote, EFSA rendered a favourable opinion and that in rendering its favourable opinion, EFSA considered all of the member States' objections in relation to safety issues. Canada considers, therefore, that whatever the rationalization for member

[1467] Exhibit EC-70/At. 26.

States to vote against or abstain from voting, such rationalizations were not justified by science-based health or safety considerations. In Canada's view, it follows that the failure of the Regulatory Committee to approve the application forced additional unwarranted delays.

7.1976 Finally, Canada contends that the length of time it has taken, so far, for this application to move through the approval system – seven years – is, by any reasonable standard, "undue" and therefore a violation of Annex C(1)(a), keeping in mind that it still has not been approved. However, the amount of time this application has languished in the approval procedure is not the sole reason for Canada's claim that the delay has been undue. First and foremost, the European Communities has had in place, since October 1998, an unjustified moratorium on approvals. Furthermore, the refusal to approve the application concerning RR oilseed rape (EC-70) is not based on a risk assessment, despite numerous favourable risk assessments conducted by the European Communities' own scientific committees.

7.1977 The **European Communities** argues that in this procedure there was a continuous exchange of correspondence between the lead CA and the applicant until December 2002, when the applicant updated its application in accordance with the requirements of Directive 2001/18. According to the European Communities, this period of time was entirely dedicated to resolving scientific and technical issues, such as molecular characterisation and feed safety. The lead CA requested additional information on molecular characterization and on certain feed safety aspects, and exchanges regarding these issues continued until the year 2000. After the adoption of Directive 2001/18 in March 2001, the lead CA asked the applicant to provide information on a detection method as required under the new legislation. The applicant requested confidentiality status for the information to be provided. The lead CA initially did not accept the reasons provided for requesting that status and several letters were exchanged on the issue. The lead CA also requested reference material which again triggered a debate on confidentiality. The European Communities notes that these issues were only settled in the autumn of 2002. By that time, Directive 2001/18 had entered into force and the lead CA and applicant worked on up-dating the application according to Directive 2001/18. As regards the issue of confidentiality, the European Communities submits that it was at the request of the applicant that the discussion on these issues was undertaken and that the European Communities cannot be responsible for any slippage in the timetable resulting from a request made by an applicant.

7.1978 The European Communities further points out that once the applicant had provided an update, the application moved immediately to the Community level. A few member States requested additional information and six member States raised objections. The objections related to issues of molecular characterisation (insufficient data), feeding studies, the monitoring plan, allergenicity, detection/identification methods as well as traceability and labelling. Meetings were held with the applicant to settle these issues and the applicant provided additional information. The European Communities contends that the objections raised by member States were based on legitimate and scientifically sound concerns, or regulatory requirements outside the scope of this dispute (traceability and labelling).

7.1979 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.1980 We note that in the approval procedure concerning RR oilseed rape (EC-70), the applicant submitted an application to the lead CA (the Netherlands) on 7 July 1998. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. The dossier was forwarded to the Commission with a favourable assessment report on 16 January 2003, after the applicant had provided an updated application in accordance with Directive 2001/18.

7.1981 The United States and Canada assert that the lead CA took too long to complete its assessment. They note that the lead CA took much more time for its own assessment of the application than the 90 days envisaged in Article 12(2) of Directive 90/220.[1468] We consider that this is correct.[1469] However, whether or not the lead CA complied with the 90-day deadline stipulated in Directive 90/220 in our view is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. Indeed, legislation of different WTO Members may stipulate deadlines for this type of assessment which are more or less strict. Nevertheless, we consider that the deadline set forth in Directive 90/220 provides a useful indicator to guide the Panel's analysis. The 90-day deadline is binding and applies to all relevant applications submitted under Directive 90/220. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.[1470]

7.1982 In the present case, however, the European Communities contends that all of the time taken by the lead CA until December 2002, when the applicant complemented its application in accordance with the requirements of Directive 2001/18, was necessary to resolve scientific and technical issues.[1471] Since we do not view the fact that the 90-day deadline was exceeded as dispositive, *per se*, we go on to examine whether the lead CA was justified in forwarding an assessment report to the Commission only in mid-January 2003.

7.1983 In its earlier findings on the approval procedure concerning RR oilseed rape (EC-70), the Panel noted its understanding that when evaluating applications for placing on the market, the Netherlands CA notably took into consideration the advice from the COGEM and the opinion of the RIKILT-DLO. In the approval procedure in question, the RIKILT-DLO submitted its favourable opinion in February 2000[1472], and the lead CA advised the applicant in March 2000 in an e-mail that no further technical information for the risk assessment needed to be supplied.[1473] The COGEM did not provide its favourable advice until 10 January 2001.[1474]

7.1984 Regarding the advice from the COGEM, it should be recalled that the COGEM met in September 1998 to discuss the application in question. This led to a request for additional information on molecular characterization, which was transmitted to the applicant also in September 1998.[1475] The applicant provided the requested information in December 1998.[1476] Yet the COGEM did not meet again to discuss the application and the additional information for another two years. The relevant meeting took place in December 2000, a month before the COGEM provided its final

[1468] We recall that the 90 days envisaged in Directive 90/220 do not include any periods of time during which the lead CA is awaiting further information which it requested from the applicant.

[1469] For instance, as is clear from Exhibit EC-70, the lead CA was assessing the application between 13 August 1998 and 25 September 1999; between 2 April 1999 and 17 August 1999; and between 18 November 1999 and 21 January 2000 when the RIKILT-DLO appears to have requested additional information (Exhibit EC-70/At. 17). These periods of time, which are but examples, already add up to more than seven months.

[1470] Our remarks concerning the 90-day deadline set out in Article 12(2) of Directive 90/220 are also applicable, *mutatis mutandis*, to the corresponding 90-day deadline set out in Article 14(2) of Directive 2001/18.

[1471] EC second written submission, para. 199.

[1472] Exhibit EC-70/At. 66, Summary of the evaluation carried out by the Netherlands Competent Authority (GT73), p. 5; *see also* Exhibit CDA-57.

[1473] Exhibit EC-70/At. 18; Exhibit CDA-132.

[1474] Exhibit EC-70/At. 66, Summary of the evaluation carried out by the Netherlands Competent Authority (GT73), p. 5; *see also* Exhibit CDA-57.

[1475] Exhibit EC-70/At. 7.

[1476] Exhibit EC-70/Ats. 9 and 10.

advice.[1477] The record does not support the inference that the COGEM provided its advice only in January 2001 because it needed to resolve scientific or technical issues. Nor is there any indication in the record that the COGEM had other reasons for delaying the provision of its advice. There is therefore no apparent reason why the COGEM could not have provided its advice before or by the time the lead CA informed the applicant by e-mail that no further technical information needed to be submitted, *i.e.*, before or by March 2000.

7.1985 In the light of the foregoing, the Panel considers that at the latest in March 2000 the lead CA could have had all the elements to complete its assessment report. The European Communities notes that the applicant submitted additional information in April and May 2000. It is correct that in the aforementioned e-mail of March 2000 from the lead CA to the applicant, the lead CA also noted that the legal name and registration of the applicant would need to be confirmed, and that the original application would need to be modified to take into account the additional information submitted in the course of the assessment process.[1478] In April 2000, the applicant confirmed its legal name and registration.[1479] And in mid-May 2000, the applicant sent a draft document to the lead CA to indicate how it intended to modify the original application and to ask for comments and suggestions.[1480] The lead CA replied that it would communicate its "findings" as soon as possible, probably within less than a fortnight.[1481] This estimate demonstrates that the document submitted in mid-May 2000 did not call for a lengthy analysis by the lead CA. Moreover, the Panel does not consider that the March 2000 e-mail from the lead CA constitutes a formal request for information which triggered a clock-stop.[1482]

7.1986 If, as the Panel believes, the lead CA could have obtained all necessary elements at least by March 2000, it may reasonably be assumed that the lead CA could have completed its assessment report at the latest 90 days later, *i.e.*, around the end of June 2000. It should be recalled that Article 12(2) of Directive 90/220 requires that "at the latest 90 days after receipt" of an application, the lead CA must, in the case of a favourable assessment, forward the application to the Commission with a favourable opinion. The Panel has already observed in respect of the corresponding 90-day deadline stipulated in Directive 2001/18 that that deadline provides a useful indicator for determining how much time might be needed to complete an member State level assessment. Assuming that 90 days would have been sufficient seems all the more reasonable as by March 2000 the lead CA had already assessed the application for more than the 90 days envisaged in Article 12(2) of Directive 90/220.[1483]

7.1987 Based on the foregoing considerations, the Panel considers that the lead CA could have forwarded its assessment report to the Commission well before the end of 2000 and thus much before

[1478] Exhibit EC-70/At. 18.

[1479] Exhibit EC-70/At. 19. In addition, the applicant sent some information which the European Communities acknowledges had already been transmitted to the lead CA. EC reply to Panel question No. 152.

[1480] Exhibit EC-70/At. 21. The Panel fails to see a basis for the European Communities' contention that the relevant draft document was "a new element in the authorization process because it change[d] the terms of the application". Nor does the Panel think that Exhibit EC-70/At. 23 supports the conclusion that the lead CA was still "analys[ing] the update" in November 2000. EC reply to Panel question No. 152.

[1481] Exhibit EC-70/At. 22.

[1482] Indeed, the chronology provided to the Panel by the European Communities does not describe the communication as such, which is in contrast to other entries in the chronology. Exhibit EC-70/At. 18.

[1483] As noted previously and by way of example, the lead CA was assessing the application between 13 August 1998 and 25 September 1999 as well as between 2 April 1999 and 17 August 1999. These periods of time add up to more than 90 days. Exhibit EC-70.

mid-January 2003. This means that, contrary to the European Communities' contention, not all of the time taken by the lead CA up to December 2002 was necessary to resolve scientific and technical issues. Moreover, the lead CA's failure to complete and forward an assessment report before the end of 2000 could not, in the Panel's view, be excused on the basis that there was insufficient time to complete the approval procedure concerning RR oilseed rape (EC-70) while Directive 90/220 was still in force. Directive 90/220 was not repealed until October 2002. There was thus enough time for the other member States to review the lead CA's assessment report within 60 days following the circulation of the assessment report and, in the absence of objections, for the lead CA to give its consent to the placing on the market of RR oilseed rape (EC-70).[1484]

7.1988 In its earlier findings, the Panel also stated that even assuming that the COGEM could not have provided its advice before January 2001, the Netherlands could still have completed and forwarded its assessment report sooner than it did. Specifically, the Panel noted that when the COGEM provided its advice in January 2001, the lead CA did not complete its assessment report but on 12 March 2001 – the date of adoption of Directive 2001/18 – requested a detection method based on the provisions of Directive 2001/18, even though that Directive did not enter into force until October 2002. The applicant provided a detection method four days later.[1485] However, the applicant requested confidential treatment of the detection method. This resulted in an eight-month exchange with the applicant. As we noted earlier, during that exchange, the lead CA caused delays by not requesting clarification promptly. Our examination focuses on the delays caused by the lead CA during the course of the exchange over confidentiality issues.

7.1989 We begin our examination by recalling relevant facts. In May 2001, the lead CA asked the applicant to reconsider its request for confidential treatment of the detection method it had submitted, or else to provide further substantiation. The lead CA also stated that in the absence of further substantiation by June 2001, it would take a decision with respect to the request.[1486] In September 2001, after providing further clarification at the request of the lead CA and "in order to keep the approval process moving forward", the applicant agreed to disclose the protocol for the detection of RR oilseed rape (EC-70). But the applicant requested that the primer sequences in the protocol remain confidential until the first patent application was published.[1487] In response, the lead CA again sought further substantiation. After receiving additional substantiation, the lead CA in January 2002 granted the request that the primer sequences should be treated as confidential.

7.1990 It is clear from these facts that there was a disagreement between the lead CA and the applicant regarding whether certain information was by nature confidential. Article 19 of

[1484] In its earlier findings on the application concerning RR oilseed rape (EC-70), the Panel noted that the Netherlands could have considered that for as long as Directive 90/220 was still in force, there was no realistic prospect that the Group of Five countries and the Commission would allow the final approval of the application in question. However, the Panel does not consider that this would have justified the Netherlands' failure to forward an assessment report to the Commission. The Netherlands might have anticipated opposition from the Group of Five countries on the basis of their June 1999 declaration. As pointed out above, notwithstanding this declaration, the Group of Five countries retained the freedom under EC law to approve applications. The same is true for the Commission, which had not issued a declaration comparable to that of the Group of Five countries.

[1485] As Directive 2001/18 was not yet in force on the date of the lead CA's request, the applicant was arguably not obliged, as a matter of EC law, to comply with it. In our view, there can be no doubt in view of the wording of the lead CA's request for a detection method that the applicant was aware that the basis for the request was legislation not yet in force. But there is no indication in the record that the applicant contested the propriety of the request.

[1486] Exhibit EC-70/At. 26.

[1487] Exhibit EC-70/At. 30.

Directive 90/220 provides that in such cases it is for the lead CA to decide, after consultation with the applicant, whether the information should be treated as confidential.[1488] It appears to the Panel that the lead CA was following this procedure. However, it took a long time – eight months – to resolve the issue of the confidentiality status of the relevant information. While the applicant took a total of three and a half months to reply to the several requests for further substantiation, in June 2001 the lead CA waited for more than a month after receiving further substantiation before it followed up with a request for yet more substantiation.[1489] A similar situation arose in September 2001 when the lead CA waited for more than two months before following up with another request.[1490] The substantiation provided by the applicant in June and September 2001 was neither very extensive nor particularly complex.[1491] Moreover, in June and September 2001, there was no apparent reason for the lead CA to consider that there was insufficient time to approve the application before Directive 90/220 was repealed in October 2002. The Panel therefore does not see any justification for the lead CA's failure to follow up more promptly. In the Panel's view, the lead CA's delayed action in response to the June and September submissions of the applicant demonstrates that, contrary to the European Communities' contention, not all of the time taken by the lead CA up to December 2002 was necessary to resolve scientific and technical issues.

7.1991 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning RR oilseed rape (EC-70) – notably the time spent waiting for COGEM to provide its advice, and the time taken to follow up on substantiation provided by the applicant for its request for confidential treatment of certain information – was unjustifiably long.

7.1992 In relation to DS291, we recall that the United States claims that the approval procedure concerning RR oilseed rape (EC-70) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by the Netherlands to complete its assessment is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands' conduct was a consequence of the general moratorium on approvals.

7.1993 In view of our conclusion with regard to the time taken by the Netherlands for its assessment, we do not go on to examine other arguments put forward by the United States and Canada in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.1994 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning RR oilseed rape (EC-70) was unjustifiably long, and that it can reasonably be inferred from surrounding

[1488] Canada refers to the analogous provisions of Article 25 of Directive 2001/18. However, these provisions were not applicable at the time.
[1489] Exhibit EC-70/At. 28.
[1490] Exhibit EC-70/At. 33.
[1491] The June letter from the applicant is two pages long, that of September is only one page long.

circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning RR oilseed rape (EC-70) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning RR oilseed rape (EC-70), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, the Panel recalls its finding that the time taken by the lead CA for its assessment of the application concerning RR oilseed rape (EC-70) was unjustifiably long. Based on this finding, the Panel accepts Canada's contention that the European Communities failed to "consider or approve, without undue delay", the application concerning RR oilseed rape (EC-70), and that it consequently did not complete the relevant approval procedure without "undue delay". Accordingly, the Panel concludes that in respect of the approval procedure concerning RR oilseed rape (EC-70), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xi) LL soybeans (EC-71)

7.1995 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning LL soybeans (EC-71) has been unduly delayed.

7.1996 The **United States** submits that although the applicant in this procedure provided answers to all of the questions raised by the lead CA, the lead CA failed to approve the product under Directive 90/220.

7.1997 The United States also points out that the application concerning LL soybeans (EC-71) is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning LL soybeans (EC-71) is excessive and unjustified and, hence, undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.1998 **Argentina** claims that the application was delayed at the member State level for 68 months without a final decision on its approval. Argentina asserts that the European Communities neither processed the application nor conducted the required risk assessment. Argentina argues that there is no scientific justification for the delay, as the "initial reports" were not prepared.

7.1999 The **European Communities** provides three explanations for the delay at the member State level: (1) requests by the lead CA for further information during the period from September 1998 to 2001; (2) procedural problems arising from the fact that the applicant submitted an application for the same product in Portugal; and (3) delays caused by the applicant's lack of response to requests for additional information on 25 February 2003.

7.2000 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2001 We note that in the approval procedure concerning LL soybeans (EC-71), the applicant submitted an application to the lead CA (Belgium) on 28 September 1998. In September 1999, the applicant submitted an application for this same product to Portugal. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. The applicant updated the application on 15 January 2003. Also in January 2003, the applicant withdrew the parallel application to Portugal.

7.2002 We recall that in relation to Belgium's assessment of LL soybeans (EC-71) three separate time periods can be usefully distinguished: (1) the time period between the submission of the application to the Belgian CA and the concurrent submission in Portugal; (2) the time period between the submission of the concurrent application in Portugal and the repeal of Directive 90/220; and (3) the time period between the submission of the application under Directive 2001/18 and the applicant's withdrawal of the application.

7.2003 The Panel begins its analysis with the alleged delay at member State level during the period before the parallel application was submitted to Portugal. We recall that in a letter dated 31 March 1999, the Belgian Biosafety Council stated that it was "of the opinion that the file [concerning the application submitted under Directive 90/220] in its present form (with addition of molecular data and after minor corrections) can be passed on to the European Commission with a positive opinion".[1492] Based on the March 1999 advice by the Biosafety Council the Belgian CA on 28 May 1999 asked for more information, including information on molecular characterization, nutritional analysis (concerning the approval procedure for LL soybeans (EC-93)) and herbicide aspects.[1493] The applicant did not respond to the May 1999 request until July 2001.

7.2004 The European Communities provides no justification for the time taken by the lead CA to forward the request for additional information from the Belgian Biosafety Council. While the lead CA as the responsible agency could review the request in order to determine whether it was appropriate to transmit it to the applicant, we are not convinced, in the absence of any justification offered by the European Communities, that two months were needed to review this straightforward request for additional information. Indeed, at an earlier stage in the approval procedure, the lead CA forwarded a similar request from the Biosafety Council within a matter of several days.[1494] We therefore consider that the lead CA could and should have acted more promptly than it did when the Biosafety Council suggested a request for additional information in March 1999.

7.2005 As noted, the applicant did not respond to the lead CA's May 1999 additional request for information until July 2001, *i.e.*, more than two years later. Meanwhile, however, the applicant had submitted an application to Portugal. The time during which a parallel application was maintained concurrently in Portugal contributed to the delayed progress of the application in Belgium. We note in this regard that in a communication to Belgium dated 1 December 2000, the applicant explicitly indicated its intention of maintaining dual applications.[1495] In this letter the applicant also stated it would take all necessary measures to ensure that only one application would circulate at the Community level. On 5 December 2000, the Biosafety Advisory Council of the Belgian CA

[1492] Exhibit EC-71/At. 16.
[1493] Exhibit EC-71/Ats. 17 and 22.
[1494] Exhibit EC-71/Ats. 4 and 5.
[1495] Exhibit EC-71/At. 23.

confirmed the continuation of the evaluation process in Belgium and requested that the applicant forward the questions posed by the Portuguese CA in the approval procedure concerning LL soybeans (EC-81) in order to complete the application dossier in Belgium.[1496] On 5 September 2001, ten months after confirming the continuation of the evaluation process in Belgium, the Belgian CA indicated to the applicant that further evaluation of the application would be suspended until the applicant specified a single country to handle the application.[1497] The applicant responded on 8 October 2001 by asserting the maintenance of double concurrent applications.[1498] No further exchanges appear to have occurred between the applicant and the lead CA until January 2003, when the applicant updated the application submitted to Belgium under Directive 2001/18. While there is no evidence on the record to confirm this, it appears that in view of the applicant's response the lead CA did not further assess the application concerning LL soybeans (EC-71) between October 2001 and January 2003. Thus, the consideration of the application appears to have been suspended as from September 2001 as a result of the applicant's refusal to discontinue one of the two applications submitted under Directive 90/220.

7.2006 We note that the applicant was of the view that Directive 90/220 did not prevent it from filing identical applications to different lead CAs. It nevertheless acknowledged that this approach could give rise to procedural problems, and it therefore indicated that it would withdraw one of the two applications as soon as one of the applications was ready for transmission to the Commission. The Belgian CA appears to have considered that the approach followed by the applicant was either not permitted by Directive 90/220 or otherwise inappropriate.

7.2007 The United States and Argentina did not submit arguments or evidence which would indicate that Belgium's position rested on an incorrect interpretation of Directive 90/220. While Directive 90/220 does not explicitly require that applications be maintained with a single competent authority, it also does not explicitly state that applications may be maintained with more than one competent authority. We note that the issue of parallel applications arose also in the approval procedure concerning Bt-11 maize (EC-80). In that procedure, the lead CA in Spain did not appear to consider this a problem.[1499] On the other hand, it should also be noted that the applicant in the procedure concerning LL soybeans (EC-71) apparently did not contest Belgium's refusal to continue to consider its application.

7.2008 From the information before us, it is not apparent that Belgium's position on this issue, which appears to have led it to suspend consideration of the application concerning LL soybeans (EC-71) under Directive 90/220, was a mere pretext for delaying the consideration of the application. Indeed, Belgium indicated to the applicant that it would continue considering the relevant application if the applicant decided to discontinue the application submitted to Portugal. Furthermore, in applying the provisions of Annex C(1)(a), first clause, we think we must be mindful of Members' limited resources and the consequent need to avoid unnecessary duplication and administrative inefficiencies. Thus, a delay in the consideration of an application which was caused by a Member's refusal to conduct concurrent approval procedures in respect of an identical application does not appear to us to be unjustifiable *per se*. Taking account of these elements, we are not convinced that in the specific circumstances of this case, Belgium's refusal to continue its assessment of the application concerning LL soybeans (EC-71) while the applicant maintained its concurrent application to Portugal resulted in a loss of time which was unjustifiable.

[1496] Exhibit EC-71/At. 24.
[1497] Exhibit EC-71/At. 28.
[1498] Exhibit EC-71/At. 29.
[1499] Exhibit EC-80/At. 12.

7.2009 Regarding the consideration of this application under Directive 2001/18, we note that after the applicant updated its application under Directive 2001/18 (15 January 2003) and withdrew its application in Portugal (27 January 2003), the Belgian CA acknowledged receipt of the updated application and requested further information regarding molecular characterization, detection methods and reference materials. The applicant provided preliminary informal answers regarding information for labelling requirements and detection methods in March 2003. There is no record of further exchanges between the applicant and the lead CA until the applicant withdrew the application in July 2004.

7.2010 The European Communities claims that the delay which occurred after the applicant had provided preliminary informal answers was attributable to the applicant. The record shows that the applicant provided a partial response to the lead CA's request for additional information and indicated that further information would be forthcoming regarding reference samples of genomic DNA for this product. Given the applicant's stated intention of submitting further information to address questions from the lead CA and the lack of arguments addressing this issue from the United States and Argentina, it is reasonable to believe that the lead CA was waiting for the submission of further information. Accordingly, we have no reason to disagree with the European Communities' contention that the delay in question was attributable to the applicant rather than the lead CA.

7.2011 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning LL soybeans (EC-71) – specifically the time taken by the lead CA to forward the request for additional information suggested by the Biosafety Council in March 1999 – was unjustifiably long.

7.2012 In relation to DS291, we recall that the United States claims that the approval procedure concerning LL soybeans (EC-71) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier finding that the record supports the conclusion that the European Communities applied a *de facto* moratorium on approvals as of June 1999. Our finding that the time taken by Belgium for its assessment of the application concerning LL soybeans (EC-71) was unjustifiably long is based on the view that the lead CA could and should have transmitted its May 1999 request for additional information earlier than it did. Thus, our finding above relates to a time period which pre-dates June 1999. In the light of this, we do not consider that we can infer that Belgium's conduct in March, April and May 1999 was a consequence of the general moratorium on approvals which we found was in effect between June 1999 and August 2003.

7.2013 In view of our conclusion above, in relation to DS291 we need to go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Total amount of time taken since submission of application

7.2014 The United States also puts forward the argument that the total amount of time during which the application concerning LL soybeans (EC-71) was pending is excessive and unjustified. The application concerning LL soybeans (EC-71) was first submitted for approval under Directive 90/220 in September 1998. This means that as of August 2003, the approval procedure had been pending for four years and eleven months.

7.2015 The Panel agrees with the United States that, in absolute terms, this is a long period of time for the assessment by the lead CA. However, as we have explained earlier, the mere identification of

the total amount of time during which an application has been pending does not demonstrate, in and of itself, that the time taken was unjustifiably long.

7.2016 Moreover, even if the United States were correct in asserting that before there was an EC moratorium, approval procedures used to be completed in less than three years, it must be remembered that the European Communities assesses applications on a case-by-case basis. Thus, the fact that the approval procedure concerning LL soybeans (EC-71) was not completed in less than three years in our view does not demonstrate that it was not justifiable for the European Communities to take more time to process the application concerning LL soybeans (EC-71).[1500]

7.2017 The United States further argues that in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, the fact that the application in question lingered at the member State level for almost five years demonstrates the existence of undue delay. We recall in this respect our finding that the record supports the conclusion that the European Communities applied a *de facto* moratorium on approvals as of June 1999. At that time, the application concerning LL soybeans (EC-71) had already been pending for almost nine months. Thus, some of the total time taken cannot be explained by the moratorium. Moreover, the mere fact that a general moratorium was in effect does not necessarily imply that each particular application was affected by it at all stages of the procedure. The United States itself has repeatedly stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process" and that "certain progress in the process, short of a final decision, is not the least bit inconsistent with a moratorium on final approvals".[1501] Therefore, by itself, the fact that a moratorium on approvals was in effect between June 1999 and August 2003 is not sufficient to demonstrate that the period of time during which the application concerning LL soybeans (EC-71) was pending as of August 2003 reflects a failure on the part of the lead CA to complete the relevant approval procedure without undue delay.

7.2018 Accordingly, the Panel is unable to accept the United States' assertion that the total period of time during which the application concerning LL soybeans (EC-71) had been pending as of August 2003 demonstrates that the time taken was unjustifiably long.

Conclusions

7.2019 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that it has not been established that the time taken by the lead CA for its assessment of the application concerning LL soybeans (EC-71) was unjustifiably long, or that the total period of time during which the application concerning LL soybeans (EC-71) had been pending as of August 2003 demonstrates that the time taken by the European Communities was unjustifiably long. Based on these findings, the Panel is unable to accept the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning LL soybeans (EC-71) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval

[1500] It is worth recalling, more generally, that the approval procedures which were completed before there was a moratorium on approvals were not affected by the special circumstance that Directive 90/220 was repealed in 2002.

[1501] *See, e.g.*, US second written submission, para. 51 (emphasis in original).

procedure concerning LL soybeans (EC-71), the United States has failed to establish that the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the lead CA for its assessment of the application concerning LL soybeans (EC-71) was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning LL soybeans (EC-71) without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement.*

(xii) LL oilseed rape (EC-72)

7.2020 One Complaining Party, the United States, claims that the completion of the approval procedure concerning LL oilseed rape has been unduly delayed.

7.2021 The **United States** argues that the total time taken at the member State level for the initial review of this application was over four years, as this product still had not been forwarded to the Commission at the time of establishment of the Panel. The United States contrasts this with the 90 days referred to in Directives 90/220 and 2001/18. Although the United States initially indicated that the applicant had provided answers to all of the questions from the lead CA, in response to a question from the Panel the United States recognized that the applicant failed to provide some of the data requested.[1502] Nonetheless, the United States contends that the delays by the lead CA in completing the approval procedure concerning LL oilseed rape are undue.

7.2022 The United States also points out that the application concerning LL oilseed rape is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning LL oilseed rape is excessive and unjustified and, hence, undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2023 The **European Communities** argues that the time taken by the lead CA was necessary in order to ensure a valid safety assessment. Following receipt of the application, the lead CA requested further information from the applicant. The lead CA also requested a preliminary review by its scientific committee, the Advisory Committee on Releases to the Environment (hereafter "ACRE"). The ACRE found that the dossier contained inconsistent data on molecular characterization and was presented in a manner which made assessment difficult. In December 1999, the lead CA requested the applicant to provide a substantial revision and clarification.

7.2024 According to the European Communities, the applicant did not get back to the lead CA on this dossier for almost two years. In January 2003, the applicant provided some up-dated documents in accordance with Directive 2001/18, but the European Communities argues that the full dossier was not submitted. During the first half of 2003, there were various exchanges between the lead CA and the applicant, and the applicant provided additional updates and information. Following a request in

[1502] US answer to Panel question No. 168.

June 2003 for the re-submission of a complete dossier, in March 2004 the applicant withdrew the pending notification and submitted a new notification. The European Communities maintains that it cannot be responsible for delays arising at the instigation of the applicant.

7.2025 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2026 We note that in the approval procedure concerning LL oilseed rape the applicant submitted an application to the lead CA (the United Kingdom) on 28 January 1999. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. An updated application was submitted following the entry into force of Directive 2001/18, although the record is not clear as to when a complete dossier was actually submitted. At the time of establishment of the Panel, this application was still under consideration by the lead CA.

7.2027 The United States contends that the lead CA took too long to complete its assessment. It is correct that the lead CA took much more time for its assessment of the application than the 90 days envisaged in Directives 90/220 and 2001/18. However, we have observed that that deadline was not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. Moreover, the European Communities contends that much of the time taken by the lead CA until August 2003 is attributable to failures by the applicant promptly to provide requested information. The European Communities submits that without this information, it was not possible for the lead CA to complete its assessment and submit a report to the Commission. We therefore need to examine whether the lead CA was justified in not completing its assessment by August 2003.

7.2028 As we noted in our previous consideration of this application, the record before us is not complete. Following receipt of the application, the lead CA promptly requested additional information from the applicant in February and March 1999. This information was provided in June 1999, and the lead CA acknowledged on 30 June 1999 that the clock had been "restarted". One month later, the lead CA requested further information, but this information was not provided by the applicant before the date of repeal of Directive 90/220. The letter from the lead CA dated 20 July 1999 requests that the applicant provide further information and clarification on points raised in an annex to the letter, but the annex was not provided to us.[1503]

7.2029 In November 1999, the lead CA apparently requested the ACRE to provide guidance to the lead CA as to where the application needed improvement and noted that the ACRE would be asked for formal advice only at a later stage. The preliminary advice by ACRE was that there were a number of inconsistencies in the molecular data provided, some deficiencies in the molecular studies and too much important material was in annexes rather than being in the core dossier. It was noted that the appropriate experimental data may have been supplied somewhere in the application dossier but it was not immediately obvious where it might be.[1504] As advised by ACRE, the lead CA in December 1999 requested that the applicant undertake substantial revision and clarification of the dossier. The lead CA suggested a meeting with the applicant later in the same month to provide the applicant with some guidance. There is no evidence in the information before the Panel that such a meeting took place, and that the applicant provided what was requested in December 1999. Indeed, the record shows no further communication from the applicant until January 2003, when the applicant updated its application under Directive 2001/18.

[1503] Exhibit EC-72/At. 11.
[1504] Exhibit EC-72/At. 12.

7.2030 On 16 January 2003, the applicant submitted an updated application under Directive 2001/18 to the lead CA.[1505] In acknowledging receipt of the updated application, the lead CA indicated, on 27 January 2003, that the dossier was still incomplete and information requested in July and December 1999 was still missing.[1506] Further requests for clarifications or modification of the application were made by the lead CA in the first half of 2003, with responses apparently provided by the applicant in May 2003.[1507] On 13 June 2003, the lead CA requested further clarifications and suggested that a complete version of the application be re-submitted.[1508] On 26 March 2004, the applicant withdrew the application, saying that certain elements of that application were incomplete or out-of-date, and submitted a new one (C/GB/04/M5/4).[1509]

7.2031 In reviewing the lead CA's conduct in this approval procedure, we note that the exchanges between the lead CA and the applicant generally took place in a timely fashion, with the lead CA reacting promptly to information provided by the applicant. It is clear from the foregoing, however, that the consideration of the application concerning LL oilseed rape was delayed for almost two years between 2 December 1999 and the repeal of Directive 90/220 in October 2002, following a letter from the lead CA advising the applicant that the dossier required substantial revision and clarification. Based on the information submitted to us, we understand that this gap was caused by the failure of the applicant to provide the additional information and clarification requested by the lead CA in July and December 1999. However, the precise reasons for the failure of the applicant to respond to the information solicited by the lead CA in July and December 1999 are unclear.

7.2032 We note that the United States has not specifically challenged the justifiability of any of the requests for additional data or clarifications made by the lead CA. We nonetheless asked the experts advising us whether the information requested by the lead CA up to and in December 1999 was necessary to ensure that conclusions of the safety assessment were valid.[1510] Dr. Nutti, the only expert who responded to this question, concurred that the deficiencies in the application as identified by the ACRE were such that the requested information was necessary for the safety assessment.[1511] Taking account of these elements, we have no grounds for considering that the lead CA's requests of July and December 1999 which led to the gap between December 1999 and January 2003 were not justified.

7.2033 Regarding the assessment of the application concerning LL oilseed rape under Directive 2001/18, we note that the United States has offered no specific arguments relating to the consideration of this application under Directive 2001/18. At any rate, the facts as summarized by us above do not suggest that the time taken by the lead CA up to August 2003 for assessing the application under Directive 2001/18 was unjustifiably long. We note in particular the repeated requests by the lead CA for completion of the updated application, and the fact that the applicant itself withdrew the application in March 2004 saying that certain elements of its application were incomplete.

7.2034 Based on the above considerations, the Panel is not persuaded that the time taken by the lead CA for its assessment of the application concerning LL oilseed rape was unjustifiably long.

[1505] Exhibit EC-72/At. 15.
[1506] Exhibit EC-72/At. 16.
[1507] Exhibit EC-72/Ats. 18 and 19.
[1508] Exhibit EC-72/At. 28.
[1509] Exhibit EC-72/At. 29.
[1510] Annex H, Panel Question 29.
[1511] Annex H, para. 600.

Total amount of time taken since submission of application

7.2035 The United States also puts forward the argument that the total amount of time during which the application concerning LL oilseed rape was pending is excessive and unjustified. The application concerning LL oilseed rape was first submitted for approval under Directive 90/220 in January 1999. This means that as of August 2003, the approval procedure had been pending for four years and seven months.

7.2036 The Panel agrees with the United States that, in absolute terms, this is a long period of time for the assessment by the lead CA. However, as we have explained earlier, the mere identification of the total amount of time during which an application has been pending does not demonstrate, in and of itself, that the time taken was unjustifiably long.

7.2037 Moreover, even if the United States were correct in asserting that before there was an EC moratorium, approval procedures used to be completed in less than three years, it must be remembered that the European Communities assesses applications on a case-by-case basis. Thus, the fact that the approval procedure concerning LL oilseed rape was not completed in less than three years in our view does not demonstrate that it was not justifiable for the European Communities to take more time to process the application concerning LL oilseed rape.[1512]

7.2038 The United States further argues that in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, the fact that the application in question lingered at the member State level for over four and a half years demonstrates the existence of undue delay. We recall in this respect our finding that the record supports the conclusion that the European Communities applied a *de facto* moratorium on approvals as of June 1999. At that time, the application concerning LL oilseed rape had already been pending for almost six months. Thus, some of the total time taken cannot be explained by the moratorium. Moreover, the mere fact that a general moratorium was in effect does not necessarily imply that a particular application was affected by it. The United States itself has repeatedly stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process" and that "certain progress in the process, short of a final decision, is not the least bit inconsistent with a moratorium on final approvals".[1513] Therefore, by itself, the fact that a moratorium on approvals was in effect between June 1999 and August 2003 is not sufficient to demonstrate that the period of time during which the application concerning LL oilseed rape was pending as of August 2003 reflects a failure on the part of the lead CA to complete the relevant approval procedure without undue delay.

7.2039 Accordingly, the Panel is unable to accept the United States' assertion that the total period of time during which the application concerning LL oilseed rape had been pending as of August 2003 demonstrates that the time taken was unjustifiably long.

[1512] It is worth recalling, more generally, that the approval procedures which were completed before there was a *de facto* moratorium on approvals were not affected by the special circumstance that Directive 90/220 was repealed in 2002.

[1513] *See, e.g.*, US second written submission, para. 51 (emphasis in original).

Conclusions

7.2040 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that it has not been established that the time taken by the lead CA for its assessment of the application concerning LL oilseed rape was unjustifiably long, or that the total period of time during which the application concerning LL oilseed rape had been pending as of August 2003 demonstrates that the time taken by the European Communities was unjustifiably long. Based on these findings, the Panel is unable to accept the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning LL oilseed rape for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning LL oilseed rape, the United States has failed to establish that the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xiii) BXN cotton (EC-73)

7.2041 One Complaining Party, the United States, claims that the completion of the approval procedure concerning BXN cotton has been unduly delayed.

7.2042 The **United States** argues that the total time taken at the member State level for the initial review of this application was over four years, as this product still had not been forwarded to the Commission at the time of establishment of the Panel. The United States contrasts this with the 90 days referred to in Directives 90/220 and 2001/18. The United States contends that although the applicant had provided answers to all of the questions from the lead CA, the lead CA still failed to complete its assessment. The United States contends that the delays by the lead CA in completing the approval procedure concerning BXN cotton are undue.

7.2043 The United States also points out that the application concerning BXN cotton is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning BXN cotton is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2044 The **European Communities** argues that the time taken by the lead CA was necessary in order to ensure a valid safety assessment. Following receipt of the application, the lead CA requested further information from the applicant to address deficiencies in the application. Spain's scientific committee, the National Biosafety Committee, found that a considerable amount of information was missing on issues such as compositional analysis, environmental impact, toxicity and nutritional analysis. In addition, a number of points required clarification, such as the scope of the application and the labelling proposal. The lead CA requested this information from the applicant in July 1999.

7.2045 The European Communities contends that the applicant did not respond to the lead CA's request for three years, until January 2003. At that time, the lead CA was informed of a change in the company submitting the application, and the new applicant company submitted an up-dated notification in accordance with Directive 2001/18. However, according to the European Communities, the new dossier was also incomplete with regard to the molecular characterization of the product. The European Communities points out that further information was requested of the applicant in October 2003.

7.2046 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2047 We note that in the approval procedure concerning BXN cotton, the applicant submitted an application to the lead CA (Spain) on 3 May 1999. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. On 16 January 2003, an updated application was submitted following the entry into force of Directive 2001/18. At the time of establishment of the Panel, this application was still under consideration by the lead CA.

7.2048 The United States contends that the lead CA took too long to complete its assessment. It is correct that the lead CA took much more time for its assessment of the application than the 90 days envisaged in Directives 90/220 and 2001/18. However, we have observed that that deadline was not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. Moreover, the European Communities contends that much of the time taken by the lead CA until August 2003 is attributable to failures by the applicant to promptly provide requested information. The European Communities submits that without this information, it was not possible for the lead CA to complete its assessment and submit a report to the Commission. We therefore need to examine whether the lead CA was justified in not completing its assessment by August 2003.

7.2049 As we noted in our previous consideration of this application, the record before us is very incomplete. This said, it is clear that within two months of receipt of the application, the Spanish National Biosecurity Committee identified a number of concerns with the application, and these were communicated to the applicant in July 1999. Two months later, the applicant provided the information requested. The applicant clarified, *inter alia*, that the application was both for the import and processing of seeds of BXN cotton as well as for the cultivation of BXN cotton. Following the further examination of the application in January 2000 by the Spanish National Biosafety Committee, the lead CA requested further clarifications on some of the same issues in a communication dated 2 February 2000.[1514] The applicant did not respond to this request before an updated application was submitted in January 2003 under Directive 2001/18.[1515]

7.2050 On 15 January 2003, the lead CA was informed of a change in the company pursuing the application, and on 16 January 2003 an updated application was submitted under Directive 2001/18 and completed in March 2003. It appears that the updated application concerns only the importation of seed for processing, but not for cultivation. In August 2003, when this Panel was established, the application appears to have been under review by the National Biosafety Committee.[1516]

[1514] Exhibit EC-73/At. 6.
[1515] This is confirmed by Exhibit EC-73/At. 12.
[1516] There is no information about when the application was submitted to the National Biosafety Committee.

7.2051 It is clear from the foregoing that in this procedure a delay of more than two and a half years occurred between February 2000, when the lead CA requested clarifications, and October 2002, when Directive 90/220 was repealed. Based on the information submitted to us, we understand that this gap was caused by the failure of the applicant to provide the requested clarifications. However, the precise reasons for the failure of the applicant to respond to the lead CA's February 2000 request are unclear.

7.2052 The United States has not specifically challenged the justifiability of any of the requests for additional data or clarifications made by the lead CA. In the light of the three-year delay in response from the applicant following the request in February 2000 for additional information, we asked the experts advising us whether the information requested by the lead CA up to and in February 2000 was necessary to ensure that conclusions of the safety assessment were valid.[1517] The experts noted that only the table of contents of the actual submission by the applicant had been provided, and the response from the applicant. On the basis of this limited information, Dr. Nutti was of the view that the responses provided by the applicant in September 1999 appeared to be satisfactory as far as food safety was concerned. These responses provided clarification or explanations of information that presumably was contained in the original application.[1518] Dr. Andow noted that the information previously requested by the lead CA was normally necessary to assess environmental risks, particularly those related to the cultivation of the plant. However, without the application itself, he could not determine to what extent relevant information may have already been provided by the applicant, or how much additional information might be necessary. Dr. Andow further observed that, according to the table of contents, only two pages of the text of the application were devoted to issues relating to environmental impact studies, herbicide or residue toxicity or ecotoxicity tests or proposals to manage, monitor and handle the crop to reduce the risk of herbicide resistance in weeds.[1519]

7.2053 Like the experts advising us, we consider that the incomplete information before us does not permit us to form a definitive view on whether the clarifications requested by the lead CA in February 2000 were justified to ensure that conclusions of the safety assessment were valid and hence on whether the resulting three-year delay in the consideration of the application was justified by the need to check and ensure that relevant requirements of Directive 90/220 were fulfilled.

7.2054 Turning to Spain's assessment of the application concerning BXN cotton under Directive 2001/18, we note that the updated notification was submitted to Spain on 16 January 2003. It was not until 14 February 2003, *i.e.*, almost one month later, that the lead CA requested the applicant to submit a summary of the application as required by Directive 2001/18. The applicant provided such a summary on 19 March 2003, and thus the updated application appears to have been complete as of that date. The application was apparently forwarded to the National Biosafety Committee for an assessment, but as of August 2003 that assessment had not yet been completed. The record shows that the assessment was completed in September 2003.[1520]

7.2055 The European Communities offers no justification for the time taken by the lead CA to follow up with the applicant to request a summary of the application. We are not persuaded that almost a full month was required to determine the completeness of the updated application and forward an appropriate request to the applicant.

[1517] Annex H, Panel Questions 30 and 31.
[1518] Annex H, para. 601.
[1519] Annex H, paras. 604-612.
[1520] Exhibit EC-73/At. 12.

7.2056 Furthermore, with regard to the time taken by the lead CA to assess the application once it had been completed by the applicant in March 2003, we recall that in accordance with Article 14(2) of Directive 2001/18, the lead CA should have prepared an assessment report within 90 days. The 90 days do not include any periods of time during which the lead CA is awaiting further information which it requested from the applicant. In the present case, the record shows that the lead CA requested additional information only in October 2003.[1521] Thus, the lead CA should have completed its assessment at the latest 90 days after 19 March 2003, which is the date on which the applicant completed its updated application. However, as of August 2003, the lead CA had still not completed its assessment. Thus, as of 29 August 2003, the lead CA had already taken more than five months to assess the application, and first request for additional information was forwarded more than a month later.

7.2057 As we have said, the question of whether or not the lead CA complied with the 90-day deadline stipulated in Directive 2001/18 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. However, as we have also noted earlier, the deadline set forth in Directive 2001/18 nonetheless provides a useful indicator to guide the Panel's analysis. The 90-day deadline is binding and applies to all relevant applications submitted under that Directive. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2058 The European Communities provides no justification for the time taken by the lead CA in excess of the 90-day period, other than the assertion that the updated application was incomplete with regard to the molecular characterization of the product. It is correct that the lead CA in October 2003 requested additional information, including on molecular characterization of the product. However, we are not convinced that more than five months were needed to identify this and other substantive shortcomings in the updated application.

7.2059 From the record of the consideration of this application by the National Biosafety Committee, it is clear that the Committee had also been reviewing the applications concerning Bt-531 cotton and RR-1445 cotton, for which Spain was also the lead CA. However, we recall that pursuant to Directive 2001/18, the lead CA was to prepare an assessment report within 90 days after receipt of an application. It should also be noted in this connection that the National Biosafety Committee's assessment concerning BXN cotton is quite short, *i.e.*, there is no indication that the preparation of the Committee's assessment required much time. Additionally, we note that the lead CA in this case was not examining the application concerning BXN cotton for the first time. While it is true that the lead CA in 2003 had to undertake an assessment in accordance with the partly new requirements of Directive 2001/18, it seems equally clear that the prior assessments rendered the lead CA's task less complex than it would have been if the lead CA had had to undertake an assessment of the application for the first time.

7.2060 Taking account of the foregoing elements, we consider that the lead CA could and should have acted more promptly than it did when it received an updated, but incomplete, application in January 2003 and subsequently, when the applicant submitted the missing summary in March 2003. Accordingly, we conclude that the time taken by the lead CA up to August 2003 for its assessment of the application concerning BXN cotton under Directive 2001/18 was unjustifiably long.

7.2061 In addition, we recall that the United States claims that the approval procedure concerning BXN cotton was unduly delayed because, due to the moratorium, the European Communities failed to

[1521] Exhibit EC-73/At. 13.

consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by Spain to assess the application concerning BXN cotton under Directive 90/220 and subsequently under Directive 2001/18 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that Spain's conduct after the entry into force of Directive 2001/18 was a consequence of the general moratorium on approvals.

7.2062 In view of our conclusion with regard to the time taken by Spain for its assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.2063 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning BXN cotton under Directive 2001/18 was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning BXN cotton for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning BXN cotton, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xiv) Bt-1507 maize (EC-74)

7.2064 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Bt-1507 maize (EC-74) has been unduly delayed.

7.2065 The **United States** argues that the application concerning Bt-1507 maize (EC-74) was delayed at the member State level. The United States submits that although the applicant provided answers to all of the questions, the lead CA nonetheless delayed its consideration of the product. The United States explicitly contests the justifiability of one of the information requests by the lead CA, as well as of a number of the objections raised by other member States following the circulation of the application by the Commission.

7.2066 The United States also points out that the application concerning Bt-1507 maize (EC-74) is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-1507 maize (EC-74) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2067 The **European Communities** argues that the time taken by the lead CA was necessary in order to ensure a valid safety assessment. Exchanges between the lead CA and the applicant regarding data relating to molecular characterization, allergenicity, toxicity of CRY1F and labelling went on until late 2002. In two instances, the applicant requested an extension of the time granted by the lead CA to submit further data or information. The applicant updated the notification just after the entry into force of Directive 2001/18. After a further exchange on compositional data, a monitoring plan, and confidentiality of the detection method, the lead CA submitted the full application and its assessment report to the Commission in August 2003. The European Communities observes that once the application reached the Community level, a considerable number of objections were raised by member States, including on environmental effects, the monitoring plan, molecular characterisation, sampling and detection methods, allergenicity and toxicity.

7.2068 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2069 We recall that in the approval procedure concerning Bt-1507 maize (EC-74), the applicant submitted an application to the lead CA (the Netherlands) on 23 November 2000. When Directive 90/220 was repealed on 17 October 2002, the lead CA had not yet forwarded the dossier to the Commission. The dossier was forwarded to the Commission with a favourable assessment report on 15 August 2003, after the applicant had provided an updated application in accordance with Directive 2001/18.

7.2070 The United States contends that the lead CA took too long to complete its assessment. On the other hand, the European Communities contends that all of the time taken by the lead CA until August 2003 when the lead CA forwarded its assessment report to the Commission was necessary to resolve scientific and technical issues. It therefore needs to be examined whether the lead CA was justified in forwarding an assessment report to the Commission only in August 2003.

7.2071 As we noted previously, there was frequent communication between the lead CA and the applicant on this product from the initial application on 23 November 2000 until the lead CA sent its assessment report to the Commission on 15 August 2003. The United States explicitly challenges the justifiability of only one of the requests for additional data made by the lead CA, namely, the lead CA's follow-up request of 13 December 2001. We recall that in response to a March 2001 request from the lead CA the applicant on 16 October 2001 provided field trials from Chile, France and Italy, which it considered representative for the cultivation areas exporting maize to the European Communities.[1522] Yet on 13 December 2001 the lead CA indicated that it was not convinced by the response and maintained its request. Specifically, the lead CA indicated that it was not convinced that these locations would be representative of locations exporting maize to the European Communities. It therefore requested that the applicant conduct additional field trials and provide compositional data for two consecutive growing seasons.[1523]

7.2072 The applicant addressed this further request for additional field trials in its responses of 21 November 2002. It provided arguments as to why the results of the field trials for 1998/1999 from Chile, France and Italy should be considered to be sufficient, and also submitted the results of field trials for 1999/2000 from Bulgaria, France and Italy.[1524] On 10 February 2003, the lead CA indicated that it accepted this response, but requested that the data provided from the field trials in Chile be

[1522] Exhibit EC-74/At. 33.
[1523] Exhibit EC-74/At. 52.
[1524] Exhibit EC-74/At. 65, response to Panel Question 3.

presented in the same detail and manner as for France and Italy, and suggested a format.[1525] This was apparently done by the applicant on 24 March 2003.[1526]

7.2073 The United States argues that when the lead CA on 13 December 2001 rejected the applicant's compositional data from field trials that had been conducted in France, Italy and Chile, on the grounds that these locations were insufficiently representative of locations exporting maize to the European Communities, the lead CA provided no explanation for its conclusion that the locations were "insufficiently representative." The United States argues that the data provided by the applicant in October 2001 would generally be considered "representative" and relevant for evaluating maize that might be imported into the European Communities. The United States maintains that, in the absence of some further explanation, such as an anomaly in the submitted data, the only explanation for the lead CA's request for additional field trials of 13 December 2001 appeared to be the resulting two-year delay caused by the time it would take for the applicant to generate the data.

7.2074 Even assuming that the additional field trials were not necessary, we note that the applicant's response of 21 November 2002 was provided together with responses to a request of March 2002 for other additional information which has not been questioned by the United States. It is therefore not clear that the delay in the consideration of the application until 21 November 2002 is attributable to the request for additional field trials.

7.2075 At any rate, we note that on 21 November 2002 the applicant also updated its application in the light of the new requirements of Directive 2001/18. This resulted in the lead CA requesting further information from the applicant on 10 February 2003 with respect to a surveillance plan and the confidentiality of the proposed detection method. Furthermore, as noted, in February 2003 the lead CA dropped its request for the additional field trials, but requested that the data be presented in a uniform manner. The responses to these requests were provided by the applicant on 24 March 2003, and on 28 May 2003 the applicant withdrew the request for confidentiality with respect to the detection method.

7.2076 In the light of the foregoing, we consider that by the end of March 2003 the lead CA had all the elements to complete its safety assessment. The outstanding clarification of the confidentiality issue should not have delayed the completion of the safety assessment itself. In any event, as we have noted, the confidentiality issue was resolved in May 2003. Notwithstanding this, the lead CA did not send its completed assessment report to the Commission until 15 August 2003.

7.2077 We recall that in accordance with the requirements of Directive 2001/18 the lead CA was to have transmitted its completed assessment report at the latest 90 days after receipt of the updated application. As we have already pointed out, following the receipt of the application in November 2002, the lead CA reviewed the application for more than two and a half months before forwarding its request for additional information. After receiving the applicant's response in March 2003, the lead CA took an additional period of time of more than four and a half months to complete its assessment report and transmit it to the Commission. Thus, by the time the lead CA sent its assessment report to the Commission it had taken more than seven months to evaluate the updated application instead of the 90 days envisaged in Directive 2001/18.

7.2078 We have observed earlier in respect of the 90-day deadline stipulated in Directive 2001/18 that that deadline provides a useful indicator for determining how much time might be needed to complete an assessment. As we have said, in the case of the application concerning Bt-1507 maize

[1525] Exhibit EC-74/At. 84.
[1526] Exhibit EC-74/Ats. 87-88.

(EC-74), by the end of March 2003 the lead CA had all the elements to complete its safety assessment. If the lead CA at that point in time had taken a full 90-day period to complete its assessment, it would have completed its assessment before the end of June 2003.

7.2079 The European Communities has offered no justification for the time taken by the lead CA between March and August 2003. It is pertinent to note in this respect that the lead CA in 2003 was not examining the application concerning Bt-1507 maize (EC-74) for the first time. While it is true that the lead CA in 2003 had to undertake an assessment in accordance with the partly new requirements of Directive 2001/18, the lead CA had already spent two and a half months assessing the application in question. Moreover, it seems clear that the lead CA's prior assessment of the same application under Directive 90/220 rendered the lead CA's task considerably less complex than it would have been if the lead CA had had to undertake an assessment for the first time. Yet notwithstanding this, even when the lead CA had all the necessary information, it failed to complete and transmit its assessment report within 90 days.

7.2080 Thus, even if we were to accept that it was legitimate for the lead CA to insist on the confidentiality issue being resolved before it transmitted its assessment report to the Commission, in the light of the generally applicable 90-day period stipulated in Directive 2001/18, and in the absence of any justification offered by the European Communities, we are not convinced that the lead CA could not have completed and transmitted its assessment report considerably earlier than mid-August 2003. Hence, taking account of the aforementioned elements, we consider that the lead CA should have transmitted its assessment report to the Commission more promptly than it did.

7.2081 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (EC-74) – notably the time taken by the lead CA after May 2003, when the applicant withdrew the request for confidentiality with respect to the detection method – was unjustifiably long.

7.2082 In relation to DS291, we recall that the United States claims that the approval procedure concerning Bt-1507 maize (EC-74) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the failure of the Netherlands to complete its assessment of the application concerning Bt-1507 maize (EC-74) earlier than in August 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands' conduct was a consequence of the general moratorium on approvals.

7.2083 In view of our conclusion with regard to the time taken by the Netherlands for its assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2084 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (EC-74) was

> unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-1507 maize (EC-74) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-1507 maize (EC-74), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xv) Bt-1507 maize (EC-75)

7.2085 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Bt-1507 maize (EC-75) has been unduly delayed. To recall, this application concerns the same product as above, however it was submitted to Spain and concerns the cultivation of the product. The previous application was for processing, food and feed use, but not for cultivation.

7.2086 The **United States** argues that the application concerning Bt-1507 maize (EC-75) was delayed at the member State level.. The United States submits that although the applicant provided answers to all of the questions, the lead CA nonetheless delayed consideration of the product. The United States also contests the justifiability of some of the information requested by the lead CA, and particularly of a number of the objections raised by other member States following its circulation by the Commission.

7.2087 The United States also points out that the application concerning Bt-1507 maize (EC-75) is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-1507 maize (EC-75) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2088 The **European Communities** argues that the time taken by the lead CA was necessary in order to ensure a valid safety assessment. The European Communities argues that following a preliminary assessment of this application by the Spanish National Biosafety Committee, the lead CA requested further data relating to molecular characterization, allergenicity and toxicity of CRY1F, environmental impact and a monitoring plan. These requests were dealt with by the applicant during the following 12 months, until 17 July 2002.[1527] After the entry into force of Directive 2001/18, the applicant updated the application in line with the requirements of the new legislation. Exchanges between the applicant and the lead CA continued until the 28 May 2003. The lead CA submitted the full application and its assessment report to the Commission on 5 August 2003.

7.2089 The European Communities further observes that once the application reached the Community level, a considerable number of objections were raised by member States, including on the monitoring plan, molecular characterization, effects on non-target organisms, toxicity, allergenicity, and detection methods.

[1527] Exhibit EC-75/Ats. 1-3.

7.2090 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2091 We recall that following the receipt of the application concerning Bt-1507 maize (EC-75), the lead CA (Spain) consulted with its National Biosafety Committee, which took more than two and a half months to review the application. The lead CA then waited over a month, until 30 October 2001, before requesting additional information from the applicant based on the advice received from the Committee. This request was apparently repeated in a communication of 28 November 2001. A response was provided by the applicant on 14 February 2002. Once again, the lead CA consulted with the National Biosafety Committee. The Committee took three months to review the additional information submitted in February 2002. As it had done previously, the lead CA waited over a month, until 17 June 2002, before submitting another request for additional information to the applicant. The applicant responded to these requests on 17 December 2002. This was after the date of repeal of Directive 90/220.

7.2092 Even assuming that the October/November 2001 and June 2002 requests were necessary to ensure that the conclusions of the safety assessment were valid, we recall that in accordance with the requirements of Directive 90/220 the lead CA was to have completed its assessment at the latest 90 days after receipt of the application concerning Bt-1507 maize (EC-75). As we have already pointed out, following the receipt of the application in July 2001, the lead CA exceeded the 90-day period even before it submitted its initial request for additional information to the applicant. Of particular concern in this connection is the circumstance that the lead CA waited for more than one month before forwarding the questions suggested by the National Biosafety Committee in September 2001.

7.2093 The European Communities has offered no justification for the time taken by the lead CA to transmit the October/November 2001 request for additional information. We note that the time taken by the lead CA in this instance contrasts with other approval procedures where Spain was also the lead CA and where the Spanish CA forwarded requests for information from the National Biosafety Committee more promptly.[1528] Furthermore, we note that the lead CA did not modify the questions suggested by the National Biosafety Committee, but simply forwarded them.

7.2094 We recognize that the application in this case was submitted and acknowledged just fifteen months before the date of repeal of Directive 90/220. However, we do not consider that in September 2001, when the lead CA received the suggested questions from the National Biosafety Committee, the lead CA could have legitimately concluded that it was impossible to complete the required steps and have the application approved or rejected while Directive 90/220 was still in force.

7.2095 Taking account of the aforementioned elements, we consider that the lead CA could, and should, have forwarded the questions suggested by the National Biosafety Committee in September 2001 more promptly than it did.

7.2096 We recall that in May 2002 the lead CA received a further suggested request for additional information from the National Biosafety Committee. The lead CA again waited for over a month before forwarding the request in June 2002, even though it did not modify the Committee's request.

7.2097 We recognize that May 2002 was relatively close to the date of repeal of Directive 90/220. However, even if we were to accept, *arguendo*, that the application could not go through the required steps before the repeal of Directive 90/220, in our view, this would not have justified the lead CA in

[1528] *See, e.g.*, the approval procedure concerning BXN cotton. Exhibit EC-73/Ats. 2-3 and 5 and 6.

delaying the transmission of the new request for information. We note in this regard that Directive 2001/18 entered into force in October 2002. If the application submitted under Directive 90/220 remained incomplete or required further clarification, knowledge of this would have assisted the applicant in correcting any deficiencies and submitting an updated, more complete application soon after the entry into force of Directive 2001/18.[1529]

7.2098 Therefore, as with the previously discussed delayed transmission of a request for additional information, we consider that the lead CA could, and should, have forwarded the Committee's request more promptly than it did.

7.2099 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (EC-75) – notably the time taken by the lead CA to forward questions from the National Biosafety Committee – was unjustifiably long.

7.2100 In relation to DS291, we recall that the United States claims that the approval procedure concerning Bt-1507 maize (EC-75) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the failure of Spain to complete its assessment of the application concerning Bt-1507 maize (EC-75) earlier than in August 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that Spain's conduct was a consequence of the general moratorium on approvals.

7.2101 In view of our conclusion with regard to the time taken by Spain for its assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2102 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (EC-75) was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-1507 maize (EC-75) for final approval, and that this resulted in "undue delay" in the completion of the

[1529] We note that Spain could have considered that for as long as Directive 90/220 was still in force, there was no realistic prospect that the Group of Five countries and the Commission would allow the final approval of the application in question. However, the Panel does not consider that this would have justified the time taken by Spain to forward the questions suggested by the National Biosafety Committee. Spain might have anticipated opposition from the Group of Five countries on the basis of their June 1999 declaration. As pointed out above, notwithstanding this declaration, the Group of Five countries retained the freedom under EC law to approve applications. The same is true for the Commission, which had not issued a declaration comparable to that of the Group of Five countries.

relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-1507 maize (EC-75), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xvi) NK603 maize (EC-76)

7.2103 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning NK603 maize has been unduly delayed.

7.2104 The **United States** argues that the application was delayed at the first stage of the approval process under 90/220 because the lead CA declined to forward the application to the Commission. Although the applicant provided answers to all of the questions raised by the lead CA, the lead CA nonetheless delayed this product under Directive 90/220. The application remained at member State level for a period of 25 months. This product was resubmitted under Directive 2001/18, and received favourable initial assessments from the Spanish CA.

7.2105 The United States also points out that the application concerning NK603 maize is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning NK603 maize is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2106 **Argentina** notes that a risk assessment of NK603 maize was initiated under Directive 90/220 and re-initiated under Directive 2001/18. This was concluded with a favourable opinion from the scientific panel. Argentina notes that, as of April 2004, the approval procedure concerning NK603 maize, which was initiated on 4 August 2000, had lasted 3 years and 8 months and no final decision had been reached on the application for approval.

7.2107 The **European Communities** claims that the only delays in the application for NK603 maize arose due to questions on additional information; otherwise the application process has proceeded smoothly. In addition, the European Communities asserts that the application submitted in August 2000 was incomplete and therefore not considered as received until January 2001. The European Communities further claims that 44 days after the application was submitted, the clock was stopped because the scientific committee of the lead CA requested additional information on issues such as molecular characterization, nutritional composition, and environmental impact.[1530]

7.2108 The **United States** notes that using the January 2001 date of receipt suggested by the European Communities, and taking account of the "clock stop" when requested information was awaited from the applicant, out of the total 25 months for which the application was at the CA level, the European Communities had delayed action on the application for NK603 maize under Directive 90/220 for 12 months.

7.2109 The **European Communities** responds that, given that the applicant had taken 13 months to gather additional information, it was not unreasonable that the lead CA required 12 months to digest and process that information.

[1530] Exhibit EC-76/At. 1.

7.2110 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at the member State level

7.2111 We recall that the applicant sent the first application to the Spanish CA on 4 August 2000. Four months later, on 20 December 2000, the applicant resubmitted the application in Spanish and apparently with additional studies added to the application.[1531] We note that there is no record of these additional studies. The Spanish CA acknowledged receipt of the information in a letter of 2 January 2001.

7.2112 The record shows that the lead CA requested additional information in February 2001, October 2001 and May 2002.[1532] The progress of the application was adversely affected notably by the February and October 2001 requests, in that the applicant took more than six months to respond to the February 2001 request and more than five months to respond to the October 2001 request.

7.2113 We recall that we asked the experts advising us whether the information requested by the lead CA in February 2001 was necessary to ensure that conclusions of the product's safety assessment were valid. Dr. Nutti concluded that the further studies requested were not necessary for the assessment of the safety of NK603 as a food. Furthermore, given that the application was for import and use in the European Communities and not for cultivation, Dr. Andow concluded that requests for additional detailed environmental studies were not justified, although some information relating to potential adverse effects of spillage could be considered reasonable. The European Communities submits that the expert replies with respect to the food safety studies were based on the mistaken premise that certain studies had already been provided, which the European Communities argues was not the case. We note that on the basis of the information provided to us, we cannot determine whether or not such information had been previously provided.

7.2114 Turning to the October 2001 request for additional information, we note that this request concerned additional information which the Spanish CA emphasized was "essential for product traceability". Further details were also requested on the potential environmental impact of accidental dissemination or germination. When the applicant provided the additional information requested more than five months later, in March 2002, the applicant stressed that the conclusion provided in relation to safety was not altered by the new studies that had been requested. In response to a question from the Panel regarding this second request for information, Dr. Andow noted that information on the potential environmental impact of accidental release could be useful to the lead CA, but also observed that the lead CA could have been more specific regarding its particular concerns.[1533]

7.2115 Even if we were to accept that all of the information requested by the lead CA in February and October 2001 and in May 2002 was necessary to ensure the validity of the safety assessment, it is apparent from the record that the lead CA in this approval procedure exceeded the maximum period of 90 days envisaged in Directive 90/220 for a lead CA assessment. Between January 2001 and August 2002, when the applicant of its own motion updated its application in accordance with the requirements of Directive 2001/18[1534], the lead CA spent six and a half months evaluating the application without finishing its assessment report. This is more than twice the length of time established in Directive 90/220.

[1531] Exhibit EC-76/At. 3.
[1532] Exhibit EC-76/Ats. 6, 10 and 14, respectively.
[1533] Annex H, Dr. Andow's response to Panel Question 38.
[1534] Exhibit EC-76/Ats. 15 and 18.

7.2116 Specifically, the lead CA initially took one and a half months to assess the application before it forwarded the February 2001 request for additional information.[1535] Subsequently, the lead CA reviewed the application for over one month before it transmitted its October 2001 request for additional information.[1536] Then, the lead CA spent just under two months prior to sending its last request for additional information in May 2002.[1537] The applicant responded to this last request in June 2002. However, the lead CA did not complete its assessment in the following two months, *i.e.*, prior to the end of August of 2002, when the applicant updated its application based on the new requirements of Directive 2001/18. This is despite the fact that at its meeting of 11 July 2002, the Spanish scientific body assessing the application, the National Biosafety Committee, recommended for adoption a favourable report on the application.[1538]

7.2117 As we have said before, we recognize that the question of whether or not the lead CA complied with the 90-day deadline stipulated in Directive 90/220 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. However, we have also said that the deadline set forth in Directive 90/220 provides a useful indicator to guide the Panel's analysis. The 90-day deadline is binding and applies to all relevant applications submitted under that Directive. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2118 The European Communities provides no justification for the time taken by the lead CA in excess of the 90-day period, other than the assertion that the time taken by the lead CA was not unreasonable in view of the need to digest and process the information provided by the applicant. While we agree that the lead CA needs to be able to "digest and process" information provided at its request, it is clear from Directive 90/220 that the EC legislator considered that 90 days was a reasonable period of time within which to do so. Also, the European Communities does not argue that in the case at hand the replies and documents provided by the applicant at the lead CA's request were particularly voluminous or complex, such that more than double the amount of time was required than the maximum amount of time Directive 90/220 allows lead CAs for the assessment of applications. From a review of the relevant documents, it is not apparent to us that they are any more voluminous or complex than others on the record which concern different applications.

7.2119 We have previously pointed out that Spain was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Spanish CA's conduct reflects a precautionary approach. Notably, we are not convinced that the Spanish CA could not have identified its needs for additional information and forwarded appropriate requests for information to the applicant sooner than it did, even while following a precautionary approach.

7.2120 Moreover, we do not think that there was insufficient time to complete the approval procedure while Directive 90/220 was still in force. We note that as of July 2002, the lead CA had all necessary information, including positive scientific advice from the National Biosafety Committee, to complete its assessment. We recognize that as of July 2002 there was not much time left to complete the approval procedure under Directive 90/220. However, if Spain had proceeded more rapidly at earlier stages in the procedure, there would certainly have been enough time for the other member States to

[1535] Exhibit EC-76/Ats. 4 and 5.
[1536] Exhibit EC-76/Ats. 7 and 10.
[1537] Exhibit EC-76/Ats. 11 and 14.
[1538] Exhibit EC-76/At. 17.

review the lead CA's assessment report within 60 days following the circulation of the assessment report and, in the absence of objections, for the lead CA to give its consent to the placing on the market of NK603 maize.[1539] As indicated above, we consider that Spain could have identified its needs for additional information and forwarded appropriate requests for information sooner than it did, particularly prior to forwarding its request for information of May 2002.

7.2121 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning NK603 maize – notably the time taken by the lead CA up to August 2002, when the applicant updated its application in accordance with the requirements of Directive 2001/18 – was unjustifiably long.

7.2122 In relation to DS291, we recall that the United States claims that the approval procedure concerning NK603 maize was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the failure of Spain to complete its assessment of NK603 maize earlier than in January 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that Spain's conduct was a consequence of the general moratorium on approvals.

7.2123 In view of our conclusion with regard to the time taken by Spain for its assessment, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.2124 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning NK603 maize was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning NK603 maize for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning NK603 maize, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

[1539] We note that Spain could have considered that for as long as Directive 90/220 was still in force, there was no realistic prospect that the Group of Five countries and the Commission would allow the final approval of the application in question. However, the Panel does not consider that this would have justified Spain's failure to forward an assessment report to the Commission prior to the date of repeal of Directive 90/220. Spain might have anticipated opposition from the Group of Five countries on the basis of their June 1999 declaration. As pointed out above, notwithstanding this declaration, the Group of Five countries retained the freedom under EC law to approve applications. The same is true for the Commission, which had not issued a declaration comparable to that of the Group of Five countries.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the lead CA for its assessment of the application concerning NK603 maize was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning NK603 maize without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xvii) GA21 maize (EC-78)

7.2125 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning GA 21 maize (EC-78) has been unduly delayed.

7.2126 The **United States** argues that even though GA21 maize (EC-78) was forwarded by the lead CA to the Commission with a favourable opinion, received a positive opinion from the SCP in September 2000, the consultations with relevant member States were completed, and the scope of the application was reduced to exclude cultivation, the Commission failed to submit a draft measure to the Regulatory Committee. The United States argues that there was no action or communication by the Commission on this application. The United States adds that the only activity that occurred after the SCP's positive opinion was efforts by the applicant to re-start the process, including the applicant's voluntary offer in September 2001 to update the application (in the form of undertakings) to the requirements of the impending Directive 2001/18. Furthermore, the United States argues that although the applicant submitted all necessary supplementary information according to Directive 2001/18 to the lead CA on 15 January 2003, no action was taken in the following eight months, either by the lead CA or the Commission, to move the product towards consideration by the Regulatory Committee.

7.2127 The United States submits, finally, that the application concerning GA21 maize (EC-78) is one of nine applications identified by the United States which were stalled at the Commission level at the time Directive 90/220 expired and which, as of the date of establishment of the Panel, have been pending for an average of six and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning GA21 maize (EC-78) is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2128 **Argentina** argues that once the SCP issued its favourable opinion on 22 September 2000, the procedure on this application was suspended. Two years and two months had elapsed between the submission of the application and its suspension. Upon the replacement of Directive 90/220 by Directive 2001/18, the application had to be re-submitted. However, the approval process has not made any progress since that time. One year and eight months elapsed from the re-submission until September 2003, when the application was withdrawn. In total, counting the time that elapsed under Directives 90/220 and 2001/18, the procedure dragged on for 5 years and 2 months without a definitive response concerning approval.

7.2129 The **European Communities** argues that after assessment at both member State and Community level, the application was withdrawn by the applicant on 15 September 2003. The European Communities notes that the applicant, in its withdrawal letter, gave three reasons for the

withdrawal: *first*, the progress in the notification procedure of another Roundup Ready maize to a more advanced stage than the GA21 maize (EC-78) notification; *second*, the introduction of the new regulations concerning commercialisation of GM products in the European Communities; and *third*, the change of the company's commercial priorities.

7.2130 **Argentina** responds that although the applicant's letter of withdrawal does not have a specific reference to "undue delay", this does not imply that no "undue delay" occurred. Argentina considers that the silence of the applicants cannot be taken as evidence of satisfaction with the process, but rather that it was due to the applicant's concern with maintaining good relations with the approving authorities.

7.2131 The **Panel** begins its analysis by addressing the delay allegedly caused by the Commission.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.2132 We recall that the SCP issued a favourable opinion on 22 September 2000. Following the issuance of the SCP opinion, the Commission did not submit a draft measure to the Regulatory Committee until Directive 90/220 was repealed in October 2002. The United States and Argentina argue that the Commission should have submitted a draft measure to the Regulatory Committee before October 2002. The European Communities argues that the application was being assessed according to the procedures.

7.2133 We recall that according to the procedures set out in Directive 90/220, after the issuance of the SCP opinion, it was for the Commission to submit a draft measure to the Regulatory Committee for a vote. The Commission did not do so, however. Indeed, it seems that unlike in other procedures[1540], the Commission in this procedure never launched inter-service consultations on a draft measure. We are therefore not persuaded by the European Communities' assertion that the application concerning GA21 maize (EC-78) was being assessed according to the procedures.

7.2134 At any rate, we observe that the preparation by the Commission of a draft measure and its submission to the Regulatory Committee is not a process which inherently takes more than two years. In other approval procedures, the Commission was able to prepare and submit draft measures to the Regulatory Committee within a matter of a few months. For example, in the procedure concerning Bt-531 cotton, the Commission prepared a draft measure and launched a vote in the Regulatory Committee in less than three months.[1541] It may be inferred from this that the Commission could in principle have submitted a draft measure to the Regulatory Committee well before October 2002.

7.2135 The fact that the Commission could in principle have submitted a draft measure to the Regulatory Committee before October 2002 does not necessarily mean that the Commission could have done so in the specific circumstances of this case. We note in this respect that the SCP's favourable opinion stated that "[t]he applicant should however establish a monitoring plan to identify unexpected and unusual events and analyse grower experiences, in order to develop and implement any necessary changes in crop management practices in response to the results of monitoring."[1542] However, as with the approval procedures we have considered earlier, there is no evidence that the Commission or the lead CA ever requested the applicant to propose a monitoring plan in accordance with the SCP's opinion. In January 2003, the applicant submitted an updated application, including a monitoring plan. But this information was submitted at the applicant's initiative, in anticipation of the

[1540] *See, e.g.*, Exhibits EC-62/At. 76; EC-65/At. 48.
[1541] Exhibit EC-65/Ats. 48 and 51.
[1542] Exhibit EC-78+85/At. 90.

entry into force of the new requirements contained in Directive 2001/18, and not because the applicant was requested to address the SCP opinion.[1543] Therefore, there is no reason to believe that the Commission was waiting for the applicant to put forward a monitoring plan, or, indeed, to provide any of the other additional information submitted by the applicant in January 2003. Consequently, we do not consider that the SCP's recommendation justified the Commission's failure to forward a draft measure to the Regulatory Committee before October 2002

7.2136 We further note that four months after the SCP issued its opinion, in January 2001, the applicant sent a letter to the lead CA requesting that the scope of its application be limited to import only and no longer include cultivation.[1544] In March 2001, the lead CA informed the Commission that it had no objection to the applicant's request.[1545] There is no indication that the Commission opposed the applicant's request. While the scope of the application was relevant to the draft measure to be submitted by the Commission to the Regulatory Committee, the requested change of scope did not, in our view, present an obstacle to the Commission launching, or continuing, inter-service consultations on a draft measure.

7.2137 Nor do we see a possible obstacle in the fact that Directive 90/220 was repealed in October 2002. Indeed, the SCP opinion in this procedure dates from September 2000. In our assessment, there was thus enough time for the Commission to launch and complete inter-service consultations on a draft measure to be submitted to the Regulatory Committee and for the Commission to adopt its draft measure in the event of a favourable vote in the Regulatory Committee.[1546] In our assessment, the Commission's inaction cannot, therefore, be excused on the grounds that the approval procedure concerning GA21 maize could not be completed while Directive 90/220 was still in force.

7.2138 In its earlier findings on the application concerning GA21 maize, the Panel noted that the Commission could have considered that due to the "blocking minority" of the Group of Five countries in the Regulatory Committee and the Council, a favourable draft measure would not achieve the required qualified majority and that the Commission would then have to complete the procedure by adopting its draft measure. In the Panel's view, even in this scenario, there was enough time for the Commission to complete the procedure in question while Directive 90/220 was still in force. But even if it was doubtful that there would be enough time in view of anticipated member State opposition, the Panel does not consider that this would have justified the Commission's failure to forward a draft measure to the Regulatory Committee. The Commission would have anticipated a "blocking minority" on the basis of the June 1999 declaration by the Group of Five countries. As pointed out above, there is no indication that the June 1999 declaration was intended to bind the Governments of the Group of Five countries *vis-à-vis* other member States or the Commission. In other words, the Group of Five countries retained the freedom under EC law to vote in favour of applications in the Regulatory Committee and Council. In the light of this, we think the Commission could not have legitimately invoked the June 1999 declaration as a justification for not submitting a draft measure to the Regulatory Committee prior to October 2002.

7.2139 Based on the above considerations, the Panel is of the view that, in the specific circumstances of this procedure, the time actually taken by the Commission to prepare and forward a draft measure

[1543] Exhibit EC-78+85/At. 94.
[1544] Exhibit EC-78+85/At. 91.
[1545] Exhibit EC-78+85/At. 92.
[1546] We note, by way of example, that in the procedure concerning NK603 maize, the Regulatory Committee voted on the application less than three months after the SCP issued its opinion. Exhibit EC-76/At. 72.

to the Regulatory Committee – no draft measure was forwarded between September 2000 and October 2002 – was unjustifiably long.

7.2140 Regarding DS291, we recall that the United States claims that the approval procedure concerning GA21 maize (EC-78) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure to the Regulatory Committee following the issuance of the SCP's opinion is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's inaction was a consequence of the general moratorium on approvals.

7.2141 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Regulatory Committee, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.2142 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee once the SCP had issued its opinion – no draft measure was forwarded between September 2000 and October 2002 – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's inaction was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning GA21 maize (EC-78) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning GA21 maize (EC-78), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee – no draft measure was forwarded between September 2000 and October 2002 – was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning GA21 maize (EC-78) without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xviii) MON810 x GA21 maize (EC-82)

7.2143 One Complaining Party, the United States, claims that the completion of the approval procedure concerning MON810 x GA21 maize has been unduly delayed.

7.2144 The **United States** argues that this application never reached the Community level stage of review due to the moratorium. On 30 November 1999, the lead CA requested that the applicant provide several additional studies to support the application for this product.[1547] The applicant responded in August 2001 to all requests, except for a scientifically unjustified study on the nutritional composition of milk from dairy cows fed this product.[1548] Given the demonstrated safety of maize in feed generally, as well as the substantial data submitted to support the feed safety of both transgenic parents, there is no scientific basis to suggest a concern. One of the parental lines (MON810 maize) was approved by the European Communities several years prior to this application, and the feed safety was established as part of that process.[1549] In addition, as part of its original submission, the applicant had relied on substantial compositional analyses of the other parent (GA21 maize), as well as feeding studies.[1550] None of these studies identified anything that would provide any basis for the concern raised by the member State.

7.2145 The United States notes that the lead CA also requested additional studies of the hybrid in order to verify the stability of both events jointly. In the view of the United States, there was no logical basis for this request, which implies some interaction between the MON810 and GA21 events. The United States submits that the applicant had already shown the stability of these transformation events in each parental line. The insertions, having been shown to be stable in the parental lines, would be no more likely to be affected by crossing than any other gene already present in either parent.

7.2146 The United States notes that the applicant provided translations in January 2002 of various studies it had previously submitted. Following that, the only activity by the lead CA was a meeting held in April 2002.[1551] No further action was taken on this application for over 18 months, until the applicant volunteered to update the application under Directive 2001/18 on 16 January 2003.[1552] The applicant, however, subsequently withdrew the application on 15 September 2003, at the same time it withdrew the application for GA21 maize (EC-78), as the delays caused by the moratorium had rendered the applications for GA21 maize (EC-78) and MON810 x GA21 maize commercially obsolescent.[1553]

7.2147 The United States also points out that the application concerning MON810 x GA21 maize is one of nine applications identified by the United States which have been pending at the member State

[1547] Exhibit EC-82/At. 8.

[1548] Exhibit EC-82/ Ats. 9, 10 and 11. According to the United States, conducting the dairy cattle feeding study would have involved considerable cost and delay to the applicant. Such a test would require the applicant to obtain approval for further experimental plantings to generate sufficient maize for the feeding study; employ external consultants to undertake the required study; grow maize for the feeding study in the 2000 season; harvest, transport and ensile the maize under rigorous experimental conditions; undertake the cow-feeding phase; analyse the milk samples; and produce all reports to the Standards of Good Laboratory Practice.

[1549] Commission Decision concerning the placing on the market of genetically modified maize (zea mays L. line MON810) pursuant to Council Directive 90/220/EEC, (98/294/EC), April 22, 1998, Official Journal of the European Communities, L 131/32, May 5, 1998 (Exhibit US-131).

[1550] Exhibit EC-82/Ats. 2 and 5.

[1551] Exhibit EC-82/At. 18.

[1552] Exhibit EC-82/At. 20.

[1553] Exhibit EC-82/At. 21.

level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning MON810 x GA21 maize is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2148 The **European Communities** argues that the delays identified by the United States can be explained by the fact that the safety of one of the parental lines of this hybrid product, GA 21 maize, had not yet been assessed. The lead CA was awaiting that assessment. The European Communities maintains that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open. Furthermore, according to the European Communities, the United States acknowledges that the delays were caused by the applicant when it stated in response to a question from the Panel that "the applicant was unable to devote resources to respond to the questions posed by the [lead CA] in a timely fashion".[1554]

7.2149 The European Communities further observes that after discussions between the lead CA and the applicant, the application was withdrawn with a letter of 15 September 2003. The applicant gave three reasons for the withdrawal: first, the progress in the procedure of NK603 maize to a more advanced stage than the GA21 maize (EC-78) application; second, the introduction of the new regulations concerning commercialisation of GM products in the European Communities; and third, the change of the company's commercial priorities.

7.2150 The **United States** denies acknowledging that the delays were caused by the applicant. The summary table of the US response to question 47 from the Panel was not intended to indicate that delay was the fault of the applicant. Rather, the applicant recognized that the application for MON810 x GA21 maize would not move forward as long as consideration of the application for the single trait parent GA21 maize (EC-78) remained suspended under the moratorium. The United States contends that it was pointless for the applicant to devote resources to pursue the application for MON810 x GA21 maize when the approval of GA21 maize (EC-78) had been stalled for years under the moratorium. Thus, the delay in the application for MON810 x GA21 maize was a direct consequence of the delay in the application for GA21 maize (EC-78) under the moratorium.

7.2151 The United States points out that because of the delay in the approval procedure concerning GA21 maize (EC-78), that product, as well as MON810 x GA21 maize, have been superseded by a second generation Roundup Ready maize product (NK603 maize and NK603 × MON810 maize, respectively). The United States maintains that the applicant may not have cited undue delays in its withdrawal letter because it had a strong incentive to maintain cordial relations with EC regulators and saw no advantage of complaining to EC regulators about the length of the delays.

7.2152 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2153 We recall that the lead CA (Spain) in November 1999 requested additional information from the applicant. The applicant did not provide the information requested until August 2001. A translation into Spanish of the documents submitted in the August 2001 response was provided to the Spanish CA in January 2002. The United States has pointed out that the applicant did not comply

[1554] The European Communities refers to the United States' response to question 47 of the Panel, table in Annex I.

with the Spanish CA's request that it provide a study on the nutritional composition of milk from dairy cows which had been fed the product in question.

7.2154 It was only in April 2002 that the Spanish National Biosafety Committee completed its review of the January 2002 Spanish translation of the applicant's documents. The National Biosafety Commission concluded that it still needed the results of feeding studies on cows, and other information.[1555] However, there is no indication in the record that a further request for information was ever sent to the applicant prior to the repeal of Directive 90/220 in October 2002.

7.2155 According to the European Communities, the failure of the lead CA to forward the application concerning MON810 x GA21 maize to the Commission prior to the date of repeal of Directive 90/220 is justified by the fact that the lead CA was waiting for the result of the Community level assessment of one of the parental lines of this hybrid product, GA21 maize (EC-78). The European Communities maintains that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open.

7.2156 We recall that the Spanish CA in May 1999 had given a favourable assessment to the application concerning GA21 maize (EC-78) and forwarded that application to the Commission. When the application concerning MON810 x GA21 maize was submitted, the application concerning GA21 maize (EC-78) was under assessment at Community level. Furthermore, in September 2000 the SCP also issued a favourable opinion on the application concerning GA21 maize (EC-78).[1556] It is therefore not clear to us why the Spanish CA would not be in a position to reach a conclusion also with regard to the application concerning the hybrid product, *i.e.*, MON810 x GA21 maize. Indeed, the record does not indicate that the Spanish CA ever indicated to the applicant that it was unable to proceed due to the failure of the European Communities to approve the GA21 maize (EC-78) parent.

7.2157 As a general matter, it may be correct to say, as the European Communities does, that "the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open". However, it would seem that the assessment of the parental lines could also be made in the context of the assessment of the hybrid. At any rate, the Spanish CA could not "conclude" the assessment of the application concerning MON810 x GA21 maize completely on its own. If other member States had concerns with Spain's assessment of GA21 maize (EC-78), even though that assessment appears to have been confirmed by the SCP, they could have raised an objection on that basis to Spain's assessment of MON810 x GA21 maize and the assessment of that application would then also have been "concluded" at Community level.

7.2158 For these reasons, it is not apparent to us that the Spanish CA needed to keep the application at the member State level in order to avoid the possibility of conflicting assessments of GA21 maize, and we therefore do not consider that the fact that one of the parental lines was still pending justified Spain in not completing its assessment of the application concerning MON810 x GA21 maize.

7.2159 We note that after receiving a translation of the additional information requested from the applicant, it was incumbent on the Spanish CA either to seek further clarifications or to complete its assessment within the 90-day period provided for in Directive 90/220. As indicated, the National Biosafety Commission did not complete its review of the information until two and a half months later. Moreover, there is no evidence that the Spanish CA requested additional or missing information once the National Biosafety Commission had completed its review of the applicant's documents. Nor

[1555] Exhibit EC-82/At. 18.
[1556] Exhibit EC-78+85/At. 90.

did the Spanish CA complete its assessment after receiving further advice from the National Biosafety Commission in April 2002.

7.2160 We recognize that, by April 2002, the date of repeal of Directive 90/220 was approaching. However, we note that in another approval procedure, the Spanish CA forwarded questions from the National Biosafety Commission as late as mid-June 2002.[1557] Moreover, even if the lead CA had taken another two or three months to complete its assessment[1558], we think that there was still enough time for the other member States to review the lead CA's assessment report within 60 days following the circulation of the assessment report and, in the absence of objections, for the lead CA to give its consent to the placing on the market of MON810 x GA21 maize.[1559]

7.2161 Taking account of the aforementioned elements, we see no justification for the lead CA's failure, after receiving further advice from the National Biosafety Commission in April 2002, to follow up with the applicant to seek more information or additional clarifications, or for the lead CA's failure to complete its assessment in April 2002 or soon thereafter. We therefore are not convinced that the lead CA could not have proceeded more promptly than it did.

7.2162 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning MON810 x GA21 maize – notably the time taken by the lead CA between January and October 2002 – was unjustifiably long.

7.2163 In addition, we recall that the United States claims that the approval procedure concerning MON810 x GA21 maize was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the failure of Spain to complete its assessment of the application concerning MON810 x GA21 maize prior to the repeal of Directive 90/220 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that Spain's conduct was a consequence of the general moratorium on approvals.

7.2164 In view of our conclusion with regard to the time taken by Spain for its assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

[1557] Exhibit EC-75/At. 13.

[1558] We note, however, that by April 2002 the 90-day period envisaged in Directive 90/220 for a lead CA assessment had already been exceeded.

[1559] We note that Spain could have considered that for as long as Directive 90/220 was still in force, there was no realistic prospect that the Group of Five countries and the Commission would allow the final approval of the application in question. However, the Panel does not consider that this would have justified Spain's failure to complete its assessment prior to the date of repeal of Directive 90/220. Spain might have anticipated opposition from the Group of Five countries on the basis of their June 1999 declaration. As pointed out above, notwithstanding this declaration, the Group of Five countries retained the freedom under EC law to approve applications. The same is true for the Commission, which had not issued a declaration comparable to that of the Group of Five countries.

Conclusion

7.2165 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning MON810 x GA21 maize was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning MON810 x GA21 maize for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning MON810 x GA21 maize, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(xix) RR sugar beet (EC-88)

7.2166 One Complaining Party, the United States, claims that the completion of the approval procedure concerning RR sugar beet has been unduly delayed.

7.2167 The **United States** claims that the application for RR sugar beet was delayed at the first stage of the approval process under 90/220 because the lead CA (Belgium) declined to forward the application to the Commission. The United States argues that although the applicant provided answers to all of the questions raised by the lead CA, the lead CA failed to complete its review.

7.2168 The United States also points out that the application concerning RR sugar beet is one of nine applications identified by the United States which have been pending at the member State level for an average of three years and ten months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning RR sugar beet is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2169 The **European Communities** notes that after discussions between the lead CA and the applicant, the application was withdrawn by the companies producing the product on 16 April 2004. As the reason for the withdrawal, the applicant pointed to a decision to stop any further development of the RR sugar beet derived from event T9100152.

7.2170 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2171 We recall that the application was considered at a meeting of the Belgian Biosafety Advisory Council held on 26 April 1999. The questions which were generated by this meeting were transmitted to the applicant in June 1999 and included questions on agricultural practices, molecular

characterization, toxicology, allergenicity, and food/feed equivalence.[1560] The applicant provided responses to some of these questions in July 1999.[1561] Other questions were answered in December 1999.[1562]

7.2172 In October 1999 the lead CA requested additional information on gene transfer in digestive tracts.[1563] The applicant provided such information in January 2000.[1564] We asked the experts advising us whether the information regarding allergenicity, molecular characterization and gene transfer in digestive tracts requested by the lead CA was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti stated that the information provided by the applicant prior to October 1999 on these three topics was adequate to ensure that the conclusions of the assessment were valid.[1565]

7.2173 In February 2000, the lead CA requested missing bibliographical references. The applicant provided the relevant references in February and March 2000.[1566] According to the chronology provided to us, in April 2000 the applicant met with the CA to discuss issues relating to identity preservation, Good Agricultural Practices, post-market monitoring, traceability, public information, line-specific detection methods and primers. The record of this meeting was not provided to us, however. In July 2000, the applicant at its own initiative provided additional information on the characterization of a protein and detection protocols. The applicant noted that this data did not change the conclusions of the safety assessment.[1567]

7.2174 In November 2000, the lead CA requested further clarifications regarding molecular characterization and allergenicity of "event '77'".[1568] We asked the experts if the information regarding molecular characterization and allergenicity of "event '77'" requested by the lead CA was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti emphasized that the information "for allergenicity was not necessary to ensure that the conclusions of the safety assessment were valid", as the initial application had satisfactorily established the safety of this product in this respect.[1569] The applicant apparently did not provide the requested information.

7.2175 In January 2001 the lead CA "invited" the applicant to provide a proposal for labelling and traceability as well as a proposal for a monitoring plan and Good Agricultural Practices in accordance with the principles of the Common Position of the Council on the amendment of Directive 90/220. The lead CA indicated that in the absence of voluntary compliance with these principles, it seemed that the Commission and the other member States would oppose the approval of the application even if the lead CA forwarded it with a positive assessment.[1570] The applicant apparently did not reply to the lead CA's invitation. In June 2001, the lead CA sent the applicant some comments on its application, asking the applicant to make corresponding corrections.[1571] After the June 2001 communication from the lead CA there appear to have been no further exchanges between the lead CA and the applicant until the repeal of Directive 90/220 in October 2002.

[1560] Exhibit EC-88/Ats. 8 and 9.
[1561] Exhibit EC-88/At. 10.
[1562] Exhibit EC-88/At. 13.
[1563] Exhibit EC-88/At. 12.
[1564] Exhibit EC-88/At. 15.
[1565] Annex H, Dr. Nutti's response to Panel Question 42.
[1566] Exhibit EC-88/Ats. 17-21.
[1567] Exhibit EC-88/At. 22.
[1568] Exhibit EC-88/At. 27.
[1569] Annex H, Dr. Nutti's response to Panel Question 43.
[1570] Exhibit EC-88/At. 29.
[1571] Exhibit EC-88/At. 30.

7.2176 We begin our examination of the lead CA's assessment of the application under Directive 90/220 by recalling that the applicant did not respond to the lead CA's November 2000 request for additional information.[1572] It would therefore appear that after November 2000 the lack of progress of the application under Directive 90/220 is attributable to the applicant. The focus of our examination is therefore on the lead CA's conduct prior to the November 2000 request.

7.2177 We note in this respect that by the end of March 2000 the applicant had provided all additional information requested by the lead CA. Moreover, there is no indication that the Biosafety Advisory Council had been asked for further scientific input either before or after March 2000. Notwithstanding this, the lead CA did not complete its assessment in the next several weeks. Instead, more than seven months later, in November 2000, the lead CA requested further clarification on molecular characterization and allergenicity issues previously addressed by the applicant. As indicated previously, notably in the case of the clarifications sought concerning allergenicity, Dr. Nutti questioned the need for the information that was requested. Even ignoring this, we note that the European Communities did not provide an explanation for why the Belgian CA could not have sought these clarifications much earlier, given that the applicant had provided additional information on these issues before the end of 1999.

7.2178 Furthermore, even assuming *arguendo* that the lead CA could not have finished its assessment between March 2000, when the applicant provided all additional information requested by the lead CA, and the end of July 2000, when the applicant voluntarily submitted additional information, and accepting, again *arguendo*, that the lead CA required some time to review the July 2000 information, we recall that the November 2000 request came more than seven months after the applicant had provided all information requested by the lead CA. We are not persuaded that the completion of the review of the March and July 2000 information required more than twice the maximum 90-day period envisaged in Directive 90/220 for the entire assessment by a lead CA. We note in this connection that by November 2000, Belgium had already far exceeded the 90-day period provided for in Directive 90/220.

7.2179 Moreover, the seven-month delay after March 2000 could not, in our view, be excused on the basis that there was insufficient time to complete the approval procedure concerning RR sugar beet while Directive 90/220 was still in force. Directive 90/220 was not repealed until October 2002. There was thus enough time for the other member States to review the lead CA's assessment report within 60 days following the circulation of the assessment report and, in the absence of objections, for the lead CA to give its consent to the placing on the market of RR sugar beet.[1573]

7.2180 Taking account of the aforementioned elements, we consider that, even assuming that the lead CA's November 2000 request for additional information was justified, the lead CA could have sought that information earlier than it did. We also consider that the lead CA should have done so, as we think that by November 2000 the lead CA should have been able to resolve all other outstanding scientific or technical issues.

[1572] The lead CA in January 2001 reminded the applicant of its November 2000 request for information. Exhibit EC-88/At. 29.

[1573] We note that Belgium could have considered that for as long as Directive 90/220 was still in force, there was no realistic prospect that the Group of Five countries and the Commission would allow the final approval of the application in question. However, the Panel does not consider that this would have justified the seven-month delay after March 2000. Belgium might have anticipated opposition from the Group of Five countries on the basis of their June 1999 declaration. However, as pointed out above, notwithstanding this declaration, the Group of Five countries retained the freedom under EC law to approve applications. The same is true for the Commission, which had not issued a declaration comparable to that of the Group of Five countries.

7.2181 Based on the above considerations, the Panel concludes that the time taken by the lead CA for its assessment of the application concerning RR sugar beet – notably the time taken by the lead CA between March and November 2000 – was unjustifiably long.

7.2182 In addition, we recall that the United States claims that the approval procedure concerning RR sugar beet was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by Belgium to complete its assessment is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that Belgium's conduct was a consequence of the general moratorium on approvals.

7.2183 In view of our conclusion with regard to the time taken by Belgium for its assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2184 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning RR sugar beet was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning RR sugar beet for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning RR sugar beet, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the SPS Agreement.

(xx) MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape (EC-90)

7.2185 One Complaining Party, Canada, claims that the completion of the separate approval procedures for MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape have been unduly delayed. While we are mindful of the fact that Canada is making separate product-specific claims in respect of the two approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, in view of the very similar facts of these procedures, we examine the two claims together.

7.2186 **Canada** argues that the delays in completing the approval procedures for MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape are both excessive and unjustified, and hence undue. The EC decisions authorizing the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape in July 1997 stated that "consent shall be given by the competent authority of France to

the placing on the market" of the products in question[1574], yet in 2003, when the Panel was established, the lead CA had still failed to give its consent for either product.

7.2187 Canada notes that although the Commission took the procedural step of sending a "reasoned opinion" to France in relation to the withholding of consent for these products on 7 July 1999, the Commission has not pursued legal proceedings against France for infringement of European law before the European Court of Justice.[1575] No explanation has been provided by France for its refusal to comply with the Commission decisions and Directive 90/220, nor by the Commission for not pursuing legal action against France. This is despite the November 2000 judgment of the French Conseil d'Etat that, without new information concerning the risks associated with MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, the French Ministry could not call into question the decision taken by the Commission.[1576]

7.2188 Canada contends that the length of time it has taken, so far, for these applications to move through the approval system – more than eight years – is, by any reasonable standard, "undue" and therefore a violation of Annex C(1)(a), keeping in mind that the final approval for these products still has not been given. However, the amount of time these applications have languished in the approval procedure is not the sole reason for Canada's claim that the delays have been undue. First and foremost, the European Communities has had in place, since October 1998, an unjustified moratorium on approvals. Furthermore, the refusal to approve the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape are not based on risk assessments, particularly since both products were formally approved by the Commission in 1997.

7.2189 The **European Communities** argues that these products obtained a market authorization by virtue of Commission decisions of 6 June 1997. The European Communities submits that from the point of view of EC law, the absence of the final consent does not mean that the applicant is not entitled to place MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape on the market. The doctrine of "direct effect" in Community law means that the applicant could assert the rights granted them through the provisions of EC law.[1577]

7.2190 The European Communities confirms that the Commission initiated infringement proceedings against France in 1998, however it decided not to take the case to the Court. This was because the very legislation on the basis of which the approval had been granted had been identified to be insufficient and was being revised. Furthermore, France had raised the same environmental risk concerns regarding these two products as it had for the products for which it subsequently adopted safeguard measures (*i.e.* the identical product MS1/RF1 oilseed rape which had been approved for breeding activities in 1996).

7.2191 The approvals of MS1/RF1 and MS1/RF2 oilseed rape for import, processing and cultivation in 1996 and 1997 did not provide for any reporting or monitoring of marketing in the European

Ministère de l'Agriculture et de la Pêche*, C-6/99 [2000] ECR I-01651 (Exhibit CDA-51).

[1577] The European Communities refers to European Court of Justice, *Leberpfennig*, Case 9/70 [1970] ECR 825.

Communities. Accordingly, the European Communities claims it is unable to say whether these products have been sold in the European Communities. According to the European Communities, no oilseed rape varieties derived from MS1/RF1 or MS1/RF2 oilseed rape have been registered in member States' national catalogues or in the Common Catalogue of varieties of agricultural plant species – which is a prerequisite for allowing their commercial cultivation – because there has been no application from companies to do so.

7.2192 **Canada** rejects the EC argument that the absence of the final consent does not mean that the applicant is not entitled to place MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape on the market. Canada submits that this would require the applicant to pursue legal proceedings within the European Communities in order to bring to an end the approval procedures. According to Canada, under these circumstances it is obvious that the European Communities has failed to complete the relevant approval procedures under Directive 90/220. The applicant has been unable to market its products in the European Communities as a result of the failure of France to issue the letters of consent and the consequent uncertainty regarding the legal status of the products. Therefore, the European Communities has failed to "complete" the relevant approval procedures without "undue delay" in patent violation of Annex C(1)(a) of the *SPS Agreement*. Moreover, Canada argues that by failing to complete the approval procedures, the European Communities has instituted and maintained effective product-specific marketing bans for MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape.

7.2193 The **Panel** begins its analysis by addressing the delay allegedly caused by France as the lead CA.

Member State failure to give consent to placing on the market

7.2194 The Panel notes that although the two applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were formally approved by the Commission for placing on the market in June 1997, the lead CA subsequently failed to take the final step of the approval procedure provided for in Article 13(4) of Directive 90/220, which is to grant written consent to the placing on the market of a product. The relevant Commission decisions, which are addressed to the member States, also provide in their Article 1(1) that "consent shall be given by the competent authority of France to the placing on the market" of the oilseed rape products in question.[1578]

7.2195 Neither Article 13(4) of Directive 90/220 nor the relevant Commission decisions lay down specific time periods within which the lead CA had to give consent. However, it is clear to us that this does not mean that the lead CA could take any amount of time to complete the step required of it. If it were otherwise, the deadlines stipulated in Directive 90/220 for the completion of other steps of the approval procedure, such as the 90-day member State assessment period set out in Article 12, the 60-day objection period set out in Article 13 and the three-month action period set out in Article 21, could easily be nullified and rendered meaningless. We recall that in the case of the two applications at issue, the approval for both applications was given by the Commission on 6 June 1997. As of October 2002, when Directive 90/220 was repealed, France had not granted its consent to the placing on the market of the products at issue. Thus, under Directive 90/220, France did not grant its consent for more than five years.[1579]

[1578] Exhibits CDA-48 and -49.

[1579] We note, by way of example, that in the approval procedure concerning the Red-hearted chicory, which was also conducted under Directive 90/220, the lead CA gave its written consent two-and-a-half months after the Commission approved the application for breeding activities. Exhibit EC-77/At. 42.

7.2196 There is some uncertainty as to the status of the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape after the repeal of Directive 90/220. Article 35 of Directive 2001/18 provides that applications submitted under Directive 90/220 in respect of which the approval procedures under Directive 90/220 have not been completed by 17 October 2002 are subject to Directive 2001/18. It further provides that by 17 January 2003 applicants had to complement their applications in accordance with Directive 2001/18. There is no indication that the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were complemented in accordance with Directive 2001/18.

7.2197 The European Communities appears to argue, however, that the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were completed under Directive 90/220. The European Communities contends that in accordance with the jurisprudence of the European Court of Justice the absence of the final consent from the lead CA does not mean that the applicant is not legally entitled to place MS1/RF1 oilseed rape (EC-89) and/or MS1/RF2 oilseed rape on the market. According to the European Communities, the applicant could invoke before French courts the obligation imposed by the above-noted Commission decisions on France to give its consent to the placing on the market of the products in question. Canada did not contest that the applicant would have this right under EC law. In these circumstances, and in the absence of evidence to the contrary, we see no grounds for rejecting the European Communities' contention regarding the position under its own law.

7.2198 Accepting the European Communities' contention means that as of the date of establishment of this Panel, the above-noted Commission decisions were still legally binding, and that as of that date the applicant could still invoke the above-noted Commission decisions against France, since France had not given its written consent by then. This does not mean, however, that either before or after the repeal of Directive 90/220 France itself was no longer required to comply with the Commission decisions and was not obliged to grant its written consent.

7.2199 We must not, and hence do not, express a view on whether the approval procedures conducted under Directive 90/220 concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape were "completed" as a matter of EC law.[1580] However, we may express a view on whether these approval procedures were "completed" within the meaning of Annex C(1)(a), first clause. We have observed earlier that the verb "complete" as it appears in Annex C(1)(a), first clause, indicates that approval procedures are not only to be undertaken, but are also to be finished, or concluded, and that the phrase "undertake and complete", which also appears in Annex C(1)(a), first clause, covers all stages of approval procedures and should be taken as meaning that approval procedures are to be started and carried out from beginning to end.[1581]

7.2200 We do not consider that the European Communities finished, or concluded, the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, or that the European Communities carried out these procedures from beginning to end. Indeed, Directive 90/220 provides for the granting of the lead CA's written consent to the placing on the market as an integral and last step of the approval procedure.[1582] In our view, the fact that the applicant could invoke before French courts the obligation imposed by the above-noted Commission decisions on France to give its consent to the placing on the market of the products in question does not demonstrate that the relevant approval procedures have already been "completed" within the meaning of Annex C(1)(a), first

[1580] We note that Article 35 of Directive 2001/18 uses the phrase "not [...] completed" in connection with procedures commenced under Directive 90/220.

[1581] *See supra*, para. 7.1494.

[1582] Article 13(4) of Directive 90/220.

clause. Rather, it indicates that, notwithstanding France's failure to finish the procedures, the Commission decisions may be enforceable *vis-à-vis* France.

7.2201 Having determined that the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape have not been completed, we now turn to address whether the time taken by France to grant its written consent is unjustifiably long. The European Communities asserts in this respect that France's inaction after June 1997 was due to concerns about environmental risks, and that these same risks led France in November 1998 to adopt a safeguard measure on MS1/RF1 oilseed rape (EC-161).[1583] In considering the EC assertion, we note that we have been provided very little information on the approval procedures concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape. In particular, we have seen no evidence which points to the alleged environmental concerns by France. To the contrary, the Commission decisions approving the applications concerning MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape make clear that France forwarded the application to the Commission with a favourable opinion.

7.2202 Furthermore, there is no indication that France after June 1997 sought additional information from the applicant, or proposed to the applicant voluntarily to accept stricter conditions to meet France's alleged environmental concerns. Moreover, the Commission decisions approving the two products specify that Directive 90/220 provides for additional safeguards if new information on risks of the products in question became available. In the light of this, even if France considered that by June 1997 there were justifiable reasons for it to consider that the products in question constituted a risk to the environment, it could have taken a safeguard measure, as it did for MS1/RF1 oilseed rape (EC-161), *after* giving its written consent to the placing on the market of the two products in question.[1584] The concerns underlying France's safeguard measure would then have been examined by the SCP, and a decision on the validity of France's concerns would then have had to be taken at Community level.

7.2203 For these reasons, we are not persuaded that there were outstanding environmental issues which were specific to the products in question, and which France was trying to have the applicant address prior to giving its written consent to the placing on the market of these products.

7.2204 The European Communities offered no other explanation for France's prolonged inaction. We recall in this regard that in June 1999 France was one of the Group of Five countries which declared that they would take steps to suspend further approvals under Directive 90/220 pending the adoption of new EC rules on labelling and traceability. We found earlier that at least as from June 1999 France's conduct is consistent with the June 1999 declaration by the Group of Five countries. Indeed, despite a clear legal obligation to give written consent to the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape, France withheld its consent and thus prevented these products from being approved. As we have explained earlier[1585], however, we consider that the perceived need for new EC rules on labelling and traceability does not provide a sufficient justification for not completing the approval procedures for the products in question and for preventing their final approval.

[1583] The application concerning MS1/RF1 oilseed rape (EC-161) had been submitted to the United Kingdom and was approved for breeding activities in 1996.

[1584] There is nothing in Directive 90/220 which says that a lead CA forwarding an application with a positive opinion and giving written consent to the placing on the market of a product may not subsequently take a safeguard measure in respect of that product.

[1585] *See supra*, paras. 7.1511-7.1518.

7.2205 Based on the above considerations, the Panel concludes that the time taken by France up to August 2003, including the time taken after June 1999, for the purpose of giving its written consent to the placing on the market of MS1/RF1 oilseed rape (EC-89) and MS1/RF2 oilseed rape following the approval of both applications by the Commission in June 1997 is unjustifiably long.

7.2206 In view of this conclusion, we do not go on to examine other arguments put forward by Canada in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.2207 In the light of the above, the Panel reaches the following conclusions:

(i) DS292 (Canada) – MS1/RF1 oilseed rape (EC-89)

With reference to DS292, the Panel recalls its findings that the time taken by France to give its written consent for the placing on the market of MS1/RF1 oilseed rape (EC-89) following its approval by the Commission in June 1997 – no consent was given between June 1997 and August 2003 – was unjustifiably long. Based on these findings, the Panel accepts Canada's contention that the European Communities failed to "consider or approve, without undue delay" the application concerning MS1/RF1 oilseed rape (EC-89), and that it consequently did not complete the relevant approval procedure without "undue delay". Accordingly, the Panel concludes that in respect of the approval procedure concerning MS1/RF1 oilseed rape (EC-89), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS292 (Canada) – MS1/RF2 oilseed rape (EC-90)

With reference to DS292, the Panel recalls its findings that the time taken by France to give final consent for the placing on the market of MS1/RF2 oilseed rape following its approval by the Commission in June 1997 – no consent was given between June 1997 and August 2003 – was unjustifiably long. Based on these findings, the Panel accepts Canada's contention that the European Communities failed to "consider or approve, without undue delay" the application concerning MS1/RF2 oilseed rape, and that it consequently did not complete the relevant approval procedure without "undue delay". Accordingly, the Panel concludes that in respect of the approval procedure concerning MS1/RF2 oilseed rape, the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(c) Novel Foods – Applications submitted under Regulation 258/97

7.2208 We now turn to examine the approval procedures which were conducted under Regulation 258/97 for the applications identified by the Complaining Parties. Before embarking on an examination of individual approval procedures, however, we should briefly address certain issues presented by the application of Annex C(1)(a), first clause, to approval procedures conducted under Regulation 258/97.

(i) Application of Annex C(1)(a), first clause, to approval procedures conducted under Regulation 258/97

7.2209 We have found earlier that the approval procedure set out in Regulation 258/97, to the extent it is applied to check and ensure the fulfilment of the requirement that novel foods not present a danger for the consumer, constitutes an "approval procedure" within the meaning of Annex A(1) of the *SPS Agreement*. On the other hand, we found that to the extent the same approval procedure is applied to check and ensure the fulfilment of the requirements that novel foods not mislead the consumer and that they not be nutritionally disadvantageous for the consumer, that procedure is not an "approval procedure" within the meaning of Annex A(1) of the *SPS Agreement*.

7.2210 Under Regulation 258/97, once an application for the approval of a novel food product is submitted, the fulfilment of the aforementioned three requirements is to be checked through one single approval procedure. Regulation 258/97 also envisages that if an application does not meet one of three requirements, the relevant food product may not be placed on the market. We recall that the Complaining Parties did not challenge Regulation 258/97 as such, and thus did not question the European Communities' decision to conduct one single approval procedure to check all three requirements and to grant approvals only in cases where applications comply with all three requirements.

7.2211 It follows from the design of Regulation 258/97 that in the event there is a delay in the processing of an application due to the need to check the fulfilment of the requirement that novel foods not mislead the consumer, or that they not be nutritionally disadvantageous for the consumer, that delay would also affect the SPS approval procedure conducted for the same application, *i.e.*, the procedure applied to check and ensure the fulfilment of the requirement that novel foods not present a danger for the consumer. In other words, the SPS approval procedure would be delayed if, and to the extent that, there was a delay in the non-SPS approval procedure.

7.2212 We have previously stated that, in our view, Annex C(1)(a), first clause, requires that SPS approval procedures be undertaken and completed with no unjustifiable loss of time. In the context of Regulation 258/97, the issue thus arises whether a delay caused by the need to check the fulfilment of, *e.g.*, the non-SPS requirement that novel foods not be nutritionally disadvantageous for the consumer should be considered to constitute, *ipso facto*, unjustifiable loss of time.

7.2213 In addressing this issue, we recall that the Complaining Parties did not challenge or question the fact that Regulation 258/97 provides that for each application a single procedure is to be conducted, leading to a single approval. We consider that, in these circumstances, a delay in the SPS approval procedure should not be viewed as "undue" merely because it arose from the need to check the fulfilment of one of the two non-SPS requirements contained in Regulation 258/97, *e.g.*, the requirement that novel foods not be nutritionally disadvantageous for the consumer. Indeed, if it were otherwise, a situation might arise where the European Communities would have to complete the procedure with a substantive decision on the application concerned even if it had not yet been able adequately to determine whether the application meets the requirement that the novel food product not be nutritionally disadvantageous for the consumer. The European Communities might thus have to approve a novel food product the consumption of which is nutritionally disadvantageous for the consumer, and this even though the Complaining Parties never questioned the fact that in accordance with Regulation 258/97 the requirement that a product not be nutritionally disadvantageous must be fulfilled before a product is approved.

7.2214 While we thus do not consider that, in the specific circumstances of this case, a delay in the SPS approval procedure should be treated as "undue" merely because it arose from the need to check

the fulfilment of one of the two non-SPS requirements contained in Regulation 258/97, it is our view that for instance if the time taken to check the fulfilment of one of those non-SPS requirements exceeded the time that is required to do so, the resulting delay in the SPS approval procedure would be at least partly "undue".

7.2215 In view of the above considerations, we think that for the purposes of our examination of the relevant approval procedures in the light of Annex C(1)(a), first clause, we need not, and hence do not, make specific findings on whether any delays in a relevant approval procedure arose from the need to check the fulfilment of the SPS requirement that novel foods not present a danger for the consumer or whether they arose from the need to check the fulfilment of the non-SPS requirements that novel foods not mislead the consumer and that they not be nutritionally disadvantageous for the consumer. In the circumstances of this case, either type of delays would be relevant to an inquiry under Annex C(1)(a), first clause.

7.2216 As an additional, but separate, matter, we should recall that the Regulation 258/97 applications covering foods or food ingredients which contain or consist of GMOs are subject to Article 9 of Regulation 258/97 which provides that the Commission decision approving the placing on the market under Regulation 258/97 must "respect the environmental safety requirements laid down by [Directive 90/220] to ensure that all appropriate measures are taken to prevent the adverse effects on human health and the environment which might arise from the deliberate release of [GMOs]". As we have said earlier, it would seem to follow from Article 9 that if the applicant did not submit an environmental risk assessment, a Regulation 258/97 application could not be approved by the Commission unless a Directive 90/220 application concerning the same biotech product had previously been approved. We observe in this context that it would in our view be contrary to the requirements of Annex C(1)(a), first clause, for the European Communities to proceed with a Regulation 258/97 procedure at a delayed pace merely because of delays which have occurred, or are anticipated to occur, in a parallel Directive 90/220 (or Directive 2001/18) procedure concerning the same biotech product, provided that further progress in the Regulation 258/97 procedure is still possible. In other words, we consider that the European Communities must proceed as far as possible with a Regulation 258/97 procedure as promptly as possible, unless the applicant requests that the Regulation 258/97 procedure proceed more slowly, or that it not proceed faster or further, than a parallel Directive 90/220 (or Directive 2001/18) procedure. In the case of the Regulation 258/97 applications at issue in this dispute, we are not aware of the existence of such a request by an applicant or of a situation where no further progress in the relevant Regulation 258/97 procedure was possible.

7.2217 Finally, we recall that in Section VII.D we have addressed whether the reason for the general EC moratorium on final approvals could have provided a justification for delays which might have occurred as a result of that moratorium. These earlier observations are relevant and applicable also to our examination of the Regulation 258/97 approval procedures identified by the Complaining Parties.

7.2218 With these general observations in mind, we now proceed with the examination of the individual product-specific measures complained against.

(ii) GA21 maize (food) (EC-91)

7.2219 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning GA21 maize (food) has been unduly delayed.

7.2220 The **United States** argues that the application concerning GA21 maize (food) under Regulation 257/98 was delayed first at the member State level in that the lead CA (the Netherlands)

took at least 10 months more than required to complete its initial assessment. Subsequently, the SCF failed to consider the application for 11 months, and later delayed issuing its assessment for 11 months without explanation. Finally, following the positive assessment of the SCF, the Commission failed to submit a draft decision to the Regulatory Committee for approval of this product prior to the establishment of the Panel. The United States considers these delays to be unwarranted and thus undue.

7.2221 The United States observes that this product was under consideration by the lead CA between the submission of the application in July 1998 and the lead CA's opinion in January 2000. In February 1999, the lead CA requested the applicant to perform a further study on compositional analysis, and the applicant provided its response in October 1999. Therefore, of the total 18 months during which this product was considered at the member State level, only 8 were used by the applicant to answer questions.

7.2222 The United States points out that the application was forwarded to the Commission on 21 January 2000. The official member State consultation period was over by April 2000. The United States notes that the Commission asked the SCF for an opinion on 18 May 2000. However, it was eleven months later that the SCF contacted the applicant for the first time, asking for additional information.[1586] Within less than one month, the applicant provided answers to all questions.[1587] It took a further 11 months for the SCF to issue an opinion on 27 February 2002.[1588] Hence the application was delayed for 17 months at the Community level before the SCF rendered its positive opinion on 27 February 2002. In its opinion, the SCF concluded that the data submitted, including the two whole food studies, were "sufficient for evaluation"[1589] and cited these studies in support of its ultimate conclusion that "from the point of view of consumer health, maize grain from maize line GA21 and derived products […] are as safe as grain and derived products from conventional maize lines."[1590]

7.2223 According to the United States, almost two months passed after the positive SCF opinion with no activity on this application. On 23 April 2002, the applicant offered to reduce the scope of the application to include only processed grain and derived ingredients, but not unprocessed grains, in order to enable the authorization procedure under Regulation 258/97 to proceed immediately.[1591] The applicant explained that the reason for this proposal was because the food use of unprocessed grains is also subject to Directive 90/220 and that "progress under this Directive has been suspended for some time, with the result that GA21 maize grain has not yet been considered for consent."[1592]

7.2224 The United States argues that despite the efforts of the applicant to remove any possible impediments, the Commission still failed to forward the application to the Regulatory Committee after the positive SCF opinion. Instead, as reflected in the minutes of a meeting on 5 June 2002 between the Commission and the applicant, the Commission noted that although the next step was to take a Community Decision, "[i]t is desirable that such a Decision would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and

[1586] Exhibit EC-91/At. 39.
[1587] Exhibit EC-91/At. 40.
[1588] The current revised regulatory framework recognizes that a period of six months is an achievable timeframe for the EC's Scientific Authority (EFSA GMO Panel) to come to an opinion. Regulation (EC) No. 1829/2003, Article 6.1.
[1589] Exhibit EC-91/At. 43, pp. 11-12.
[1590] Exhibit EC-91/At. 43.
[1591] Exhibit EC-91/At. 44.
[1592] Exhibit EC-91/At. 44.

feed as well as the labelling of GM products".[1593] The United States maintains that the European Communities simply halted the processing of this application in anticipation of possible upcoming changes to its regulations, an action entirely consistent with the moratorium which the European Communities and member State officials had announced. Although both the new food and feed and traceability and labelling legislations would not enter into force until 2004, and although the applicant stated its preference to apply the labelling requirements currently in effect under Regulation 258/97, the Commission noted that "it is clear that it would be more difficult to obtain a favourable opinion by a majority of Member States in the Comitology procedure" if the applicant were not required to anticipate the new labelling requirements before the new legislation was adopted.[1594] In other words, the applicant was required to wait until the requirements for labelling under pending legislation were finalized. Thus the Commission failed to forward a draft measure to the Regulatory Committee as is required to complete the approval process, resulting in further delay that lasted until the new Food and Feed regulation was passed in September 2003.

7.2225 The United States submits, in addition, that the application concerning GA21 maize (food) is one of five applications identified by the United States which are pending at Commission level and which, as of the date of establishment of the Panel, have been pending for an average of four years and six months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning GA21 maize (food) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2226 **Argentina** argues that consideration of the application for GA-21 maize (food) under Regulation 258/97 dragged on for a total of 5 years and 2 months without a definitive response. Argentina further contends that the chronologies provided by the European Communities verify the numerous opportunities in which information additional to what is necessary for appropriate control, inspection and approval procedures was required from the applicant. Argentina contends that since 27 February 2002, the date on which the SCF expressed its favourable opinion, there has been no further progress in the approval process. Argentina indicates that the application was withdrawn in September 2003 because no progress had been made since 27 February 2002.

7.2227 The **European Communities** argues that the 18 months spent at member State level were due to the incompleteness of the dossier initially submitted and to the need for additional scientific data.[1595] The dossier was circulated at the Community level in January 2000, as required by the regulation. Many member States requested additional information and raised questions, several raised objections mainly on grounds of insufficient data on molecular characterisation and on compositional analysis (substantial equivalence). In May 2000, the Commission requested the opinion of the SCF. The SCF found that the dossier did not contain sufficient information concerning substantial equivalence and toxicity testing, and had to request the relevant information from the applicant.[1596] The SCF finally issued its opinion February 2002.

7.2228 The European Communities notes the difference between risk assessment and risk management and argues that the former is the task of the scientific committees, while the latter is the function of the Regulatory Committee. Since the Regulatory Committee fulfils risk management functions, it has to take into account all relevant factors, including risk assessment *stricto sensu*. The

[1593] Exhibit EC-91/At. 45, p. 1.
[1594] Exhibit EC-91/At. 45**,** p. 2.
[1595] Exhibit EC-91/At. 1-6.
[1596] *See* Request of 24 April 2001 (Exhibit EC-91/At. 17).

European Communities argues that the draft measures forwarded by the Commission to the Regulatory Committee are therefore supported by scientific assessments, but also address other legitimate issues, including risk management issues, which are not addressed by a scientific committee.

7.2229 In relation to Regulation 258/97, the European Communities contends that in terms of risk management it became clear in 1999 that there would have to be new legislation addressing issues such as labelling and traceability, and also the development and validation of detection methods. In relation to the application concerning GA21 maize (food), the European Communities submits that the SCF's opinion did not address sufficiently all relevant elements. The elements which determined the insufficiency of the SCF's opinion related to the issues of validation of detection methods, which were requirements to be included in the new legislation on "Food and Feed" and on whose importance the applicant agreed. More particularly, the European Communities notes that in view of the pending legislative proposal for "Food and Feed", in June 2002 the applicant committed on a voluntary basis to providing detection and validation methods for its product in collaboration with the Joint Research Centre of the Commission (hereafter the "JRC").

7.2230 The European Communities notes that agreement on the amount of data and material and the circumstances of their submission to the JRC took a considerable amount of time. All the necessary data were received in proper condition in mid-September 2003. The pre-validation study was initiated in October and was concluded after the applicant delivered the full data set at the end of November 2003. Some additional testing on the method and materials was carried out in early 2004. The collaborative study of method validation was launched in April 2004 and was expected to be finished by the end of June 2004.

7.2231 The **Panel** begins its analysis by addressing the Commission's failure up to August 2003 to submit a draft measure to the Regulatory Committee.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.2232 We recall that the SCF issued a positive evaluation of this application in February 2002. Following the issuance of the SCF opinion, the Commission did not submit a draft measure to the Regulatory Committee at any point up to August 2003. The United States and Argentina argue that the Commission should have prepared and submitted a draft measure to the Regulatory Committee shortly after the issuance of the SCF opinion.

7.2233 The record shows that some two months after the issuance in February 2002 of the favourable opinion by the SCF Instead, on 23 April 2002, the applicant informed the Commission that it was no longer seeking to obtain approval to place on the market unprocessed GA21 maize grain for food use. The applicant explained that this food use would be subject to Directive 90/220[1597], and noted that the progress of the application concerning GA21 maize (EC-78) under Directive 90/220 had been suspended for some time. The applicant was hoping that this move would enable the application under Regulation 258/97 to proceed immediately.[1598]

[1597] Pursuant to Article 9 of Regulation 258/97, in the case of foods or food ingredients containing or consisting of GMOs, the approval decision to be taken must "respect the environmental safety requirements laid down by Directive 90/220 to ensure that all appropriate measures are taken to prevent the adverse effects on human health and the environment which might arise from the deliberate release of [GMOs]".

[1598] Exhibit EC-91/At. 44.

7.2234 The record further shows that more than a month later, on 5 June 2002, the Commission services met with the applicant. According to a Commission report about the meeting, the Commission indicated at the meeting that "it would be desirable that a [draft measure on the application] would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and feed as well as the labelling of GM products".[1599] Specifically, the Commission sought voluntary commitments with regard to the labelling of foods and food ingredients derived from GA21 maize as well as with regard to detection methods and reference materials.

7.2235 At the June 2002 meeting, the applicant agreed to provide additional information and materials, including a detection method, so as to provide a basis for traceability, as envisaged in the new EC rules proposed by the Commission. The Commission's report of the meeting notes in this regard that the Commission might present a draft measure to the Regulatory Committee in November 2002, provided that a validated detection method was available by then. At the time of establishment of the Panel, the question of the validation of the detection method had not yet been resolved, and so by August 2003 no draft measure had been forwarded to the Regulatory Committee.

7.2236 The record of the approval procedure concerning GA21 maize (food) does not contain any evidence to show that the Commission in this procedure launched inter-service consultations on a draft measure after the issuance in February 2002 of the favourable opinion by the SCF. This contrasts with the record of other approval procedures which contains such evidence.[1600] Therefore, we cannot assume that inter-service consultations were launched on a draft measure on GA21 maize (food).

7.2237 Indeed, it appears that the Commission preferred first to explore whether the applicant would be willing to provide certain additional information, or to make certain additional commitments, on the basis of proposals for new EC legislation. While we accept that the applicant's response could have had an impact on the kind of draft measure on which the Commission would launch inter-service consultations, this circumstance would not explain why the Commission waited for more than three months after the issuance of the SCF opinion before approaching the applicant.

7.2238 Since the Commission was seeking voluntary commitments, it was possible that the applicant would reject the Commission's request in its entirety. Had the applicant done so, the Commission would have delayed the procedure by more than three months, as the Commission would have launched inter-service consultations only at that point.

7.2239 The record contains no information which suggests that June 2002 was the earliest date on which the Commission could have sought the relevant voluntary commitments. Indeed, the European Communities itself stated in relation to Regulation 258/97 that in terms of risk management it became clear in 1999 that there would have to be new legislation addressing issues such as labelling and traceability, and also the development and validation of detection methods. In the light of this, we fail to see why it would not have been possible for the Commission to explore the possibility of voluntary commitments with the applicant already in March 2002 rather than only in June 2002. Indeed, the Commission had circulated proposals for appropriate EC legislation as early as July 2001. Had the applicant said no to the Commission's request, this would have disposed of the issue.

7.2240 In fact, it is clear from the record that the applicant showed little interest in undertaking additional commitments with regard to labelling. However, the applicant did accept the

[1599] Exhibit EC-91/At. 45.
[1600] *See, e.g.*, Exhibits EC-62/At. 76; EC-65/At. 60.

Commission's request to provide reference material and a detection method which was to be validated by the Joint Research Centre of the Commission. It appears to us from the record that the applicant accepted this request on the basis of the Commission proposals for new legislation, since the European Parliament was apparently scheduled to debate the proposals only in July 2002. This supports our view that the Commission could have sought this particular commitment prior to June 2002.

7.2241 The Commission's report of the June 2002 meeting indicates that the Commission expected "no particular problem with respect to the validation. However, the availability of reference material has not been discussed."[1601] It is clear from this statement that the Commission was aware that relevant material might or might not have been available, and that it was therefore possible that the applicant would require time to put together relevant data and material. Moreover, as this approval procedure shows, a material transfer agreement needed to be reached before any materials would be transferred. Finally, the Commission in its report of the June 2002 meeting made clear that it would not forward a draft measure to the Regulatory Committee until a detection method had been validated. Therefore, had the applicant been made aware of the Commission's request earlier, the detection method could have been validated sooner, and a draft measure would also have been submitted to the Regulatory Committee sooner.

7.2242 Taking account of the foregoing elements, we consider that for the purposes of exploring the possibility of the applicant undertaking voluntary commitments, the Commission could, and should, have approached the applicant soon after the issuance of the SCF opinion (or before) rather than more than three months later.

7.2243 Based on the above considerations, the Panel is of the view that, in the specific circumstances of this procedure, the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee – and in particular the time taken by the Commission to explore the possibility of the applicant undertaking voluntary commitments – was unjustifiably long.

7.2244 Regarding DS291, we recall that the United States claims that the approval procedure concerning GA21 maize (food) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure to the Regulatory Committee meeting concerning GA21 maize (food) prior to August 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's conduct was a consequence of the general moratorium on approvals.

7.2245 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Regulatory Committee, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

[1601] Exhibit EC-91/At. 45.

Conclusions

7.2246 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to prepare a draft measure to be submitted to the Regulatory Committee – and in particular the time taken to explore the possibility of the applicant undertaking voluntary commitments – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning GA21 maize (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning GA21 maize (food), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the Commission to prepare a draft measure to be submitted to the Regulatory Committee – and in particular the time taken to explore the possibility of the applicant undertaking voluntary commitments – was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning GA21 maize (food) without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(iii) Bt-11 sweet maize (food) (EC-92)

7.2247 One Complaining Party, the United States, claims that the completion of the approval procedure concerning the Bt-11 sweet maize (food) has been unduly delayed.

7.2248 The **United States** submits that the processing of this application had been delayed at the Commission stage of the process, as the Commission had refused to forward a draft measure to the Regulatory Committee as is required to complete the approval process, and the request remained blocked as of then.

7.2249 The United States also points out that the application concerning Bt-11 sweet maize (food) is one of five applications identified by the United States which are pending at Commission level and which, as of the date of establishment of the Panel, have been pending for an average of four years and six months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-11 sweet maize (food) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2250 The **European Communities** notes that, after the lead CA sent its initial assessment report to the Commission in May 2000, four member States raised objections and several more requested additional information, relating mainly to the antibiotic resistance marker used (PAT protein) and to the toxicity studies done in relation to this protein as well as to molecular characterization.

7.2251 The Commission requested the opinion of the SCF in December 2000. The SCF requested further data which the applicant only supplied in February 2002. The SCF issued its opinion in April 2002, stating that on the basis of the information supplied in the application and further material supplied by the applicant in response to queries raised by member States and in the light of the published literature, it was to be concluded that Bt-11 sweet maize (food) was as safe for human food use as its conventional counterparts.

7.2252 According to the European Communities, in view of the pending legislative proposal on "Food and Feed", the applicant, on a voluntary basis, agreed to provide detection and validation methods for its product in collaboration with the JRC. The amount of data and material and the circumstances of their submission to the JRC were agreed upon in a planning meeting in October 2002. The first set of material sent at the beginning of 2003 was inadequate in terms of necessary amounts and the method provided by the applicant performed very poorly in a pre-validation study. The applicant delivered a proper method and all the necessary materials only by July 2003. The JRC finalized the validation method in October 2003.

7.2253 In November 2003, the Commission submitted a draft measure to the Regulatory Committee. At member States' request, however, the Commission did not ask for a formal vote, given that several member States considered that the scientific questions they had formulated earlier on the basis of their conflicting national scientific evaluations were still open, and others were still awaiting further scientific risk assessments of their national scientific committees. Between October and early December 2003, three new risk assessments were issued by the member States, all of which conflicted with the SCF opinion.

7.2254 Finally, the Commission asked for the formal vote on its draft measure. However, the draft measure did not obtain a qualified majority in the Regulatory Committee, nor subsequently in the Council. The draft measure was adopted by the Commission on 19 May 2004.

7.2255 With regard to the period of time taken by the Commission before requesting the SCF for an opinion, the **United States** maintains that when the application was first evaluated at the Community level in 2000, member States objected on the basis not of scientific grounds, but the general moratorium. The United States cites, as an example, that Denmark's Agriculture and Fisheries Council recalled "[i]n August 2000, Denmark submitted an objection to the approval of Bt-11 maize in respect of the novel food regulation with reference to the declaration approved by Denmark, France, Italy, Greece and Luxembourg on the suspension of new GMO licenses (the moratorium declaration), which was made at the Council meeting (environment) on 24-25 June 1999. The objection included a reference to the fact that, pending the approval of a regulation that would guarantee the labelling and effective tracing of GMOs and products derived from them, the moratorium countries would block any new licenses for the cultivation and marketing of GMOs."[1602] Also in August 2000, France cited the yet to be implemented food and feed regulations as a reason for withholding support for Bt-11 sweet maize (food), choosing to disregard comprehensive scientific findings and instead continue the moratorium on biotech reviews.[1603]

[1602] Exhibit EC-92/At. 80.
[1603] Exhibit EC-92/At. 23, p.2.

7.2256 According to the United States, there is no scientific basis for the requests from Austria, France and Greece for additional long-term animal feeding studies given the results of the compositional analyses, and the fact that feeding studies conducted on Bt-11 field maize had been provided along with simulated digestibility studies, and acute toxicity tests.[1604] Greece had acknowledged that these latter studies "showed not a single adverse effect in the dosage tested."[1605] Furthermore, Greece did not identify, with any specificity, any deficiencies in the data provided, nor any reason to believe that these proteins would behave any differently than any other protein would spontaneously develop new or different toxic properties or would otherwise interact with other components of the food. Instead, Greece merely noted that "the *in vitro* methodology to study degradability of Btk and PAT proteins can be improved", but failed to specify how.

7.2257 The key difference between sweet and field maize being that sweet maize has a higher amount of natural sugars, the United States maintains that there is no reason to believe that this fact alone would render the results of the safety assessments conducted on the field maize inapplicable to this product. Nonetheless, Austria, Greece and the United Kingdom also argued that additional compositional and safety data were necessary to establish the equivalence between Bt-11 sweet maize (food) and Bt-11 field maize. Austria summarily rejected the applicant's reliance on the risk assessments conducted by the lead CA and the SCP on Bt-11 field maize, on the grounds that this evidence "cannot be considered adequate since sweet maize and field maize have different component spectrums."[1606] Greece required "analyses for all the parameters" (especially for amino acids, fatty acids, anti-nutrients and secondary plant substances) for both the Bt-11 sweet maize (food) and Bt-11 field maize, without identifying any unique property that would make the Bt-11 sweet maize (food) behave differently than all of the data indicated was likely.[1607] Even though the United Kingdom acknowledged that "it is accepted that the protein [in sweet maize] is the same as in the field maize", it nevertheless objected on the grounds that studies relating to the expression of the introduced genes in sweet maize were necessary.[1608] No further explanation was provided for rejecting the results of the safety data conducted on the parent field maize.

7.2258 The United States observes that these concerns were discounted by the SCF. Indeed, the SCF noted that "the distinction between the results for the sweet maize and field maize is not relevant to the assessment as long as the appropriate corresponding non-modified maize is used as control".[1609]

7.2259 With regard to the period after the positive assessment of the SCF in April 2002, the United States notes that the European Communities attempts to justify delays in the processing of the Bt-11 application by claiming that "[b]etween October and early December 2003 [after the SCF positive opinion], three new risks assessment were issued by the Member States, all of which conflicted with the SCF opinion".[1610] These risk assessments were supposedly provided by Austria, Belgium and France. The United States maintains that the EC contention is unsupported by the record. No risk assessments were submitted during that time period, according to the European Communities' own chronology. None of the documents submitted during that time period contain any purported risk assessments conducted by France, Austria, or Belgium. At the 10 November 2003 meeting of the

[1604] The applicant had referenced the whole food feeding studies it had performed on Bt-11 field maize in its submission of 28 November 1998. The European Communities did not provide the original submission of 6 April 1998 for processed products of sweet maize.

[1610] Responses by the European Communities to the questions posed by the Panel on 3 June 2004, Response to Question 1.

Regulatory Committee,[1611] only a comment was provided by France, not a risk assessment.[1612] At the Regulatory Committee meeting on 8 December 2003, Austria[1613], Belgium[1614] and France[1615] submitted written declarations to their votes. But none of these was a risk assessment. Rather, when the Regulatory Committee failed to obtain a qualified majority, it was because certain member States objected due to the proposed new traceability and labelling regulations (which did not become effective until April 2004).[1616]

7.2260 The **Panel** begins its analysis by addressing the Commission's failure up to August 2003 to submit a draft measure to the Regulatory Committee.

Failure by the Commission to submit a draft measure to the Regulatory Committee

7.2261 We recall that the SCF issued a positive evaluation of this application in April 2002. Following the issuance of the SCF opinion, the Commission did not submit a draft measure to the Regulatory Committee at any point up to August 2003, although subsequently it did submit a draft measure to the Regulatory Committee which was on the Committee's agenda in November 2003. The United States argues that the Commission should have prepared and submitted a draft measure to the Regulatory Committee shortly after the issuance of the SCF opinion in April 2002.

7.2262 More than a month and a half later, on 5 June 2002, the Commission services met with the applicant. The Commission in its report of the meeting states that "it would be desirable that a [draft measure on the application] would take into account in an appropriate manner the legislative developments with respect to the authorization of GM food and feed as well as the labelling of GM products".[1617]

7.2263 More specifically, the report of the meeting addresses the issue of "[d]etection methods, traceability, reference materials [and] identification". According to the report, the applicant "agree[d] to provide" the necessary information and materials to the JRC in a timely manner.[1618] There is nothing in the record which indicates that this "agreement" from the applicant was not voluntary. The report notes that a draft measure might be presented to the Regulatory Committee in November 2002, provided that a validated detection method was available by then. At the time of establishment of the

[1611] Exhibit EC-92/At. 67.

[1612] The French comment does not "evaluate the potential for adverse effects on human or animal health" posed by the sweet corn's different sugar metabolism from field corn. The comment is concerned with unintended effects, theoretical risks not identified by any of the existing protein toxicity or animal studies conducted. As the Commission stated in its Proposal for a Council Decision of 28 January 2004, "[t]he concerns raised in the opinion of the 'Agence française de sécurité sanitaire des aliments' (AFSSA) of 26 November 2003 do not bring any new scientific elements in addition to the initial assessment of sweet maize Bt-11 carried out by the competent authorities of the Netherlands". In fact, these concerns were also expressed in two AFSSA opinions of 21 July 2000 and 20 March 2001 and were duly considered by the SCF in its opinion of 17 April 2002, which confirmed the findings of the initial assessment that Bt-11 sweet maize is as safe for human food use as conventional maize. Exhibit EC-92/At. 77.

[1613] Exhibit EC-92/At. 71.

[1614] Exhibit EC-92/At. 73.

[1615] Exhibit EC-92/At. 72.

[1616] Exhibit EC-92/Ats. 67 ("Finally, several Member States questioned the opportunity to proceed with the authorization of this product in anticipation of the coming into application of Regulation (EC) 1829/2003 and 1830/2003."),71,74,75 and76.

[1617] Exhibit EC-92/At. 54.

[1618] *Ibid*.

Panel, the question of the validation of the detection method had not yet been resolved, and so by August 2003 no draft measure had been forwarded to the Regulatory Committee.

7.2264 The record of the approval procedure concerning Bt-11 sweet maize (food) does not contain any evidence to show that the Commission in this procedure launched inter-service consultations on a draft measure after the issuance in April 2002 of the favourable opinion by the SCF. This contrasts with the record of other approval procedures which contains such evidence.[1619] Therefore, we cannot assume that inter-service consultations were launched on a draft measure on Bt-11 sweet maize (food).

7.2265 Indeed, it appears that the Commission preferred first to explore whether the applicant would be willing to provide certain additional information, or to make certain additional commitments, on the basis of proposals for new EC legislation. While we accept that the applicant's response could have had an impact on the kind of draft measure on which the Commission would launch inter-service consultations, this circumstance would not explain why the Commission waited for more than a month and a half after the issuance of the SCF opinion before approaching the applicant.

7.2266 Since the Commission was seeking voluntary commitments, it was possible that the applicant would reject the Commission's request in its entirety. Had the applicant done so, the Commission would have delayed the procedure by more than a month and a half, as the Commission would have launched inter-service consultations only at that point.

7.2267 The record contains no information which suggests that June 2002 was the earliest date on which the Commission could have sought the relevant voluntary commitments. Indeed, the European Communities itself stated in relation to Regulation 258/97 that in terms of risk management it became clear in 1999 that there would have to be new legislation addressing issues such as labelling and traceability, and also the development and validation of detection methods. In the light of this, we fail to see why it would not have been possible for the Commission to explore the possibility of voluntary commitments with the applicant earlier than only in June 2002. Indeed, the Commission had circulated proposals for appropriate EC legislation as early as July 2001. Had the applicant said no to the Commission's request, this would have disposed of the issue.

7.2268 In fact, the applicant did accept the Commission's request to provide reference material and a detection method which was to be validated by the Joint Research Centre of the Commission. It appears to us from the record that the applicant accepted this request on the basis of the Commission proposals for new legislation, since the European Parliament was apparently scheduled to debate the proposals only in July 2002. This supports our view that the Commission could have sought this particular commitment prior to June 2002.

7.2269 As we have noted earlier in the context of the approval procedure concerning GA21 maize (food), we have reason to believe that in seeking the provision by the applicant of a detection method, the Commission was aware that relevant reference material might or might not have been available, and that it was therefore possible that the applicant would require time to put together relevant data and material. Moreover, as the European Communities itself points out, the amount of data and material and the circumstances of their submission to the JRC needed to be agreed upon. Finally, the Commission in its report of the June 2002 meeting made clear that it would not forward a draft measure to the Regulatory Committee until a detection method had been validated. Therefore, had the applicant been made aware of the Commission's request earlier, the detection method could have been

[1619] *See, e.g.*, Exhibits EC-62/At. 76; EC-65/At. 60.

validated sooner, and a draft measure would also have been submitted to the Regulatory Committee sooner.

7.2270 In our view, since the Commission sought the provision of a detection method on a voluntary basis, the Commission could even have approached the applicant prior to the issuance of the SCF opinion in April 2002. The applicant would then have had the opportunity to make sure that reference material and other documents and materials relevant to the validation of a detection method were available if and when the Commission sought their transmission. Indeed, we note that in the approval procedure concerning NK603 maize (food), work on method validation was undertaken even before the Commission had sought a scientific opinion of the EFSA.[1620]

7.2271 Taking account of the foregoing elements, we consider that for the purposes of exploring the possibility of the applicant undertaking voluntary commitments, the Commission could, and should, have approached the applicant either before or soon after the issuance of the SCF opinion rather than more than a month and a half later.

7.2272 Based on the above considerations, the Panel is of the view that, in the specific circumstances of this procedure, the time taken by the Commission to prepare and forward a draft measure to the Regulatory Committee – and in particular the time taken by the Commission to explore the possibility of the applicant undertaking voluntary commitments – was unjustifiably long.

7.2273 In addition, we recall that the United States claims that the approval procedure concerning Bt-11 sweet maize (food) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the Commission's failure to submit a draft measure to the Regulatory Committee meeting concerning Bt-11 sweet maize (food) prior to August 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Commission's conduct was a consequence of the general moratorium on approvals.

7.2274 In view of our conclusion with regard to the Commission's failure to submit a draft measure to the Regulatory Committee, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2275 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the Commission to prepare a draft measure to be submitted to the Regulatory Committee – and in particular the time taken to explore the possibility of the applicant undertaking voluntary commitments – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the Commission's conduct was a consequence of the general moratorium on approvals. Based on these

[1620] Exhibit EC-96/At. 34, as well as entries concerning 20 February 2003 and 31 March 2003.

findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-11 sweet maize (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-11 sweet maize (food), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(iv) LL soybeans (food) (EC-93)

7.2276 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning LL soybeans (food) has been unduly delayed.

7.2277 The **United States** submits that the lead CA (Belgium) refused to forward the application for LL soybeans (food) for consideration at the Community level.

7.2278 The United States also points out that the application concerning LL soybeans (food) is one of four applications identified by the United States which have been pending at the member State level for an average of three and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning LL soybeans (food) is excessive and unjustified and, hence, undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2279 **Argentina** claims that as of the date of Argentina's first written submission the application was delayed at the member State level for 5 years and 8 months without a final decision on its approval. Argentina asserts that the European Communities neither processed the application nor conducted the required risk assessment. Argentina argues that there is no scientific justification for the delay, as the "initial reports" were not prepared.

7.2280 The **European Communities** notes that the application for LL soybean (food) was with the Belgian CA only as of February 1999. The Commission gave notice of the Belgian application to all other member States in March 1999. In April 1999, the Belgium Biosafety Council requested additional information from the applicant in order to proceed with the initial assessment. The request touched upon the issues of substantial equivalence and presence of transgenic PAT DNA and PAT protein.[1621] The applicant did not fully respond to this request for additional information. Greece (June 1999) and Italy (July 1999) also asked for additional information on various points such as nutritional and biochemical characterization and toxicity of the transgenic plant, but did not receive any answer.[1622] In April 2004, the lead CA reminded the applicant to respond to the requests for additional information so that it would be able to finalize the pending assessment report.

7.2281 The European Communities submits that the United States and Argentina choose to ignore the fact that the applicant failed to provide the additional information that was requested by the lead CA in April 1999, and by Greece and Italy in June and July 1999. According to the European Communities, all three requests for additional information remained mostly unanswered. The European Communities also notes that on 6 July 2004, the applicant withdrew its application.

[1621] Exhibit EC-93/At. 11.
[1622] Exhibit EC-93/Ats. 16 and 17.

7.2282 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2283 We note that contrary to what the European Communities asserts, the application concerning LL soybeans (food) was with the Belgian CA as of early December 1998, and not only as of February 1999.[1623] On 8 December 1998, the Belgian General Food Inspectorate requested the Belgian Biosafety Council to prepare a first evaluation report within 90 days of referral of the file.

7.2284 The record indicates that the Biosafety Council met on the application on 17 December 1998. At that meeting, concerns were raised that while the application focused on animal nutrition, a number of tests concerning possible human consumption impacts were absent. The applicant apparently gave a written undertaking to address these concerns relating to substantial equivalence following instructions from a Belgian expert.[1624]

7.2285 Towards the end of April 1999, the Belgian Biosafety Council responded to a query from the Belgian General Food Inspectorate. The letter notes that the applicant had still not addressed the Biosafety Council's concerns relating to substantial equivalence. The letter further states that the applicant needed to provide additional information regarding the implementation of labelling and, more specifically, the presence of PAT DNA and PAT protein in derived soya products.[1625] The letter of the Biosafety Council concludes by saying that due to the absence of data and information on substantial equivalence and the presence of transgenic PAT DNA and PAT protein it was not possible for the Biosafety Council to issue a final evaluation report with regard to the application concerning LL soybeans (food). We asked the experts advising us whether information regarding substantial equivalence and the presence of transgenic PAT DNA and PAT protein was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti responded that these requests were valid.[1626]

7.2286 In May 1999, the lead CA sent a reminder to the applicant informing it that it had yet to reply to the two requests for additional information referred to in the letter of April 1999.[1627] The lead CA also informed the Commission that the deadline for evaluation of this application would not be met due to the lack of response from the applicant to the aforementioned two requests for additional information.[1628] The record indicates that as of August 2003, the applicant had still not fully replied to the first request relating to substantial equivalence.[1629] It appears that the applicant responded to the first request concerning the presence of PAT DNA and PAT protein in derived soya products, but it is not clear when.[1630]

7.2287 Greece (June 1999) and Italy (July 1999) also requested additional information regarding nutritional and biochemical characterization and toxicity of the transgenic plants. We again asked the experts advising us whether the additional information requested by Greece and Italy was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti responded that the application did not provide all the information which would be expected in order to comply with the recommended Codex evaluation procedure, and therefore the requests for some of this information

[1623] Exhibit EC-93/Ats. 1 and 3.
[1624] Exhibit EC-93/At. 11.
[1625] *Ibid*.
[1626] Annex H, Dr. Nutti's response to Panel Question 48.
[1627] Exhibit EC-93/At. 14.
[1628] Exhibit EC-93/At. 13.
[1629] Exhibit EC-93/At. 25.
[1630] *Ibid*.

were justified.[1631] In December 2000 and again in July 2001, the applicant apparently provided additional information to the lead CA regarding insert characterization, however this information was not provided to us. In the same correspondence, the applicant indicated that information on compositional analyses would be forthcoming at a later date.[1632] Seven months later, in correspondence dated July 2001, the applicant apparently provided information to satisfy these requests, although this information was not included in the evidence provided to us.[1633]

7.2288 In August 2001, the lead CA requested clarification regarding nutritional composition, stating that the data provided by the applicant in July 2001 had not adequately addressed the lead CA's request of April 1999. We again asked the experts whether this clarification was necessary to ensure that conclusions of the safety assessment were valid. Dr. Nutti noted that the information requested would normally be necessary to judge the safety of the product, however given the incompleteness of the record, it was impossible for her to determine whether or not this information had previously been provided to the lead CA.[1634] The lead CA also inquired about a broiler chicken growth performance study which the applicant had said was already included in the dossier, but which the lead CA could not find. Finally, the lead CA indicated that in accordance with new recommendations by the Biosafety Council on molecular characterization, the lead CA would be requesting some additional information on molecular characterization.

7.2289 The record suggests that the applicant never replied to the August 2001 request for clarification. Indeed, in June 2003, in internal e-mail correspondence concerning a request from the Commission for an update on this dossier, the lead CA highlighted the fact that the applicant had not provided the requested broiler chicken growth study. The lead CA also indicated that it had requested, but not received, additional information on molecular characterization. However, the record does not indicate that such a request was forwarded to the applicant.[1635]

7.2290 It is unfortunate that the evidence provided on this application is incomplete. While the experts indicated that much of the information requested by the lead CA and by other member States was necessary to ensure a valid safety assessment, it was not possible to determine to what extent such information may already have been provided by the applicant. It is also very difficult to determine from the information before us whether particular requests for information were met by the applicant.

7.2291 This said, as noted earlier, it appears that the applicant never fully replied to the lead CA's April 1999 request for additional information. As also noted, the part of the request which remained unresolved, notwithstanding the applicant's undertaking to provide the relevant information, was made known to the applicant already after the December 1998 meeting. It also appears that the responses which were given by the applicant in response to the April 1999 request were not provided in a timely manner. Furthermore, the record suggests that the applicant never responded to the August 2001 request for clarification. In fact, there does not appear to have been any further communication from the applicant until it withdrew its application in July 2004.

7.2292 In the light of the foregoing elements, and in particular the fact that the applicant did not provide information it apparently undertook to provide and otherwise failed to respond to requests for information which were not explicitly challenged, we are not persuaded by the United States' and

[1631] Annex H, Dr. Nutti's response to Panel Question 49.

[1635] Exhibit EC-93/At. 25.

Argentina's assertion that the time taken by Belgium up to August 2003 to assess the application concerning LL soybeans was unjustifiably long.

7.2293 In view of our conclusion with regard to the time taken by Belgium for its assessment, we go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Total amount of time taken since submission of application

7.2294 The United States and Argentina also put forward the argument that the total amount of time during which the application concerning LL soybeans (food) was pending is excessive and unjustified. The application concerning LL soybeans (food) was first submitted for approval at the end of November 1998. This means that as of August 2003, the approval procedure had been pending for four years and nine months.

7.2295 We agree with the United States and Argentina that, in absolute terms, this is a long period of time for an initial assessment. However, as we have explained earlier, the mere identification of the total amount of time during which an application has been pending does not demonstrate, in and of itself, that the time taken was unjustifiably long.

7.2296 The United States argues that that before there was an EC moratorium, approval procedures used to be completed in less than three years. Even if the United States were correct, however, it must be remembered that the European Communities assesses applications on a case-by-case basis. Thus, the fact that the approval procedure concerning LL soybeans (food) was not completed in less than three years in our view does not demonstrate that it was not justifiable for the European Communities to take more time to process that particular application.

7.2297 The United States further argues that in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, the fact that the application in question lingered at the member State level for well over four years demonstrates the existence of undue delay. We recall in this respect our finding that the record supports the conclusion that the European Communities applied a *de facto* moratorium on approvals as of June 1999. At that time, the application concerning LL soybeans (food) had already been pending for almost seven months. Thus, some of the total time taken cannot be explained by the moratorium. Moreover, the mere fact that a general moratorium was in effect does not necessarily imply that a particular application was affected by it. The United States itself has repeatedly stated that "the moratorium was a decision by the EC not to move products to a *final* decision in the approval process" and that "certain progress in the process, short of a final decision, is not the least bit inconsistent with a moratorium on final approvals".[1636] Therefore, by itself, the fact that a moratorium on approvals was in effect between June 1999 and August 2003 is not sufficient to demonstrate that the period of time during which the application concerning LL soybeans (food) was pending as of August 2003 reflects a failure on the part of the lead CA to complete the relevant approval procedure without undue delay.

7.2298 Accordingly, the Panel is unable to accept the United States' and Argentina's assertion that the total period of time during which the application concerning LL soybeans (food) had been pending as of August 2003 demonstrates that the time taken was unjustifiably long.

[1636] *See, e.g.*, US second written submission, para. 51 (emphasis in original).

Conclusions

7.2299 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that it has not been established that the time taken by the lead CA for its initial assessment of the application concerning LL soybeans (food) was unjustifiably long, or that the total period of time during which the application concerning LL soybeans (food) had been pending as of August 2003 demonstrates that the time taken by the European Communities was unjustifiably long. Based on these findings, the Panel is unable to accept the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning LL soybeans (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning LL soybeans (food), the United States has failed to establish that the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its findings that it has not been established that the time taken by the lead CA for its initial assessment of the application concerning LL soybeans (food) was unjustifiably long, or that the total period of time during which the application concerning LL soybeans (food) had been pending as of August 2003 demonstrates that the time taken by the European Communities was unjustifiably long. In the light of these findings, the Panel concludes that in respect of the approval procedure concerning LL soybeans (food), Argentina has failed to establish that the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(v) MON810 x GA21 maize (food) (EC-94)

7.2300 One Complaining Party, the United States, claims that the completion of the approval procedure concerning MON810 x GA21 maize (food) has been unduly delayed.

7.2301 The **United States** argues that approval for MON810 x GA21 maize (food), which is produced by conventionally hybridizing two "parental" biotech products, MON810 maize and GA21 maize, has been delayed by the failure of the lead CA to complete its initial assessment. More specifically, the United States argues that at the time of establishment of the Panel, the application had already been under consideration by the lead CA for three and a half years. The United States contends that this lag had two distinct causes.

7.2302 According to the United States, one cause for the lag was the undue delay in the EC approval of GA21 maize under Regulation 258/97. The application for approval of MON810 x GA21 maize (food) submitted under Regulation 258/97 referenced the detailed risk assessments undertaken on the parental biotech products, complemented with confirmatory safety and characterization data on the MON810 x GA21 hybrid. One parent, MON810 maize, was approved under Directive 90/220 in

1998[1637] and was notified in 1998 on the basis of an opinion of substantial equivalence as required under Regulation 258/97 in 1998.[1638] However, the application for the single trait parent GA21 maize (food) under Regulation 258/97 stalled at the Commission level after the Commission requested an opinion from the SCF in May 2000 and then again after the final SCF opinion in February 2002. Therefore, progress on GA21 maize (food) was a limiting step on the progress of the application concerning MON810 x GA21 maize (food) in the regulatory process. In fact, in its comments on the application for MON810 x GA21 maize (food), Italy stated that "examination of the documentation relating to authorization [of MON810 x GA21 maize] should only be carried out after the marketing of GA21 has been authorized [under Regulation 258/97]."[1639] At the time of establishment of the Panel, the approval of GA21 maize (food) under Regulation 258/97 had not yet been granted.

7.2303 The United States contends that the other cause of the lag reflected, in part, the need for the applicant to respond to requests for information that were scientifically unjustified. The United States points out that the lead CA insisted on molecular characterization of the MON810 x GA21 line without regard to the previous data that had been submitted on the parental lines. In particular, the lead CA requested an additional whole food study in mice.[1640] The rationale offered for this request was the need to address hypothetical concerns that unknown pieces of DNA could be scattered over the genome. The impact of any such insertions can be determined by evaluating the compositional analyses of the plant as well as its agronomic performance. If both analyses indicate no unexpected changes, the United States argues, there is no basis on which to hypothesize a food safety concern for food from the plant. In this case, such assessments had been performed on each of the parental lines and no unexpected changes were observed. At no time did the lead CA provide any explanation of the reason it believed that the compositional analyses or feeding studies previously submitted on both the parent lines, as well as the compositional analyses submitted on the hybrid, did not adequately address this issue.

7.2304 The United States notes that, nonetheless, the applicant analysed the composition of the MON810 x GA21 maize, which was found to be comparable to that of the parental lines and other commercial maize varieties.[1641] The applicant also had previously submitted several whole food feeding studies, including a 90-day feeding study in rats using MON810 maize or GA21 maize, and a broiler chicken feeding study using grain from MON810 x GA21 maize. None of these studies revealed any adverse effects.

7.2305 Furthermore, the United States notes, the lead CA requested further information on the levels of EPSPS protein expressed in the hybrid lines, although such information is not relevant to assessing the risks given the known safety information about the EPSPS protein.[1642] The lead CA also requested unnecessary comparisons of compositional data between the new hybrid and non-transgenic control lines. The data submitted in the application analysed the new hybrid in comparison to the

[1637] Commission Decision concerning the placing on the market of genetically modified maize (zea mays L. line MON810) pursuant to Council Directive 90/220/EEC, (98/294/EC), April 22, 1998, Official Journal of the European Communities, L 131/32, May 5, 1998 (Exhibit US-131).

[1638] Exhibit US-132.

[1639] Exhibit EC-94/At. 11.

[1640] Exhibit EC-94/At. 12.

[1641] Exhibit EC-82/At. 9.

[1642] The United States refers to LA Harrison, MR Bailey, MR Naylor, JE Ream, BG Hammond, DL Nida, BL Burnette, TE Nickson, TA Mitsky, ML Taylor, RL Fuchs, and SR Padgette, "The Expressed Protein in Glyphosate-Tolerant Soybean, 5-Enolypyruvylshikimate-3-Phosphate Synthase from Agrobacterium sp. Strain CP4, Is Rapidly Digested in Vitro and Is Not Toxic to Acutely Gavaged Mice", *Journal of Nutrition* 126:728-740 (1996) (Exhibit US-143).

transgenic parental lines.[1643] The transgenic parental lines had already been shown to be substantially equivalent to non-genetically modified maize except for the introduced traits. Given all of the data that had been submitted on both parental lines, the United States argues that the requests for yet further studies lacked any scientific basis.

7.2306 According to the United States, the United Kingdom also insisted that the applicant provide extensive characterization of the new hybrid, rather than rely on the analyses previously carried out on the transgenic parental lines.[1644] As part of this request, the United Kingdom requested molecular characterization to "confirm[] the absence of antibiotic resistance markers and have details regarding the homology between the two constructs introduced as a result of the crosses."[1645] Given that neither parent contained an antibiotic marker gene, there is absolutely no scientific basis, in the United States' view, for theorizing that cross-breeding between the two products would somehow introduce such a gene.

7.2307 Under these circumstances, the United States argues that it was pointless for the applicant to devote resources to pursue the application for MON810 x GA21 maize (food) as long as consideration of the applications for the single trait parent GA21 maize remained suspended under the moratorium. The United States contends that the delay in the application for MON810 x GA21 maize (food) and GA21 maize (food) is thus a direct consequence of the delays in the application for GA21 maize under the moratorium. The United States further points out that because of the delay in the approval procedure concerning GA21 maize (food), that product, as well as MON810 x GA21 maize, have been superseded by a second generation Roundup Ready maize product (NK603 maize and NK603 × MON810 maize, respectively). Nonetheless, the applicant has continued to pursue the necessary regulatory clearance for MON810 x GA21 maize (food).

7.2308 The United States submits, in addition, that the application concerning MON810 x GA21 maize (food) is one of four applications identified by the United States which have been pending at the member State level for an average of three and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning MON810 x GA21 maize (food) is undue. The United States further argues that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2309 The **European Communities** argues that the lead CA requested additional information from the applicant in July 2000, and that that request was only partly answered in February 2002. Contrary to the United States, the European Communities maintains that the lead CA request for a whole food study in mice was necessary to assess unintended effects caused by possible additional DNA fragments. The request was made on valid grounds. Therefore, the delay caused by it cannot be considered "undue." The European Communities adds that issues such as molecular characterization of inserted DNA from transgenic parent lines, the determination of flanking DNA or compositional analysis, still remain unaddressed. Furthermore, the European Communities considers that it is obvious that the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open.

7.2310 The **Panel** commences its analysis with the alleged delay at member State level.

[1643] Exhibit EC-94/At. 2.
[1644] Exhibit EC-94/At. 10.
[1645] *Ibid*.

Delay at member State level

7.2311 We recall that although the application was submitted on 29 February 2000, the record shows that the first contact by the lead CA to request additional information from the applicant occurred only on 17 July 2000[1646], *i.e.*, more than four and a half months after receipt of the application. The response to the July 2000 request for information was provided by the applicant only on 15 February 2002. Subsequently, there was a further, five-month delay before the lead CA followed up with the applicant to request additional information on 2 July 2002. Finally, we note that no information has been provided regarding any action on this application between July 2002 and August 2003. It appears that during that period the applicant did not respond to the lead CA's July 2002 request for information.

7.2312 The United States contends that the lengthy delay caused by the applicant due to the time it took to respond to the July 2000 request for information occurred, in part, because there was no justification for requesting the relevant data. In our earlier findings, we observed that the experts expressed the view that whereas some of the information requested by the lead CA was not necessary to ensure the validity of the safety assessment, other requested information was indeed needed. We also previously noted the disagreement of the European Communities with the views expressed by the experts regarding the need for the data requested.

7.2313 Even accepting that contrary to the views of the experts the information requested by the lead CA in July 2000 was necessary to ensure the validity of the safety assessment, this could not provide a justification for the time taken by the lead CA for its assessment of the application both before and after the July 2000 request for information.

7.2314 In examining the issue of the time taken by the lead CA before and after the July 2000 request, we first recall that Regulation 258/97 provides that the lead CA should complete its initial assessment within three months of receipt of an application which contains the necessary information. We recognize that the question of whether or not the lead CA complied with the three-month deadline stipulated in Regulation 258/97 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. This said, in the Panel's view, the deadline set forth in Regulation 258/97 provides a useful indicator to guide the Panel's analysis. The three-month deadline is binding and applies to all relevant applications submitted under Regulation 258/97. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2315 We first turn to consider the time taken by the lead CA before forwarding its initial request for information of July 2000. We note that when the Commission circulated notice of this application to all member States, it indicated that the initial assessment was to be completed by the lead CA by 16 June 2000 at the latest.[1647] However, by 16 June 2000, the lead CA not only had not completed its initial assessment, but it apparently had not even identified any need for further information. It was not until one full month after the deadline circulated by the Commission that the lead CA forwarded an initial request for information.

7.2316 The European Communities asserts that all of the time taken by the lead CA was necessary to resolve scientific and technical issues, but provides no specific justification for the time taken by the lead CA up to July 2000. Even if it were accepted that in this procedure the lead CA could not have

[1646] Exhibit EC-94/At. 12.
[1647] Exhibit EC-94/At. 5.

met the mid-June deadline circulated by the Commission, this would not imply that the lead CA could not have requested missing information much sooner, rather than a full month after the date on which it should have completed its entire initial assessment.

7.2317 We note that three member States submitted substantive comments or requests for further data prior to July 2000.[1648] However, Regulation 258/97 does not require the lead CA to await comments from other member States, let alone possible responses thereto from the applicant, prior to undertaking its initial assessment.

7.2318 We have previously pointed out that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. Indeed, we are not convinced that the Dutch CA could not have identified any need for additional information and forward an appropriate request for information to the applicant sooner than it did even while following a precautionary approach.

7.2319 We now turn to the time taken by the lead CA after it had received the applicant's response to its initial request for information of July 2000. As we indicated above, four and a half months lapsed between the receipt of the information requested in July 2000 and the next request, in July 2002, for additional information. Thus, the lead CA took more time to assess the additional information than it should have used, in accordance with Regulation 258/97, to complete its entire initial assessment.

7.2320 As with the time taken by the lead CA up to the first request for information, the European Communities asserts that the time taken by the lead CA up to the second request for information was necessary to resolve scientific and technical issues. However, the European Communities provides no specific justification for why the lead CA required more than four and a half months to complete its consideration of the responses provided and to identify short-comings. It is pertinent to note in this respect that the information provided by the applicant in response to the July 2000 request was 34 pages long. Given this, and in the absence of a specific justification offered by the European Communities, we are not convinced that the lead CA could not have evaluated much sooner than it did whether additional information was still needed. We also consider that the Dutch CA could have forwarded its July 2002 request for additional information to the applicant at a much earlier date even while following a precautionary approach.

7.2321 In relation to the time taken by the lead CA both before and after the July 2000 request for information, we note, as an additional matter, the European Communities argument that the assessment of a hybrid product such as MON810 x GA21 maize cannot be concluded as long as the assessment of one of its parental lines is still open. Thus, the European Communities appears to argue that the time taken by the lead CA to assess the application concerning MON810 x GA21 maize (food) is justified by the fact that the lead CA was waiting for the result of the Community level assessment of one of the parental lines of this hybrid product, GA21 maize (food).

7.2322 It is correct that between February 2000 and July 2002, the application concerning GA21 maize (food) was still being evaluated at Community level. However, the record does not indicate that the Dutch CA ever stated that it was unable to proceed due to the failure of the European Communities to approve the GA21 maize (food) parent. Moreover, we recall that it was the same Dutch CA which assessed the application concerning GA21 maize (food) and which in late January 2000 forwarded it to the Commission with a favourable assessment. Therefore, we see no reason why

[1648] Exhibit EC-94/Ats. 9-11.

the Dutch CA would not be in a position to reach a conclusion also with regard to the application concerning the hybrid product, *i.e.*, MON810 x GA21 maize.

7.2323 As a general matter, it may be correct to say, as the European Communities does, that "the assessment of a hybrid cannot be concluded as long as the assessment of one of its parental lines is still open". However, it would seem that the assessment of the parental lines could also be made in the context of the assessment of the hybrid. At any rate, the Dutch CA could not have "concluded" the assessment of the application concerning MON810 x GA21 maize (food) completely on its own. If other member States had concerns with the Dutch assessment of the application concerning GA21 maize (food) (even though that assessment was confirmed by the SCP in early 2002), they could have raised an objection on that basis to the Dutch assessment of the application concerning MON810 x GA21 maize (food) and the assessment of that application would then have been "concluded" at Community level.

7.2324 For these reasons, it is not apparent to us that the Dutch CA needed to keep, or would have been justified in keeping, the application at the member State level in order to avoid the possibility of conflicting assessments of MON810 x GA21 maize (food), and we therefore do not consider that the fact that one of the parental lines was still pending justified the Netherlands in not completing its assessment of the application concerning MON810 x GA21 maize (food).

7.2325 Taking account of all of the aforementioned elements, we consider that upon receipt of the original application and subsequently upon on receipt of the information requested by it in July 2000, the lead CA could, and should, have determined more promptly that additional information was needed and could, and should, have forwarded appropriate requests to the applicant more promptly.

7.2326 Based on the above considerations, we therefore conclude that the time taken by the lead CA for its assessment of the application concerning MON810 x GA21 maize (food) was unjustifiably long.

7.2327 In addition, we recall that the United States claims that the approval procedure concerning MON810 x GA21 maize (food) was unduly delayed because, due to the moratorium, the Netherlands failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by the Netherlands for its initial assessment of MON810 x GA21 maize (food) is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands' conduct was a consequence of the general moratorium on approvals.

7.2328 In view of our conclusion with regard to the time taken by the Netherlands for its initial assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2329 In the light of the above, we reach the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning MON810 x GA21 maize was

> unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning MON810 x GA21 maize (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning MON810 x GA21 maize (food), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(vi) Bt-1507 maize (food) (EC-95)

7.2330 One Complaining Party, the United States, claims that the completion of the approval procedure concerning Bt-1507 maize (food) has been unduly delayed.

7.2331 The **United States** argues that the lead CA (Netherlands) refused to forward this application to the Commission, thereby unduly delaying its consideration for approval.

7.2332 The United States also points out that the application concerning Bt-1507 maize (food) is one of four applications identified by the United States which have been pending at the member State level for an average of three and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning Bt-1507 maize (food) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2333 The **European Communities** observes that after receiving the application in February 2001, the lead CA asked for additional information in June 2001. This information was finally provided in February 2003. Between February 2003 and July 2003, there was ongoing correspondence between the applicant and the lead CA on additional information to be submitted by the applicant, in particular on labelling, monitoring, molecular characterization, and event-specific detection methods. The lead CA finalized the initial assessment report in November 2003 and concluded that the consumption of Bt-1507 maize as well as foods and food ingredients derived from it were as safe for humans as the consumption of the non-genetically modified counterparts.

7.2334 The European Communities further notes that the Commission forwarded the initial assessment report to member States for comments in December 2003, and received comments and reasoned objections against the initial assessment. On 26 March 2004, the complete dossier (including responses to the objections and comments raised by member States) was forwarded to EFSA for consideration under Regulation 1829/2003. In parallel, the applicant undertook the steps to ensure the production of certified reference material and for the validation of a detection method by the JRC.

7.2335 The **Panel** notes that the United States' claim is based on an alleged delay at member State level.

Delay at member State level

7.2336 We recall that the application concerning Bt-1507 maize (food) was submitted on 15 February 2001. However, the first request for additional information from the lead CA was made only on 28 June 2001, *i.e.*, almost four and a half months following receipt of the application. Although the applicant apparently provided a partial response in November 2001, it appears that it did not provide all of the information requested until 12 February 2003. Following the twenty-month period taken by the applicant to provide all the information requested, in March 2003, the lead CA requested further clarifications, which were provided in May 2003. In June 2003, the lead CA posed questions in relation to the applicant's May 2003 reply. The applicant provided answers by 9 July 2003. The information as provided by 9 July 2003 was apparently deemed sufficient by the lead CA to conclude its assessment. As noted, a positive assessment was reported on 4 November 2003.

7.2337 It is clear from the foregoing that the major delay in the assessment of this application is attributable to the time taken by the applicant to provide the information requested in June 2001. We asked the experts advising us for their views on the necessity of the information requested by the lead CA in June 2001 to ensure that the conclusions of the safety assessment were valid. We recall that the experts considered that some of the information requested by the lead CA in June 2001 was not necessary to ensure the validity of the safety assessment for Bt-1507 maize (food). This included some of the information which was not provided by the applicant until February 2003.

7.2338 Even if we were to accept that all of the information requested by the lead CA in June 2001 was necessary to ensure the validity of the safety assessment, this could not provide a justification for the time taken by the lead CA for its assessment of the application before the June 2001 request for information. We recall that the application concerning Bt-1507 maize (food) had been under review in the Netherlands for more than four and a half months before the Dutch CA forwarded its June 2001 request for information.

7.2339 In examining the issue of the time taken by the lead CA before the June 2001 request, we first recall that Regulation 258/97 provides that the lead CA should complete its initial assessment within three months of receipt of an application which contains the necessary information. We recognize that the question of whether or not the lead CA complied with the three-month deadline stipulated in Regulation 258/97 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. This said, in the Panel's view, the deadline set forth in Regulation 258/97 provides a useful indicator to guide the Panel's analysis. The three-month deadline is binding and applies to all relevant applications submitted under Regulation 258/97. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2340 We note that by the time the lead CA forwarded its first request for information at the end of June 2001, the lead CA had already exceeded the three-month period envisaged in Regulation 258/97 by a month and a half, yet it was far from completing its initial assessment. The European Communities asserts that all of the time taken by the lead CA was necessary to resolve scientific and technical issues, but provides no specific justification for the time taken by the lead CA up to the end of June 2001. Even if it were accepted that in this procedure the lead CA could not have completed its initial assessment within the three-month period provided for in Regulation 258/97, this would not imply that the lead CA could not have requested missing information much sooner. Given the three-month maximum assessment period envisaged in Regulation 258/97, and lacking a specific justification by the European Communities, we are not convinced that the lead CA could not have evaluated much more promptly than it did whether additional information was still needed.

7.2341 We have previously pointed out that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. Indeed, we are not convinced that the Dutch CA could not have identified any need for additional information and forwarded an appropriate request for information to the applicant sooner than it did even while following a precautionary approach.

7.2342 Taking account of all of the aforementioned elements, we consider that upon receipt of the original application, the lead CA could, and should, have determined more promptly that additional information was needed and could, and should, have forwarded an appropriate request to the applicant more promptly.

7.2343 Based on the above considerations, we thus conclude that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (food) – and in particular the time taken by the lead CA before forwarding its first request for additional information – was unjustifiably long.

7.2344 In addition, we recall that the United States claims that the approval procedure concerning Bt-1507 maize (food) was unduly delayed because, due to the moratorium, the Netherlands failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the failure of the Netherlands to complete the initial assessment of the application concerning Bt-1507 maize (food) by August 2003 is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands failure to complete its initial assessment by August 2003 was a consequence of the general moratorium on approvals.

7.2345 In view of our conclusion with regard to the time taken by the Netherlands for its initial assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusion

7.2346 In the light of the above, we reach the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning Bt-1507 maize (food) – particularly the time taken prior to the lead CA's initial request for additional information – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning Bt-1507 maize (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning Bt-1507 maize (food), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(vii) NK603 maize (food) (EC-96)

7.2347 Two Complaining Parties, the United States and Argentina, claim that the completion of the approval procedure concerning NK603 maize (food) has been unduly delayed.

7.2348 The **United States** argues that although the application concerning NK603 maize (food) eventually received a positive assessment from the lead CA (Netherlands), this product was at the member State level for almost 19 months, instead of the 90 days foreseen by Regulation 258/97. Of this period of time, only three and a half months were used by the applicant to provide additional information; the lead CA used the remaining fourteen and a half months.

7.2349 The United States questions certain requests for additional information from the lead CA, arguing they were scientifically unnecessary. For example, the lead CA requested an additional whole food feeding study in mice or rats, to address concerns about the presence of unintended DNA fragments that the applicant had identified as part of their molecular characterization data.[1649] The lead CA stated that "the presence of additional unintended modifications cannot be excluded with sufficient certainty". The United States argues that the mere fact that an additional insert is present does not necessarily mean that the product presents an additional risk. Rather, the determination turns on the results of all of the other data and information provided by the applicant, which the lead CA failed to take into consideration in making this request. If the results of those tests raise questions, then further examination would be warranted. But in this case, the applicant had conducted compositional analysis and a broiler chicken whole food study with the product containing the additional insert, and in these circumstances would have detected any resulting changes relevant to food safety. The United States observes that the applicant nevertheless conducted the requested test, which identified no adverse effects.

7.2350 The United States further argues that once the application had reached the Community level Austria filed an objection in respect of the application for NK603 maize (food) on the grounds that not only acute but also sub-chronic, mutagenic, reproductive and ecotoxic effects of the protein (EPSPS) should be studied. However, Austria failed to discuss the results of the acute studies, or to provide an explanation of why the proteins in this product would behave differently than all available data indicate is likely. The United States submits that given that EPSPS proteins are commonly found in a wide variety of food sources which have a long history of safe use, the available information regarding the enzyme function of the protein, lack of homology to toxic proteins based on bioinformatics searches, and lack of acute oral toxicity when administered to mice at high doses, the additional toxicological testing for the EPSPS protein that Austria demanded is unfounded and unreasonable. Such testing exceeds Codex Alimentarius guidelines,[1650] as well as the European Communities' own Scientific Committee Guidance Document for the Risk Assessment of Genetically Modified Plants and Derived Food and Feed (March 2003).

7.2351 The United States submits, in addition, that the application concerning NK603 maize (food) is one of five applications identified by the United States which are pending at Commission level and which, as of the date of establishment of the Panel, have been pending for an average of four years and six months. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning NK603 maize (food) is undue. The

[1649] Exhibit EC-96/At. 7.

[1650] The United States refers to Codex Alimentarius, "Guideline for the Conduct of Food Safety Assessment of Foods Derived from Recombinant-DNA Plants", CAC/GL 45-2003, paras. 37, 38.

United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2352 **Argentina** argues that NK603 maize (food) was stalled at various stages of the approval process under Regulation 258/97. Argentina notes that the assessments performed by the lead CA and subsequently the EFSA concluded that there was no evidence of risk to human health or life. Therefore, it is clear that the delays by the lead CA to complete its initial assessment and forward this application to the Commission were not justified.

7.2353 The **European Communities** notes that the application for food use of the NK603 maize was submitted to the Netherlands in 2001. After the applicant submitted additional information requested by the lead CA, the lead CA completed its evaluation in November 2002 and sent its initial assessment report to the Commission. The eighteen months spent at member State level were due to the incompleteness of the dossier initially submitted by the applicant and the need for further data on molecular characterization and compositional analysis.

7.2354 The European Community further notes that the Commission circulated the dossier to all member States in January 2003. Three member States raised objections and several others requested additional information. The European Communities points out in this connection that Regulation 258/97, in general terms, provided an adequate framework for a risk assessment for GM food products. However, in terms of risk management, it became clear in 1999 that there would have to be new legislation addressing some issues such as labelling and traceability, and also the development and validation of detection methods. The application concerning NK603 maize (food) was partially affected by this situation as it had reached the Community level and the stage of risk management considerations. Thus, it was considered necessary to require the validation of a detection method as a pre-condition for marketing approval. This was done on the basis of a voluntary agreement with the applicant. These detection methods were validated for NK603 maize (food) and the decision-making process was launched immediately after.

7.2355 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2356 We recall that the applicant first submitted the application to the lead CA in April 2001. Two months later the lead CA requested copies of cited literature and data in order to facilitate the lead CA's work. The applicant provided these documents in July 2001. However, the first request for additional information from the lead CA was made only in December 2001, more than four and a half months later. In August 2002, five months after the applicant supplied the information requested by the lead CA, the lead CA's advisory body, the Dutch Health Council's Committee on the Safety Assessment of Novel Foods, finished its assessment report. It was not until November 2002, however, that the lead CA forwarded its assessment report to the Commission.

7.2357 It is clear from the foregoing that the December 2001 request for information led to delay in the consideration of this application inasmuch as the applicant took more than three months and a half to respond to the request. We asked the experts advising us for their views on the necessity of the information requested by the lead CA in December 2001 to ensure that the conclusions of the safety assessment were valid. We recall the view expressed by one of the experts that the request in question was not necessary to ensure the validity of the safety assessment.

7.2358 However, even accepting that the information requested by the lead CA in December 2001 was appropriate to ensure the validity of the safety assessment, this could not provide a justification

for the time taken by the lead CA to assess the application. Notably, the application concerning NK603 maize (food) had been under review in the Netherlands for more than seven months before the Dutch CA forwarded its December 2001 request for information.[1651] Moreover, once the applicant had provided information in response to the Dutch CA's December 2001 request for information, the Health Council's Committee on the Safety Assessment of Novel Foods still took more than four months to complete its initial assessment report. While this report needed to be adopted by the Dutch CA, the report was not forwarded to the Commission for another two and a half months.

7.2359 In examining the issue of the time taken by the lead CA for its assessment of the application concerning NK603 maize (food), we first recall that Regulation 258/97 provides that the lead CA should complete its initial assessment within three months of receipt of an application which contains the necessary information. We recognize that the question of whether or not the lead CA complied with the three-month deadline stipulated in Regulation 258/97 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. This said, in the Panel's view, the deadline set forth in Regulation 258/97 provides a useful indicator to guide the Panel's analysis. The three-month deadline is binding and applies to all relevant applications submitted under Regulation 258/97. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2360 We first turn to consider the time taken by the lead CA before forwarding its initial request for information of December 2001. We note that by the time the lead CA forwarded its first request for information, the lead CA had already exceeded the three-month period envisaged in Regulation 258/97 by more than four months, yet it was far from completing its initial assessment.[1652] The European Communities asserts that all of the time taken by the lead CA was necessary to resolve scientific and technical issues, but provides no specific justification for the time taken by the lead CA up to December 2001. Even if it were accepted that in this procedure the lead CA could not have completed its initial assessment within the three-month period provided for in Regulation 258/97, this would not imply that the lead CA could not have requested missing information much sooner. Given the three-month maximum assessment period envisaged in Regulation 258/97, and lacking a specific justification by the European Communities, we are not convinced that the lead CA could not have evaluated much more promptly than it did whether additional information was still needed.

7.2361 We have previously pointed out that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. Indeed, we are not convinced that the Dutch CA could not have identified any need for additional information and forwarded an appropriate request for information to the applicant sooner than it did even while following a precautionary approach.

7.2362 Taking account of the aforementioned elements, we consider that upon receipt of the original application, the lead CA could, and should, have determined more promptly that additional information was needed and could, and should, have forwarded an appropriate request to the applicant more promptly.

[1651] The application had been under review for more than four months after receipt of copies of the cited literature and data. These copies were not requested by the lead CA until two months after receipt of the application.

[1652] Even if it were considered that a complete application was only available as of the end of July 2001, the lead CA would still have exceeded the three-month period by more than four and a half months.

7.2363 We now turn to consider the time taken by the lead CA to complete and forward its assessment report. To recall, five months after the applicant supplied the information requested by the lead CA in December 2001, the lead CA's scientific advisory body in August 2002 finished its assessment report. However, the lead CA did not forward its assessment report to the Commission until November 2002, *i.e.*, for more than two and a half months.

7.2364 While accepting that the advisory body's assessment report needed to be adopted by the Dutch CA, we recall that in accordance with Regulation 258/96 the Dutch CA was required to complete its entire initial assessment within no more than three months. Given this, and lacking a specific justification by the European Communities, we are not convinced that the Dutch CA could not have adopted the report in question much sooner than it did in the case of the application concerning NK603 maize (food).

7.2365 Thus, based on the above considerations, we conclude that the time taken by the lead CA for its assessment of the application concerning NK603 maize (food) – and in particular the time taken by the lead CA before forwarding its first request for additional information as well as the time taken by the lead CA to forward its completed assessment report – was unjustifiably long.

7.2366 In addition, we recall that the United States claims that the approval procedure concerning NK603 maize (food) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by the Netherlands to complete its initial assessment of the application concerning NK603 maize (food) is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands' conduct was a consequence of the general moratorium on approvals.

7.2367 In view of our conclusion with regard to the time taken by the Netherlands for its initial assessment, we do not go on to examine other arguments put forward by the United States and Argentina in support of their claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

Conclusions

7.2368 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning NK603 maize (food) – particularly the time taken by the lead CA before forwarding its first request for additional information as well as the time taken by the lead CA to forward its completed assessment report – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning NK603 maize (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning NK603 maize (food), the European

Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, the Panel recalls its finding that the time taken by the lead CA for its assessment of the application concerning NK603 maize (food) – particularly the time taken by the lead CA before forwarding its first request for additional information as well as the time taken by the lead CA to forward its completed assessment report – was unjustifiably long. In the light of this finding, the Panel concludes that the European Communities failed to complete the approval procedure concerning NK603 maize (food) without "undue delay", thus breaching its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(viii) RR sugar beet (food) (EC-102)

7.2369 One Complaining Party, the United States, claims that the completion of the approval procedure concerning RR sugar beet (food) has been unduly delayed.

7.2370 The **United States** argues that the lead CA (Netherlands) refused to forward the application to the Commission and that this resulted in undue delay.

7.2371 The United States also points out that the application concerning RR sugar beet (food) is one of four applications identified by the United States which have been pending at the member State level for an average of three and one half years. The United States contends in this respect that although time alone is not dispositive, in the light of the acknowledgement by EC officials of the existence of a moratorium on approvals, this delay in completing the approval procedure concerning RR sugar beet (food) is undue. The United States submits, in addition, that before the European Communities adopted its moratorium, all approval procedures under Directive 90/220 were undertaken and completed in less than three years.

7.2372 The **European Communities** argues that after discussions between the Dutch CA and the applicant, the request was withdrawn on 16 April 2004. As the reason for its withdrawal the applicant pointed to a decision to stop any further development of the RR sugar beet.

7.2373 The **Panel** commences its analysis with the alleged delay at member State level.

Delay at member State level

7.2374 We recall that the applicant submitted the application concerning RR sugar beet (food) to the lead CA on 3 November 1999. However, the first request for additional information from the lead CA was made only on 24 March 2000, almost five months later. The applicant responded one month later. In May 2000, the lead CA requested further information. That information was provided on 7 December 2000. On 16 May 2001, after reviewing the additional information provided by the applicant in December 2000, the lead CA requested further information. The lead CA indicated that it was not yet fully satisfied with the information provided by the applicant concerning the likelihood of specific protein formation. In addition, mentioning recent studies which had shown that "unintended effects on GMOs" were possibly caused by transformation of plant cells, the lead CA also requested a semi-chronic oral toxicity study on rats in order to "to rule out possible undesirable effects [...] with

sufficient certainty".[1653] No specific study was cited in this regard. There is no indication in the evidence before us that the applicant responded to the requests from the lead CA for further information prior to August 2003.

7.2375 We sought the advice of the experts assisting us regarding whether the additional information requested by the lead CA in May 2001 was necessary to ensure that the conclusions of the safety assessment were valid. Dr. Nutti expressed the view that "the information requested by the lead CA regarding the derived proteins and the request for a semi-chronic oral toxicity test on mice or rats with edible parts of sugar beet was not necessary to ensure that the conclusions of the safety assessment were valid". She emphasized that the applicant had already completed an acute toxicity test on rats and conducted studies which confirmed that RR sugar beet "was equivalent in composition and nutrition to the conventional counterpart".[1654]

7.2376 Even accepting that contrary to the views of Dr. Nutti the information requested in May 2001 was necessary to ensure the validity of the safety assessment, this would not provide a justification for the time taken by the lead CA before initially requesting additional information in March 2000 (almost five months), and the time taken to review the information received in December 2000 (five months).

7.2377 In examining the issue of the time taken by the lead CA for its assessment of the application concerning RR sugar beet (food), we first recall that Regulation 258/97 provides that the lead CA should complete its initial assessment within three months of receipt of an application which contains the necessary information. We recognize that the question of whether or not the lead CA complied with the three-month deadline stipulated in Regulation 258/97 is not dispositive, *per se*, of whether the European Communities met its WTO obligation to complete its approval procedures without undue delay. This said, in the Panel's view, the deadline set forth in Regulation 258/97 provides a useful indicator to guide the Panel's analysis. The three-month deadline is binding and applies to all relevant applications submitted under Regulation 258/97. It may therefore be assumed that the EC legislator set this binding deadline in such a way as to make it possible for the CAs of all member States to assess even complex applications within the prescribed deadline.

7.2378 We first turn to consider the time taken by the lead CA before forwarding its initial request for information of March 2000. We note that by the time the lead CA forwarded its first request for information, the lead CA had already exceeded the three-month period envisaged in Regulation 258/97 by almost two months, yet it was far from completing its initial assessment. The European Communities asserts that all of the time taken by the lead CA was necessary to resolve scientific and technical issues, but provides no specific justification for the time taken by the lead CA up to March 2000. Even if it were accepted that in this procedure the lead CA could not have completed its initial assessment within the three-month period provided for in Regulation 258/97, this would not imply that the lead CA could not have requested missing information much sooner. Given the three-month maximum assessment period envisaged in Regulation 258/97, and lacking a specific justification by the European Communities, we are not convinced that the lead CA could not have determined much more promptly than it did whether additional information was still needed.

7.2379 We have previously pointed out that the Netherlands was part of the Group of Seven countries which declared in June 1999 that they would take a thoroughly precautionary approach in dealing with applications for the placing on the market of biotech products. However, in this instance, we are not convinced that the Dutch CA's conduct reflects a precautionary approach. Indeed, we are not

[1653] Exhibit EC-102/At. 32.
[1654] Annex H, paras. 775 and 778.

convinced that the Dutch CA could not have identified any need for additional information and forwarded an appropriate request for information to the applicant sooner than it did even while following a precautionary approach.

7.2380 Taking account of the aforementioned elements, we consider that upon receipt of the original application, the lead CA could, and should, have determined more promptly that additional information was needed and could, and should, have forwarded an appropriate request to the applicant more promptly.

7.2381 We now turn to consider the time taken by the lead CA taken to review the information received in December 2000. To recall, more than five months after the applicant supplied the information requested by the lead CA in May 2000, the lead CA requested further information on protein analysis and a semi-chronic oral toxicity study on rats in order to "to rule out possible undesirable effects". Regarding protein analysis, the lead CA indicated that it was not yet fully satisfied with the information previously provided by the applicant. Regarding the requested toxicity study, the lead CA mentioned recent studies which had shown that "unintended effects on GMOs" were possibly caused by transformation of plant cells. However, as noted, no specific study was cited in this regard.

7.2382 Since it is not clear from the record what recent studies the lead CA was referring to, we have no basis on which to determine whether the lead CA could, and should, have put forward its request for a toxicity study earlier than it did.

7.2383 With regard to protein analysis, we note that the European Communities provides no specific justification for why the lead CA required more than five months to identify a need for yet more information. In the absence of a specific justification by the European Communities, we are not convinced that the lead CA could not have evaluated much sooner than it did whether additional information on protein analysis was still needed. We are also of the view that the Dutch CA could have requested supplementary information on protein analysis at a much earlier date even while following a precautionary approach.

7.2384 Taking account of the aforementioned elements, we consider that the lead CA could, and should, have determined more promptly that additional information was needed on protein analysis and could, and should, have forwarded an appropriate request to the applicant more promptly.

7.2385 Thus, based on the above considerations, we conclude that the time taken by the lead CA for its assessment of the application concerning RR sugar beet (food) – and in particular the time taken by the lead CA before forwarding its first request for additional information as well as the time taken by the lead CA to review the information received in December 2000 and to put forward a new request for information – was unjustifiably long.

7.2386 In addition, we recall that the United States claims that the approval procedure concerning NK603 maize (food) was unduly delayed because, due to the moratorium, the European Communities failed to consider the application in question for final approval. In this respect, we note our earlier findings that (i) a general *de facto* moratorium on approvals was in effect in the European Communities between June 1999 and August 2003 and that (ii) the time taken by the Netherlands to complete its initial assessment of the application concerning RR sugar beet (food) is consistent with the application of such a moratorium. In the light of this, and in the absence of effective rebuttal by the European Communities, we agree with the United States that it is reasonable to infer that the Netherlands' conduct was a consequence of the general moratorium on approvals.

7.2387 In view of our conclusion with regard to the time taken by the Netherlands for its initial assessment, we do not go on to examine other arguments put forward by the United States in support of its claim under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

7.2388 Taking account of the aforementioned elements, we consider that the time taken by the lead CA before initially requesting additional information in March 2000, and the time taken to review the information received in December 2000, is consistent with the United States' view that a general moratorium on final approvals was in effect in the European Communities at that time.

Conclusion

7.2389 In the light of the above, the Panel reaches the following overall conclusion:

(i) DS291 (United States)

With reference to DS291, the Panel recalls its findings that the time taken by the lead CA for its assessment of the application concerning RR sugar beet (food) – particularly the time taken by the lead CA before forwarding its first request for additional information as well as the time taken by the lead CA to review the information received in December 2000 and to put forward a new request for information – was unjustifiably long, and that it can reasonably be inferred from surrounding circumstances that the lead CA's conduct was a consequence of the general moratorium on approvals. Based on these findings, the Panel accepts the United States' contention that, consistent with the general moratorium, the European Communities failed to consider the application concerning RR sugar beet (food) for final approval, and that this resulted in "undue delay" in the completion of the relevant approval procedure. Accordingly, the Panel concludes that in respect of the approval procedure concerning RR sugar beet (food), the European Communities has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

(d) Summary of the Panel's conclusions

7.2390 In view of the large number of approval procedures reviewed, it is useful to summarize in table form the Panel's conclusions on the Complaining Parties' claim that the European Communities has failed to complete the relevant approval procedures without undue delay and hence has breached its obligations under Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*.

7.2391 We should recall that most of the conclusions identified in the table are relevant to only one or two of the three complaints we are examining. Our preceding analysis identifies which of these conclusions are applicable to which complaint(s).

	Approval procedures examined by the Panel	**Panel's conclusions on asserted "undue delay"** (X: unduly delayed, ✓: not unduly delayed)

10. Consistency of the product-specific measures with Article 8 and Annex C(1)(a), second clause, of the *SPS Agreement*

7.2392 Argentina claims that the product-specific measures identified by it are inconsistent with the European Communities' obligations under Article 8 and Annex C(1)(a), second clause, of the *SPS Agreement*.

7.2393 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or

> feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.2394 Annex C(1)(a), second clause, of the *SPS Agreement* provides:

> "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> [...]
>
> (a) such procedures are undertaken and completed [...] in no less favourable manner for imported products than for like domestic products[.]"

7.2395 **Argentina** argues that Annex C(1)(a), second clause, establishes an obligation to avoid discriminatory treatment. Members must not differentiate the treatment granted to an imported product and to a like domestic product. Argentina submits that in the present case a comparison should be made between the manner in which the EC approval system has been applied in the case of biotech products and the manner in which it has been applied in the case of novel non-biotech products. Specifically, Argentina points to Regulation 258/97 which it says defines a procedure that does not differ in terms of implementation between the two products. According to Argentina, undue delays have, however, occurred only in the treatment of biotech products. Furthermore, Argentina identifies another instance of less favourable treatment of biotech products. In the view of Argentina, prior to 1998, the European Communities granted approvals for the marketing of biotech products, whereas it has not done so since, as a consequence of the general *de facto* moratorium on approvals.

7.2396 The **European Communities** argues that the differences in treatment alleged by Argentina between biotech products and novel non-biotech products, and between biotech products before and after the "moratorium", have nothing to do with the national treatment obligation set forth in Annex C(1)(a), second clause. According to the European Communities, a national treatment issue would arise if the European Communities in the application of its approval system treated imported biotech products differently from domestic biotech products. The European Communities submits that this is not the case as all products are being treated equally, irrespective of their origin. The European Communities considers, therefore, that Argentina has failed to establish an inconsistency with Annex C(1)(a), second clause.

7.2397 The **Panel** notes that Argentina relies on the alleged inconsistency of the product-specific measures with Annex C(1)(a), second clause, to make consequential claims of inconsistency under Article 8. Accordingly, we will begin our analysis with the claims under Annex C(1)(a), second clause, before turning to Article 8.

(a) Annex C(1)(a), second clause

7.2398 We note that in accordance with the lead-in to Annex C(1) the provisions of Annex C(1)(a) apply "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have previously found that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures "to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1) and, as such, are subject to the provisions of Annex C(1), which include those of Annex C(1)(a). Therefore, the European Communities was and is required under the provisions of Annex C(1)(a) to "undertake and complete" the approval procedures set out in Directives 90/220 and 2001/18 as well as

Regulation 258/97 (to the extent it is an SPS measure) "in no less favourable manner for imported products than for like domestic products".

7.2399 Argentina is challenging alleged undue delays in completing the consideration and processing of specified applications. In our view, the type of measure challenged by Argentina could conceivably constitute, or lead to, a breach of the European Communities' obligations under Annex C(1)(a), second clause, and it can therefore be examined in the light of the provisions of Annex C(1)(a), second clause. Since Argentina seeks to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(a), second clause, this conclusion applies also to Article 8.

7.2400 In order to establish an inconsistency with Annex C(1)(a), second clause, Argentina must establish (i) that imported products have been treated in a "less favourable manner" than domestic products in respect of the undertaking and completion of approval procedures, and (ii) that the imported products which are alleged to have been treated less favourably are "like" the domestic products which are alleged to have been treated more favourably. If either one of these two elements is not met, that is, if imported products have not been treated "less favourably" than the domestic products to which they are being compared, or if these domestic products are not "like" the relevant imported products, Argentina's claim of inconsistency must fail. In the circumstances of this case, we find it appropriate to begin our analysis with the first element. Thus, we will examine first whether Argentina has demonstrated that imported products have been treated in a "less favourable manner" than domestic products in respect of the undertaking and completion of approval procedures.

7.2401 We note the phrase "in no less favourable manner". It is clear from this phrase that Annex C(1)(a), second clause, lays down a national treatment obligation. National treatment obligations are found in numerous WTO agreements. Moreover, the relevant provisions often use similar language. The Appellate Body has confirmed that, in such circumstances, the jurisprudence on a national treatment provision in one WTO agreement may be useful in interpreting a national treatment provision in another WTO agreement.[1655] In the present case, we find it useful to look to the jurisprudence on Articles III:1 and III:4 of the GATT 1994 for appropriate interpretative guidance.

7.2402 Article III:1 provides:[1656]

> "The contracting parties recognize that internal taxes and other internal charges, and laws, regulations and requirements affecting the internal sale, offering for sale, purchase, transportation, distribution or use of products, and internal quantitative regulations requiring the mixture, processing or use of products in specified amounts or proportions, should not be applied to imported or domestic products so as to afford protection to domestic production."

7.2403 Article III:4 provides in relevant part:

> "The products of the territory of any contracting party imported into the territory of any other contracting party shall be accorded treatment no less favourable than that accorded to like products of national origin in respect of all laws, regulations and requirements affecting their internal sale, offering for sale, purchase, transportation, distribution or use."

[1655] Appellate Body Report, *US – Section 211 Appropriations Act*, para. 242.
[1656] *Ad* Note omitted.

7.2404 In *EC – Asbestos*, the Appellate Body had this to say on the term "less favourable treatment" as it appears in Article III:4:

> "[...] there is a second element [in addition to the 'likeness' of the products being 'compared] that must be established before a measure can be held to be inconsistent with Article III:4. [...] A complaining Member must [...] establish that the measure accords to the group of 'like' *imported* products 'less favourable treatment' than it accords to the group of 'like' *domestic* products. The term 'less favourable treatment' expresses the general principle, in Article III:1, that internal regulations 'should not be applied … so as to afford protection to domestic production'. If there is 'less favourable treatment' of the group of 'like' imported products, there is, conversely, 'protection' of the group of 'like' domestic products. However, a Member may draw distinctions between products which have been found to be 'like', without, for this reason alone, according to the group of 'like' *imported* products 'less favourable treatment' than that accorded to the group of 'like' *domestic* products. In this case, we do not examine further the interpretation of the term 'treatment no less favourable' in Article III:4, as the Panel's findings on this issue have not been appealed or, indeed, argued before us."[1657]

7.2405 Subsequently, in *Dominican Republic – Import and Sale of Cigarettes*, the Appellate Body again addressed the meaning of the phrase "less favourable treatment", stating that:

> "[T]he existence of a detrimental [competitive] effect on a given imported product resulting from a measure does not necessarily imply that this measure accords less favourable treatment to imports if the detrimental effect is explained by factors or circumstances unrelated to the foreign origin of the product, such as the market share of the importer in this case."[1658]

7.2406 We recognize that Annex C(1)(a), second clause, does not use the phrase "treatment no less favourable", but the phrase "in no less favourable manner". In our view, there is, however, a close conceptual similarity between these two phrases, and the textual difference between them does not, therefore, render inapposite appropriate reliance on the Appellate Body's interpretation of the phrase "treatment no less favourable" as it appears in Article III:4.

7.2407 We also recognize that Annex C(1) to the *SPS Agreement* does not contain a provision analogous to Article III:1 of the GATT 1994. But the fact that Article III:4 expresses a general principle which is explicitly spelt out in Article III:1 does not necessarily mean that a similar general principle cannot be implicit in Annex C(1)(a), second clause. Indeed, we consider that a central purpose of the provisions of Annex C(1)(a), second clause, is precisely to prevent Members from applying their approval procedures in a manner which would afford protection to domestic production. This view is consistent with Article 2.3 of the *SPS Agreement*, which is part of the context of Annex C(1)(a). The second sentence of Article 2.3, which would appear to be applicable to approval procedures, provides that SPS measures "shall not be applied in a manner which would constitute a disguised restriction on international trade". Thus, we do not think that the absence in Annex C(1) of an analogue to Article III:1 should prevent us from being guided by the Appellate Body's interpretation of the phrase "treatment no less favourable".

[1657] Appellate Body Report, *EC – Asbestos*, para. 100 (emphasis in original).
[1658] Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 96.

7.2408 Reading Annex C(1)(a), second clause, in the light of the jurisprudence on Article III:4, we consider that in undertaking and completing its approval procedures, a Member may, in principle, differentiate between products that have been found to be like because this would not, by itself, mean that the relevant approval procedures have been undertaken or completed in less favourable manner for the group of like imported products than for the group of like domestic products. In particular, a mere showing that a Member has undertaken or completed a particular approval procedure in a manner which is unfavourable for a given imported product would not be sufficient to establish a "less favourable manner" of undertaking or completing approval procedures if the relevant Member's conduct is explained by factors or circumstances unrelated to the foreign origin of the product.

7.2409 With these considerations in mind, we now turn to analyse Argentina's arguments. Argentina's first argument is that the European Communities has undertaken approval procedures under Regulation 258/97 in less favourable manner for the biotech products which are the subject of the product-specific measures challenged by Argentina than for like novel non-biotech products. Argentina asserts that undue delays have occurred only in the processing of applications concerning biotech products.

7.2410 We note that it is not entirely clear from Argentina's submissions which approval procedures are at issue. We understand Argentina to refer to the procedures set out in Articles 4, 6, 7 and 8 of Regulation 258/97. These procedures apply in the same way to biotech products as they do to novel non-biotech products. These procedures also apply equally to imported and domestic products. Finally, we note that we have previously determined that these procedures constitute an approval procedure within the meaning of Annex C. Therefore, in undertaking and completing these procedures, the European Communities must comply with Annex C(1)(a), second clause.

7.2411 Turning to the merits of Argentina's argument, we observe, initially, that Argentina has not provided factual information about the processing of applications concerning those novel non-biotech products which Argentina considers to be like the biotech products at issue. At any rate, even if it were the case, as Argentina seems to assert, that the processing of applications concerning the relevant imported biotech products (*e.g.*, imported biotech maize) has been unduly delayed, while the processing of applications concerning the corresponding domestic non-biotech varieties (*e.g.*, domestic novel non-biotech maize) has not been unduly delayed, this would not be sufficient, in and of itself, to raise a presumption that the procedures envisaged in Regulation 258/97 have been applied in less favourable manner for the group of like imported products than for the group of like domestic products. Argentina does not assert that the processing of applications concerning relevant domestic biotech products (*e.g.*, domestic biotech maize) has not been unduly delayed, or that the processing of applications concerning corresponding imported non-biotech varieties (*e.g.*, imported novel non-biotech maize) has been unduly delayed. In other words, Argentina is not alleging that the manner of processing applications under Regulation 258/97 has differed depending on the origin of the products. In these circumstances, it is not self-evident that the alleged less favourable manner of processing applications concerning the relevant imported biotech products (*e.g.*, imported biotech maize) is explained by the foreign origin of these products rather than, for instance, a perceived difference between biotech products and novel non-biotech products in terms of the required care in their safety assessment, risk for the consumer, etc. Argentina has not adduced argument and evidence sufficient to raise a presumption that the alleged less favourable treatment is explained by the foreign origin of the relevant biotech products.

7.2412 In the light of the above, we find that Argentina has not established that the approval procedures set out in Regulation 258/97 have been undertaken or completed in a less favourable manner for imported products than for domestic products.

7.2413 Argentina's second argument is that after 1998 the European Communities has applied its approval procedures in a less favourable manner for the biotech products which are the subject of the product-specific measures challenged by Argentina than for like biotech products before 1998. More particularly, Argentina submits that after 1998 undue delays have occurred in the processing of applications under the relevant approval procedures. The year 1998 is the year in which, in Argentina's view, the European Communities began applying its general *de facto* moratorium on approvals.

7.2414 We understand Argentina's second argument to relate to the approval procedures contained in Directives 90/220 and 2001/18 as well as Regulation 258/97. Directives 90/220 and 2001/18 as well as Regulation 258/97 apply equally to imported and domestic biotech products. We have previously determined that these pieces of legislation contain approval procedures within the meaning of Annex C. Therefore, in undertaking and completing these approval procedures, the European Communities was and is required to comply with Annex C(1)(a), second clause. We note that Directive 2001/18 is formally and, to some extent, substantively different from Directive 90/220. Argentina appears to assume that the obligation laid down in Annex C(1)(a), second clause, applies not only in situations where imported and domestic products are dealt with under one and the same approval procedure, but also in situations where like products are dealt with under formally or substantively different approval procedures. For the purposes of our analysis of Argentina's argument, we are prepared to proceed on the basis of this assumption, but we do not make a finding in this regard.

7.2415 It seems to us that Argentina wishes to argue, in effect, that approval procedures were applied in less favourable manner for relevant imported biotech products after 1998 than for like domestic biotech products before 1998. Even if this were correct as a factual matter, however, this would not be sufficient, in and of itself, to raise a presumption that the approval procedures at issue have been applied in less favourable manner for the group of like imported products than for the group of like domestic products. Argentina asserts that after 1998 applications concerning the relevant biotech products were processed in less favourable manner, irrespective of whether they were of foreign or domestic origin, and that before 1998 applications concerning biotech products were processed in more favourable manner, irrespective of whether they were of foreign or domestic origin. Thus, it is not Argentina's contention that there has been a difference, before and after 1998, in the manner in which the European Communities has processed applications concerning imported biotech products and the manner in which it has processed applications concerning domestic biotech products. It is therefore not obvious that the alleged less favourable manner of conducting approval procedures for the relevant imported biotech products after 1998 is explained by the foreign origin of these products rather than by other factors or circumstances, such as a different perception of risks associated with biotech products, etc. Argentina has not adduced argument and evidence sufficient to raise a presumption that the alleged less favourable treatment is explained by the foreign origin of the relevant biotech products.

7.2416 Additionally, we note that one of the consequences of accepting Argentina's second argument would be that Members could not consistently with Annex C(1)(a), second clause, elect to conduct their approval procedures in a less favourable manner for all subject products regardless of their origin, *e.g.*, in response to new scientific evidence suggesting that the risks associated with the products subject to the approval requirement had previously been underestimated. In our view, it would be unreasonable to interpret Annex C(1)(a), second sentence, so as to produce such an outcome.

7.2417 In the light of the above, we are not persuaded by Argentina's argument that the European Communities has undertaken and completed its approval procedures in a less favourable manner for

imported products than for domestic products by processing applications concerning biotech products in a less favourable manner after 1998 than before 1998.

7.2418 Since we have found that Argentina has not demonstrated to our satisfaction that imported products have been processed in a "less favourable manner" than domestic products in respect of the undertaking and completion of approval procedures, there is no need to go on to examine whether the imported products which Argentina alleges have been treated less favourably are "like" the domestic products which Argentina alleges have been treated more favourably.

7.2419 Based on all of the above considerations, we conclude that Argentina has failed to establish its product-specific claims under Annex C(1)(a), second clause.

(b) Article 8

7.2420 Turning to Argentina's claims under Article 8, we recall that Argentina seeks to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(a), second clause. We have determined that Argentina has failed to establish its claims under Annex C(1)(a), second clause. Under the approach followed by Argentina, this means that its claims under Article 8 have not been established either.

(c) Overall conclusion

7.2421 In the light of the above, the Panel reaches the following conclusion:

(i) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(a), second clause, of the *SPS Agreement* and, consequently, with its obligations under Article 8 of the *SPS Agreement*.

11. Consistency of the product-specific measures with Article 8 and Annex C(1)(b) of the *SPS Agreement*

7.2422 The United States and Argentina claim that the product-specific measures identified by them are inconsistent with the European Communities' obligations under Article 8 and Annex C(1)(b) of the *SPS Agreement*.

7.2423 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.2424 Annex C(1)(b) of the *SPS Agreement* provides:

> "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> [...]
>
> (b) the standard processing period of each procedure is published or that the anticipated processing period is communicated to the applicant upon request; when receiving an application, the competent body promptly examines the completeness of the documentation and informs the applicant in a precise and complete manner of all deficiencies; the competent body transmits as soon as possible the results of the procedure in a precise and complete manner to the applicant so that corrective action may be taken if necessary; even when the application has deficiencies, the competent body proceeds as far as practicable with the procedure if the applicant so requests; and that upon request, the applicant is informed of the stage of the procedure, with any delay being explained[.]"

7.2425 As we have noted earlier, Annex C(1)(b) essentially sets out five separate, but related, obligations to be observed by Members in the operation of approval procedures. These obligations relate to:

(i) the publication or communication to applicants of the processing period of each procedure;

(ii) the examination of the completeness of the documentation and the communication to applicants of deficiencies;

(iii) the transmission of the results of the procedure;

(iv) the processing of applications which have deficiencies; and

(v) the provision of information about the stage of a procedure and the provision of an explanation of any delay.

7.2426 The **United States** argues that under the relevant product-specific measures – the product-specific moratoria – the European Communities does not allow its approval procedures to proceed to conclusion. As such, the product-specific moratoria are inconsistent with each of the related procedural obligations in Annex C(1)(b) and, consequently, with Article 8 as well.

7.2427 Regarding the *first obligation* (publication or communication of processing period), the United States submits that although the applicable EC approval legislation contains processing periods, under the product-specific moratoria those processing periods are not followed. Instead, the European Communities has imposed an indefinite delay. However, since the European Communities does not acknowledge the product-specific moratoria, the standard processing period is not published, and the anticipated processing period is not communicated to the applicant.

7.2428 Regarding the *second obligation* (completeness of documentation), the United States argues that under the product-specific moratoria the European Communities does not promptly examine documentation and inform the applicant of all deficiencies. To the contrary, applications under the applicable EC legislation are stalled, without explanation. More specifically, the United States

submits that in the Bt-531 cotton, RR-1445 cotton, MS1/RF1 oilseed rape (EC 89) and MS1/RF2 oilseed rape applications, the applicant was not informed in a precise and complete manner of all deficiencies. To the contrary, when the Regulatory Committee fails to approve an application by qualified majority vote, or when the Commission enters into inter-service consultations rather than sending an application on to the Council, the applicant is given no explanation, and thus no opportunity to correct any deficiencies. The same is true when, as for the oilseed rape products, the lead member State fails to take the final step of placing the product on the market.

7.2429 Regarding the *third obligation* (transmission of results), the United States argues that under the product-specific moratoria results of procedures are not promptly communicated to applicants so that corrective action may be taken. Instead, applications are stalled in the approval process without explanation. More specifically, the United States submits that in the Bt-531 cotton, RR-1445 cotton, MS1/RF1 oilseed rape (EC 89) and MS1/RF2 oilseed rape applications, the applicant was not informed in a precise and complete manner of all deficiencies. To the contrary, when the Regulatory Committee fails to approve an application by qualified majority vote, or when the Commission enters into inter-service consultations rather than sending an application on to the Council, the applicant is given no explanation, and thus no opportunity to correct any deficiencies. The same is true when, as for the oilseed rape products, the lead member State fails to take the final step of placing the product on the market.

7.2430 Regarding the *fourth obligation* (processing of deficient applications), the United States argues that under the product-specific moratoria the European Communities does not proceed as far as practicable in the approval process. Instead, applications are stalled in the approval process.

7.2431 Regarding the *fifth obligation* (explanation of delay), the United States argues that under the product-specific moratoria delays are not explained. To the contrary, the European Communities does not even inform applicants of the existence of the general moratorium.

7.2432 **Argentina** argues that Annex C(1)(b) stipulates obligations of publication and notification of the applicant and requires the competent bodies of Members to perform their obligations "promptly" and to explain "any delay". Argentina considers that the undue delay which has been caused by the European Communities in the specific approval procedures identified by it is inconsistent with Article 8 and Annex C(1)(b). Argentina submits that the European Communities has not ensured compliance with the requirements of Annex C(1)(b) because in some cases the relevant EC entity did not promptly determine whether the documentation was complete (second obligation), and in other cases did not inform the applicant of the results of the procedure (third obligation) or of the current stage of the procedure (fifth obligation). Argentina argues in this regard that it has demonstrated that, for instance, in the approval procedure concerning GA21 maize (EC-78) the applicant was still waiting for a definitive answer with respect to its application after more than five years. Finally, Argentina submits that a violation of the provisions of Annex C simultaneously represents a violation of Article 8.

7.2433 The **European Communities** submits that the United States and Argentina have offered a mere assertion that the European Communities has not done what it is required to do under the different obligations contained in Annex C(1)(b). Argentina has offered no evidence in support of its allegations. The United States also considers it sufficient simply to allege that applications were stalled in the approval process and gives no explanations. However, it is a complaining party's burden to establish a prima facie case. In any event, the detailed chronologies of individual approval procedures and other documents submitted by the European Communities demonstrate that the allegations of the United States are unfounded.

7.2434 Regarding the United States' claim that no standard processing periods have been published for the "product-specific moratoria", the European Communities argues that these "moratoria" are individual applications subject to their own particular facts. In the European Communities' view, it is difficult to see how a "standard" processing period other than the one laid down in the legislation could be set out for these applications collectively.

7.2435 The **Panel** notes that in accordance with the lead-in to Annex C(1) the provisions of Annex C(1)(b) apply "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have previously found that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures "to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1) and, as such, are subject to the provisions of Annex C(1), which include those of Annex C(1)(b). Therefore, in respect of the approval procedures set out in the aforementioned Directives and Regulation, the European Communities was and is required to comply with the provisions of Annex C(1)(a).

7.2436 We recall that the United States is challenging the alleged failure by the European Communities to consider particular applications for final approval. We have observed in this regard that this is essentially a challenge to the application by the European Communities of a particular way of operating the relevant EC approval procedures. We also recall that Argentina is challenging alleged undue delays in completing the consideration and processing of specified applications.

7.2437 In our view, the type of measure challenged by the United States and Argentina could conceivably constitute, or lead to, a breach of EC obligations under Annex C(1)(b), and it can therefore be examined in the light of the provisions of Annex C(1)(b). Since the United States and Argentina seek to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(b), this conclusion applies also to Article 8.

7.2438 In view of the fact that the United States' and Argentina's claim under Article 8 is in the nature of a consequential claim, we will begin our analysis with the claims under Annex C(1)(b).

(a) First obligation in Annex C(1)(b) (publication or communication of processing period)

7.2439 Only the United States has presented arguments in relation to the first obligation contained in Annex C(1)(b). Specifically, the United States puts forward two main arguments. The first argument is that as a result of the European Communities' failure to consider the relevant applications for approval, the European Communities did not follow the standard processing periods which are published in the applicable EC approval legislation. The United States appears to infer from this that the effective standard processing period was not published.

7.2440 We agree with the European Communities that the first obligation in Annex C(1)(b) does not, and logically cannot, require the European Communities to publish a "standard" processing period for every individual approval procedure undertaken by it. The processing period to be published is the period which is intended to be the norm for all approval procedures of a particular type, *e.g.*, the approval procedures envisaged in Directive 2001/18 for the placing on the market of biotech products. This follows from the word "standard", which in the specific context of the first obligation should be understood as meaning "normal".[1659] However, we do not understand the United States to argue that

[1659] The dictionary defines "standard" as "[o]f a prescribed or normal size, amount, quality, etc.". *The New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. II, p. 3028. The French

the European Communities should have published a standard processing period for each individual approval procedure conducted by it.

7.2441 We understand the United States to argue that the failure by the European Communities to consider a particular application for final approval meant that it was not following the published standard processing period for the relevant type of procedure and that the effective standard processing period for the relevant type of procedure was no longer published. Even if we were to accept that what has to be published in accordance with the first obligation in Annex C(1)(b) is the "effective" standard processing period, the mere fact that the European Communities in one particular approval procedure might not have followed the published standard processing period would not, by itself, justify the conclusion that there was a new and unpublished effective "standard" processing period. A single departure from the published standard processing period in our view does not demonstrate the existence of a new "standard" processing period.[1660] In any event, even if there was a new standard processing period, the fact that it was unpublished would not be a consequence of the failure by the European Communities to consider the relevant application for final approval. In other words, it would not be a consequence of the product-specific measure at issue. Rather, it would be a consequence of a separate and independent failure by the European Communities to publish the new standard processing period.

7.2442 In the light of this, we conclude that the United States has failed to establish its product-specific claims under the first obligation contained in Annex C(1)(b), insofar as these claims are based on the requirement to publish the standard processing period of each procedure.

7.2443 The United States' second argument in support of its claim under Annex C(1)(b) is that since the European Communities does not acknowledge its failure to consider the relevant applications for approval, the anticipated processing period is not communicated to the applicants. We note that pursuant to Annex C(1)(b) the anticipated processing period is to be communicated to the applicant "upon request". The United States has provided no evidence to show (i) that an applicant requested that the anticipated processing period be communicated to it, (ii) that the request was denied by a relevant EC entity, and (iii) that this was because of a deliberate failure to consider the relevant applications for approval. Moreover, we do not think that the failure by the European Communities to consider particular applications for final approval necessarily resulted in the European Communities not communicating to applicants the anticipated processing periods upon request. Indeed, in our view, the fact that the European Communities may have prevented a particular approval procedure from proceeding to conclusion would not have made it impossible for the European Communities to communicate to the applicant the anticipated processing period upon request, as required by Annex C(1)(b).

7.2444 In the light of this, we conclude that the United States has failed to establish its product-specific claims under the first obligation contained in Annex C(1)(b), insofar as these claims are based on the requirement to communicate to applicants the anticipated processing period.

(b) Second obligation in Annex C(1)(b) (completeness of documentation)

7.2445 Concerning the second obligation contained in Annex C(1)(b), both the United States and Argentina have presented arguments. We begin our analysis with the United States' arguments.

("la durée normale") and Spanish ("el período normal de tramitación") versions of the *SPS Agreement* support this interpretation.

[1660] We recall that the measures at issue are individual product-specific measures, and not the product-specific measures collectively or the general moratorium on approvals.

7.2446 The United States argues that as a result of the European Communities' failure to consider the relevant applications for approval, the European Communities did not promptly examine the completeness of documentation and inform applicants of any deficiencies. The United States has identified individual approval procedures which it believes support its claim under the second obligation.

7.2447 Among the applications referred to by the United States are those concerning MS1/RF1 oilseed rape (EC 89) and MS1/RF2 oilseed rape. We have determined above that there are twenty-five product-specific measures on which the United States is seeking findings. However, the applications concerning MS1/RF1 oilseed rape (EC 89) and MS1/RF2 oilseed rape are not part of these twenty-five measures. We are therefore not entitled to make product-specific findings on these two applications concerning oilseed rape.

7.2448 The United States also refers to the applications concerning Bt-531 cotton and RR-1445 cotton. They are among the applications which are the subject of product-specific claims put forward by the United States. In relation to these applications, the United States argues that when the Regulatory Committee failed to approve them by a qualified majority vote, or when the Commission entered into inter-service consultations after the Regulatory Committee vote, the applicant was given no explanation, and thus no opportunity to correct any deficiencies. As an initial matter, we note that the second obligation in Annex C(1)(b) applies when a "competent body" "receives" an application. In our view, the competent body receiving the applications concerning Bt-531 and RR-1445 cotton was the lead member State to which these applications were submitted for initial assessment, not the Regulatory Committee or the Commission at the post-Regulatory Committee stage.

7.2449 In any event, the United States has not demonstrated that either the Regulatory Committee or the Commission identified deficiencies in the documentation submitted by the applicant and did not inform the applicant thereof in a precise and complete manner. We recall that in the case of the application concerning Bt-531 cotton, three member States made written statements in support of their votes in the Regulatory Committee in February 1999, and that the applicant provided additional information more than two years after the Regulatory Committee meeting and the launching by the Commission of inter-service consultations. The United States has not shown that any of the member State statements identified deficiencies in the documentation submitted by the applicant. We have found earlier that none of the member State statements specifically called for the provision of the additional information and that there is no indication that the applicant submitted the additional information in response to the written statements. We also recall our earlier finding that there is no evidence to suggest that the Commission was waiting for the additional information provided by the applicant and for that reason did not submit a draft measure to the Council. We therefore do not consider that the additional information provided by the applicant addressed "deficiencies" which had been identified by the Regulatory Committee or the Commission.

7.2450 Regarding the application concerning RR-1445 cotton, we note that as in the case of the application concerning Bt-531 cotton, a number of member States made written statements in support of their votes in the Regulatory Committee in February 1999. The United States has not shown that any of these statements identified deficiencies in the documentation submitted by the applicant. Moreover, we have found earlier that the record of the consultation of the Regulatory Committee does not contain any indication of a request to the applicant for further information. In fact, no further information was provided subsequent to the Regulatory Committee vote. Finally, the United States itself points out in a different context that nothing in the record indicates that the Commission communicated any scientific concerns to the applicant or identified any shortcomings in the application following the Regulatory Committee vote. We therefore consider that the United States has not demonstrated that either the Regulatory Committee or the Commission identified deficiencies

in the documentation submitted by the applicant and did not inform the applicant thereof in a precise and complete manner.

7.2451 By way of an additional consideration, we note that the failure by the European Communities to consider particular applications for final approval did not necessarily result in the European Communities not examining promptly the completeness of documentation and not informing applicants of any deficiencies. Indeed, in our view, the fact that the European Communities may have prevented a particular approval procedure from proceeding to conclusion would not have made it impossible for the European Communities to examine the completeness of the documentation or inform the applicant of deficiencies in the documentation submitted, as required by Annex C(1)(b).[1661]

7.2452 In the light of the above considerations, we conclude that the United States has failed to establish its product-specific claims under the second obligation contained in Annex C(1)(b).

7.2453 Argentina submits that the European Communities has not ensured compliance with the requirements of Annex C(1)(b) because in some cases the relevant EC entity did not promptly determine whether the documentation was complete. Argentina has failed specifically to identify these "cases" and has not demonstrated that in these cases the competent body found deficiencies in the documentation submitted by the applicant and did not inform the applicant thereof in a precise and complete manner.

7.2454 In the light of this, we conclude that Argentina has failed to establish its product-specific claims under the second obligation contained in Annex C(1)(b).

(c) Third obligation in Annex C(1)(b) (transmission of results)

7.2455 With regard to the third obligation contained in Annex C(1)(b), both the United States and Argentina have presented arguments. We begin our analysis with the United States' arguments.

7.2456 The United States argues that as a result of the European Communities' failure to consider the relevant applications for approval, the European Communities did not promptly communicate the results of procedures to applicants so that corrective action could be taken if necessary. The United States has identified individual approval procedures which it believes support its claim under the third obligation. Among the applications referred to by the United States are those concerning MS1/RF1 oilseed rape (EC 89) and MS1/RF2 oilseed rape. We have already determined that we are not entitled to make product-specific findings on the two applications concerning oilseed rape.

7.2457 The United States also refers to the applications concerning Bt-531 cotton and RR-1445 cotton. They are among the product-specific measures challenged by the United States. In relation to these approval procedures, the United States argues that when the Regulatory Committee failed to approve them by a qualified majority vote, or when the Commission entered into inter-service consultations after the Regulatory Committee vote, the applicant was given no explanation, and thus no opportunity to correct any deficiencies.

7.2458 We note at the outset that when the applications concerning Bt-531 and RR-1445 cotton reached the Regulatory Committee stage, they were subject to Directive 90/220. It is clear from Article 21 of Directive 90/220 that the role of the Regulatory Committee is to assist the Commission in its decision-making by delivering opinions on draft measures proposed by the Commission. The

[1661] We note in this regard that certain progress in the approval process is not inconsistent with a deliberate failure by the European Communities to move a particular application to final decision.

Regulatory Committee cannot by itself take decisions on applications. Moreover, Directive 90/220 does not provide for the applicant to be given an explanation of the vote.[1662] Indeed, we have noted earlier that there is no publicly available record of Regulatory Committee votes. The European Communities has pointed out in this regard that Regulatory Committee votes have no external legal effect and cannot, therefore, be challenged under EC law.[1663] Thus, there is no "corrective action" which can be taken by the applicant in response to an unfavourable Regulatory Committee vote. For all these reasons, we are not persuaded that a vote in the Regulatory Committee can be considered a "result of the procedure" within the meaning of the third obligation contained in Annex C(1)(b). In our view, the Regulatory Committee vote is rather a "stage of the procedure" of which the applicant must be informed upon request in accordance with the fifth obligation in Annex C(1)(b).

7.2459 We believe that the same is true for inter-service consultations held by the Commission prior to the submission of a draft measure to the Council. Such consultations are a "stage of the procedure", not a "result of the procedure". At any rate, the outcome of such consultations is a draft measure to be transmitted to the Council for action, not a decision on an application.

7.2460 Based on the preceding considerations, we find that the Regulatory Committee votes and the opening of inter-service consultations by the Commission in the approval procedures concerning Bt-531 and RR-1445 cotton were not "results" which the European Communities was required to transmit to the applicant.

7.2461 More generally, we note that the failure by the European Communities to consider particular applications for final approval meant that no final results were achieved. Thus, there were no final results which could have been communicated to applicants as required by the third obligation in Annex C(1)(b).[1664]

7.2462 In the light of the above, we conclude that the United States has failed to establish its product-specific claims under the third obligation contained in Annex C(1)(b).

7.2463 Argentina submits that the European Communities has not ensured compliance with the requirements of Annex C(1)(b) because in some cases the relevant EC entity did not inform the applicant of the results of the procedure. Argentina has failed specifically to identify these "cases" and has not demonstrated that in these cases there were "results" which needed to be transmitted to the applicants. We note that Argentina has referred to the fact that in the approval procedure concerning GA21 maize (EC-78), the applicant was still waiting for a definitive answer regarding its application after more than five years. We recall in this regard that the third obligation in Annex C(1)(b) requires the competent body to "transmit" as soon as possible "the results of the procedure" in a precise and complete manner to the applicant so that corrective action may be taken if necessary. Thus, the third obligation applies in situations where results have been reached.[1665] Argentina's example is one where no final results have been reached yet. Since no results have been reached, none could be transmitted

[1662] It is important to recall in this context that the United States is not alleging that Directive 90/220 is, as such, WTO-inconsistent.

[1663] In support of its statement, the European Communities refers to the jurisprudence of the European Court of First Instance, case T-326/99, *Nancy Fern Olivieri v. Commission and EMEA*, decision of 18 December 2003, paras. 51 *et seq*.

[1664] As is clear from the discussion of the approval procedures concerning Bt-531 and RR-1445 cotton, the United States has failed to establish that "results" other than the final results of the relevant procedures had to be transmitted to the relevant applicants and that those results were not transmitted to them.

[1665] We note that the requirement in Annex C(1)(a), first clause, that approval procedures be "completed" without undue delay serves to ensure that "results" are reached.

to the applicant. In our view, the example of the approval procedure concerning GA21 maize (EC-78) does not, therefore, assist Argentina in establishing an inconsistency with the third obligation.

7.2464 In the light of this, we conclude that Argentina has failed to establish its product-specific claims under the third obligation contained in Annex C(1)(b).

(d) Fourth obligation in Annex C(1)(b) (processing of deficient applications)

7.2465 Only the United States has presented arguments in relation to the fourth obligation contained in Annex C(1)(b). The United States argues that as a result of the European Communities' failure to consider the relevant applications for approval, the European Communities did not proceed as far as practicable in the approval process.

7.2466 We note that pursuant to Annex C(1)(b) the competent body is to proceed as far as practicable with the procedure "if the applicant so requests". The United States has provided no evidence of an applicant making such a request and of a relevant EC entity denying that request because of a decision by the European Communities not to consider the relevant application for final approval. Moreover, we do not think that the failure by the European Communities to consider particular applications for final approval necessarily resulted in the European Communities not proceeding as far as practicable with procedures if applicants so requested. Indeed, in our view, the fact that the European Communities may have prevented a particular approval procedure from proceeding to conclusion would not have made it impossible for the European Communities to proceed as far as practicable with that procedure upon request, as required by Annex C(1)(b).[1666]

7.2467 In the light of this, we conclude that the United States has failed to establish its product-specific claims under the fourth obligation contained in Annex C(1)(b).

(e) Fifth obligation in Annex C(1)(b) (explanation of delay)

7.2468 Regarding the fifth obligation contained in Annex C(1)(b), both the United States and Argentina have presented arguments. We begin our analysis with the United States' arguments.

7.2469 The United States argues that as a result of the European Communities' failure to consider the relevant applications for approval, delays were not explained. The fifth obligation states that "upon request", the applicant is to be informed of the stage of the procedure, with any delay being explained. The United States has provided no evidence of an applicant making such a request, or of a relevant EC entity denying an explanation of any delay because of a deliberate failure by the European Communities to consider the relevant application for approval. Moreover, we do not think that the failure by the European Communities to consider particular applications for final approval necessarily resulted in the European Communities not informing applicants of the stage of procedures and not explaining any delays, if applicants so requested. Indeed, in our view, the fact that the European Communities may have prevented a particular approval procedure from proceeding to conclusion would not have made it impossible for the European Communities to inform applicants of the stage of procedures and explain any delays, as required by Annex C(1)(b).

7.2470 In the light of this, we conclude that the United States has failed to establish its product-specific claims under the fifth obligation contained in Annex C(1)(b).

[1666] We note in this regard that certain progress in the approval process is not inconsistent with a deliberate failure by the European Communities to move a particular application to final decision.

7.2471 Argentina submits that the European Communities has not ensured compliance with the requirements of Annex C(1)(b) because in some cases the relevant EC entity did not inform the applicant of the current stage of the procedure. Argentina has failed specifically to identify these "cases" and has not demonstrated that the relevant applicants requested information about the stage of the procedure and were denied such information.

7.2472 In the light of this, we conclude that Argentina has failed to establish its product-specific claims under the fifth obligation contained in Annex C(1)(b).

(f) Article 8

7.2473 Turning now to the United States' and Argentina's claims under Article 8, we recall that the United States and Argentina seek to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(b). We have determined that the United States and Argentina have failed to establish their claims under Annex C(1)(b). Under the approach followed by the United States and Argentina, this means that their claims under Article 8 have not been established either.

(g) Overall conclusions

7.2474 In the light of the above, the Panel reaches the following conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence submitted by the United States and the European Communities, the Panel concludes that the United States has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(b) of the *SPS Agreement* and, consequently, with its obligations under Article 8 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(b) of the *SPS Agreement* and, consequently, with its obligations under Article 8 of the *SPS Agreement*.

12. Consistency of the product-specific measures with Article 8 and Annex C(1)(c) of the *SPS Agreement*

7.2475 Argentina claims that the product-specific measures identified by it are inconsistent with the European Communities' obligations under Article 8 and Annex C(1)(c) of the *SPS Agreement*.

7.2476 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or

> feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.2477 Annex C(1)(c) of the *SPS Agreement* provides:

> "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> [...]
>
> (c) information requirements are limited to what is necessary for appropriate control, inspection and approval procedures, including for approval of the use of additives or for the establishment of tolerances for contaminants in food, beverages or feedstuffs[.]"

7.2478 **Argentina** submits that the European Communities acted inconsistently with the provisions of Annex C(1)(c) by delaying the examination of the relevant applications and by requiring excessive submissions under the terms of subsequent legislation. Regarding the submission of information under the terms of subsequent legislation, Argentina points out that the European Communities has invoked requirements contained in subsequent legislation as grounds for not processing applications. According to Argentina, this is clear from the fact that applications submitted under Directive 90/220 had to be resubmitted under Directive 2001/18 even in cases where the procedures had already been in progress under the old Directive for three years. Argentina also points out that there were numerous requests for additional information in the approval procedures which are the subject of its product-specific claims under Annex C(1)(c). Finally, Argentina argues that a violation of the provisions of Annex C simultaneously represents a violation of Article 8.

7.2479 The **European Communities** argues that delays do not fall within the scope of application of Annex C(1)(c). Regarding information requirements, the European Communities submits that the question of which information requirements are necessary is a question of standards set forth in the *SPS Agreement* itself. The European Communities also argues that Argentina should have attacked Directive 2001/18 if it considered the requirement to resubmit an updated dossier upon entry into force of Directive 2001/18 to be inconsistent with the *SPS Agreement*.

7.2480 The **Panel** notes that in accordance with the lead-in to Annex C(1) the provisions of Annex C(1)(c) apply "with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures". We have previously found that the procedures set out in Directives 90/220 and 2001/18 as well as Regulation 258/97 (to the extent it is an SPS measure) constitute procedures "to check and ensure the fulfilment of sanitary or phytosanitary measures" within the meaning of Annex C(1) and, as such, are subject to the provisions of Annex C(1), which include those of Annex C(1)(c). Therefore, in respect of the approval procedures set out in the aforementioned Directives and Regulation, the European Communities was and is required to comply with the provisions of Annex C(1)(c).

7.2481 We note that Argentina relies on the alleged inconsistency of the relevant product-specific measures with Annex C(1)(c) to make consequential claims of inconsistency under Article 8. Accordingly, we will begin our analysis with the claims under Annex C(1)(c).

(a) Annex C(1)(c)

7.2482 We recall that the product-specific measures which Argentina says give rise to an inconsistency with Annex C(1)(c) are undue delays caused by the European Communities in the consideration of particular applications. Argentina asserts that the European Communities has breached its obligations under Annex C(1)(c) by delaying the completion of the relevant approval procedures. We are not persuaded by this assertion. In our view, the failure by the European Communities to complete particular approval procedures without undue delay did not itself impose, or lead to the imposition of, information requirements which were not necessary. We therefore fail to see how the measures challenged by Argentina could be considered to give rise to an inconsistency with Annex C(1)(c). At any rate, Argentina has not identified specific information requirements which were imposed on applicants in the relevant approval procedures, nor has it explained why any such requirements were not necessary for appropriate approval procedures.

7.2483 Argentina also asserts that the European Communities has breached its obligations under Annex C(1)(c) by requiring excessive submissions under the terms of subsequent legislation. Here again, we must recall that the product-specific measures which Argentina is challenging are undue delays caused by the European Communities in the consideration of particular applications. The failure by the European Communities to complete particular approval procedures without undue delay did not impose a requirement on applicants to provide information based on legislation not yet in force, nor did it cause such a requirement to be imposed. Likewise, the European Communities' failure to complete particular approval procedures without undue delay did not require applicants to update their applications in accordance with the provisions of Directive 2001/18 once that Directive had entered into force. Nor did that failure cause such a requirement to be imposed.[1667] We are therefore unable to agree with Argentina that the European Communities has breached its obligations under Annex C(1)(c) by requiring excessive submissions under the terms of subsequent legislation. In any event, Argentina has not explained why the submissions it referred to were "excessive" and thus not necessary.

7.2484 We note Argentina's argument that there were numerous requests for additional information in the approval procedures which are the subject of its claims under Annex C(1)(c). It is sufficient to note in this regard that if Argentina was of the view that some or all of these requests for additional information constitute information requirements and that these requirements were not limited to what was necessary, it should have challenged these requests.

7.2485 In the light of the above, we conclude that Argentina has failed to establish its product-specific claims under Annex C(1)(c).

(b) Article 8

7.2486 Turning to Argentina's claims under Article 8, we recall that Argentina seeks to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(c). We have determined that Argentina has failed to establish its claims under Annex C(1)(c). Under the approach followed by Argentina, this means that its claims under Article 8 have not been established either.

[1667] As pointed out by the European Communities, the requirement to update applications in accordance with the provisions of Directive 2001/18 flows from Article 35 of that Directive. Argentina does not challenge Article 35 as such.

(c) Overall conclusion

7.2487 In the light of the above, the Panel reaches the following conclusion:

(i) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(c) of the *SPS Agreement* and, consequently, with its obligations under Article 8 of the *SPS Agreement*.

13. Consistency of the product-specific measures with Article 8 and Annex C(1)(e) of the *SPS Agreement*

7.2488 Argentina claims that the product-specific measures identified by it are inconsistent with the European Communities' obligations under Article 8 and Annex C(1)(e) of the *SPS Agreement*.

7.2489 Article 8 of the *SPS Agreement* provides:

> "Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement."

7.2490 Annex C(1)(e) of the *SPS Agreement* provides:

> "Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:
>
> [...]
>
> (e) any requirements for control, inspection and approval of individual specimens of a product are limited to what is reasonable and necessary[.]"

7.2491 **Argentina** argues that the detailed requirements of Directive 2001/18 and of its predecessor, Directive 90/220, as well as of Regulation 258/97 do not seem to meet the criteria of "reasonableness and necessity". Moreover, the European Communities has failed to exercise the authority granted to it by the aforementioned legislation, and that failure to act cannot be deemed reasonable or necessary. Furthermore, when Directive 2001/18 came into force, no consideration was given to the newly submitted applications, nor were those applications approved which had already been submitted under the predecessor Directive. Argentina further submits that the application of the European Communities' approval procedures is not limited to what is reasonable and necessary for the approval of biotech products.

7.2492 The **European Communities** argues that to the extent that Argentina's argument relates to the EC approval legislation itself, there is no reason to respond as the legislation is not a measure at issue. Furthermore, Argentina offers no support for its assertion that the application of the European Communities' approval procedures is not limited to what is reasonable and necessary for the approval

of biotech products. The European Communities submits, therefore, that Argentina has not established a prima facie case.

7.2493 The **Panel** notes that Argentina relies on the alleged inconsistency of the relevant product-specific measures with Annex C(1)(e) to make consequential claims of inconsistency under Article 8. Accordingly, we will begin our analysis with the claims under Annex C(1)(e).

(a) Annex C(1)(e)

7.2494 We note that Annex C(1)(e) imposes limitations on any requirements for approval of "*individual specimens* of a product" (emphasis added). The product-specific measures challenged by Argentina do not concern "individual specimens" of biotech products. They concern specific biotech products for which marketing approval has been sought. We also recall that the product-specific measures which Argentina says give rise to an inconsistency with Annex C(1)(e) are undue delays caused by the European Communities in the consideration of particular applications. It is not apparent to us that the European Communities' failure to complete approval procedures concerning particular biotech products without undue delay imposed, or led to the imposition of, any requirements for the approval of individual specimens of the relevant biotech products. We therefore fail to see how the measures challenged by Argentina could be considered to give rise to an inconsistency with Annex C(1)(e).

7.2495 In the light of this, we conclude that Argentina has failed to establish its product-specific claims under Annex C(1)(e).

7.2496 To the extent Argentina is seeking to challenge requirements contained in the EC approval legislation, we agree with the European Communities that the relevant legislation is not a measure within our terms of reference.

(b) Article 8

7.2497 Turning to Argentina's claims under Article 8, we recall that Argentina seeks to establish an inconsistency with Article 8 on the basis of an alleged inconsistency with Annex C(1)(e). We have determined that Argentina has failed to establish its claims under Annex C(1)(e). Under the approach followed by Argentina, this means that its claims under Article 8 have not been established either.

(c) Overall conclusion

7.2498 In the light of the above, the Panel reaches the following conclusion:

(i) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence submitted by Argentina and the European Communities, the Panel concludes that Argentina has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Annex C(1)(e) of the *SPS Agreement* and, consequently, with its obligations under Article 8 of the *SPS Agreement*.

14. Consistency of the product-specific measures with Article III:4 of the GATT 1994

7.2499 Canada and Argentina claim that the European Communities has acted inconsistently with its obligations under Article III:4 of the GATT 1994 in respect of the product-specific measures they are challenging. We recall that the United States did not present claims under the GATT 1994.

7.2500 Article III:4 of the GATT 1994 provides in relevant part:

> "The products of the territory of any contracting party imported into the territory of any other contracting party shall be accorded treatment no less favourable than that accorded to like products of national origin in respect of all laws, regulations and requirements affecting their internal sale, offering for sale, purchase, transportation, distribution or use."

7.2501 **Canada** argues that the failure of the European Communities to consider or approve, without undue delay, the four applications of specific interest to Canada falls within the scope of the GATT 1994 and is inconsistent with the European Communities' obligations under Article III:4. According to Canada, the measures at issue are "laws, regulations or requirements laws, regulations or requirements affecting the internal sale, offering for sale, purchase, and distribution" of the biotech products concerned; the biotech products subject to the product-specific measures are "like" domestically-grown non-biotech counterparts in the light of the criteria put forth by the Appellate Body; and the imported biotech products concerned are accorded treatment less favourable than that accorded like non-biotech products of national origin. Canada submits that, for these reasons, the measures at issue constitute a violation of the European Communities' national treatment obligations under Article III:4.

7.2502 **Argentina** argues that the suspension of consideration of, or the failure to consider, the particular applications of interest to Argentina is inconsistent with Article III:4 of the GATT 1994, because it gives less favourable treatment to biotech products than to non-biotech products. Argentina argues that the inconsistencies result from the fact that (i) biotech and non-biotech products are "like products", (ii) the suspension of consideration of, or the failure to consider, the particular applications are "requirements affecting the sale, offering sale, purchase, transport, distribution and use of products on the domestic market", and (iii) the suspension of consideration of, or the failure to consider, the particular applications has modified the conditions of competition in the relevant market to the detriment of imported products.

7.2503 The **European Communities** argues that there is no violation of Article III:4 of the GATT 1994 with regard to the product-specific measures challenged by Canada and Argentina. This is because: (i) the measures challenged by Canada and Argentina are alleged delays in dealing with specific requests for approval within a specified timeframe, and these measures are not in themselves "laws, regulations or requirements" as provided for by Article III:4 of the GATT 1994; (ii) imported products are not accorded less favourable treatment than like domestic products, as there is no discrimination between relevant imported biotech products and same biotech products cultivated or processed domestically, which are the only "like products" to the imported biotech products concerned.

7.2504 The **Panel** will analyse Canada's and Argentina's claim separately.

(a) DS292 (Canada)

7.2505 In relation to DS292, we recall that we have already reached the conclusion that the failure by the European Communities to consider or approve, without undue delay, the four particular applications identified by Canada has given rise to a breach of the European Communities' obligations under Annex C(1)(a), first clause, of the *SPS Agreement* and, consequently, its obligations under Article 8 of the *SPS Agreement*. In these circumstances, we see no need to examine, and offer additional findings on, whether the relevant measures are also inconsistent with Article III:4. Accordingly, we exercise judicial economy with regard to Canada's claim under Article III:4.

(b) DS293 (Argentina)

7.2506 In relation to DS293, we begin our analysis with the applications concerning Bt-531 cotton and RR-1445 cotton which Argentina says have yet to be approved under Regulation 258/97.

(i) Product-specific measures affecting the approval of Bt-531 cotton and RR-1445 cotton under Regulation 258/97

7.2507 Argentina challenges under Article III:4 the suspension of consideration of, or failure to consider, applications concerning Bt-531 cotton and RR-1445 cotton which were allegedly submitted for "approval"[1668] under Regulation 258/97.

7.2508 We recall that in respect of the same alleged product-specific measures Argentina presented a claim under Article 5.1 of the *SPS Agreement*. In the context of our analysis of that claim, we have pointed out that we have seen no evidence that applications concerning Bt-531 cotton and RR-1445 cotton were submitted for approval under Regulation 258/97, and we therefore found that Argentina has failed to meet its burden of demonstrating the existence of a suspension of consideration of, or failure to consider, Bt-531 cotton and RR-1445 cotton for approval under Regulation 258/97. As the existence of these product-specific measures has not been demonstrated, we cannot but reject Argentina's claim that the European Communities has acted inconsistently with its obligations under Article III:4 in relation to these alleged measures.

(ii) Other product-specific measures challenged by Argentina

7.2509 We now turn to address the remaining eight product-specific measures in respect of which the Panel has decided to make findings.

7.2510 Argentina claims that the alleged suspension of consideration of, or the failure to consider, the relevant eight applications is inconsistent with Article III:4 of the GATT 1994 because it resulted in less favourable treatment being accorded to the biotech products which are the subject of the eight applications than to like non-biotech products.

7.2511 Argentina submits that the alleged suspension of consideration of, or the failure to consider, an application for the approval of a biotech product constitutes a "requirement" affecting the sale, offering for sale, etc. within the meaning of Article III:4. For the purposes of our analysis, we are willing to proceed on the assumption that the alleged suspension of consideration of, or the failure to consider, an application constitutes a "requirement" within the meaning of Article III:4. Moreover, we initially focus our analysis on the "no less favourable treatment" obligation contained in Article III:4, rather than on the "like products" element. We recall in this connection that the

[1668] Argentina's first written submission, paras. 201-202.

Appellate Body in *EC – Asbestos* and *Dominican Republic – Import and Sale of Cigarettes* made statements in relation to the meaning of the phrase "no less favourable treatment" in Article III:4.[1669] We find these statements to be relevant to the type of measures challenged by Argentina under Article III:4.

7.2512 Argentina contends that, as a result of the alleged suspension of consideration of, or the failure to consider, the relevant eight applications, the European Communities has accorded "less favourable treatment" to the biotech products which are the subject of the eight applications than to like non-biotech products. More particularly, Argentina considers that the measures at issue have modified the conditions of competition in the EC market to the detriment of imported biotech products. Argentina notes in this regard that as a result of the alleged suspension of consideration of, or the failure to consider, the relevant eight applications the biotech products which are the subject of these applications were not approved.

7.2513 In considering Argentina's contention, the first thing to be observed is that Argentina has not provided specific factual information about the treatment accorded by the European Communities to the non-biotech products which Argentina considers to be like the biotech products at issue. It appears to be Argentina's contention, however, that these non-biotech products may be marketed in the European Communities, whereas the relevant biotech products may not be marketed.

7.2514 At any rate, even if it were the case that, as a result of the measures challenged by Argentina, the relevant imported biotech products cannot be marketed, while corresponding domestic non-biotech products can be marketed, in accordance with the aforementioned statements by the Appellate Body this would not be sufficient, in and of itself, to raise a presumption that the European Communities accorded less favourable treatment to the group of like *imported* products than to the group of like *domestic* products. We note that Argentina does not assert that domestic biotech products have not been less favourably treated in the same way as imported biotech products, or that the like domestic non-biotech varieties have been more favourably treated than the like imported non-biotech varieties. In other words, Argentina is not alleging that the treatment of products has differed depending on their origin. In these circumstances, it is not self-evident that the alleged less favourable treatment of imported biotech products is explained by the foreign origin of these products rather than, for instance, a perceived difference between biotech products and non-biotech products in terms of their safety, etc. In our view, Argentina has not adduced argument and evidence sufficient to raise a presumption that the alleged less favourable treatment is explained by the foreign origin of the relevant biotech products.

7.2515 In the light of the above, we find that Argentina has not established that, as a result of the alleged suspension of consideration of, or the failure to consider, the relevant eight applications, the European Communities has accorded "less favourable treatment" to imported products than to domestic products.

7.2516 Since we have found that Argentina has not demonstrated to our satisfaction that imported products have been treated "less favourably" than domestic products, there is no need to go on to determine whether the challenged measures in fact constitute "requirements" within the meaning of Article III:4, and whether the imported products which Argentina alleges have been treated less favourably are "like" the domestic products which Argentina alleges have been treated more favourably. Our finding on the "no less favourable treatment" obligation necessarily implies that Argentina has failed to establish its claim under Article III:4 with regard to the eight product-specific measures in question.

[1669] We have reproduced the relevant statements at paras. 7.2404 and 7.2405 above.

(c) Conclusions

7.2517 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the product-specific measures which are being challenged by Canada are inconsistent with Article III:4 of the GATT 1994. Accordingly, the Panel offers no findings under Article III:4.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that Argentina has not established that the product-specific measures in respect of which the Panel is making findings have resulted in the European Communities acting inconsistently with its obligations under Article III:4 of the GATT 1994.

15. Consistency of the product-specific measures with the *TBT Agreement*

7.2518 The Panel now turns to address Canada's and Argentina's claims of inconsistency under the *TBT Agreement*. We recall that the United States did not present claims under the *TBT Agreement*.

7.2519 **Canada** considers that the product-specific measures it is challenging are SPS measures and that, as such, they are not subject to the requirements of the *TBT Agreement*. Canada argues, however, that if the Panel decides that the product-specific measures at issue are not SPS measures, then Canada submits, in the alternative, that these measures are subject to the requirements of the *TBT Agreement*. More particularly, Canada's alternative claim is that the relevant measures are inconsistent with Articles 2.1, 2.2, 5.1.2 and 5.2.1, first part, of the *TBT Agreement.*

7.2520 Furthermore, Canada states that to the extent that the Panel determines that parts of the measures at issue are covered by the *TBT Agreement* in addition to the *SPS Agreement*, Canada's TBT claims are to be considered cumulative rather than alternative, *vis-à-vis* its SPS claims.

7.2521 **Argentina** considers that the Panel should examine the product-specific measures Argentina is challenging under the *SPS Agreement*. However, if the Panel concludes that it should not analize Argentina's claim under the *SPS Agreement*, Argentina submits, in the alternative, that the product-specific measures at issue are subject to the requirements of the *TBT Agreement*. More particularly, in Argentina's view the relevant measures are inconsistent with Articles 2.1, 2.2, 5.1.1, 5.1.2, 5.2.1, 5.2.2 and 12 of the *TBT Agreement*.

7.2522 The **European Communities** considers that, given the reasons on which the relevant product-specific measures are based, they fall in part within the scope of the *SPS Agreement* and in part outside the scope of the *SPS Agreement*. However, the European Communities rejects the alternative claims by Canada and Argentina that the relevant product-specific measures they are challenging are inconsistent with the *TBT Agreement*.

7.2523 The **Panel** will analyse Canada's and Argentina's claims separately.

(a) DS292 (Canada)

7.2524 Canada has stated that if the Panel determines that parts of the relevant product-specific measures are covered by the *TBT Agreement* in addition to the *SPS Agreement*, Canada's claims under the *TBT Agreement* are to be considered cumulative rather than alternative. We note that each of the four product-specific measures challenged by Canada concerns an approval procedure which was conducted under Directive 90/220. In two cases, the relevant procedure was continued under Directive 2001/18 after the repeal of Directive 90/220. We have found that the relevant approval procedures set out in these Directives are SPS measures within the meaning of Annex A(1) of the *SPS Agreement*. We did not determine that parts of the approval procedures set out in the Directives are not covered by the *SPS Agreement*. In the light of this, and in view of Article 1.5 of the *TBT Agreement*[1670], we have no basis for finding that parts of the relevant approval procedures are covered by the *TBT Agreement* in addition to the *SPS Agreement*. Consequently, we should treat Canada's claims under Articles 2.1, 2.2, 5.1.2 and 5.2.1, first part, of the *TBT Agreement* as alternative claims. Since Canada's alternative claims are relevant only in the event that we decide that the relevant product-specific measures are not subject to the *SPS Agreement*, and since we have found that these measures are subject to the *SPS Agreement* (notably Annex C(1)(a) and Article 8), we see no need to address Canada's alternative claims under Articles 2.1, 2.2, 5.1.2 and 5.2.1, first part, of the *TBT Agreement* further.

(b) DS293 (Argentina)

7.2525 Argentina's claim that the product-specific measures it is challenging are inconsistent with the *TBT Agreement* is presented in the alternative, in the event the Panel "considers that it should not analyse Argentina's claim under the *SPS Agreement*".[1671]

7.2526 Regarding the product-specific measures described by Argentina as the undue delays in finalizing consideration of particular applications, we found above that the European Communities has breached its obligations under Annex C(1)(a), first clause, of the *SPS Agreement* and Article 8 of the *SPS Agreement* in respect of each of the eight measures concerned. Accordingly, in respect of these measures, we found that we *should* analyse Argentina's claim under the *SPS Agreement*. Since Argentina's alternative claim under the *TBT Agreement* is relevant only in the event that we consider that the relevant product-specific measures should *not* be analysed under the *SPS Agreement*, we see no need to address Argentina's alternative claim under the *TBT Agreement* further.

7.2527 Regarding the product-specific measures described by Argentina as the suspension by the European Communities of consideration of, or the failure to consider, particular applications, we found above that Argentina has not established that the European Communities acted inconsistently with its obligations under Articles 5.1, 5.5, 5.6 or 2.2 of the *SPS Agreement* in respect of the ten measures concerned. Thus, we found that the ten measures are not inconsistent with the provisions of the *SPS Agreement* identified by Argentina. However, the relevant findings do not imply that Argentina's claim that the relevant product-specific measures are WTO-inconsistent should not be analysed under the *SPS Agreement*. As we have said earlier, the second type of measures challenged by Argentina in our view is conceptually the same as the type of product-specific measures challenged by the United States. Our findings above show that the measures challenged by the United States could, and in many cases did, give rise to an inconsistency with the provisions of Annex C(1)(a), first clause, and Article 8 of the *SPS Agreement*. Hence, we consider that Argentina's claim *could* be

[1670] We recall that Article 1.5 states that the provisions of the *TBT Agreement* do not apply to SPS measures within the meaning of Annex A(1) of the *SPS Agreement*.

[1671] Argentina's first written submission, paras. 374 and 450.

properly analysed under the *SPS Agreement*. Since Argentina's alternative claim under the *TBT Agreement* is relevant only in the event that we consider that the relevant product-specific measures should *not* be analysed under the *SPS Agreement*, we see no need to address Argentina's alternative claim under the *TBT Agreement* further.

(c) Conclusions

7.2528 In the light of the above, the Panel reaches the following conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the product-specific measures which are being challenged by Canada are inconsistent with Articles 2.1, 2.2, 5.1.2 and 5.2.1, first part, of the *TBT Agreement*. Accordingly, the Panel offers no findings under Articles 2.1, 2.2, 5.1.2 or 5.2.1, first part, of the *TBT Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the relevant ten product-specific measures challenged by Argentina are inconsistent with Articles 2.1, 2.2, 5.1.1, 5.1.2, 5.2.1, 5.2.2 and 12 of the *TBT Agreement*. Accordingly, the Panel offers no findings under Articles 2.1, 2.2, 5.1.1, 5.1.2, 5.2.1, 5.2.2 or 12 of the *TBT Agreement*.

F. EC MEMBER STATE SAFEGUARD MEASURES

1. Introduction

7.2529 The Complaining Parties have made a series of claims concerning measures adopted by EC member States which allegedly prohibit the import, use of, or marketing of certain biotech products. These measures (hereafter "safeguard measures" or "member State measures") were adopted by EC member States on the basis of Article 16 of Directive 90/220[1672] (later replaced by Article 23 of Directive 2001/18[1673]) and Article 12 of Regulation 258/97.[1674]

(a) Safeguard measures in the context of the relevant EC approval procedures

7.2530 Where a biotech product has been approved for Community-wide marketing under Directives 90/220 or 2001/18, or Regulation 258/97, member States ordinarily may not prohibit or restrict trade in, or use of, that product on their respective territories, provided the conditions attached to the marketing approval are being met. Exceptionally, however, member States may provisionally adopt safeguard measures which prohibit or restrict trade in, or use of, biotech products which have been granted Community-wide marketing approval.

[1672] Exhibits US-25; CDA-18; ARG-4.
[1673] Exhibits US-24; CDA-17; ARG-3.
[1674] Exhibits US-26; CDA-19; ARG-5.

7.2531 Pursuant to Article 16 of Directive 90/220, a member State may provisionally restrict or prohibit the use and or sale of a product in its territory where it has "justifiable reasons to consider that a product which has been properly notified and has received written consent [...] constitutes a risk to human health or the environment".[1675] Safeguard measures adopted pursuant to Article 16 of Directive 90/220 have been maintained and reviewed on the basis of Article 23 of Directive 2001/18 since the entry into force of that Directive. Article 23 provides that a safeguard measure may be adopted where, "as a result of new or additional information made available since the date of the consent and affecting the environmental risk assessment or reassessment of existing information on the basis of new or additional scientific knowledge", a member State has "detailed grounds for considering that a GMO as or in a product [...] constitutes a risk to human health or the environment [...]".[1676] Finally, Article 12 of Regulation 258/97 provides that a safeguard measure may be adopted where, "as a result of new information or a reassessment of existing information", a member State has "detailed grounds for considering that the use of a food or a food ingredient complying with this Regulation endangers human health or the environment [...]".[1677]

7.2532 The safeguard measures taken pursuant to Directives 90/220 and 2001/18, or Regulation 258/97, can be maintained only on a provisional basis, pending a full assessment at EC level.[1678] The member State adopting a safeguard measure must immediately inform the Commission and other member States of its measure.[1679] Upon notification of the safeguard measure, the Commission must take a decision with respect to that measure. Such decision will result either in the modification of the Community-wide marketing approval, or in the termination of the measure.[1680]

7.2533 According to the procedure laid down in the relevant provisions of Directives 90/220 and 2001/18, and Regulation 258/97[1681], the Commission, when making a decision on a safeguard measure which has been notified, is assisted for this purpose by the Regulatory Committee[1682] or by the Standing Committee on Foodstuffs, respectively.[1683] The Commission must submit a draft of the measure to be taken to the Regulatory Committee or the Standing Committee on Foodstuffs, which shall deliver their opinion on the draft within a time-limit which the chairman may lay down according to the urgency of the matter.[1684] If the draft measure is in accordance with the opinion of the Regulatory Committee or the Standing Committee on Foodstuffs, the Commission must adopt the draft measure. However, if the measure is not in accordance with the opinion of the Committee, or if no opinion is delivered, the Commission must submit without delay a proposal to the Council of

[1675] *See supra*, footnote 1672.
[1676] *See supra*, footnote 1673.
[1677] *Supra*, footnote 1674.
[1678] Article 16(1) of Directive 90/220; Article 23(1), 3rd paragraph of Directive 2001/18; and Article 12(1) of Regulation 258/97.
[1679] Article 16(1) of Directive 90/220; Article 23(1), 3rd paragraph of Directive 2001/18; and Article 12(1) of Regulation 258/97.
[1680] Article 21 of Directive 90/220. Under Directive 90/220, such a decision by the Commission must be taken within a period of three months from the time of notification of the measure. We note that there is no similar timeframe pursuant to Regulation 258/97.
[1681] Details of the procedures for Directives 90/220 and 2001/18, and Regulation 258/97 are described in section C.
[1682] Articles 21 of Directive 90/220 and 30(2) of Directive 2001/18.
[1683] Article 13 of Regulation 258/97.
[1684] Article 21 of Directive 90/220; Article 30(2) of Directive 2001/18; and Article 13 of Regulation 258/97. While Article 30(2) of Directive 2001/18 refers to Articles 5, 7 and 8 of Decision 1999/468, the European Communities notes that these provisions are similar to Article 21 of Directive 90/220 (EC reply to Panel question No. 84, para. 229).

Ministers on the measure to be taken. The Council must act on the proposal within a period of three months, failing which the Commission must adopt the proposed measure.[1685]

(b) Overview of the specific measures at issue

7.2534 The Complaining Parties make claims with respect to nine different safeguard measures, which they allege prohibit the importation or marketing of various biotech products. The nine measures were taken by six different member States, namely Austria, France, Germany, Greece, Italy and Luxembourg. For ease of reference, the safeguard measures are identified hereinafter by the name of the member State which has adopted the measure and the product(s) affected by such measure. Accordingly, the following safeguard measures are at issue in this dispute:

(1) *Austria – T25 maize*;
(2) *Austria – Bt-176 maize*;
(3) *Austria – MON810 maize*;
(4) *France – MS1/RF1 oilseed rape (EC-161)*;
(5) *France – Topas oilseed rape*;
(6) *Germany – Bt-176 maize*;
(7) *Greece – Topas oilseed rape*;
(8) *Italy – Bt-11 maize (EC-163), MON810 maize, MON809 maize and T25 maize*; and
(9) *Luxembourg – Bt-176 maize*.

7.2535 The safeguard measures at issue have all been taken pursuant to Article 16 of Directive 90/220, with the exception of the measure by Italy on Bt-11 maize (EC-163), MON810 maize, MON809 maize and T25 maize, which was adopted on the basis of Article 12 of Regulation 258/97.

7.2536 Each safeguard measure was notified to the Commission by the relevant member State with evidence allegedly supporting the adoption of the measure. On the basis of the information provided by the member State, the Commission requested in each case the opinion of the relevant EC scientific committee on whether this information constituted relevant scientific evidence that would cause the committee to consider that the product(s) at issue constituted a risk for human health or the environment. For each safeguard measure at issue, the relevant EC scientific committee reaffirmed its earlier assessment, or that of another EC scientific committee that the relevant products did not present any risks to human health or the environment. However, the Panel understands that as of the date of establishment of this Panel, no decision had been taken at Community level with regard to any of the safeguard measures at issue in this dispute. That is to say, no decision had been taken with regard to whether the Community-wide marketing approval for the relevant products should be modified, or whether the safeguard measures at issue should be terminated.[1686]

7.2537 The safeguard measures at issue in this dispute were still in force at the time of establishment of this Panel.[1687] However, the European Communities asserts that the safeguard measure adopted by Italy was repealed by a Decree adopted in October 2004.[1688]

[1685] Article 21 of Directive 90/220; Article 30 of Directive 2001/18; and Article 13(4)(b) of Regulation 258/97.

[1686] According to Canada, the Commission indicated that it had called upon all EC member States with national measures in place restricting or prohibiting the marketing of EC-approved biotech products to lift or withdraw those measures. *See* Exhibits CDA-33 and -34.

[1687] EC reply to Panel question No. 101.

(c) Overview of Parties' claims and Panel's approach

7.2538 The **United States** is challenging all nine safeguard measures at issue in this case, as mentioned in paragraph 6 above. According to the United States, these safeguard measures are covered by the *SPS Agreement*. The United States argues that the safeguard measures violate various provisions of the *SPS Agreement*. In particular, the member States have failed to base their measures on a risk assessment and on scientific principles pursuant to Articles 5.1 and 2.2 of the *SPS Agreement*. Moreover, the member States have applied arbitrary or unjustifiable distinctions in their levels of protection against risks that have resulted in discrimination or a disguised restriction on international trade pursuant to Articles 5.5 and 2.3 of the *SPS Agreement*. The United States further argues that the safeguard measure prohibiting the importation of Topas oilseed rape adopted by Greece, in addition to violating various provisions of the *SPS Agreement*, violates Article XI:1 of the GATT 1994.

7.2539 **Canada** is challenging five safeguard measures, namely:

(1) *Austria – T25 maize*;
(2) *France – MS1/RF1 oilseed rape (EC-161)*;
(3) *France – Topas oilseed rape*;
(4) *Greece – Topas oilseed rape*; and
(5) *Italy – Bt-11 maize (EC-163), MON809 maize, MON810 maize and T25 maize*.

7.2540 Canada argues that the safeguard measures are SPS measures pursuant to Annex A of the *SPS Agreement*, and also affect international trade. Canada argues that the safeguard measures are not based on a risk assessment, as required by Article 5.1 of the *SPS Agreement*. Canada further argues that the safeguard measures violate Article 5.6, since the European Communities' own regulatory regime constitutes another measure, reasonably available taking into account technical and economic feasibility. Canada argues that the safeguard measures fail to meet any of the three requirements of Article 2.2, namely that they 1) be applied to the extent necessary to protect human, animal or plant life or health; 2) be based on scientific principles; and 3) not be maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5. Consequently Canada argues that these measures violate Article 2.2. Finally, Canada argues that the safeguard measures are inconsistent with the European Communities' obligations under Article 5.5 of the *SPS Agreement*, and thus by implication, also violate Article 2.3.

7.2541 With respect to the Greek safeguard measure, Canada considers that it violates Article XI:1 of the GATT 1994. Canada further argues that the safeguard measures are inconsistent with Article III:4 of the GATT 1994. Canada also makes cumulative claims under the *TBT Agreement* arguing that the measures constitute technical regulations because they establish product specifications. In particular, Canada argues that the safeguard measures are inconsistent with Articles 2.1, 2.2 and 2.9 of the *TBT Agreement*.

7.2542 **Argentina** makes claims with respect to six member State measures, as follows:

(1) *Austria – T25 maize*;
(2) *Austria – Bt-176 maize*;
(3) *Austria – MON810 maize*;
(4) *Germany – Bt-176 maize*;

[1688] *See* EC reply to Panel question No. 160 and Exhibit EC-166. This was contested by Canada in their comments on other Parties' responses to Panel question 160, paras. 52-53.

(5) *Italy – MON810 maize, T25 maize, Bt-11 maize (EC-163)*[1689]; and
(6) *Luxembourg – Bt-176 maize.*

7.2543 Argentina argues that the safeguard measures are SPS measures pursuant to Annex A of the *SPS Agreement*, and also affect international trade. Argentina argues that the safeguard measures are not based on a risk assessment, as required by Article 5.1 of the *SPS Agreement*. Argentina further argues that the safeguard measures violate Article 5.6, since the European Communities' own regulatory regime constitutes another measure, reasonably available taking into account technical and economic feasibility. Argentina argues that the safeguard measures fail to meet the requirements of Article 2.2, which requires that a measure be applied "only to the extent necessary," while also requires that it be based on "sufficient scientific evidence." Consequently, the safeguard measures conflict with Article 2.2, and cannot be justified under the exception of Article 5.7. Finally, Argentina argues that the safeguard measures are inconsistent with the European Communities' obligations under Article 5.5 of the *SPS Agreement*, and thus by implication, also violate Article 2.3.

7.2544 Argentina argues that the safeguard measures are inconsistent with Article III:4 of the GATT 1994. Argentina also makes alternative claims under the *TBT Agreement* arguing that the measures constitute technical regulations because they establish product specifications. In particular, Argentina argues that the safeguard measures are inconsistent with Articles 2.1, 2.2 and 2.9 of the *TBT Agreement*.

2. Analysis of the safeguard measures in the light of the *SPS Agreement*

7.2545 Before examining whether the relevant safeguard measures are inconsistent with the *SPS Agreement*, as claimed by the Complaining Parties, we must determine whether the *SPS Agreement* is applicable to these measures.

(a) Applicability of the *SPS Agreement*

7.2546 We begin our examination of whether the *SPS Agreement* is applicable to the relevant safeguard measures by summarizing the Parties' general positions. In the light of these, we will outline how we will approach this issue, and subsequently address the applicability of the *SPS Agreement* measure-by-measure.

(i) General

7.2547 The **United States** argues that all the safeguard measures fall within the scope of the *SPS Agreement*. The general purpose of the member State measures can be inferred from the text of the EC legislation on which the measures are based. The overall objective set out in Article 16 of Directive 90/220 and Article 12 of Regulation 258/97 is the protection of human health and the environment. Since all measures were based on one of these provisions, it can be inferred that the measures were enacted for the purpose of protecting human health and the environment. Moreover, the sanitary or phytosanitary purpose of the member State measures can be found in the measures themselves, as well as in the justifications offered by the member States when the measures were adopted.

[1689] In respect of the safeguard measure imposed by Italy, while the complaints by the United States and Canada refer to four products, *i.e.*, Bt-11 maize (EC-163), MON809 maize, MON810 maize and T25 maize, the complaint by Argentina refers to only three products, *i.e.*, Bt-11 maize (EC-163), MON810 maize and T25 maize.

7.2548 The United States notes that the European Communities has not contested the fact that each of the member State measures was adopted at least for some reasons that fall within the scope of the *SPS Agreement*. It considers that the fact that the measures were adopted for some reasons covered by the *SPS Agreement* is sufficient to bring those measures within the scope of that Agreement. Annex A of the *SPS Agreement* makes it clear that "any measure" applied to protect against one of the enumerated risks falls within the scope of the Agreement. Annex A does not state that the measure needs to be exclusively applied to protect against only the enumerated risks, nor does the *SPS Agreement* state that a measure addressing one of the risks enumerated in Annex A loses its status as an SPS measure if the adoption of the measure is also supported by other rationales. The United States notes that in the *EC - Hormones* case, all parties agreed that the relevant EC Directives fell within the scope of the *SPS Agreement*, even though the Directives were not adopted solely to address alleged effects on human health.

7.2549 **Canada** argues that the safeguard measures it is challenging fall within the scope of paragraph 1(a) to (d) of Annex A of the *SPS Agreement*. Canada notes that the member State measures are intended to "protect" "human", "animal" or "plant" "life or health", or "to prevent or limit other damage" within their territories, as can be inferred from the relevant provisions of EC law on which the measures are based. According to Canada, this can also be inferred from the measures themselves, as well as from official statements made by government officials in relation to the passage or adoption of the measures. This evidence also supports the conclusion that these measures are designed to protect against "risks arising from" "the entry, establishment or spread" of "pests" or "disease-causing organisms" or "additives, contaminants, toxins or disease-causing organisms" in "food" or "feedstuffs". Although these terms are not defined in the *SPS Agreement*, their ordinary meaning, when read in context and in light of the object and purpose of the *SPS Agreement*, falls within the scope of the types of concerns intended to be addressed by the safeguard measures. More importantly, the text of the measures themselves, as well as the supporting documentation provided at the time the measures were adopted, demonstrate that the measures are SPS measures.

7.2550 **Argentina** argues that the purpose of the safeguard measures may be inferred from the Community legislation under which the measures were adopted. The relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2551 The **European Communities** notes that each of the safeguard measures was adopted for some reasons that fall within the scope of the *SPS Agreement*, and some reasons that fall outside the scope of that Agreement. According to the European Communities, if a WTO Member acts on the basis of two different objectives, one of which falls within the scope of the *SPS Agreement* and the other of which does not, these two measures are in effect different for WTO purposes. Therefore, the measure or part of the measure adopted for reasons that fall outside the scope of the *SPS Agreement* cannot be inconsistent with that Agreement. Only the measure, or part of the measure, adopted for reasons that fall within the scope of the *SPS Agreement* require further analysis. This is so even if the two different objectives sought to be achieved by a measure are reflected in a single document.

7.2552 The **Panel** recalls that pursuant to Article 1.1 of the *SPS Agreement*, the Agreement applies to "all sanitary and phytosanitary measures which may, directly or indirectly, affect international trade".

7.2553 We recall once again that the term "SPS measures" is defined in Annex A(1) of the *SPS Agreement* as any measure applied:

> (a) to protect animal or plant life or health within the territory of the Member from risks arising from the entry, establishment or spread of pests, diseases, disease-carrying organisms or disease-causing organisms;
>
> (b) to protect human or animal life or health within the territory of the Member from risks arising from additives, contaminants, toxins or disease-causing organisms in foods, beverages or feedstuffs;
>
> (c) to protect human life or health within the territory of the Member from risks arising from diseases carried by animals, plants or products thereof, or from the entry, establishment or spread of pests; or
>
> (d) to prevent or limit other damage within the territory of the Member from the entry, establishment or spread of pests.
>
> Sanitary or phytosanitary measures include all relevant laws, decrees, regulations, requirements and procedures [...].

7.2554 In order to determine whether the *SPS Agreement* applies to the safeguard measures, the Panel must therefore determine (1) whether such measures are "sanitary or phytosanitary measures", or "SPS measures", as defined in Annex A of the *SPS Agreement*; and (2) whether these measures may, directly or indirectly, affect international trade.

7.2555 It is clear from the definition contained in Annex A(1) that one of the elements which determines whether a particular measure is an SPS measure is the purpose of the measure.[1690] A measure is an SPS measure if it is applied "to protect" life or health from certain enumerated risks, or if it is applied "to prevent or limit" certain other damage.

7.2556 In the case at hand, the Complaining Parties are challenging the maintenance in August 2003 of the relevant safeguard measures. We must therefore determine whether at that time each of the relevant safeguard measures served at least one of the purposes identified in the definition contained in Annex A of the *SPS Agreement*. In our view, a determination as to whether a particular safeguard measure was applied in August 2003 for one of the purposes enumerated in Annex A(1) must be made in the light of the specific circumstances of each case.

7.2557 We note that applicable EC legislation required the member States in question to provide justification for the adoption of their safeguard measures. We think that documents submitted by these member States by way of justification for the adoption of their measures are relevant to ascertaining the purposes of these measures.

7.2558 However, we consider that it would not be appropriate in this case to limit our inquiry to determining the purposes for which the safeguard measures were adopted. To begin with, we recall that our task in this case is to determine the purposes for which the relevant safeguard measures were maintained in August 2003. Furthermore, Annex A(1) does not refer to measures "adopted" for one of the enumerated purposes, but, more broadly, to measures "applied" for one of the enumerated purposes. Moreover, we see nothing in the *SPS Agreement* which would bar a panel from considering purposes which were not articulated by the member States when they adopted their safeguard

[1690] As we have noted above in the context of our discussion of the general *de facto* moratorium on approvals, there are other elements which must be met for a measure to constitute an "SPS measure". *See supra*, para. 7.456.

measures.[1691] Finally, our approach is consistent with the view expressed by the Appellate Body that in identifying the purposes of a measure, panels need not seek to determine the subjective intent of the legislators or regulators who adopted the measure. According to the Appellate Body, the purposes of a measure may and should rather be ascertained on the basis of objective considerations, for instance by examining whether there is an objective relationship between the stated purposes and the text and structural features of the relevant measure.[1692]

7.2559 We recall that the safeguard measures were originally adopted on the basis of Article 16 of Directive 90/220 and Article 12 of Regulation 258/97. Both provisions make it clear that safeguard measures may be taken in case of a risk, or danger, to human health or the environment.[1693] The Complaining Parties argue that it can be inferred from this that the purpose of the safeguard measures is to protect against risks to human health or the environment. We note that the provisions of the *SPS Agreement* reflect similar objectives.[1694] We agree that the fact that the member States have invoked Article 16 of Directive 90/220 and Article 12 of Regulation 258/97 in support of their measures may, together with other elements, support the conclusion that these measures are applied to protect against risks to human health or the environment. However, the mere invocation of, and reference to, the aforementioned articles does not demonstrate, in and of itself, that a particular measure is in fact being applied for the purpose of protecting human health or the environment. Thus, we think it is necessary to make a separate assessment of the applicability of the *SPS Agreement* for each of the nine safeguard measures at issue.

7.2560 With these considerations in mind, we now turn to examine individually the nine safeguard measures at issue in this case.

[1691] This does not mean, however, that we need to accept at face value assertions of purposes which are implausible in the light of all relevant circumstances.

[1692] *See, e.g.*, Appellate Body Reports, *Japan – Alcoholic Beverages II*, pp. 27-28 (including the statement that "[i]t is irrelevant that protectionism was not an intended objective if the particular tax measure in question is nevertheless, to echo Article III:1 [of the GATT 1994], "applied to imported or domestic products so as to afford protection to domestic production. This is an issue of how the measure in question is applied"); *Chile – Alcoholic Beverages*, paras. 62 and 71-72; and *US – Offset Act* (*Byrd Amendment*), para. 259. While these Appellate Body reports discussed claims under WTO agreements other than the *SPS Agreement*, the logic followed by the Appellate Body in these reports is applicable, in our view, to the issue we are considering here.

[1693] Article 16 of Directive 90/220: "1. Where a Member State has justifiable reasons to consider that a product which has been properly notified and has received written consent under this Directive constitutes a risk to human health or the environment, it may provisionally restrict or prohibit the use and/or sale of that product on its territory. It shall immediately inform the Commission and the other Member States of such action and give reasons for its decision. 2. A decision shall be taken on the matter within three months in accordance with the procedure laid down in Article 21."

Article 12 of Regulation 258/97: "1. Where a Member State, as a result of new information or a reassessment of existing information, has detailed grounds for considering that the use of a food or a food ingredient complying with this Regulation endangers human health or the environment, that Member State may either temporarily restrict or suspend the trade in and use of the food or food ingredient in question in its territory. It shall immediately inform the other Member States and the Commission thereof, giving the grounds for its decision. 2. The Commission shall examine the grounds referred to in paragraph 1 as soon as possible within the Standing Committee for Foodstuffs; it shall take the appropriate measures in accordance with the procedure laid down in Article 13. The Member State which took the decision referred to in paragraph 1 may maintain it until the measures have entered into force."

[1694] *See* e.g. Preamble for protection of human health; relevant ecological and environmental conditions to be taken into account in assessment of risks pursuant to Article 5.2 of the *SPS Agreement*.

(ii) Austria – T25 maize

7.2561 We begin with the safeguard measure applied by Austria on T25 maize. We recall that the product at issue was approved by the Commission for placing on the market in April 1998.[1695] In April 2000, Austria adopted an ordinance to prohibit commercialisation of T25 maize on its territory.[1696] Austria's safeguard measure, which was taken on the basis of Article 16 of Directive 90/220, was notified to the Commission in May 2000.[1697]

Is the Austrian safeguard measure on T25 maize an SPS measure?

7.2562 We start with the issue of whether the Austrian safeguard measure on T25 maize is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2563 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2564 The **United States** notes that among the reasons set out to prohibit T25 maize, Austria cited the failure by the European Commission, at the time it approved the product, to set forth "protection for ecologically sensitive regions." According to the United States, a measure based on such justification is an SPS measure because it is applied "to protect animal life or health" from "disease-causing organisms"; or "to prevent or limit [...] damage" from the "spread of pests".

7.2565 **Canada** notes that Austria sought to justify its ban on T25 maize on the grounds that pollen from the genetically modified variety could spread to fields containing non-biotech maize, giving rise to a risk of genetic transfer and the development of herbicide resistance in other species. Austria also cited the absence of a monitoring programme on the long-term effects of genetically altered plants, particularly in relation to the protection of ecologically sensitive regions, and the need for further testing of possible long-term ecological effects. Since these concerns relate to potential risks arising from T25 maize acting as a "pest" in relation to its surrounding environment, Canada argues that the Austrian safeguard measure is an SPS measure within the meaning of Annex A(1) of the *SPS Agreement*.

7.2566 **Argentina** argues that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed

[1695] Commission Decision 98/293.

[1696] We note that the text of the ordinance provides for an exception in cases where the product is to be immediately re-exported after handling and repackaging. Regulation No. 120, Federal Ministry for Social Protection and Generations, Ordinance issued on 28 April 2000 prohibiting the commercialization of the genetically altered corn Zea Mays L. T25 in Austria, approved by the European Commission on 22 April 1998 under Decision 98/293, Federal Gazette, vol. 2000, 28 April 2000 (Exhibits EC-160/At. 3_trans; CDA-76; US-53).

[1697] Exhibit EC-160/At. 3_trans.

for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2567 The **European Communities** asserts that the main reasons for which the Austrian measure affecting T25 maize was adopted and maintained include, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.[1698]

7.2568 In examining the purposes for which Austria's safeguard measure on T25 maize is applied, the **Panel** will first consider the documents notified by Austria to the Commission in support of its safeguard measure. We note that Austria provided a justification for its safeguard measure in a document entitled "*Reasons for the decision of the Republic of Austria to prohibit the placing on the market of GM maize line T25* [...]" (hereafter the "Reasons document").

7.2569 In the Reasons document, Austria argued that the product had not been examined under realistic conditions of the use of the herbicide and of corresponding agricultural practices.[1699] Austria noted in this regard that neither the applicant's application seeking approval for the placing on the market of T25 maize nor the approval decision of the Commission foresaw a monitoring programme. In particular, Austria considered that special measures monitoring the spread of pollen to surrounding fields cultivated with conventional maize were missing. Austria further criticized the lack of a monitoring programme regarding the long-term effects of biotech plants and herbicides especially because of the fact that the conditions attached to the approval of T25 maize for Community-wide marketing did not foresee the protection of environmentally sensitive areas. An additional reason cited by Austria in support of its safeguard measure was that regional ecological aspects were not differentiated. Austria pointed out in this regard that the use of herbicide resistant plants such as T25 maize in areas of unavoidable applications of herbicides seemed to be useful, if good agricultural practices minimized the danger of the development of resistance in other species. Austria argued, however, that since mountain ecosystems are susceptible to accelerated soil erosion and rapid loss of habitat and genetic diversity, the use of herbicide resistant plants such as T25 maize in these areas should only take place after further investigations of possible long-term and secondary ecological effects.

7.2570 A document submitted by Austria to the Commission for an Experts Meeting held in Brussels in January 2004 (hereafter the "January 2004 document") also sheds light on the reasons for which Austria is applying its safeguard measure on T25 maize.[1700] In this document, Austria states that it adopted a safeguard measure because: (a) the environmental risk assessment was considered as insufficient, as it had not taken into account an integrated point of view of the use of herbicides under realistic conditions[1701]; and (b) possible long term effects and ecological aspects had not been scientifically assessed. In addition to these reasons, Austria cited other, more general concerns which in its view justify the precautionary approach embodied in Austria's safeguard measure. Specifically, Austria pointed out that the allergological and toxicological risk assessment concerning EC-approved biotech products such as T25 maize had been inadequate. Austria also noted that pending the report of the Working Group on antibiotic resistance marker genes set up by the European Communities in

[1698] Exhibit EC-155.
[1699] Exhibit EC-160/At. 3_trans.
[1700] Exhibit EC-158/At. 30.
[1701] It is not clear to the Panel if Austria is referring to a specific environmental risk assessment, and if so, which assessment.

accordance with Directive 2001/18, products containing such genes, including T25 maize, should not be placed on the market.

7.2571 Finally, we note that Austria's reasons for adopting the safeguard measure on T25 maize are also discussed in a letter addressed to the Commission in February 2004 by the Austrian Federal Minister for Health and Women. In that letter, Austria rejected a request by the Commission for the withdrawal of Austria's safeguard measure. In this context, Austria recalled that "[t]he crucial factors in the case of [the decision concerning] maize T25 were the absence of a supervisory programme and of an examination of the use of herbicide and agricultural practice. Both are related to the consideration of regional ecological characteristics and the protection of ecologically sensitive areas."[1702] Austria also reiterated its concern about inadequacies in the allergological and toxicological risk assessment concerning biotech products, such as T25 maize, which were submitted for approval under Directive 90/220[1703] and/or Regulation 258/97. Furthermore, Austria noted that it could not withdraw its safeguard measure on T25 maize in view of the fact that a coherent regulatory solution to the problem of coexistence had not yet been found.

7.2572 Based on the foregoing, we consider that at the time of review by the Panel, Austria applied its safeguard measure on T25 maize to address concerns about:[1704]

(1) the spread of pollen to cultivated surrounding fields (co-existence);
(2) long-term ecological effects in environmentally sensitive areas;
(3) allergenicity and toxicity; and
(4) the development of antibiotic resistance.

7.2573 The European Communities asserts that Austria's safeguard measure on T25 maize is also applied in view of concerns about labelling**.** This concern was not articulated by Austria in the documents discussed by us above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Austria is applying its safeguard measure also to address the additional concern identified by the European Communities.

7.2574 Having determined the purposes for which Austria applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Austria's safeguard measure.

Spread of pollen to cultivated surrounding fields (co-existence)

7.2575 We begin with the purpose of preventing the spread of pollen to surrounding areas cultivated with conventional maize. We observe that Austria does not claim that its safeguard measure on T25 maize is intended to prevent environmental effects associated with out-crossing between T25 maize and conventional maize. Rather, Austria emphasizes the need for "special measures monitoring the possible – mostly regarded as safe – spread of pollen to fields in the surroundings cultivated with conventional maize".[1705] As Austria in this statement explicitly notes the lack of compelling safety

[1702] Exhibit EC-158/At. 31_trans.

[1703] The document submitted by Austria actually refers to Regulation 2001/18, which appears to be an error.

[1704] We note that some of these concerns were articulated by Austria in documents which post-date the date of establishment of this Panel. However, we see no grounds for considering that these plausible concerns did not underlie the safeguard measure at issue already in August 2003.

[1705] Exhibit EC-160/At. 3, p. 4.

concerns, we understand this statement to refer to concerns over the possible loss of economic value to farmers, who due to the existence of unwanted, out-crossed plants in their fields, can no longer market their crops as non-GM crops.

7.2576 In Section VII.C we have found that the term "other damage" as it appears in Annex A(1)(d) includes economic damage which arises from the entry, establishment or spread of pests and which is not a consequence of damage to the life or health of animals or plants. We also found that plants growing where they are undesired can be considered as "pests". This includes cross-breeds between GM maize and conventional maize which grow in a conventional maize field.

7.2577 In view of these findings, we consider that Austria's safeguard measure on T25 maize, to the extent it is applied to prevent economic damage resulting from the entry, establishment or spread of cross-breeds between T25 and conventional maize in cultivated surrounding maize fields, falls within the scope of Annex A(1)(d) of the *SPS Agreement.*

Long-term ecological effects in environmentally sensitive areas

7.2578 The Panel turns now to the next objective stated by Austria for prohibiting the placing on the market of T25 maize, namely, Austria's concerns over long-term ecological effects. Austria includes in this category of concerns secondary ecological effects. The Panel understands the term "secondary ecological effects" to refer to indirect environmental effects which might be caused by the cultivation of T25 maize.

7.2579 In Section VII.C we have addressed concerns that GM plants might crowd out or eliminate other plants, due to a potential competitive advantage, invasiveness or persistence, thus affecting the genetic diversity of remaining plant populations and putting at risk the survival of certain plant species. In relation to these concerns, we stated that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a), as it would be applied "to protect [...] plant life or health […] from risks arising from the entry, establishment or spread" of GM plants *qua* "pests".

7.2580 We further found that to the extent that GM plants may result in changes in plant populations, this may increase or decrease the food available for particular animal populations and thus enhance, or detract from, the fitness and health of these animal populations, which in turn may have a deleterious effect on the life or health of plants, *e.g.*, by affecting their ability to reproduce. We stated that, by causing harm to the health of animals or other plants in this way, GM plants would act as "pests" within the meaning of Annex A(1)(a), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a).

7.2581 We also found that Annex A(1)(a) covers measures applied to protect animal or plant life or health from risks arising directly or indirectly from the entry, establishment or spread of cross-breeds with undesired traits (such as herbicide resistance) resulting from transfer of genetic material from a GM plant.

7.2582 Moreover, we addressed potential risks to the environment, including to farmland wildlife, resulting from a change in weed control practices (the application of a herbicide where none was used before the increased application of a herbicide, or the application of a different, more harmful herbicide). We said that to the extent a measure is applied to avoid adverse effects on the life or health of animals or plants which arise from the management techniques associated with GMOs, such a measure falls within the scope of Annex A(1)(a), in that it can be viewed as a measure applied to

protect the life or health of animals or plants from risks arising indirectly from the entry, establishment or spread of weeds *qua* "pests".

7.2583 Finally, we found that to the extent a measure seeks to avoid adverse effects of GMOs on the environment other than adverse effects on animal or plant life or health, including on geochemical processes, such a measure can be considered to be covered by Annex A(1)(d), inasmuch as it can be viewed as a measure which is applied to prevent or limit "other damage" from the entry, establishment or spread of "pests". As noted earlier, the GMOs themselves or cross-breeds of GM plants might qualify as the relevant pests, or other plants or animals might become pests as a result of the release of GMOs into the environment. Furthermore, we said that to the extent that a measure is applied to avoid adverse effects arising from the management techniques associated with GMOs other than damage to the life or health of animals or plants, that measure can be considered as a measure applied to prevent or limit "other damage" resulting indirectly from the entry, establishment or spread of weeds *qua* "pests".

7.2584 In view of the above findings, we consider that Austria's safeguard measure on T25 maize, to the extent it is applied to avoid potential long-term ecological effects of the release into the environment of T25 maize, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Allergenicity and toxicity

7.2585 We turn now to Austria's stated concern regarding potential risks of allergenicity and toxicity associated with T25 maize.

7.2586 In Section VII.C we have found that Annex A(1)(b) covers measures applied to protect the life or health of humans or animals (not including target organisms) from risks arising from toxins produced in GM plants which are foods or feedstuffs. Furthermore, we found that to the extent that a measure seeks to protect humans and animals from allergenic effects of GM plants used as or in foods, that measure can be considered to be a measure applied to protect human or animal life or health from risks arising from toxins produced in GM plants which are foods or feedstuffs and, as such, would fall within the scope of Annex A(1)(b).

7.2587 We also recall our view that if interaction with, and exposure to, GMOs other than as or in a food produced allergenic effects in persons, the GMOs in question could be considered "pests" within the meaning of Annex A(1). We therefore found that to the extent that a measure seeks to avoid the entry, establishment or spread of allergenic GM plants, that measure can be considered to be a measure applied to protect human life or health from risks arising from the entry, establishment or spread of GM plants *qua* "pests". As such, it would fall within the meaning of Annex A(1)(c).

7.2588 In view of the above findings, we consider that Austria's safeguard measure on T25 maize, to the extent it is applied to protect from potential allergenic and toxicologic effects associated with T25 maize, falls within the scope of Annex A(1)(b) and (c) of the *SPS Agreement*.

Development of antibiotic resistance

7.2589 We turn finally to the purpose of managing potential risks associated with the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans or animals due to consumption of T25 maize. We recall our discussion in Section VII.C regarding antibiotic resistance marker genes (ARMG). More particularly, we recall that in our view, the concern relates to the potential transfer to pathogens of ARMG present in certain GMOs, and the possible resulting decrease in effectiveness of

medical treatments involving specific antibiotics which might pose a risk to the life or health of animals infected with the resistant pathogen.

7.2590 In Section VII.C we have found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of disease-causing organisms which have or might become resistant to antibiotics due to the transfer of ARMG from a GM plant. Similarly, we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of diseases due to the reduced effectiveness of antibiotics used to treat the pathogens which have become resistant to these antibiotics through gene transfer. Furthermore, we found that Annex A(1)(b) covers measures applied to protect human or animal life or health from risks arising indirectly, namely *via* the potential transfer to humans or animals of marker genes conferring resistance to antibiotics used in human or veterinary medicine, from additives in foods or feedstuffs. We recall in this respect that, in our view, ARMGs can be considered to be additives for the purposes of Annex A(1)(b).

7.2591 In view of the above findings, we consider that Austria's safeguard measure on T25 maize, to the extent it is applied to avoid risks associated with the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans or animals due to consumption of T25 maize, falls within the scope of Annex A(1)(a) and (b) of the SPS Agreement.

Conclusion with regard to the purpose of the safeguard measure

7.2592 In the light of the above considerations, we conclude that the safeguard measure applied by Austria with respect to T25 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the safeguard measure

7.2593 We now turn to the issue of the form and nature of the Austrian safeguard measure on T25 maize. We start by recalling the Parties' arguments on this matter.

7.2594 The **United States** notes that the Austrian measure is in the form of an "ordinance", which is defined as "an authoritative decree or command"[1706]. The United Stated further notes that a decree is among the types of measures explicitly mentioned in Annex A(1) of the *SPS Agreement*.

7.2595 **Canada** argues that the measure falls within the scope of "laws, decrees, regulations, requirements and procedures." As indicated by the use of the word "include", Annex A provides a non-exhaustive list of the forms that an SPS measure can take. The Austrian measure takes the form of an "ordinance", a type of measure which is not among those expressly enumerated in Annex A, but which is nonetheless legally binding and lawfully promulgated by the central government authorities. The term ordinance is also defined as synonymous to the word "decree", which is specifically referred to in Annex A(1).

7.2596 **Argentina** notes that an "ordinance" is defined as an "authoritative decree or command", and that a decree is one of the types of measures specifically mentioned in Annex A of the *SPS Agreement*.

[1706]*The New Shorter Oxford English Dictionary*, L. Brown (ed.) (Clarendon Press, 1993), Vol. I, p. 2017.

7.2597 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms. Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered as "requirements". The second example would constitute a negative requirement.

7.2598 We note that the Austrian safeguard measure on T25 maize was implemented by Austria through an ordinance to prohibit commercialization of T25 maize on its territory. Annex A(1) does not specifically refer to "ordinances". As we have pointed out, this fact alone does not necessarily mean that Austria's safeguard measure is not an SPS measure, since no specific legal form is prescribed. Austria's ordinance clearly is a measure attributable to the Austrian Government. It is also not in dispute that the ordinance is legally binding. We therefore consider that, for the purposes of Annex A(1), the Austrian ordinance may be assimilated to measures adopted in the form of "laws", "decrees" or "regulations".

7.2599 In respect of the nature of the Austrian measure, we note that the ordinance prohibits the marketing of T25 maize. As indicated above, we are of the view that a prohibition on the marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2600 We therefore conclude that the safeguard measure taken by Austria with respect to T25 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2601 We have now considered Austria's safeguard measure on T25 maize in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Austria's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure taken by Austria with respect to T25 maize constitutes an "SPS measure" within the meaning of Annex A(1).

7.2602 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the Austrian safeguard measure could be considered to embody more than one SPS measure. However, neither the Complaining Parties nor the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the Austrian safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the Austrian safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2603 We now turn to the issue of whether Austria's safeguard measure on T25 maize is a measure that may affect international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Austria's safeguard measure on T25 maize to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2604 The **United States** argues that the measure adopted by Austria prohibits the "placing on the market" of T25 maize, thereby effectively blocking the importation of the product.

7.2605 **Canada** argues that the measure prohibits commercialization of T25 maize and bans its importation, except where the imported product is "immediately" exported "after possible handling and repackaging" in Austria. Since the measure effectively blocks market access for the targeted biotech product, it clearly affects international trade.

7.2606 **Argentina** notes that since the safeguard measure prevents access of T25 maize to Austria, resulting in the absence of imports of this product, the measure can be said to affect international trade.

7.2607 The **Panel** notes that pursuant to Article 1.1 of the *SPS Agreement*, it is not necessary to demonstrate that an SPS measure has an actual effect on trade. Article 1.1 merely requires that an SPS measure "may, directly or indirectly, affect international trade".

7.2608 Austria's decision to apply a safeguard measure on T25 maize is contained in the text of the Ordinance that entered into force on 29 April 2000.[1707] According to the text of the Ordinance, Austria's decision prohibits the placing on the Austrian market of T25 maize. In our understanding, the prohibition applies also to imports of T25 maize from outside the European Communities.[1708]

7.2609 In view of the fact that Austria's safeguard measure prohibits imports of T25 maize, we have no difficulty concluding that the safeguard measure by Austria is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2610 In the light of the above, the Panel reaches the following overall conclusions:

(a) DS291 (United States)

(b) With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the Austrian safeguard measure on T25 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

[1707] Exhibit EC-160/At. 3.

[1708] We note that this is subject to an exception for imported T25 maize that is immediately exported after handling and repackaging in Austria.

(c) DS292 (Canada)

(d) With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that the Austrian safeguard measure on T25 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(e) DS293 (Argentina)

(f) With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that the Austrian safeguard measure on T25 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(iii) Austria – Bt-176 maize

7.2611 We now turn to the safeguard measure applied by Austria on Bt-176 maize. We recall that the application for placing on the market of this product was initially submitted to France.[1709] The product was authorized by the EC Commission in 1996.[1710] Austria adopted an Ordinance to prohibit the sale of Bt-176 maize on its territory in February 1997 on the basis of Article 16 of Directive 90/220.[1711] Austria notified its Decision to the Commission on 14 February 1997.

Is the Austrian safeguard measure on Bt-176 maize an SPS measure?

7.2612 We start with the issue of whether the Austrian safeguard measure on Bt-176 maize is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2613 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2614 The **United States** recalled that in its decision to adopt the measure, Austria noted its concern with regard to the effect of Bt toxin on non-target organisms and the potential transfer of antibiotic resistant genes to humans and animals. According to the United States, a measure based on such justification is an SPS measure because it is applied "to protect animal life or health" from "disease-causing organisms"; "to protect human life or health" from "toxins" or "disease-causing organisms in foods"; or "to prevent or limit [...] damage" from the "spread of pests".

7.2615 **Argentina** argued that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed

[1709] C/F/94/11-03.
[1710] Commission Decision 97/98 (Exhibits US–97; ARG–37).
[1711] Regulation No. 45 of the Federal Ministry for Consumer Health and Protection, 13 February 1997.

for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2616 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; toxicity or allergenicity; persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.[1712]

7.2617 In examining the purposes for which Austria's safeguard measure on Bt-176 maize is applied, the **Panel** will first consider the document notified by Austria to the Commission in support of its safeguard measure in February 1997, hereafter referred to as Austria's "Reasons document".[1713] In the Reasons' document, Austria stated that "new scientific results have questioned the present scientific possibility of a conclusive evaluation of the mechanism of gene transfer, as well as the development of resistance to Bt toxin. Accordingly, possible risks are very hard to assess and should be avoided at the present state of the scientific discussion."[1714] Austria considered that, in the case of Bt-176 maize, approving the product despite the uncertainties regarding both the ampicillin resistance as well as the resistance against the Bt toxin without any legally binding resistance management programme was in conflict with the principle of precaution.[1715] In particular, Austria noted that evidence on "the impact of a potential gene transfer of the *bla*-gene/b-lactamase and potential induction of resistance in bacteria on the therapy of humans and animals with antibiotics remains not fully conclusive."[1716]

7.2618 We note that Austria also notified the Commission in May 1997 of the results of two studies concerning the possible adverse effects on the environment due to the cultivation of Bt maize.[1717] In the cover letter, Austria states that "[...] these studies prove that pests may evolve (*sic*) resistance against *Bt* toxins much faster than previously expected, due to the fact that transgenic crops producing insecticidal proteins from *Bt* [...] are being grown commercially."[1718]

7.2619 Furthermore, in the cover letter addressed to the Commission at the time of notification of the measure, Austria indicated that it maintained its position that "the labelling laid down in the Commission's decision is insufficient", and that "[c]onsumers should be informed precisely about the fact that this product has been genetically modified."[1719]

7.2620 The January 2004 document submitted by Austria to the Commission also sheds light on the reasons for which Austria is applying its safeguard measure on Bt-176 maize.[1720] In this document, Austria states that it adopted its safeguard measure regarding Bt-176 maize because: "(a) [t]he transgenic maize line contains the ampicillin-resistance gene including its bacterial regulatory sequences. The probability of gene transfer of a functional *bla*-construct into bacteria – even though it is considered low – has to be taken into account for the risk assessment, because the spreading of antibiotic resistance is unacceptable; and (b) [t]he environmental risk assessment has been considered

[1712] Exhibit EC-155.
[1713] Exhibit EC-158/At. 7.
[1714] *Ibid*, p. 5.
[1715] *Ibid.*
[1716] Exhibit EC-158/At. 7 p. 6.
[1717] Exhibit EC-158/At. 10. The two studies referred to by Austria are contained in Exhibits EC-158/At. 11-12.
[1718] Exhibit EC-158/At. 10.
[1719] Exhibit EC-158/At. 7.
[1720] Exhibit EC-158/At. 30.

as insufficient: the possible unintended effects of the Bt-toxin on non-target organisms and the possible resistance-development in insects, *e.g*. the European corn borer, has not been thoroughly assessed".[1721] In addition to these reasons, Austria cited other, more general concerns which in its view justify the precautionary approach embodied in Austria's safeguard measure. Specifically, Austria pointed out that the allergological and toxicological risk assessment concerning EC-approved biotech products such as Bt-176 maize had been inadequate. Austria also noted that pending the report of the EC working group on antibiotic resistance marker genes established pursuant to Directive 2001/18, products containing such genes, including Bt-176 maize, should not be placed on the market.

7.2621 We note that Austria's concerns for adopting a safeguard measure on Bt-176 maize are also discussed in a letter addressed to the Commission in February 2004 by the Austrian Federal Minister for Health and Women. In that letter, Austria rejected a request by the Commission for the withdrawal of Austria's safeguard measure. In this context, Austria recalled that "[t]he Austrian decision concerning Bt-176 maize was based on health doubts regarding the ampicillin-resistant gene (*bla*) with a bacterial promoter and the possible resistance formation of insects to the bacillus thuringiensis (Bt) protein. There was also a lack of clarity regarding the ecological effects of herbicide resistance and inadequate designation."[1722] Austria also reiterated its concern about inadequacies in the allergological and toxicological risk assessment concerning biotech products, such as Bt-176 maize, which were submitted for approval under Directive 90/220 and/or Regulation 258/97. Furthermore, Austria noted that it could not withdraw its safeguard measure on T25 maize in view of the fact that a coherent regulatory solution to the problem of co-existence had not yet been found. The Austrian letter notes in this respect that in June 2003 a resolution had been approved in the Austrian parliament calling on the Austrian Federal Government to refrain from approving new GM plants, especially in relation to their cultivation, until a coherent solution was found on this issue.

7.2622 Based on the foregoing, we consider that at the time of review by the Panel, Austria applied its safeguard measure on Bt-176 maize to address concerns about:[1723]

(1) the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans and animals;
(2) the development of resistance to Bt toxin in insects;
(3) effects on non-target organisms;
(4) environmental effects of herbicide resistance;
(5) co-existence;
(6) allergenicity and toxicity; and
(7) insufficient labelling.

7.2623 Having determined the purposes for which Austria applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Austria's safeguard measure.

[1721] Exhibit EC-158/At. 30, p. 2.
[1722] Exhibit EC-158/At. 31_trans.
[1723] We note that some of these concerns were articulated by Austria in documents which post-date the date of establishment of this Panel. However, we see no grounds for considering that these plausible concerns did not underlie the safeguard measure at issue already in August 2003.

Transfer of the bla-ampicillin resistance gene to bacteria of the intestine of humans or animals

7.2624 The Panel begins with Austria's stated concern regarding the potential transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans or animals due to consumption of Bt-176 maize. The concern identified by Austria with regard to Bt-176 is similar to that identified by Austria with regard to its safeguard measure on T25 maize, discussed above. We recall our discussion in Section VII.C regarding antibiotic resistance marker genes, and in particular our view that the concern relates to the potential transfer to pathogens of ARMG present in certain GMOs, and the possible resulting decrease in effectiveness of medical treatments involving specific antibiotics which might pose a risk to the life or health of animals infected with the resistant pathogen.

7.2625 In Section VII.C we have found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of disease-causing organisms which have or might become resistant to antibiotics due to the transfer of ARMG from a GM plant. Similarly, we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of diseases due to the reduced effectiveness of antibiotics used to treat the pathogens which have become resistant to these antibiotics through gene transfer. Furthermore, we found that Annex A(1)(b) covers measures applied to protect human or animal life or health from risks arising indirectly, namely *via* the potential transfer to humans or animals of marker genes conferring resistance to antibiotics used in human or veterinary medicine, from additives in foods or feedstuffs. We recall in this respect that, in our view, ARMGs can be considered to be additives for the purposes of Annex A(1)(b).

7.2626 Thus, consistent with the Panel's reasoning above in the context of Austria's safeguard measure on T25 maize, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to avoid potential risks associated with the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans or animals, falls within the scope of Annex A(1)(a) and (b) of the *SPS Agreement*.

Development of resistance to Bt toxin in insects

7.2627 We turn now to another objective stated by Austria for prohibiting the placing on the market of Bt-176 maize, namely the managing of potential risks associated with the development of resistance to Bt toxin in both target and non-target insects. We understand the concern identified by Austria to be that resistance in insects to Bt toxin may develop due to frequent exposure to this pesticide (the Bt toxin) and that the development of high levels of resistance in insect populations might require the application of a pesticide where none was used before, the increased application of a pesticide, or the application of more harmful pesticides, to control the resistant populations and that this might have adverse effects on the environment.

7.2628 We recall our analysis in Section VII.C regarding the development of pesticide-resistance in target organisms. We found that resistant target organisms (insects) could be regarded as "pests" within the meaning of Annex A(1), inasmuch as they present a risk to animal, plant or human life or health or result in other damage. We further determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of resistant target organisms *qua* relevant pest. We found that to the extent that a measure seeks to avoid such risks and damage, it can be considered to be covered by Annex A(1)(a) and (d) of the *SPS Agreement*.

7.2629 In view of the above findings, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to protect from potential risks associated with the development of resistance to Bt toxin in insects due to the cultivation of Bt-176 maize, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Effects on non-target organisms

7.2630 We now consider Austria's stated objective of managing risks associated with potential effects on non-target organisms, other than risks associated with the development of resistance in insects as addressed above. As we noted earlier, we understand "non-target" organisms to mean plants and animals (including insects) which are not themselves the organisms farmers seek to control or eliminate through the cultivation of GM crops, but which are affected by the cultivation of the GM crop, including through consumption of the GM plants or components thereof (*e.g.*, pollen).

7.2631 We recall our conclusions in Section VII.C that a GM crop that is eaten by animals can be considered to be a "food" for that animal. This would include, for example, pollen of the GM crop which is consumed by insects and GM plants consumed by non-target insects, deer, rabbits or other wild fauna. As we previously noted, a poisonous substance, such as the Bt toxin, which is produced by a GM crop could qualify as a "toxin" within the meaning of Annex A(1)(b). We determined on that basis that measures applied to protect the life or health of animals (not including target organisms) from risks arising from toxin produced in GM plants are covered by Annex A(1)(b).

7.2632 Moreover, we indicated in Section VII.C our view that if a GM plant produces a poisonous substance which could adversely affect the health of non-target organisms, even if the non-target organisms do not eat the GM plant, *e.g.* through exposure other than through ingestion of food, the GM plant could be considered a "pest" within the meaning of Annex A(1)(a). Thus, a measure applied to protect from risks arising from such exposure to GM plants would, in our view, fall within the scope of Annex A(1)(a).

7.2633 In addition, in Section VII.C we concluded that to the extent that GM plants may result in changes in animal or plant populations, this may increase or decrease the food available for particular non-target animal populations and thus alter the fitness and health of these animal populations, which may in turn lead to further deleterious effects on the life or health of animals or other plants. We also recall our conclusion that by causing harm to the health of animals or other plants in this way, GM plants would act as "pests" within the meaning of Annex A(1), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a). Furthermore, we found that Annex A(1)(a) covers measures applied to protect animal or plant life or health from risks arising directly or indirectly from the entry, establishment or spread of cross-breeds with undesired traits (such as insecticidal traits) resulting from transfer of genetic material from a GM plant.

7.2634 In view of these findings, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to avoid potential risks to the health of non-target organisms from the consumption of Bt-176 maize, falls within the scope of Annex A(1)(b) of the *SPS Agreement*. Furthermore, to the extent that Austria's safeguard measure is applied to avoid other potential risks to the life or health of non-target organisms arising directly or indirectly from Bt-176 maize (*i.e.*, risks unrelated to the ingestion of Bt-176 maize as food), it falls within the scope of Annex A(1)(a) of the *SPS Agreement*.

Environmental effects of herbicide resistance

7.2635 Another concern raised by Austria concerns the environmental effects of herbicide resistance. We understand this to be a concern about the environmental effects of Bt-176 maize which contains a herbicide resistance marker gene.

7.2636 In Section VII.C we have found that cross-breeds between conventional and GM plants, including herbicide-resistant plants, could be regarded as "pests" for the purposes of Annex A(1), to the extent they have undesired introduced traits (such as herbicide resistance) and harm animal or plant life or health or result in other damage. We have determined on that basis that measures applied to protect animal or plant life or health from risks arising directly (*e.g.*, through changes in selective advantage) from the entry, establishment or spread of cross-breeds with undesired traits resulting from the transfer of genetic material from a GM plant fall within the scope of Annex A(1)(a), while measures applied to prevent "other damage" to the environment from the entry, establishment or spread of cross-breeds fall within the scope of Annex A(1)(d).

7.2637 In addition, we recall that one possible concern arising from cross-breeds that have acquired herbicide resistance is that they may lead to the need for an increased use of the same herbicides, or different, more toxic herbicides, to control the resistant weeds. We determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of cross-breeds *qua* relevant pest. We deduced from this that measures applied to avoid such indirect adverse effects on the environment fall within the scope of Annex A(1)(a) and (d).

7.2638 Furthermore, in Section VII.C we have found that to the extent a measure is applied to avoid adverse effects on the life or health of animals or plants which arise from particular management (weed control) practices associated with GMOs, including herbicide resistant GMOs, such a measure falls within the scope of Annex A(1)(a), in that it can be viewed as a measure applied to protect the life or health of animals or plants from risks arising indirectly from the entry, establishment or spread of weeds *qua* "pests". Similarly, we said that to the extent that a measure is applied to avoid adverse environmental effects arising from management (weed control) practices associated with GMOs other than damage to the life or health of animals or plants, that measure can be considered as a measure applied to prevent or limit "other damage" resulting indirectly from the entry, establishment or spread of weeds *qua* "pests" and would thus also be covered by Annex A(1)(d).

7.2639 In view of our findings above, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to avoid risks to the environment arising from herbicide resistance, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Co-existence

7.2640 We now turn to Austria's stated concern about co-existence. We understand this to be a concern that farmers cultivating conventional maize might experience a loss of economic value of their crop due to the existence of unwanted genetically modified maize plants in their fields (contamination). The loss would result from the circumstance that the farmers might no longer be able to market their crops as non-GM crops.

7.2641 In Section VII.C we have found that the term "other damage" as it appears in Annex A(1)(d) includes economic damage which arises from the entry, establishment or spread of pests and which is not a consequence of damage to the life or health of animals or plants. We also found that plants growing where they are undesired can be considered as "pests". Such plants include cross-breeds

between GM maize and conventional maize which grow in a conventional maize field as a result of pollen dispersal. Such plants further include GM maize plants growing in a conventional maize field as a result of unintentional dispersal of GM seed. Thus, we consider that to the extent Austria's safeguard measure on Bt-176 maize is applied to prevent economic damage resulting from the contamination of conventional maize due to the entry, establishment or spread of Bt-176 maize (via dispersal of GM seed), or of cross-breeds between Bt-176 maize and conventional maize (via dispersal of GM pollen), in cultivated conventional maize fields, it falls within the scope of Annex A(1)(d) of the *SPS Agreement.*

7.2642 In view of the above findings, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to prevent or limit damage from the possible contamination of conventional maize by Bt-176 maize, falls within the scope of Annex A(1)(d) of the *SPS Agreement*.

Allergenicity and toxicity

7.2643 We now turn to Austria's stated concern regarding the potential risks of allergenicity and toxicity associated with Bt-176 maize. We recall our analysis related to allergens and toxins in Section VII.C and our analysis of this concern in the context of Austria's safeguard measure on T25 maize.

7.2644 In particular, we recall that in Section VII.C we have found that to the extent that a measure seeks to protect humans and animals from allergenic effects of GM plants used as or in foods or feedstuffs, that measure can be considered to be a measure applied to protect human or animal life or health from risks arising from toxins produced in GM plants which are foods or feedstuffs and, as such, would fall within the scope of Annex A(1)(b). We furthermore recall our view that if interaction with, and exposure to, GMOs other than as or in a food or feedstuff produced allergenic effects in persons, the GMOs in question could be considered "pests" within the meaning of Annex A(1)(c).

7.2645 Consistent with our reasoning above, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to avoid potential allergenic or toxic effects, falls within the scope of Annex A(1)(b) and (c) of the *SPS Agreement*.

Insufficient labelling

7.2646 Finally, we turn to Austria's stated concern regarding insufficient labelling of Bt-176 maize. We recall that Austria considered that "the labelling laid down in the Commission's decision is insufficient" and that "[c]onsumers should be informed precisely about the fact that this product has been genetically modified."[1724] The Commission's decision to which Austria refers stipulates that the label of each package of seeds of Bt-176 maize is to indicate that the product "protects itself against corn borers", and that it "has increased tolerance to the herbicide glufosinate-ammonium".[1725] The preamble to the decision further notes that there were no safety grounds for mentioning on the label that the product has been obtained by genetic modification techniques. Thus, it appears that contrary to the Commission, Austria wanted the label to indicate the presence of GMOs, in addition to providing the information the Commission required to be indicated on the label of each package of seeds.

[1724] Exhibit EC-158/At. 7.
[1725] Exhibits US-97; ARG-37.

7.2647 We note that Austria stated that the explicit identification of the presence of GMOs which it was seeking would be for the information of consumers of Bt-176 maize. We also note, however, that Austria's letter to the Commission states that Austria's safeguard measure on Bt-176 maize is taken in accordance with Article 16 of Directive 90/220. To recall, Article 16 provides that member States may take safeguard measures in cases where there are justifiable reasons to consider that an approved biotech product constitutes a risk to human health or the environment. Article 16 does not authorize a member State to restrict or prohibit the use and/or sale of an approved biotech product merely because a labelling requirement specified in the written consent for the placing on the market of that biotech product does not ensure consumers' freedom of choice (with regard to the consumption of GM products *vs*. non-GM products).

7.2648 Since Austria specifically claimed to be acting in accordance with the provisions of Article 16 of Directive 90/220, we consider that Austria's reference to consumer information should be read in the light of, and together with, Austria's reference to Article 16. Indeed, in our view, Austria's argument that consumers should be explicitly informed about the presence of GMOs can be understood as an argument that identification of the presence of a GMO would help protect notably from unanticipated adverse effects on human health which might arise from the consumption of Bt-176 maize.[1726] As we have indicated in Section VII.C, explicit identification of the presence of a GMO alerts and sensitises users of a product containing or consisting of a GMO to the possibility that any observed adverse effects of the product on human health might be attributable to the presence of a GMO as opposed to other factors. In view of the foregoing elements, we consider that Austria's concern about insufficient labelling reflects a concern about risks to consumer health arising from the consumption of Bt-176 maize.

7.2649 This interpretation of Austria's labelling concern is consistent with the provisions of Directive 90/220. While Directive 90/220 does not require a statement on a label to the effect that a GMO is present in a product, it does not state that such a requirement may not be imposed as part of the conditions attached to the written consent to placing on the market. Furthermore, we recall that Directive 2001/18 requires labelling to indicate the presence of GMOs. We find in Section VII.C that this requirement could be presumed to be applied to protect human health and the environment from possible unanticipated effects of GMOs. Thus, our interpretation of Austria's labelling concern is consistent with the kind of general labelling requirement which was subsequently imposed by Directive 2001/18.

7.2650 We refer to our analysis in Section VII.C of labelling to indicate the presence of GMOs. As noted in that section, we are of the view that labelling to indicate the presence of GMOs imposed for the purpose of protecting human health from unanticipated effects of GMOs falls within the scope of Annex A(1)(b) or (c) of the *SPS Agreement*, depending on what the adverse effects would be.

7.2651 In view of our findings above, we consider that Austria's safeguard measure on Bt-176 maize, to the extent it is applied to avoid adverse effects on human health (due to the potential transfer of ARMG to gut bacteria and possible allergenicity and toxicity) which in Austria's view were not adequately avoided by the labelling requirements imposed by the Commission, falls within the scope of Annex A(1)(b) and (c) of the *SPS Agreement*.

[1726] In view of Austria's reference to "consumers", we are assuming that Austria was concerned with unanticipated adverse effects on human health from consumption of Bt-176 maize, and not with other adverse effects on human health, on animals or on the environment.

Conclusion with regard to the purpose of the safeguard measure

7.2652 In the light of the above considerations, we conclude that the safeguard measure applied by Austria with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2653 We now turn to the issue of the form and nature of Austria's safeguard measure on Bt-176 maize.

7.2654 We note that the arguments presented by the United States and Argentina regarding the form and nature of Austria's safeguard measure on Bt-176 maize are the same as for Austria's safeguard measure on T25 maize.

7.2655 Thus, as in the case of Austria's safeguard measure on T25 maize we conclude that the safeguard measure applied by Austria with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2656 We have now considered Austria's safeguard measure on Bt-176 maize in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Austria's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure taken by Austria with respect to Bt-176 maize constitutes an "SPS measure" within the meaning of Annex A(1).

7.2657 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the Austrian safeguard measure could be considered to embody more than one SPS measure. However, neither the United States, nor Argentina or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the Austrian safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the Austrian safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2658 We now turn to the issue of whether Austria's safeguard measure on Bt-176 maize is a measure that may affect international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Austria's safeguard measure on Bt-176 maize to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2659 The **United States** argues in this regard that the measure adopted by Austria prohibits the "placing on the market" of Bt-176 maize, thereby effectively blocking the importation of the product.

7.2660 **Argentina** notes that since the safeguard measure prevents access of Bt-176 maize to Austria, resulting in the absence of imports of this product, the measure can be said to affect international trade.

7.2661 The **Panel** notes that the arguments of the parties regarding the effects on trade of Austria's safeguard measure on Bt-176 maize are essentially the same as their arguments with respect to Austria's measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's safeguard measure on T25 maize in paragraphs 7.2603-7.2609 above. In view of the fact that Austria's measure prohibits imports of Bt-176 maize, we have no difficulty concluding that Austria's safeguard measure is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2662 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the Austrian safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that the Austrian safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(iv) Austria – MON810 maize

7.2663 We now turn to the safeguard measure applied by Austria on MON810 maize. We recall that the application for placing on the market of this product was initially submitted to France.[1727] The product was authorized for all uses by the European Commission in 1998.[1728] In June 1999, Austria adopted an Ordinance to prohibit the sale of MON810 maize on its territory pursuant to Article 16 of Directive 90/220.[1729]

Is the Austrian safeguard measure on MON810 maize an SPS measure?

7.2664 We start with the issue of whether the Austrian safeguard measure on MON810 maize is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

[1727] C/F/95/12-02.
[1728] Commission Decision 98/294.
[1729] Regulation No. 175, Federal Ministry for Women's Issues and Consumer Protection, Ordinance issued on 10 June 1999 prohibiting the entry of MON810 maize into Austria.

Purpose of the safeguard measure

7.2665 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2666 The **United States** notes that in its decision to adopt a safeguard measure to prohibit MON810 maize, Austria referred to the adverse effects of Bt toxin on non-target organisms. Austria also expressed a concern that insects could develop resistance to the Bt toxin, thus becoming more difficult to manage and control.[1730] According to the United States, a measure based on such justification is an SPS measure because it is applied "to protect animal life or health" from "disease-causing organisms"; "to protect human life or health" from "toxins" or "disease-causing organisms in foods"; or "to prevent or limit [...] damage" from the "spread of pests".

7.2667 **Argentina** argued that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2668 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; toxicity or allergenicity; development of resistance; biodiversity; monitoring; labelling; co-existence; and human and animal health.[1731]

7.2669 In examining the purposes for which Austria's safeguard measure on MON810 maize is applied, the **Panel** will first consider the document notified by Austria to the Commission in support of its safeguard measure, hereafter referred to as Austria's Reasons document. In this document, Austria notes that its objections regarding the assessment of MON810 maize concern the possible unintended effects of the Bt toxin on non-target organisms, and the possible development of Bt resistance in insects, such as the European corn borer.[1732]

7.2670 The concerns of Austria with respect to MON810 maize are further identified in a January 2004 document as follows: "(a) [a] risk assessment on indirect and long term effects of the Bt toxin is missing; and (b) [t]he environmental risk assessment has been considered as insufficient: the possible unintended effects of the Bt-toxin on non-target organisms and the possible resistance-development in insects [...] has not been thoroughly assessed".[1733] In addition to these reasons, Austria cited other, more general concerns which in its view justify the precautionary approach embodied in Austria's safeguard measure. Specifically, Austria pointed out that the allergological and toxicological risk assessment concerning EC-approved biotech products such as MON810 maize had been inadequate. Austria also noted that pending the report of the EC Working Group on antibiotic resistance marker genes (ARMG), biotech products containing such genes, such as MON810 maize, should not be placed on the market.

[1730] US first written submission, para. 157.
[1731] Exhibit EC-155.
[1732] Exhibit EC-159/At. 3_trans., pages 5-6.
[1733] Exhibit EC-159/At. 30, p. 2.

7.2671 We note that Austria's concerns for adopting a safeguard measure with regard to MON810 maize are also discussed in a letter addressed to the Commission in February 2004 by the Austrian Federal Minister for Health and Women. In this letter, Austria rejected a request by the Commission that Austria withdraw its safeguard measure. In this context, Austria recalled that "[t]his prohibition on cultivation was issued in the light of scientific discoveries concerning the effects of the *bacillus thuringiensis* (Bt) protein, which is directed at insects, on monarch butterflies in the US and other non-target organisms. In addition, Austria referred to the question of resistance formation, as in the case of Bt-176 maize."[1734] Austria also reiterated its concern about inadequacies in the allergological and toxicological risk assessment concerning biotech products, such as MON810 maize, which were submitted for approval under Directive 90/220 and/or Regulation 258/97. Furthermore, Austria noted that it could not withdraw its safeguard measure on MON810 maize in view of the fact that a coherent regulatory solution to the problem of co-existence had not yet been found. The Austrian letter notes in this respect that in June 2003 a resolution had been approved in the Austrian parliament calling on the Austrian Federal Government to refrain from approving new GM plants, especially in relation to their cultivation, until a coherent solution was found on this issue.

7.2672 Based on the foregoing, we consider that at the time of review by the Panel, Austria applied its safeguard measure on MON810 maize to address concerns about:[1735]

(1) the effects on non-target organisms, including indirect and long-term effects;
(2) the development of resistance to Bt toxin in insects, including indirect and long-term effects of insect resistance;
(3) allergenicity and toxicity;
(4) the development of antibiotic resistance; and
(5) co-existence.

7.2673 The European Communities asserts that Austria's safeguard measure on MON810 maize is also applied in view of concerns about labelling. This concern was not articulated by Austria in the documents discussed by us above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Austria is applying its safeguard measure to address this concern asserted by the European Communities.

7.2674 Having determined the purposes for which Austria applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Austria's safeguard measure.

Effects on non-target organisms, including indirect and long-term effects

7.2675 We turn first to Austria's stated concern regarding the potential effects on non-target organisms associated with MON810 maize. We recall our analysis related to effects on non-target organisms in Section VII.C and our analysis of this concern in the context of Austria's safeguard measure on Bt-176 maize.

[1734] Exhibit EC-158/At. 31.
[1735] We note that some of these concerns were articulated by Austria in documents which post-date the date of establishment of this Panel. However, we see no grounds for considering that these plausible concerns did not underlie the safeguard measure at issue already in August 2003.

7.2676 We recall our conclusions in Section VII.C that a GM crop that is eaten by animals can be considered to be a "food" for that animal. This would include, for example, pollen of the GM crop which is consumed by insects and GM plants consumed by non-target insects, deer, rabbits or other wild fauna. As we previously noted, a poisonous substance, such as the Bt toxin, which is produced by a GM crop could qualify as a "toxin" within the meaning of Annex A(1)(b). We determined on that basis that measures applied to protect the life or health of animals (not including target organisms) from risks arising from toxin, produced in GM plants are covered by Annex A(1)(b).

7.2677 Moreover, in Section VII.C we indicated our view that if a GM plant produces a poisonous substance which could adversely affect the health of non-target organisms, even if the non-target organisms do not eat the GM plant, *e.g.* through exposure other than through ingestion of food (such as contact with the leaves of a GM plant), the GM plant could be considered a "pest" within the meaning of Annex A(1)(a). Thus, a measure applied to protect from risks arising from such exposure to GM plants would, in our view, fall within the scope of Annex A(1)(a).

7.2678 In addition, in Section VII.C we concluded that to the extent that GM plants may result in changes in animal or plant populations, this may increase or decrease the food available for particular non-target animal populations and thus alter the fitness and health of these animal populations, which may in turn lead to further deleterious effects on the life or health of animals or other plants. We also recall our conclusion that by causing harm to the health of animals or other plants in this way, GM plants would act as "pests" within the meaning of Annex A(1), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a). Furthermore, we found that Annex A(1)(a) covers measures applied to protect animal or plant life or health from risks arising directly or indirectly from the entry, establishment or spread of cross-breeds with undesired traits (such as insecticidal traits) resulting from transfer of genetic material from a GM plant.

7.2679 In view of the above findings, we consider that Austria's safeguard measure on MON810 maize, to the extent it is applied to avoid potential adverse effects on non-target organisms of MON810 maize, falls within the scope of Annex A(1)(a) and (b) of the *SPS Agreement*.

Development of resistance to Bt toxin in insects, including indirect and long-term effects of insect resistance

7.2680 We turn now to Austria's stated concern regarding the potential development of resistance to Bt toxin in insects associated with MON810 maize. We understand the concern identified by Austria to be that resistance in insects to Bt toxin may develop due to frequent exposure to this pesticide (the Bt toxin) and that the development of high levels of resistance in insect populations might require the application of a pesticide where none was used before, the increased application of a pesticide, or the application of more harmful pesticides to control the resistant populations.

7.2681 We recall our analysis in Section VII.C regarding the development of pesticide-resistance in insects. We found that resistant target organisms (insects) could be regarded as "pests" within the meaning of Annex A(1), inasmuch as they present a risk to animal, plant or human life or health or result in other damage. We further determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of resistant target organisms *qua* relevant pest. We found that to the extent that a measure seeks to avoid such risks and damage, it can be considered to be covered by Annex A(1)(a) and (d) of the *SPS Agreement*.

7.2682 In view of the above findings, we consider that Austria's safeguard measure on MON810 maize, to the extent it is applied to avoid potential risks associated with the development of resistance to Bt toxin in insects due to the cultivation of MON810 maize, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Allergenicity and toxicity

7.2683 We turn now to Austria's stated concern regarding the potential risks of allergenicity and toxicity associated with MON810 maize. We recall our analysis related to allergens and toxins in Section VII.C and our analysis of this concern related to Austria's safeguard measures on T25 maize and Bt-176 maize.

7.2684 In particular, we recall that in Section VII.C we have found that to the extent a measure seeks to protect humans and animals from allergenic effects of GM plants used as or in foods, that measure can be considered to be a measure applied to protect human or animal life or health from risks arising from toxins produced in GM plants which are foods or feedstuffs and, as such, would fall within the scope of Annex A(1)(b). We furthermore recall our view that if interaction with, and exposure to, GMOs other than as or in a food produced allergenic effects in persons, the GMOs in question could be considered "pests" within the meaning of Annex A(1)(c).

7.2685 Consistent with our reasoning above, in the context of the case before us, we consider that Austria's safeguard measure on MON810 maize, to the extent it is applied to avoid potential allergenic or toxic effects of MON810 maize, falls within the scope of Annex A(1)(b) and (c) of the *SPS Agreement*.

Development of antibiotic resistance

7.2686 We turn finally to Austria's stated concern regarding the presence in MON810 maize of an antibiotic resistance marker gene (ARMG) and the possible development of antibiotic resistance. We understand this to be a concern about a potential transfer of the ARMG present in MON810 maize to bacteria of the intestine of humans or animals due to consumption of MON810 maize. We recall our discussion in Section VII.C regarding ARMG, and in particular our view that this concern relates to the potential transfer to pathogens of ARMG present in certain GMOs, and the possible resulting decrease in effectiveness of medical treatments involving specific antibiotics which might pose a risk to the life or health of animals infected with the resistant pathogen.

7.2687 In Section VII.C we have found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of disease-causing organisms which have or might become resistant to antibiotics due to the transfer of ARMG from a GM plant. Similarly, we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of diseases due to the reduced effectiveness of antibiotics used to treat the pathogens which have become resistant to these antibiotics through gene transfer. Furthermore, we found that Annex A(1)(b) covers measures applied to protect human or animal life or health from risks arising indirectly, namely *via* the potential transfer to humans or animals of marker genes conferring resistance to antibiotics used in human or veterinary medicine, from additives in foods or feedstuffs. We recall in this respect that, in our view, ARMGs can be considered to be additives for the purposes of Annex A(1)(b).

7.2688 Thus, in view of our findings above, we consider that Austria's safeguard measure on MON810 maize, to the extent it is applied to avoid potential risks associated with the presence in MON810 maize of an ARMG, falls within the scope of Annex A(1)(a) and (b) of the *SPS Agreement*.

Co-existence

7.2689 We now turn to Austria's stated concern about co-existence. We understand this to be a concern that farmers cultivating conventional maize might experience a loss of economic value of their crop due to the existence of unwanted genetically modified maize plants in their fields (contamination). The loss would result from the circumstance that the farmers might no longer be able to market their crops as non-GM crops.

7.2690 In Section VII.C we have found that the term "other damage" as it appears in Annex A(1)(d) includes economic damage which arises from the entry, establishment or spread of pests and which is not a consequence of damage to the life or health of animals or plants. We also found that plants growing where they are undesired can be considered as "pests". Such plants include cross-breeds between GM maize and conventional maize which grow in a conventional maize field as a result of pollen dispersal. Such plants further include GM maize plants growing in a conventional maize field as a result of unintentional dispersal of GM seed. Thus, we consider that to the extent Austria's safeguard measure on MON810 maize is applied to prevent economic damage resulting from the contamination of conventional maize due to the entry, establishment or spread of MON810 maize (via dispersal of GM seed), or of cross-breeds between MON810 maize and conventional maize (via dispersal of GM pollen), in cultivated conventional maize fields, it falls within the scope of Annex A(1)(d) of the *SPS Agreement.*

7.2691 In view of the above findings, we consider that Austria's safeguard measure on MON810 maize, to the extent it is applied to prevent or limit damage from the possible contamination of conventional maize by MON810, falls within the scope of Annex A(1)(d) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2692 In the light of the above considerations, we conclude that the safeguard measure applied by Austria with respect to MON810 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2693 We now turn to the issue of the form and nature of Austria's safeguard measure on MON810 maize.

7.2694 We note that the arguments presented by the United States and Argentina regarding the form and nature of Austria's safeguard measure on MON810 maize are the same as for Austria's safeguard measure on T25 maize.

7.2695 Thus, as in the case of Austria's safeguard measure on T25 maize we conclude that the safeguard measure applied by Austria with respect to MON810 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2696 We have now considered Austria's safeguard measure on MON810 maize in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Austria's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure taken by Austria with respect to MON810 maize constitutes an "SPS measure" within the meaning of Annex A(1).

7.2697 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the Austrian safeguard measure could be considered to embody more than one SPS measure. However, neither the United States nor Argentina or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the Austrian safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the Austrian safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2698 We now turn to the issue of whether Austria's safeguard measure on MON810 maize is a measure that may affect international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Austria's safeguard measure on MON810 maize to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2699 The **United States** argues that the measure adopted by Austria prohibits the "placing on the market" of MON810 maize, thereby effectively blocking the importation of the product.

7.2700 **Argentina** notes that since the safeguard measure prevents access of MON810 maize to Austria, resulting in the absence of imports of this product, the measure can be said to affect international trade.

7.2701 The **Panel** notes that the arguments of the parties regarding the effects on trade of Austria's safeguard measure on MON810 maize are essentially the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609 above. In view of the fact that Austria's safeguard measure prohibits imports of MON810 maize, we have no difficulty concluding that the safeguard measure by Austria is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2702 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the Austrian safeguard measure on MON810 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that the Austrian safeguard measure on MON810 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(v) France – MS1/RF1 oilseed rape (EC-161)

7.2703 We now turn to the safeguard measure applied by France on MS1/RF1 oilseed rape (EC-161). We recall that the application for placing on the market, growing and obtaining seeds of this oilseed rape was initially submitted to the United Kingdom.[1736] The product was authorized by the Commission in February 1996 for cultivation and placing on the market.[1737] In November 1998, France adopted a Decree suspending commercialization of MS1/RF1 oilseed rape (EC-161) on its territory for a period of two years.[1738] The period of application of the French safeguard measure on MS1/RF1 oilseed rape (EC-161) was extended twice, namely in July 2001[1739] and July 2003.[1740]

Is the French safeguard measure on MS1/RF1 oilseed rape (EC-161) an SPS measure?

7.2704 We start with the issue of whether the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2705 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2706 The **United States** notes that according to the SCP, France justified the ban based on its "concern over the environmental impact of genetic escape" and the "spread of herbicide tolerance" to other plants. This justification indicates that the French measures are sanitary and phytosanitary measures as they are applied "to protect [...] plant life or health" from the "spread of pests" and "prevent or limit other damage" from the "spread of pests".

[1736] C/UK/94/M1/1.
[1737] Commission Decision 96/158, 6 February 1996.
[1738] France, Ministry of Agriculture and Fishing, Decree of 16 November 1998 involving suspension of the commercialisation of genetically modified colza by virtue of Article 16 of Directive 90/220/European Communities of 23 April 1990, pursuant to Decision 96/158 of 6 February 1996, Official Journal, No. 267, 18 November 1998, at 17379 (Exhibits US-60; CDA-68).
[1739] France, Ministry of Agriculture and Fishing, Decree of 26 July 2001 regarding suspension of the sale of genetically modified colza by virtue of Article 16 of Directive 90/220/European Communities of 23 April 1990, pursuant to Decision 96/158/European Communities of 6 February 1996, Official Journal, 30 August 2001 at 13903 (Exhibit CDA-70).
[1740] France, Ministry of Agriculture, Food, Fisheries and Rural Affairs, Order of 25 July 2003 suspending the marketing of genetically modified rapeseed pursuant to Article 23 of Directive 2001/18/European Communities of 12 March 2001, Official Journal, 14 August 2003 at 14061 (Exhibit CDA-71).

7.2707 **Canada** notes that the French safeguard measure against MS1/RF1 oilseed rape (EC-161) is predicated on concerns that its release into the environment may have detrimental effects on the surrounding plant life or health. More specifically, France indicated that it was concerned about genetic escape from the biotech varieties, leading to the transfer of herbicide resistance through hybridization with wild oilseed rape varieties. In essence, the concerns of France were related to potential risks arising from the release into the environment of the biotech oilseed rape varieties because of their alleged potential to function as a pest in relation to the surrounding environment, and in particular, to out-cross with wild species of oilseed rape.

7.2708 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects of management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2709 In examining the purposes for which France's measure on MS1/RF1 oilseed rape (EC-161) is applied, the **Panel** will first consider the document notified by France to the Commission in November 1998 which sets out the reasons for suspending the placing on the market of MS1/RF1 oilseed rape (EC-161) for an initial period of two years (hereafter the "Reasons document").[1741]

7.2710 In the Reasons document, France justifies its safeguard measure on MS1/RF1 oilseed rape (EC-161) on the basis of alleged risks to the environment. In particular, France was concerned with the potential dissemination of the herbicide-tolerance gene into the environment through hybridisation with other plant species, as well as among different varieties of oilseed rape. France notes that while experimental platforms have been set up to measure and quantify on an agronomic scale the extent and consequences of gene flows in various species, including oilseed rape, knowledge in this area is still fragmented. It further notes that the agricultural practices at issue must be considered in the broader context of their global impact on the environment.

7.2711 We note that France's decision to extend the application of its safeguard measure suspending the placing on the market of MS1/RF1 oilseed rape (EC-161) in July 2001[1742] and July 2003[1743] was based on opinions from the French "Commission du Génie biomoléculaire" (hereafter the "Biomolecular Engineering Committee" or "BEC"), delivered in February 2001[1744] and July 2003[1745] respectively, at the request of the French authorities. In its February 2001 opinion, the BEC invokes the need to pursue scientific experiments with a view to complete current scientific knowledge and to validate risk management options for the cultivation of GM oilseed rape that could limit potential adverse effects on the environment. In particular, the BEC opinion points to the need to obtain additional information on the effects of pollen dispersal from oilseed rape plants and the role of

[1741] The document entitled "*Motivation du moratoire, pour une période de deux ans, relative à la mise en marché sur le territoire français de colza génétiquement modifié tolérant aux herbicides, en application de l'Article 16 de la Directive 90/220/EEC: Nouveaux éléments en matière d'évaluation du risque pour l'environnement*" sets out the reasons for France's safeguard measures on MS1/RF1 oilseed rape and Topas oilseed rape (Exhibits EC-161/At. 2 and EC-162/At. 5).

[1742] The Panel notes that this decision adopted by France on 26 July 2001 to suspend the placing on the market of MS1/RF1 for a period of two years, was not submitted to the Panel.

[1743] The safeguard measure was renewed on the basis of Article 23 of Directive 2001/18 (Exhibits EC-161/At. 3 and EC-161/At. 5).

[1744] It is not clear to the Panel whether this opinion of the BEC was submitted as evidence by the European Communities. We note that the documents contained in Exhibits EC-161/At. 7 and EC-161/At. 8, which seem to be translations of the document contained in EC-161/At. 6, are not dated.

[1745] Exhibit EC-161/At. 9.

insects in its transport, as well as the effects of persistence of oilseed rape plants resulting from seed dispersal during transportation and pollenisation of neighbouring oilseed rape plants. The opinion further indicates that modalities for management are necessary in order to limit the direct and indirect effects of re-growth of oilseed rape in the case of herbicide tolerance, and that large scale experiments are necessary in order to validate such modalities.

7.2712 In its July 2003 opinion, the BEC pointed to the existence of new elements of information, including, *inter alia*, with respect to the issues of pollen dispersal, characterization of inter-specific hybrids and re-growth. The BEC considered that these new elements of information required further analysis in order to determine whether they put into question the conclusions of the February 2001 opinion, on which the decision to maintain the safeguard measure on MS1/RF1oilseed rape (EC-161) was based.[1746] To this end, the BEC recommended the organization of a scientific workshop to take stock of ongoing research and to eventually identify modalities for the management of genetically modified oilseed rape. [1747]

7.2713 We note that France further elaborated on its concerns with respect to MS1/RF1 oilseed rape (EC-161) in a Note addressed to the Commission in July 2003 regarding the extension of the safeguard measure. In this Note, France recalls that the decision to apply a safeguard measure on MS1/RF1 oilseed rape (EC-161) is based on the potential risk of contamination of conventional oilseed rape by genetically modified oilseed rape.[1748]

7.2714 A further informal Note was provided by France to the Commission after the establishment of the Panel.[1749] The Note recalls the concerns underlying, *inter alia*, the safeguard measure on MS1/RF1 oilseed rape (EC-161) , including those relating to the environmental consequences of gene transfer to other plants and the economic consequences of contamination (co-existence issue). The Note indicates that the BEC was to hold a scientific workshop in November 2003 and that the safeguard measure on MS1/RF1 oilseed rape (EC-161) might be withdrawn if after the workshop the BEC provided favourable scientific advice on the outstanding concerns. Looking ahead, the Note concludes that the maintenance of the safeguard measure at issue was justified at the time by the precautionary principle, pending a clearer and more complete scientific picture. The Note goes on to state, however, that the safeguard measure would in any event not be withdrawn before the entry into force of the new EC regulations on labelling and traceability as well as on GM food and feed.

7.2715 Finally, we note that the BEC delivered an opinion in February 2004 based on the conclusions of a scientific workshop held in November 2003.[1750] The opinion concludes that the cultivation of MS1/RF1 oilseed rape (EC-161) does not present any direct risk for the environment, but that modalities are nonetheless required to manage indirect ecological risks, which are related to practices associated with the cultivation of MS1/RF1 oilseed rape (EC-161).

7.2716 Based on the foregoing, we consider that at the time of review by the Panel, France applied its safeguard measure to address concerns about:

(1) transfer of the herbicide-tolerance gene to adventitious flora;

[1746] Exhibit EC-161/At. 9. *See also* Exhibit EC-161/At. 5.

[1747] *Ibid.*

[1748] Exhibit EC-161/At. 3.

[1749] Exhibit EC-161/At. 4. While the document is not dated, we note that it makes reference to the proceedings before this Panel, thus suggesting that the document was circulated after the establishment of the Panel.

[1750] Exhibit EC-161/At. 10.

(2) adverse effects on the environment, including from persistence and management practices associated with the cultivation of MS1/RF1 oilseed rape (EC-161); and
(3) contamination of conventional oilseed rape by genetically modified oilseed rape.

7.2717 The European Communities asserts that France's safeguard measure on MS1/RF1 oilseed rape (EC-161) is also applied in view of concerns about labelling, but provides no substantiation or explanation of this assertion. The labelling concern asserted by the European Communities was not articulated by France in any of the documents discussed by us above which date from before the date of establishment of this Panel. However, as we have pointed out, after the establishment of the Panel, France in an informal Note to the Commission made reference to the new EC regulation on labelling and traceability as well as to the new EC regulation on GM food and feed. These regulations contain new labelling requirements. Nevertheless, for the reasons which follow, we are not persuaded that it can be inferred from this post-2003 reference to labelling that France in August 2003 applied its safeguard measure on MS1/RF1 oilseed rape (EC-161) to address concerns about labelling.

7.2718 To begin with, we recall that according to the Note the relevant safeguard measure is justified by the precautionary principle, pending a clearer and more complete scientific picture. Insufficient labelling is not claimed as a separate justification. Indeed, the Note indicates that in July 2003 France extended its safeguard measure for one year on the basis of scientific advice received from the BEC in July 2003. Moreover, the reference to labelling is made in a forward-looking context, *i.e.*, in the context of a discussion of the "way ahead".[1751] It is clear from the Note that France at the time was waiting for further advice from the BEC (in the wake of the November 2003 scientific workshop to be held by the BEC) which it said could lead to the withdrawal of the safeguard measure if the outstanding concerns were satisfactorily addressed by the BEC. The Note states, however, that even if the BEC were to offer favourable scientific advice, France would not withdraw its safeguard measure prior to the entry into force of the new EC regulations. We consider that it may be appropriate to infer from this statement that in case of favourable advice from the BEC following the November 2003 workshop, concerns about labelling would be the reason for maintaining the safeguard measure.[1752] But we do not think that it may be properly inferred from this forward-looking statement that concerns about labelling were a reason for applying the relevant safeguard measure in August 2003, when France was still waiting for the results of the November 2003 scientific workshop and subsequent scientific advice from the BEC. In the light of this, as indicated, we are not persuaded that France at the time of review by the Panel was applying its safeguard measure to address concerns about labelling as asserted by the European Communities.

7.2719 Having determined the purposes for which France applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of France's safeguard measure.

Transfer of the herbicide-tolerance gene to adventitious flora

7.2720 We turn first to France's stated objective for prohibiting the placing on the market of MS1/RF1 oilseed rape (EC-161) due to concerns over the transfer of the herbicide-tolerance gene contained in MS1/RF1 oilseed rape (EC-161) to adventitious flora. We understand this to be essentially a concern about the potential environmental impacts associated with gene transfer from

[1751] The Note uses the French word "perspectives".
[1752] We note in this context that the Note in question is an informal note which bears no official letterhead nor a date or signature which would allow us to confirm that the views expressed in the Note are attributable to, and expressed on behalf of, France.

MS1/RF1 oilseed rape (EC-161) to adventitious flora, and in particular about the environmental impacts of the possible development of herbicide resistant weeds.

7.2721 We recall our finding in Section VII.C that cross-breeds between conventional and GM plants could be regarded as "pests" for the purposes of Annex A(1), to the extent they have undesired introduced traits (such as herbicide resistance) and harm animal or plant life or health or result in other damage. We have determined on that basis that measures applied to protect animal or plant life or health from risks arising directly (*e.g.*, through changes in selective advantage) from the entry, establishment or spread of cross-breeds with undesired traits resulting from the transfer of genetic material from a GM plant fall within the scope of Annex A(1)(a), while measures applied to prevent "other damage" to the environment from the entry, establishment or spread of cross-breeds fall within the scope of Annex A(1)(d).

7.2722 In addition, we recall that one possible concern arising from cross-breeds that have acquired herbicide resistance is that they may lead to the need for an increased use of the same herbicides, or different, more toxic herbicides, to control the resistant weeds. We determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of cross-breeds *qua* relevant pest. We deduced from this that measures applied to avoid such indirect adverse effects on the environment fall within the scope of Annex A(1)(a) and (d).

7.2723 Consistent with our reasoning above, we consider that France's safeguard measure on MS1/RF1 oilseed rape (EC-161), to the extent it is applied to avoid risks to the environment associated with the transfer of the herbicide-tolerance gene contained in MS1/RF1 oilseed rape (EC-161) to adventitious flora, and in particular the development of resistance in weeds, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

> *Adverse effects on the environment, including from persistence and management practices associated with the cultivation of MS1/RF1 oilseed rape*

7.2724 We turn now to the next objective stated by France for prohibiting the placing on the market of MS1/RF1 oilseed rape (EC-161), namely, France's concerns over potential adverse effects on the environment, including the environmental effects of persistence resulting from seed dispersal during transportation and of management techniques associated with the cultivation of MS1/RF1 oilseed rape (EC-161).

7.2725 In Section VII.C we have found that to the extent a measure is applied to avoid adverse effects on plant life or health that might arise if GM plants crowd out or eliminate other plants due to a potential competitive advantage, invasiveness or persistence, such a measure would be covered by Annex A(1)(a), as it would be applied "to protect [...] plant life or health […] from risks arising from the entry, establishment or spread" of GM plants *qua* "pests".

7.2726 In Section VII.C we also found that to the extent that GM plants may result in changes in plant populations, this may increase or decrease the food available for particular animal populations and thus enhance, or detract from, the fitness and health of these animal populations, which in turn may have a deleterious effect on the life or health of plants, *e.g.*, by affecting their ability to reproduce. We state that, by causing harm to the health of animals or other plants in this way, the GM plants would act as "pests" within the meaning of Annex A(1), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a).

7.2727 Moreover, we stated that to the extent a measure is applied to avoid adverse effects on the life or health of animals or plants which arise from particular management (weed control) practices associated with GMOs, such a measure falls within the scope of Annex A(1)(a), in that it can be viewed as a measure applied to protect the life or health of animals or plants from risks arising indirectly from the entry, establishment or spread of weeds *qua* "pests".

7.2728 Finally, we found that to the extent a measure seeks to avoid adverse effects of GMOs on the environment other than adverse effects on animal or plant life or health, such a measure can be considered to be covered by Annex A(1)(d), inasmuch as it can be viewed as a measure which is applied to prevent or limit "other damage" from the entry, establishment or spread of "pests". As noted earlier, the GMOs themselves might qualify as the relevant pest, or other plants or animals might become pests as a result of the release of GMOs into the environment. Furthermore, we said that to the extent that a measure is applied to avoid adverse environmental effects arising from management (weed control) practices associated with GMOs other than damage to the life or health of animals or plants, that measure can be considered as a measure applied to prevent or limit "other damage" resulting indirectly from the entry, establishment or spread of weeds *qua* "pests" and would thus also be covered by Annex A(1)(d).

7.2729 Consistent with our reasoning above, we consider that France's safeguard measure on MS1/RF1 oilseed rape (EC-161), to the extent it is applied to avoid adverse effects on the environment, including from management practices associated with the cultivation of MS1/RF1 oilseed rape (EC-161), falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Contamination of conventional oilseed rape by genetically modified oilseed rape

7.2730 We finally address France's concern with regard to the risk of contamination of conventional oilseed rape by genetically modified oilseed rape, *i.e.*, MS1/RF1 oilseed rape (EC-161).

7.2731 We have already addressed France's concern about the possible transfer of the introduced herbicide-tolerance gene from MS1/RF1 oilseed rape to adventitious flora, which includes gene transfer from MS1/RF1 oilseed rape to different species (resulting in inter-specific hybrids), but also includes gene transfer to wild or cultivated conventional oilseed rape. Thus, for the reasons which we have outlined above, we consider that to the extent France's safeguard measure on MS1/RF1 oilseed rape is applied to avoid adverse environmental effects arising from the contamination of conventional oilseed rape by MS1/RF1 oilseed rape due to gene transfer from MS1/RF1 oilseed rape to conventional oilseed rape, it falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

7.2732 In our understanding, France's concern about contamination of conventional oilseed rape is also a concern that farmers cultivating conventional oilseed rape might experience a loss of economic value of their crop due to the existence of unwanted genetically modified oilseed rape plants in their fields. The loss would result from the circumstance that the farmers might no longer be able to market their crops as non-GM crops. Even if France's concern about contamination were understood in this way, however, France's safeguard measure would, in our view, fall within the scope of Annex A(1) of the *SPS Agreement*.

7.2733 We recall in this regard that in Section VII.C we found that the term "other damage" as it appears in Annex A(1)(d) includes economic damage which arises from the entry, establishment or spread of pests and which is not a consequence of damage to the life or health of animals or plants. We also found that plants growing where they are undesired can be considered as "pests". Such plants include cross-breeds between GM oilseed rape and conventional oilseed rape which grow in a

conventional oilseed rape field as a result of pollen dispersal. Such plants further include GM oilseed rape plants growing in a conventional oilseed rape field as a result of unintentional dispersal of GM seed. Thus, we consider that to the extent France's safeguard measure on MS1/RF1 oilseed rape (EC-161) is applied to prevent economic damage resulting from the contamination of conventional oilseed rape due to the entry, establishment or spread of MS1/RF1 oilseed rape (via dispersal of GM seed), or of cross-breeds between MS1/RF1 oilseed rape and conventional oilseed rape (via dispersal of GM pollen), in cultivated conventional oilseed rape fields, it falls within the scope of Annex A(1)(d) of the *SPS Agreement*.

7.2734 In view of the above findings, we consider that France's safeguard measure on MS1/RF1 oilseed rape (EC-161), to the extent it is applied to avoid adverse effects arising from the possible contamination of conventional oilseed rape by MS1/RF1 oilseed rape (EC-161), falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2735 In the light of the above considerations, we conclude that the safeguard measure applied by France with respect to MS1/RF1 oilseed rape (EC-161) qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2736 We now turn to the issue of form and nature of France's safeguard measure on MS1/RF1 oilseed rape (EC-161). We start by recalling the Parties' arguments on this matter.

7.2737 The **United States** argues that the measure is in the form of a "decree" from the French Minister of Agriculture and Fishing, which is among the types of measures explicitly mentioned in Annex A(1) of the *SPS Agreement*.

7.2738 **Canada** argues that the French measure is in the form of a "decree", one of the types of measures expressly enumerated in Annex A(1) of the *SPS Agreement*.

7.2739 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms.[1753] Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered "requirements". The second example would constitute a negative requirement.

7.2740 We note that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) was implemented through a decree to prohibit commercialisation of MS1/RF1 oilseed rape (EC-161). Annex A(1) specifically refers to "decrees". We therefore consider that, for the purposes of Annex A(1), the French decree is an SPS measure in respect of the form of the measure.

7.2741 In respect of the nature of the French measure, we note that the decree prohibits the marketing of MS1/RF1 oilseed rape (EC-161). As indicated above, we are of the view that a prohibition on the

[1753] *See supra*, para. 7.1334.

marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2742 We therefore conclude that the safeguard measure taken by France with respect to MS1/RF1 oilseed rape qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2743 We have now considered France's safeguard measure on MS1/RF1 oilseed rape (EC-161) in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that France's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure applied by France with respect to MS1/RF1 oilseed rape (EC-161) constitutes an "SPS measure" within the meaning of Annex A(1).

7.2744 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the French safeguard measure could be considered to embody more than one SPS measure. However, neither the United States nor Canada or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the French safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the French safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2745 We now turn to the issue of whether France's safeguard measure on MS1/RF1 oilseed rape (EC-161) is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for France's safeguard measure on MS1/RF1 oilseed rape (EC-161) to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2746 The **United States** argues that the measure adopted by France prohibits the "placing on the market" of MS1/RF1 oilseed rape (EC-161), thereby effectively blocking the importation of the product.

7.2747 **Canada** argues that the measure suspends commercialization of MS1/RF1 oilseed rape (EC-161), as well as prohibiting its importation on the French territory. Since the measure effectively blocks market access for the targeted biotech product, it clearly affects international trade.

7.2748 The **Panel** notes that the arguments of the parties regarding the effects on trade of France's safeguard measure on MS1/RF1 oilseed rape (EC-161) are essentially the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609 above. Therefore, in view of the fact that France's safeguard measure prohibits imports of MS1/RF1 oilseed rape (EC-161), we have no difficulty concluding that the safeguard measure applied by France is an SPS measure

which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2749 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(vi) France – Topas oilseed rape

7.2750 We now turn to the safeguard measure applied by France on Topas oilseed rape. We recall that the application for placing on the market, growing and obtaining seeds of this oilseed rape was initially submitted to the United Kingdom.[1754] The product was authorized by the European Commission in April 1998.[1755] In November 1998, France adopted a Decree suspending the placing on the market of Topas oilseed rape for a period of two years.[1756] This Decision, which was taken on the basis of Article 16 of Directive 90/220, was notified to the Commission in May 1999. The period of application of the French safeguard measure on Topas oilseed rape was extended twice, namely in July 2001[1757] and July 2003.[1758]

Is the French safeguard measure on Topas oilseed rape an SPS measure?

7.2751 We start with the issue of whether the French safeguard measure on Topas oilseed rape is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

[1754] C/UK/95/M5/1.

[1755] Commission Decision 98/291, April 1998.

[1756] France, Ministry of Agriculture and Fishing, Decree of 16 November 1998 involving suspension of the commercialization of genetically modified colza by virtue of Article 16 of Directive 90/220 of 23 April 1990, pursuant to Decision 98/291 of 22 April 1998, Official Journal, 18 November 1998, at 17379 (Exhibit CDA-64).

[1757] France, Ministry of Agriculture and Fishing, Decree of 26 July 2001 regarding suspension of the sale of genetically modified colza by virtue of Article 16 of Directive 90/220/European Communities of 23 April 1990, pursuant to Decision 96/158/European Communities of 6 February 1996, Official Journal, 30 August 2001 at 13903 (Exhibit CDA-70).

[1758] France, Ministry of Agriculture, Food, Fisheries and Rural Affairs, Order of 25 July 2003 suspending the marketing of genetically modified rapeseed pursuant to Article 23 of Directive 2001/18/European Communities of 12 March 2001, Official Journal, 14 August 2003 at 14061 (Exhibit CDA-71).

Purpose of the safeguard measure

7.2752 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2753 The **United States** notes that according to the SCP, France justified the ban based on its "concern over the environmental impact of genetic escape" and the "spread of herbicide tolerance" to other plants. This justification indicates that the French measures are sanitary and phytosanitary measures as they are applied "to protect [...] plant life or health" from the "spread of pests" and "prevent or limit other damage" from the "spread of pests".

7.2754 **Canada** notes that the French safeguard measure against Topas oilseed rape is predicated on concerns that its release into the environment may have detrimental effects on the surrounding plant life or health. More specifically, France indicated that it was concerned about genetic escape from the biotech varieties, leading to the transfer of herbicide resistance through hybridization with wild oilseed rape varieties. In essence, the concerns of France were related to potential risks arising from the release into the environment of the biotech oilseed rape varieties because of their alleged potential to function as a pest in relation to the surrounding environment, and in particular, related wild species of oilseed rape.

7.2755 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2756 The **Panel** observes that the French decisions to suspend the placing on the market of Topas oilseed rape identify exactly the same purposes for this safeguard measure at the time of review by the Panel as those invoked by France with respect to its safeguard measure on MS1/RF1 oilseed rape.[1759] Thus, based on the relevant information provided by the Parties, we consider that at the time of review by the Panel, France applied its safeguard measure on Topas oilseed rape to address concerns about:

(1) transfer of the herbicide-tolerance gene to adventitious flora;
(2) adverse effects on the environment, including from persistence; and
(3) contamination of conventional oilseed rape by genetically modified oilseed rape.

7.2757 The European Communities asserts that France's safeguard measure on Topas oilseed rape is also applied in view of concerns about labelling, but provides no substantiation or explanation of this assertion. The labelling concern asserted by the European Communities was not articulated by France in any of the relevant documents which date from before the date of establishment of this Panel. However, after the establishment of the Panel, France in an informal Note to the Commission made reference to the new EC regulation on labelling and traceability as well as to the new EC regulation on GM food and feed.[1760] We have already examined this document in the context of our analysis of the French safeguard measure on MS1/RF1 oilseed rape. Since the document also concerns the French safeguard measure on Topas oilseed rape, our earlier analysis is applicable to the safeguard

[1759] We note, however, that unlike MS1/RF1 oilseed rape, Topas oilseed rape was not approved for cultivation. It was approved for import, storage and processing.

[1760] Exhibit EC-161/At. 4.

measure on Topas oilseed rape as well. Thus, for the reasons we have outlined earlier in paragraph 7.2718, we are not persuaded that it can be inferred from the post-2003 reference to labelling in the French Note that France in August 2003 applied its safeguard measure on Topas oilseed rape to address concerns about labelling.

7.2758 Having determined the purposes for which France applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of France's safeguard measure.

Transfer of the herbicide-tolerance gene to adventitious flora

7.2759 Considering first France's stated objective for prohibiting the placing on the market of Topas oilseed rape due to concerns over the transfer of the herbicide-tolerance gene contained in Topas oilseed rape to adventitious flora, we recall our analysis of this concern in the context of our discussion of France's safeguard measure on MS1/RF1 oilseed rape.

7.2760 Consistent with our reasoning there, we consider that France's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid risks associated with the transfer of the herbicide-tolerance gene contained in Topas oilseed rape to adventitious flora, and in particular the development of resistance in weeds due to cultivation of Topas oilseed rape, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Adverse effects on the environment, including from persistence

7.2761 We turn now to the next objective stated by France for prohibiting the placing on the market of Topas oilseed rape, namely, France's concerns over potential adverse effects on the environment, including the environmental effects of persistence resulting from seed dispersal during transportation.[1761] We recall our analysis of this concern in the context of our discussion of France's safeguard measure on MS1/RF1 oilseed rape.

7.2762 Consistent with our reasoning there, we consider that France's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid adverse effects on the environment, including from persistence, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Contamination of conventional oilseed rape by genetically modified oilseed rape

7.2763 We address finally France's concern with regard to the risk of contamination of conventional oilseed rape by genetically modified oilseed rape. We recall in this regard our analysis of this concern in the context of our discussion of France's safeguard measure on MS1/RF1 oilseed rape.

7.2764 Consistent with our reasoning there, we consider that France's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid adverse environmental or economic effects arising from the possible contamination of conventional oilseed rape by Topas oilseed rape, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

[1761] Since Topas oilseed rape was not approved for cultivation, our analysis in the context of MS1/RF1 oilseed rape relating to the adverse environmental effects resulting from management practices associated with the cultivation of MS1/RF1 oilseed rape is not applicable here.

Conclusion with regard to the purpose of the safeguard measure

7.2765 In the light of the above considerations, we therefore conclude that the safeguard measure applied by France with respect to Topas oilseed rape qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2766 We now turn to the issue of the form and nature of France's safeguard measure on Topas oilseed rape. We note that the Parties have made the same arguments with respect to France's safeguard measure on Topas oilseed rape as for France's safeguard measure on MS1/RF1 oilseed rape (EC-161).

7.2767 Consistent with our analysis with respect to France's safeguard measure on MS1/RF1 oilseed rape (EC-161), we conclude that France's safeguard measure on Topas oilseed rape qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2768 We have now considered France's safeguard measure on Topas oilseed rape in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that France's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure applied by France with respect to Topas oilseed rape constitutes an "SPS measure" within the meaning of Annex A(1).

7.2769 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the French safeguard measure could be considered to embody more than one SPS measure. However, neither the United States nor Canada or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the French safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the French safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2770 We now turn to the issue of whether France's safeguard measure on Topas oilseed rape is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for France's safeguard measure on Topas oilseed rape to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2771 The **United States** argues that the measure adopted by France prohibits the "placing on the market" of Topas oilseed rape, thereby effectively blocking the importation of the product.

7.2772 **Canada** argues that the measure suspends commercialization of Topas oilseed rape, and prohibits its importation on the French territory. Since the measure effectively blocks market access for the targeted biotech product, it clearly affects international trade.

7.2773 The **Panel** notes that the arguments of the parties regarding the effects on trade of France's safeguard measure on Topas oilseed rape are essentially the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609 above. Therefore, in view of the fact that France's safeguard measure prohibits imports of Topas oilseed rape, we have no difficulty concluding that the safeguard measure applied by France is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2774 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the French safeguard measure on Topas oilseed rape is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that the French safeguard measure on Topas oilseed rape is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(vii) Germany – Bt-176 maize

7.2775 We now turn to the safeguard measure applied by Germany on Bt-176 maize. We recall that the application for placing on the market of this product was initially submitted to France.[1762] The product was authorized by the European Commission in 1996.[1763] Germany informed the Commission of its decision to restrict the authorization for the placing on the market of Bt-176 maize in a letter dated 2 March 2000.[1764] Germany amended its original decision on Bt-176 maize by a further decision adopted on 31 March 2000.[1765] This amended decision suspends the placing on the market of Bt-176 maize and its progeny in Germany, unless cultivation is intended for research and

[1762] C/F/94/11-03.
[1763] Commission Decision 97/98 (Exhibits US-97; ARG-37).
[1764] The letter is from the Robert Koch Institute (Exhibit EC-158/At. 19_trans).
[1765] Exhibits US-65; ARG-13.

testing purposes in certain specified areas.[1766] This decision was notified to the Commission in April 2000.[1767]

Is the German safeguard measure on Bt-176 maize an SPS measure?

7.2776 We start with the issue of whether Germany's safeguard measure on Bt-176 maize is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2777 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2778 The **United States** notes that the concerns expressed by Germany with regard to Bt-176 maize include the effect of Bt toxin on non-target organisms, the development of insect resistance to Bt toxin, and the transfer of antibiotic resistant genes to humans and animals. On the basis of these justifications, the United States argues that the German safeguard measure is an SPS measure, as it is applied to "protect animal life or health" from "disease-causing organisms"; or "protect human life or health" from "toxins" or "disease-causing organisms in foods"; or "to prevent or limit [...] damage" from the "spread of pests".

7.2779 **Argentina** argued that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2780 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; toxicity or allergenicity; persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2781 The **Panel** notes that Germany sets out its reasons for adopting the safeguard measure on Bt-176 maize in a letter to the Commission dated 4 April 2000.[1768] In this document, Germany refers to recent laboratory investigations and relevant studies with insect species which suggest that the ingestion of pollen from maize plants expressing Bt-toxin may produce harmful effects in non-target

[1766] The prohibition did not apply in the case of cultivation intended for research and testing purposes in the following areas: effects on target or non-target organisms, the development of resistance, counter measures to resistance development, horizontal or vertical gene transfer, ecological assessments or the enhancement of agronomic and plant protection knowledge for practical application.

[1767] The amended decision was notified to the Commission on 4 April 2000 (Exhibit EC-158/At. 21), and again on 28 April 2000 with the relevant scientific evidence considered by Germany in the context of the adoption of its safeguard measure (Exhibits EC-158/At. 23-29).

[1768] Exhibit EC-158/At. 21. The Panel notes that the concerns of Germany with respect to Bt-176 maize are also outlined in the letter of 31 March 2000 (Exhibit US-65).

insects through their absorption of the Bt-toxin.[1769] Germany notes that in the case of unrestricted cultivation, resistance to Bt toxin may develop in maize pests and non-target organisms, thereby impeding the applicability of Bt toxin as a pesticide. Other studies reported that Bt toxin enters the soil from the roots of genetically modified maize plants. Germany submits that these studies suggest that if cultivation is unrestricted, the presence of Bt toxin could have adverse effects on living organisms in the soil. Finally, Germany notes that the cultivation of a transgenic variety with antibiotic-resistant genes might increase the development of antibiotic resistance following the ingestion of the gene by humans and animals.

7.2782 Based on the foregoing, we consider that at the time of review by the Panel, Germany applied its safeguard measure on Bt-176 maize to address concerns about:

(1) effects on non-target organisms;
(2) the development of resistance to Bt toxin in insects;
(3) possible adverse effects of the Bt toxin in the soil; and
(4) the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans and animals.

7.2783 The European Communities asserts that Germany's safeguard measure on Bt-176 maize is also applied in view of concerns about labelling and co-existence. These asserted concerns were not articulated by Germany in the documents discussed by us above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Germany is applying its safeguard measure to address these additional concerns identified by the European Communities.

7.2784 Having determined the purposes for which Germany applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Germany's safeguard measure.

Effects on non-target organisms

7.2785 We begin our analysis with the purpose of managing potential risks associated with effects on non-target organisms.

7.2786 We refer to our conclusions in Section VII.C that a GM crop that is eaten by animals can be considered to be a "food" for that animal. This would include, for example, pollen of the GM crop which is consumed by insects and GM plants consumed by non-target insects, deer, rabbits or other wild fauna. As we previously noted, a poisonous substance, such as the Bt toxin, which is produced by a GM crop could qualify as a "toxin" within the meaning of Annex A(1)(b).[1770] We determined on that basis that measures applied to protect the life or health of animals (not including target organisms) from risks arising from toxins produced in GM plants are covered by Annex A(1)(b).

7.2787 Moreover, we indicate in Section VII.C our view that if a GM plant produces a poisonous substance which could adversely affect the health of non-target organisms, even if the non-target organisms do not eat the GM plant, *e.g.* through exposure other than through ingestion of food, the GM plant could be considered a "pest" within the meaning of Annex A(1)(a). Thus, a measure

[1769] It is noted, however, that adverse effects are not expected in respect of the specified cultivation purposes if the quantity sown is limited to 12 tonnes per year in a cultivation area limited to 500 hectares.

[1770] We recall our view that the term "toxin" as it appears in Annex A(1)(b) includes allergens.

applied to protect from risks arising from such exposure to GM plants would, in our view, fall within the scope of Annex A(1)(a).

7.2788 In addition, in Section VII.C we conclude that to the extent that GM plants may result in changes in animal or plant populations, this may increase or decrease the food available for particular non-target animal populations and thus alter the fitness and health of these animal populations, which may in turn lead to further deleterious effects on the life or health of animals or other plants. We also recall our conclusion that by causing harm to the health of animals or other plants in this way, GM plants would act as "pests" within the meaning of Annex A(1), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a). Furthermore, we found that Annex A(1)(a) covers measures applied to protect animal or plant life or health from risks arising directly or indirectly from the entry, establishment or spread of cross-breeds with undesired traits (such as insecticidal traits) resulting from transfer of genetic material from a GM plant.

7.2789 Consistent with our reasoning above, we consider that Germany's safeguard measure on Bt-176 maize, to the extent it is applied to avoid potential risks to the health of non-target organisms from the consumption of Bt-176 maize, falls within the scope of Annex A(1)(b) of the *SPS Agreement*. Furthermore, to the extent that Germany's safeguard measure is applied to avoid other potential adverse effects on non-target organisms arising from Bt-176 maize, it falls within the scope of Annex A(1)(a) of the *SPS Agreement*.

Development of resistance to Bt toxin in insects

7.2790 Turning next to the concern regarding the development of resistance to Bt toxins in insects, we refer to our analysis of this type of concern in Section VII.C and in the context of our discussion of Austria's safeguard measure on Bt-176 maize above.

7.2791 We refer to our analysis in Section VII.C regarding the development of pesticide-resistance in target organisms. We found that resistant target organisms (insects) could be regarded as "pests" within the meaning of Annex A(1), inasmuch as they present a risk to animal, plant or human life or health or result in other damage. We further determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of resistant target organisms *qua* relevant pest. We found that to the extent that a measure seeks to avoid such risks and damage, it can be considered to be covered by Annex A(1)(a) and (d) of the *SPS Agreement*.

7.2792 Consistent with our reasoning above, we consider that Germany's safeguard measure on Bt-176 maize, to the extent it is applied to protect from risks associated with the development of resistance to Bt toxin in insects due to the cultivation of Bt-176 maize, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Possible adverse effects of the Bt toxin in the soil

7.2793 We turn next to Germany's concern related to the possible adverse effects of the Bt toxin in the soil. We understand Germany's concern to be about adverse effects on living organisms in the soil.

7.2794 In Section VII.C, we found that the phrase "animal and plant" in Annex A(1) covers also soil microfauna or –flora. In addition, we found that to the extent that GM plants might affect the life or health of non-target soil microfauna or –flora, they could be considered as "pests" in the sense of

Annex A(1). Thus, to the extent Germany's safeguard measure is applied to address concerns that Bt-176 maize might affect the life or health of non-target soil microfauna or –flora, it can, in our view, be considered to be a measure applied to protect the life or health of soil microfauna or –flora from risks arising from the entry, establishment or spread of a Bt-producing GM plant *qua* "pest" within the meaning of Annex A(1)(a) of the *SPS Agreement*.

7.2795 Consistent with our reasoning above, we consider that Germany's safeguard measure on Bt-176 maize, to the extent it is applied to avoid risks associated with adverse effects of the Bt toxin on living organisms in the soil, falls within the scope of Annex A(1)(a) of the *SPS Agreement*.

Transfer of the bla-ampicillin resistance gene to bacteria of the intestine of humans or animals

7.2796 We turn finally to Germany's stated concern regarding the potential transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of humans or animals due to consumption of Bt-176 maize. With respect to the transfer of antibiotic resistance marker genes to the intestine of humans or animals, we note that the Parties' arguments are the same as those made in relation to Austria's safeguard measures on T25 maize and Bt-176 maize. We refer to our discussion in Section VII.C regarding ARMG. More particularly, we recall that, in our view, the concern relates to the potential transfer to pathogens of ARMG present in certain GMOs, and the possible resulting decrease in effectiveness of medical treatments involving specific antibiotics which might pose a risk to the life or health of animals infected with the resistant pathogen.

7.2797 In Section VII.C we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of disease-causing organisms which have or might become resistant to antibiotics due to the transfer of ARMG from a GM plant. Similarly, we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of diseases due to the reduced effectiveness of antibiotics used to treat the pathogens which have become resistant to these antibiotics through gene transfer. Furthermore, we found that Annex A(1)(b) covers measures applied to protect human or animal life or health from risks arising indirectly, namely *via* the potential transfer to humans or animals of marker genes conferring resistance to antibiotics used in human or veterinary medicine, from additives in foods or feedstuffs. We recall in this respect that, in our view, ARMGs can be considered to be additives for the purposes of Annex A(1)(b).

7.2798 Consistent with our reasoning above, we consider that Germany's safeguard measure on Bt-176 maize, to the extent it is applied to avoid risks associated with the transfer of the *bla*-ampicillin resistance gene from Bt-176 maize to bacteria in the intestine of humans or animals, falls within the scope of Annex A(1)(a) and (b) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2799 In the light of the above considerations, we conclude that the safeguard measure applied by Germany with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2800 We now turn to the issue of the form and nature of Germany's safeguard measure on Bt-176 maize. We start by recalling the arguments of the Parties on this matter.

7.2801 The **United States** argues that the measure was in the form of a "notice" from the government agency with responsibility for the regulation of biotech products. Through this "notice", the German Government "ordered" suspension of the approval for commercialization of Bt-176 maize on the German territory. The word "order" is defined as "an authoritative direction", which is similar to the definition of "regulation". A "regulation" is among the types of measures explicitly mentioned in Annex A(1).

7.2802 **Argentina** notes that the measure was implemented by means of an amendment notice suspending the entry of Bt-176 maize. The measure has the same binding nature as a law, regulation, order or requirement.

7.2803 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms.[1771] Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered "requirements". The second example would constitute a negative requirement.

7.2804 We note that the German safeguard measure on Bt-176 maize was implemented through a decision by the Robert Koch Institute, the competent German authority, to prohibit commercialization of Bt-176 maize on the German territory. Annex A(1) does not specifically refer to "decisions". As we have pointed out, this fact alone does not necessarily mean that Germany's safeguard measure is not an SPS measure, since no specific legal form is prescribed. Germany's decision clearly is a measure attributable to the German Government. It is also not in dispute that the decision is legally binding. We therefore consider that, for the purposes of Annex A(1), the German decision may be assimilated to measures adopted in the form of "laws", "decrees" or "regulations".

7.2805 In respect of the nature of the German measure, we note that the decision prohibits the marketing of Bt-176 maize. As indicated above, we are of the view that a prohibition on the marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2806 We therefore conclude that the safeguard measure taken by Germany with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2807 We have now considered Germany's safeguard measure on Bt-176 maize in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Germany's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure applied by Germany with respect to Bt-176 maize constitutes an "SPS measure" within the meaning of Annex A(1).

7.2808 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the German safeguard measure could be considered to embody more than one SPS measure.

[1771] *See supra*, footnote 1753.

However, neither the United States nor Argentina or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the German safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the German safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2809 We now turn to the issue of whether Germany's safeguard measure on Bt-176 maize is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Germany's safeguard measure on Bt-176 maize to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2810 The **United States** argues that the measure adopted by Germany suspends the approval for commercialization of Bt-176 maize, thereby effectively blocking the importation of the product. The measure as such therefore affects international trade.

7.2811 **Argentina** notes that since the safeguard measure prevents access of Bt-176 maize to Germany, resulting in the absence of imports of this product, the measure can be said to affect international trade.

7.2812 The **Panel** notes that the arguments of the parties regarding the effects on trade of Germany's safeguard measure on Bt-176 maize are essentially the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609 above. Therefore, in view of the fact that Germany's safeguard measure prohibits imports of Bt-176 maize, we have no difficulty concluding that the safeguard measure applied by Germany is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2813 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the German safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that the German safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(viii) Greece – Topas oilseed rape

7.2814 We now turn to the safeguard measure applied by Greece with respect to Topas oilseed rape. We recall that the application for placing on the market of this product was initially submitted to the United Kingdom.[1772] The product was approved for import and processing by the European Commission in April 1998[1773], and Greece adopted its safeguard measure to prohibit imports of Topas oilseed rape pursuant to Article 16 of Directive 90/220 in September 1998.[1774]

Is the Greek safeguard measure on Topas oilseed rape an SPS measure?

7.2815 We start with the issue of whether the Greek safeguard measure on Topas oilseed rape is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2816 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A (1) of the *SPS Agreement*.

7.2817 The **United States** notes that according to the SCP, Greece justified its safeguard measure on the basis of its concern for "genetic escape" and the consequences it could have on agriculture, the natural environment of Greece and consumer health. Concerns regarding "genetic escape" relate to adverse effects from the transfer of the herbicide tolerant gene to other plants or to consuming organisms. According to the United States, the Greek measure is an SPS measure, as it is applied to protect "plant life or health" from the "spread of pests"; to protect "human life or health" from "contaminants" or "disease-causing organisms in food"; or "to prevent or limit other damage" from the "spread of pests".

7.2818 **Canada** notes that the Greek safeguard measure was predicated on concerns that release into the environment of Topas oilseed rape may have a detrimental effect on the surrounding plant life or health. More specifically, Greece indicated that it was concerned about genetic escape from the biotech varieties, leading to the transfer of herbicide resistance through hybridization with wild oilseed rape varieties. In essence, the concerns of Greece were related to potential risks arising from the release into the environment of the biotech oilseed rape varieties because of their alleged potential to function as a "pest" in relation to the surrounding environment, and in particular, related wild species of oilseed rape.

[1772] C/UK/95/M5/1.
[1773] Commission Decision 98/291 (Exhibits US-97; CDA-61).
[1774] Greece, Minister of Environment, Regional Planning and Public Works, Prohibition of seeds of the genetically-modified rape-plant line bearing reference number C/UK/95/M5/1, Government Gazette, 1008, 25 September 1998, at 11941 (Exhibits CDA-72; US-69).

7.2819 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2820 The **Panel** notes that the Ministerial decision adopted by the Greek authorities on 8 September 1998 prohibiting imports of Topas oilseed rape refers, without elaboration, to potential "risks for the natural environment of Greece".[1775] Greece provided the justification for its safeguard measure in a Note addressed to the Commission on 3 November 1998.[1776]

7.2821 In this document, Greece indicated that although the consent for Topas oilseed rape was not given for cultivation, the seeds could nonetheless escape into the environment during transport and grow into viable plants. Greece notes that since oilseed rape is capable of out-crossing and giving fertile hybrids with wild *Brassica* species, the release into the environment of oilseed rape could therefore generate hybrid plants bearing the glufosinate tolerance gene. The Greek climate would permit the spreading not only of volunteer oilseed rape plants, but also of their hybrids with wild related species in both the agricultural and the natural environment, with unpredictable consequences.[1777] Greece further notes that in Greece some of the wild plant varieties at issue are collected and consumed as food. Greece points out in this regard that if out-crossing were to confer on these wild plant varieties the herbicide resistance trait, the consequences of the consumption of these varieties would be unpredictable.

7.2822 Furthermore, in a letter form the Greek authorities to the Commission dated March 2004[1778] Greece highlights concerns about gene flow through pollen transfer to wild related species. This letter also notes that the maintenance of the safeguard measure at issue is justified by the precautionary principle, until new scientific information was available regarding risks to human health and the environment.

7.2823 Finally, we note that a memorandum was provided by Greece to the Commission in March 2004.[1779] It recalls the concerns underlying the safeguard measure on Topas oilseed rape, including those relating to the harm for wildlife and the environment and possible problems for consumers and farmers, specifically related to possible consumption of hybrids from outcrosses of Topas oilseed rape and wild plant species and the potential difficulties associated with managing herbicide tolerant weeds arising from these types of outcrosses. The memorandum concludes that the maintenance of the safeguard measure at issue is justified by the precautionary principle, pending complete scientific proof of the existence and seriousness of risks. The memorandum also states that the issue of co-existence is not relevant in the case of the oilseed rape since its import by Greece, if it were allowed, would be for the use of the product for oil extraction and not for cultivation.

7.2824 Based on the foregoing, we consider that at the time of review by the Panel, Greece applied its safeguard measure to address concerns about:

(1) adverse environmental effects of hybridisation and out-crossing;
(2) adverse environmental effects of volunteer Topas oilseed rape plants; and
(3) consumer health.

[1775] Exhibit EC-162/At. 4_trans.
[1776] *Ibid.*
[1777] *Ibid.*
[1778] Exhibit EC-162/At. 6.
[1779] Exhibit EC-162/At. 7.

7.2825 The European Communities asserts that Greece's safeguard measure on Topas oilseed rape is also applied in view of concerns about labelling and co-existence. These asserted concerns were not articulated by Greece in the documents discussed by us above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Greece is applying its safeguard measure to address these additional concerns identified by the European Communities.

7.2826 Having determined the purposes for which Greece applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Greece's safeguard measure.

Adverse environmental effects of hybridisation and out-crossing

7.2827 We begin with Greece's stated purpose of managing risks associated with the environmental impacts of hybridisation and out-crossing. We recall that the documentation reviewed by the Panel with respect to the Greek safeguard measure on Topas oilseed rape highlighted concerns regarding the potential loss of seeds during transportation, which could result in the establishment of viable biotech oilseed rape in the environment and potential hybridisation with other *Brassicae*. The Panel understands this concern to be related, *inter alia*, to potential out-crossing between Topas oilseed rape plants and unmodified plants, and the introduction of herbicide resistance in the out-crossed plants.

7.2828 We refer to our finding in Section VII.C that cross-breeds between conventional and GM plants could be regarded as "pests" for the purposes of Annex A(1), to the extent they have undesired introduced traits (such as herbicide resistance) and harm animal or plant life or health or result in other damage. We have determined on that basis that measures applied to protect animal or plant life or health from risks arising directly (*e.g.*, through changes in selective advantage) from the entry, establishment or spread of cross-breeds with undesired traits resulting from the transfer of genetic material from a GM plant fall within the scope of Annex A(1)(a), while measures applied to prevent "other damage" to the environment from the entry, establishment or spread of cross-breeds fall within the scope of Annex A(1)(d).

7.2829 In addition, we recall that one possible concern arising from cross-breeds that have acquired herbicide resistance is that they may lead to the need for an increased use of the same herbicides, or different, more toxic herbicides, to control the resistant cross-breeds. We determined that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of cross-breeds *qua* relevant pest. We deduced from this that measures applied to avoid such indirect adverse effects on the environment fall within the scope of Annex A(1)(a) and (d).

7.2830 Consistent with our findings above, we consider that Greece's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid risks to the environment associated with the transfer of the herbicide-tolerance gene contained in Topas oilseed rape to wild related species, and in particular the development of resistance in these wild hybrid plants, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Adverse environmental effects of volunteer Topas oilseed rape plants

7.2831 We next turn to Greece's concerns about other adverse environmental effects, notably adverse environmental effects of volunteer Topas oilseed rape plants which are the result of accidental dispersal of Topas oilseed rape seeds during transportation.

7.2832 In Section VII.C we found that to the extent a measure is applied to avoid adverse effects on plant life or health, including adverse effects on genetic diversity, that might arise if volunteer GM plants crowd out or eliminate other plants due to a potential competitive advantage, invasiveness or persistence, such a measure would be covered by Annex A(1)(a), as it would be applied "to protect [...] plant life or health […] from risks arising from the entry, establishment or spread" of GM plants *qua* "pests".

7.2833 In Section VII.C we also found that to the extent that volunteer GM plants may result in changes in plant populations, this may increase or decrease the food available for particular animal populations and thus enhance, or detract from, the fitness and health of these animal populations, which in turn may have a deleterious effect on the life or health of plants, *e.g.*, by affecting their ability to reproduce. We stated that, by causing harm to the health of animals or other plants in this way, the GM plants would act as "pests" within the meaning of Annex A(1), and that to the extent a measure is applied to avoid this kind of adverse effect, it can be considered a measure covered by Annex A(1)(a).

7.2834 Finally, we found that to the extent a measure seeks to avoid adverse effects of GM plants on the environment other than adverse effects on animal or plant life or health, such a measure can be considered to be covered by Annex A(1)(d), inasmuch as it can be viewed as a measure which is applied to prevent or limit "other damage" from the entry, establishment or spread of "pests". As noted earlier, the GM plants themselves might qualify as the relevant pest, or other plants or animals might become pests as a result of the release of GMOs into the environment.

7.2835 Consistent with our findings above, we consider that Greece's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid adverse effects on the environment arising from volunteer Topas oilseed rape plants, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Consumer health

7.2836 Turning last to Greece's stated concern regarding the potential risks to consumer health associated with Topas oilseed rape, we recall that Greece expressed concern with respect to consumer health, since some wild varieties of oilseed rape are apparently consumed in Greece as food. Specifically, Greece noted that if out-crossing were to confer on these wild plant varieties the herbicide resistance trait, the consequences of the consumption of these varieties would be unpredictable. We understand this concern to be related to potential adverse health effects associated with the consumption of GM material or the consumption of proteins produced through the expression of modified genes, in hybrids of conventional oilseed rape and Topas oilseed rape.

7.2837 In Section VII.C we found that Annex A(1) covers food safety risks which might potentially arise from the consumption of GM foods, namely, risks to human life or health from the presence in food of additives, contaminants, toxins (including allergens) or disease-causing organisms. More particularly, we found that genes intentionally added for a technological purpose to GM plants that are eaten or being used as an input in processed foods can be considered "additives" in foods within the meaning of Annex A(1)(b). We also recall our finding that substances which are produced through

the unintended expression of modified plant genes may be considered "contaminants" within the meaning of Annex A(1)(b). Finally, we recall our finding that a poisonous substance which is produced during the metabolism or growth of a plant, including allergens, could qualify as a "toxin" within the meaning of Annex A(1)(b). Therefore, we consider that potential risks to human health associated with consumption of hybrids of GM and conventional cultivated or wild plants can be considered to be risks associated with "additives", "contaminants" or "toxins" in foods within the meaning of Annex A(1)(b). Measures applied to protect from such food safety risks can thus be considered to fall within the scope of Annex A(1)(b).

7.2838 Greece did not specify the nature of the potential adverse health effects associated with the consumption of cross-breeds between Topas oilseed rape and wild oilseed rape. Hence, we cannot determine whether Greece's concern relates to the presence in hybrids of additives, contaminants or toxins (including allergens). However, in the absence of any information suggesting otherwise, there are no grounds for believing that Greece's concern about consumer health does not relate to any of the aforementioned types of risks potentially associated with the consumption of GM foods.

7.2839 Thus, consistent with our findings above, we consider that Greece's safeguard measure on Topas oilseed rape, to the extent it is applied to avoid risks to consumer health associated with the consumption of cross-breeds between Topas oilseed rape and wild oilseed rape, or food products derived therefrom, falls within the scope of Annex A(1)(b) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2840 In the light of the above considerations, we therefore conclude that the safeguard measure applied by Greece with respect to Topas oilseed rape qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2841 We now turn to the issue of the form and nature of Greece's safeguard measure on Topas oilseed rape. We start by recalling the arguments of the Parties on this matter.

7.2842 The **United States** argues that the measure is in the form of a ministerial decision, which is synonymous with the term "regulation", which is one of the types of measure explicitly mentioned in Annex A(1) of the *SPS Agreement*.

7.2843 **Canada** argues that the measure falls within the scope of "laws, decrees, regulations, requirements and procedures." As indicated by the use of the word "include", Annex A provides a non-exhaustive list of the forms that an SPS measure can take. The Greek measure is in the form of a "ministerial decision". Although this form of measure is not explicitly mentioned in Annex A, it can be equated to a regulation or other form of subordinate legislation, if legally binding and lawfully promulgated by the central government authorities.

7.2844 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms. Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing

of a particular product may be considered "requirements". The second example would constitute a negative requirement.

7.2845 We note that Greece's safeguard measure on Topas oilseed rape was implemented through a ministerial decision to prohibit commercialization of Topas oilseed rape on the Greek territory. Annex A(1) does not specifically refer to "ministerial decisions". As we have pointed out, this fact alone does not necessarily mean that Greece's safeguard measure is not an SPS measure, since no specific legal form is prescribed. Greece's decision clearly is a measure attributable to the Greek Government. It is also not in dispute that the decision is legally binding. We therefore consider that, for the purposes of Annex A(1), the Greek decision may be assimilated to measures adopted in the form of "laws", "decrees" or "regulations".

7.2846 In respect of the nature of the Greek measure, we note that the decision prohibits the marketing of Topas oilseed rape. As indicated above, we are of the view that a prohibition on the marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2847 We therefore conclude that the safeguard measure taken by Greece with respect to Topas oilseed rape qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2848 We have now considered Greece's safeguard measure on Topas oilseed rape in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Greece's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure applied by Greece with respect to Topas oilseed rape constitutes an "SPS measure" within the meaning of Annex A(1).

7.2849 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the Greek safeguard measure could be considered to embody more than one SPS measure. However, neither the United States nor Canada or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the Greek safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the Greek safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2850 We now turn to the issue of whether Greece's safeguard measure on Topas oilseed rape is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Greece's safeguard measure on Topas oilseed rape to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2851 The **United States** argues that the measure adopted by Greece prohibits the "importation" of Topas oilseed rape. The measure as such therefore affects international trade.

7.2852 **Canada** argues that the measure prohibits the importation of Topas oilseed rape on the Greek territory. Since the measure effectively blocks market access for the targeted biotech product, it clearly affects international trade.

7.2853 The **Panel** notes that the arguments of the parties regarding the effects on trade of Greece's safeguard measure on Topas oilseed rape are essentially the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize above. Therefore, in view of the fact that Greece's safeguard measure prohibits imports of Topas oilseed rape, we have no difficulty concluding that the safeguard measure applied by Greece is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2854 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the Greek safeguard measure on Topas oilseed rape is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that the Greek safeguard measure on Topas oilseed rape is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ix) Italy – T25 maize, MON810 maize, MON809 maize, Bt-11 maize (EC-163)

7.2855 We now turn to the Italian safeguard measure applied on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). We recall that the applications for placing on the market of these products were originally submitted to the United Kingdom.[1780] The products were authorized by the European Commission under the simplified authorization procedure set out in Article 3(4) of Regulation 258/97.[1781] By Decree of the President of the Council of Ministers dated 4 August 2000 (hereafter "the Decree"), Italy adopted a measure pursuant to Article 12 of Regulation 258/97 to suspend the commercialisation and use on its territory of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163).[1782]

[1780] Exhibit EC-163.
[1781] Commission Decision 98/292 (Exhibits CDA-80; ARG-35).
[1782] Italy, President of the Council of Ministers, Precautionary suspension of the commercialisation and utilization of certain transgenic products [Bt-11 maize (EC-163), MON810 maize, MON809 maize and T25

Is the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) an SPS measure?

7.2856 We start with the issue of whether the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is an SPS measure[1783]. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2857 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A (1) of the *SPS Agreement*.

7.2858 The **United States** notes that according to the SCF, one of the documents provided by Italy suggested that the herbicide tolerant biotech products Bt-11 maize and T25 maize could have adverse effects on consuming animals. The United States also notes that with respect to the products protected by Bt toxin (Bt-11, MON810 maize, MON809 maize), Italy cited another report which raised the issue of "occupational allerg[ies] to Bt bacterium spores in farmers using Bt pesticides". Based on these justifications, the Italian measure is an SPS measure, given that it is applied "to protect [...] animal life or health" from "contaminants, toxins or disease-causing organisms" in "feedstuffs"; or "to protect human life or health" from "toxins" in "foods".

7.2859 **Canada** notes that the Italian measure was predicated on concerns about the finding of substantial equivalence of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) to existing foodstuffs pursuant to Article 3(4) of Regulation 258/97. Canada argues that these concerns were triggered by laboratory tests which indicated that the products in question contained proteins derived from genetic modification at levels ranging from 0.04 to 30 parts per million.[1784]

7.2860 **Argentina** argued that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

7.2861 The **European Communities** argues that the main concerns with regard to T25 maize were, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health. With regard to MON810 maize, the concerns related to, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; toxicity or

---

maize] in the national territory, according to Article 12 of Regulation (European Communities) No. 258/97, 4 August 2000, Official Gazette, 8 August 2000, 184 (Exhibit EC-157/At. 1).

[1783] In respect of the safeguard measure imposed by Italy, while the complaints by the United States and Canada refer to four products, *i.e.*, Bt-11 maize (EC-163), MON809 maize, MON810 maize and T25 maize, the complaint by Argentina refers to only three products, *i.e.*, Bt-11 maize (EC-163), MON810 maize and T25 maize.

[1784] Exhibit CDA-86.

allergenicity; development of resistance; biodiversity; monitoring; labelling; co-existence; and human and animal health. Finally, with regard to MON809 maize and Bt-11, the European Communities asserts that the concerns of Italy relate to, *inter alia*, toxicity and allergenicity; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2862 The **Panel** notes that the Italian Decree sets out the reasons for Italy's decision to suspend the trade in and use of transgenic foodstuffs.[1785] In the Decree, Italy notes its concerns with respect to the simplified procedure under Regulation 258/97 pursuant to which the products at issue were authorized by the Commission. In particular, Italy points to the ambiguity of the term "substantial equivalence" in Article 3(4) of Regulation 258/97. In a letter addressed to the Commission before the adoption of the safeguard measure, the Italian authorities expressed their concern with the assessment carried out as part of the simplified procedure to evaluate whether a particular product is "substantially equivalent" to existing equivalent foods or food ingredients, in terms of its potential risks to human health or the environment.[1786] Similar concerns were also expressed in a subsequent letter addressed by the Italian Health Minister to the President of the European Commission and the Health and Consumer Protection Commissioner on 5 June 2000.[1787] The Decree further states that since it had been established that residues of modified components remain in the four products, the information available from the simplified procedure was also inadequate with regard to the risks arising from "environmental release" of the GMOs in question, or their products.

7.2863 The reasons set out in the Italian Decree are further based on opinions from the Italian *Consiglio Superiore di Sanità* (hereafter the "Superior Council of Health") and the *Istituto Superiore di Sanità* (hereafter the "Superior Institute of Health"). We note that the opinion of the Superior Council of Health of 16 December 1999 was not submitted to the Panel. However, according to the text of the Decree, the Superior Council of Health calls in its opinion for specific research to be undertaken on the consequences of genetic modifications before novel foodstuffs are placed on the market.[1788]

7.2864 The opinion of the Superior Institute of Health dated 28 July 2000, which is also mentioned in the Italian Decree, addresses the concept of "substantial equivalence" in the context of the product applications.[1789] In particular, the opinion identifies shortcomings in the original applications with respect to the data required to support the establishment of substantial equivalence of the product to its conventional counterpart.[1790] In this respect, the Superior Institute of Health notes that the maize products in question contain levels of protein deriving from the genetic modifications ranging from 0.04 to 30 parts per million and that, therefore, the foodstuff has been permanently affected by the modified elements. Italy observes in the Decree that even though the Superior Institute of Health concluded that there were no apparent risks to the health of humans or livestock from the consumption of derivatives of the biotech products, there were inadequacies in the risk assessment procedures.[1791]

[1785] *See supra*, footnote 1782.

[1786] The Decree refers to a letter from the Italian Health Minister to the European Health and Consumer Protection Commissioner dated 23 December 1999, which is referenced internally as document No. 100/338.7/13126. On the basis of this reference number, the Panel notes that this letter is one of the translated documents submitted by the European Communities in Exhibit EC-157/At. 2_trans.

[1787] Exhibit EC-157/At. 2_trans.

[1788] *See supra*, footnote 1782.

[1789] We note that this opinion from the Superior Institute of Health is one of the translated documents provided by the European Communities in Exhibit EC-158/At. 2_trans.

[1790] *Ibid.*

[1791] *See supra*, footnote 1782.

7.2865 The opinion of the Superior Institute of Health also raises the issue that the herbicide glyphosate is metabolised by the herbicide-tolerant biotech plant to a non-toxic metabolite, but that this metabolite can revert to the parent compound in the gut of test animals. The opinion of the Superior Institute mentions in this context a recently published observation on occupational allergy to Bt bacterium spores in farmers using Bt pesticides.[1792] Furthermore, the Superior Institute of Health addresses in its opinion the issue of antibiotic resistance transfer, but concludes that "[t]he effect on antibiotic resistance of a possible resistant gene transfer from the GMOs to the components of the intestinal flora is minimal compared to the prevalence of antibiotic-resistant genes normally present in the intestinal flora of humans and animals."[1793] Finally, the Institute opinion also indicates that observations regarding the risk of possible "environmental release" of the GMOs in question, or of their products, are unnecessary.

7.2866 Based on the foregoing, we consider that at the time of review by the Panel, Italy applied its safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) to address concerns about:

(1) adverse effects on consumer health due to the possibility that the herbicide glyphosate could revert from its non-toxic metabolite back to its original chemical composition in the gut of humans[1794]; and

(2) adverse effects on the environment arising from "environmental release" of the GM plants in question, or of the products derived therefrom.

7.2867 The European Communities asserts that Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is also applied in view of concerns about labelling. However, this concern asserted by the European Communities was not articulated by Italy in the documents discussed by us above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Italy is applying its safeguard measure to address the additional concern identified by the European Communities.

7.2868 Having determined the purposes for which Italy applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure.

Consumer health

7.2869 We consider first Italy's concerns regarding risks to human health arising from the consumption of food or food ingredients from the relevant GM plants, due to the possibility that the herbicide glyphosate could revert from its non-toxic metabolite back to its original chemical composition in the human gut.

7.2870 With respect to this concern, we recall our analysis in Section VII.C regarding contaminants, specifically our conclusion that the term "contaminants" in Annex A(1)(b) could encompass herbicide residues present in foods, and that these residues may have adverse effects on human life or health, such as allergenic effects. We determined on that basis that measures applied to protect human life or

[1792] *Ibid.*
[1793] *Ibid.*
[1794] This concern was raised generally in Exhibit EC-157/At. 1, and more specifically in Exhibit EC-157/At. 2.

health from risks arising from pesticide residues, and hence contaminants, in GM plants used as or in foods can be considered to fall within the scope of Annex A(1)(b).

7.2871 Consistent with our reasoning above, we consider that Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), to the extent it is applied to avoid potential risks to human health arising from residues in food of the herbicide glyphosate, which is associated with the cultivation of the aforementioned biotech products and thus linked to these products, falls within the scope of Annex A(1)(b) of the *SPS Agreement*.

Environmental release

7.2872 We now consider the second concern identified by Italy, that the information available from the simplified procedure under which the relevant GMOs were approved was inadequate with regard to risks arising from "environmental release" of the GMOs in question or their products. Although no further explanation of this concern is provided in Italy's Decree, and although the Italian Superior Institute of Health indicated that any observations regarding the risk to the environment of possible "environmental release" were unnecessary, it appears to us that Italy was concerned about potential adverse effects on the environment which might arise from "environmental release" of the GMOs in question or their products.

7.2873 In Section VII.C we found that measures applied to protect animal or plant life or health from risks arising directly or indirectly from the entry, establishment or spread of (i) GM plants *qua* "pests", (ii) cross-breeds with undesired traits resulting from transfer of genetic material from a GM plant or (iii) other animals or plants which become pests as a result of the release of GMOs into the environment, are measures within the scope of Annex A(1)(a). We have also determined in Section VII.C that measures applied to avoid adverse effects of GMOs on the environment other than adverse effects on animal or plant life or health, including on geochemical processes, can be considered as measures applied to prevent "other damage" to the environment resulting from the entry, establishment or spread of a pest and, as such, are covered by Annex A(1)(d).

7.2874 Consistent with our reasoning above, we consider that Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), to the extent it is applied to address potential risks to the environment arising from the "environmental release" of these GMOs, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2875 In the light of the above considerations, we conclude that the safeguard measure applied by Italy with respect to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2876 We now turn to the issue of the form and nature of Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). We start by recalling the arguments of the Parties on this matter.

7.2877 The **United States** argues that the Italian measure is in the form of a "decree", which is one of the types of measures expressly enumerated in Annex A(1) of the *SPS Agreement.*

7.2878 **Canada** argues that the Italian measure is in the form of a "decree", one of the types of measures expressly enumerated in Annex A(1) of the *SPS Agreement*.

7.2879 **Argentina** notes that the measure was taken in the form of a decree, one of the forms explicitly mentioned in Annex A(1).

7.2880 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms. Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered "requirements". The second example would constitute a negative requirement.

7.2881 We note that Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) was implemented through a decree to prohibit commercialization of the products concerned on the Italian territory. We note that Annex A(1) specifically refers to "decrees". We therefore consider that, for the purposes of Annex A(1), the Italian decree is an SPS measure in respect of the form of the measure.

7.2882 In respect of the nature of the Italian measure, we note that the decree prohibits the marketing of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). As indicated above, we are of the view that a prohibition on the marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2883 We therefore conclude that the safeguard measure taken by Italy with respect to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2884 We have now considered Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Italy's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the conclusion that the safeguard measure applied by Italy with respect to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) constitutes an "SPS measure" within the meaning of Annex A(1).

7.2885 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, the Italian safeguard measure could be considered to embody more than one SPS measure. However, neither the Complaining Parties nor the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat the Italian safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat the Italian safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2886 We now turn to the issue of whether Italy's safeguard measure with respect to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2887 The **United States** argues that the measure adopted by Italy bans the "commercialization and use" of T25 maize, MON810 maize, MON809 maize and Bt-11 maize, thereby effectively blocking the importation of these products on the Italian territory. The measure as such therefore affects international trade, and meets the second requirement under Article 1.1 of the *SPS Agreement*.

7.2888 **Canada** notes that the measure suspends the commercialization of the maize biotech varieties T25 maize, MON810 maize, MON809 maize and Bt-11. Since the measure effectively blocks market access for the targeted biotech products, it clearly affects international trade.

7.2889 **Argentina** notes that since the safeguard measure prevents access of T25 maize, MON810 maize, MON809 maize and Bt-11 maize to Italy, resulting in the absence of imports of these products, the measure can be said to affect international trade.

7.2890 The **Panel** notes that the arguments of the parties regarding the effects on trade of Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) are the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609above. Therefore, in view of the fact that Italy's safeguard measure prohibits imports of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), we have no difficulty concluding that the safeguard measure applied by Italy is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2891 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize

(EC-163) is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that the Italian safeguard measure on T25 maize, MON810 maize and Bt-11 maize (EC-163) is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(x) Luxembourg – Bt-176 maize

7.2892 We now turn to the safeguard measure applied by Luxembourg on Bt-176 maize. We recall that the application for placing on the market of this product was initially submitted to France.[1795] The product was authorized by the European Commission in 1996[1796], and Luxembourg adopted its safeguard measure to prohibit the sale of Bt-176 maize on its territory pursuant to Article 16 of Directive 90/220 by a Ministerial Order issued in February 1997.[1797]

Is the Luxembourg safeguard measure on Bt-176 maize an SPS measure?

7.2893 We start with the issue of whether Luxembourg's safeguard measure on Bt-176 maize is an SPS measure. In order to make this determination, we need to consider two distinct elements, namely: (1) the purpose of the measure; and (2) the form and nature of the measure.

Purpose of the safeguard measure

7.2894 We first consider the issue of the purpose of the safeguard measure. Before turning to the arguments of the Parties on this issue, we recall that we must determine whether the purpose of the safeguard measure falls within one of the categories of purposes set out in Annex A(1) of the *SPS Agreement*.

7.2895 The **United States** notes that in the preamble of its decision to adopt a safeguard measure concerning Bt-176 maize, Luxembourg refers to potential risks for human health related to the antibiotic resistant gene. The United States argues that the safeguard measure is an SPS measure, as it is applied "to protect human life or health" from "toxins or disease-causing organisms in foods".

7.2896 **Argentina** argues that the purpose of the safeguard measures may be inferred from the Community legislation under which the bans were adopted, and that the relevant provisions of EC Directive 90/220 and Regulation 258/97 clearly indicate that the purpose of the EC legislation is the "protection of human health and the environment". Since the EC member States have taken their measures explicitly on the basis of this legislation, it can be inferred that the measures were imposed for the purpose of protecting human health or the environment. The safeguard measures are, therefore, SPS measures as defined in the *SPS Agreement*.

[1795] C/F/94/11-03.
[1796] Commission Decision 97/98 (Exhibits US-97, ARG-37).
[1797] Luxembourg, Journal Officiel du Grand Duché de Luxembourg, A – No.10, 28 February 1997, p. 618 (Exhibit US-63).

7.2897 The **European Communities** argues that the main reasons for which the measure was adopted and maintained include, *inter alia*, horizontal gene transfer; antibiotic resistance; effects on non-target organisms; toxicity or allergenicity; persistence and invasiveness in agricultural and natural habitats; development of resistance; out-crossing; undesirable effects on management practices; biodiversity; monitoring; labelling; co-existence; and human and animal health.

7.2898 The **Panel** notes that Luxembourg explained the reasons for its safeguard measure in a document submitted to the Commission at the time of notification of its measure (hereafter the "Reasons document").[1798] The document identifies two main concerns for the adoption of the safeguard measure, namely the transfer of the antibiotic (ampicillin)-resistance gene to the bacteria of the intestinal tract of animals, and the development of insect resistance to Bt toxin. With respect to the transfer of the ampicillin-resistance gene, Luxembourg justifies its measure by arguing that although the risk is low, some of the mechanisms operating in such a transfer are still being studied. With respect to the development of insect resistance to Bt toxin, Luxembourg notes that given the risks involved, the commercialization of Bt-176 maize should be made conditional upon the adoption of relevant monitoring programmes.

7.2899 Based on the foregoing, we consider that at the time of review by the Panel, Luxembourg applied its safeguard measure on Bt-176 maize to address concerns about:

(1) the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of animals; and

(2) the development of resistance to Bt toxin in insects.

7.2900 The European Communities asserts that Luxembourg's safeguard measure on Bt-176 maize is also applied in view of concerns about labelling, co-existence, out-crossing, and toxicity and allergenicity. The asserted concerns were not articulated by Luxembourg in the Reasons document discussed above. Furthermore, the European Communities has neither substantiated nor explained its assertion. In the light of this, we are not persuaded that Luxembourg is applying its safeguard measure to address these additional concerns identified by the European Communities.

7.2901 Having determined the purposes for which Luxembourg applied its safeguard measure at the time of review by the Panel, we now go on to assess whether these purposes fall within one of the categories of purposes which according to Annex A(1) characterize an SPS measure. To that end, we will consider one by one each of the above-noted purposes of Luxembourg's safeguard measure.

Transfer of the bla-ampicillin resistance gene to bacteria of the intestine of animals

7.2902 We consider first Luxembourg's stated concern regarding the potential transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of animals due to consumption of Bt-176 maize. The concern identified by Luxembourg with regard to Bt-176 maize is similar to that identified by Austria with regard to its safeguard measures T25 maize and Bt-176 maize. Thus, as in Austria's case, we refer to our discussion in Section VII.C regarding ARMG, and in particular our view that the concern relates to the potential transfer to pathogens of ARMG present in certain GMOs, and the

[1798] The document is entitled "Interdiction provisoire d'importer le maïs génétiquement modifié ayant subi la modification combinée lui assurant les propriétés insecticides conférées par le gène Bt-endotoxine et une meilleure résistance à l'herbicide glufosinate-ammonium – Motivation de la décision luxembourgeoise", communicated to the Commission with the "Arrêté ministériel" on 17 March 1997 (Exhibit EC-158/At. 9).

possible resulting decrease in effectiveness of medical treatments involving specific antibiotics which might pose a risk to the life or health of animals infected with the resistant pathogen.

7.2903 In Section VII.C we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of disease-causing organisms which have or might become resistant to antibiotics due to the transfer of ARMG from a GM plant. Similarly, we found that Annex A(1)(a) covers measures applied to protect animal life or health from risks arising from the entry, establishment or spread of diseases due to the reduced effectiveness of antibiotics used to treat the pathogens which have become resistant to these antibiotics through gene transfer. Furthermore, we found that Annex A(1)(b) covers measures applied to protect animal life or health from risks arising indirectly, namely *via* the potential transfer to animals of marker genes conferring resistance to antibiotics used in veterinary medicine, from additives in feedstuffs. We recall in this respect that, in our view, ARMGs can be considered to be additives for the purposes of Annex A(1)(b).

7.2904 Consistent with our reasoning above, we consider that Luxembourg's safeguard measure on Bt-176 maize, to the extent it is applied to avoid risks associated with the transfer of the *bla*-ampicillin resistance gene to bacteria of the intestine of animals, falls within the scope of Annex A(1)(a) and (b) of the *SPS Agreement*.

Development of resistance to Bt toxin in insects

7.2905 Turning now to Luxembourg's stated concern regarding potential risks associated with the development of resistance to Bt toxin in insects, we understand the concern identified by Luxembourg to be that resistance in insects to Bt toxin may develop due to frequent exposure to this pesticide (the Bt toxin) and that the development of high levels of resistance in insect populations might require the application of a pesticide where none was used before, the increased application of a pesticide, or the application of more harmful pesticides to control the resistant populations.

7.2906 We refer to our analysis in Section VII.C regarding the development of pesticide-resistance in insects. We found that resistant target organisms (insects) could be regarded as "pests" within the meaning of Annex A(1), inasmuch as they present a risk to animal, plant or human life or health or result in other damage. We further determine that risks to animal or plant life or health, or other damage to the environment, resulting from a change in pesticide use may be viewed as arising indirectly from the entry, establishment or spread of resistant target organisms *qua* relevant pest. We find that to the extent that a measure seeks to avoid such risks and damage, it can be considered to be covered by Annex A(1)(a) and (d) of the *SPS Agreement*.

7.2907 In view of the above findings, we consider that Luxembourg's safeguard measure on Bt-176 maize, to the extent it is applied to protect from potential risks associated with the development of resistance to Bt toxin in insects due to the cultivation of Bt-176 maize, falls within the scope of Annex A(1)(a) and (d) of the *SPS Agreement*.

Conclusion with regard to the purpose of the safeguard measure

7.2908 In the light of the above considerations, we conclude that the safeguard measure applied by Luxembourg with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its purpose is concerned.

Form and nature of the measure

7.2909 We now turn to the issue of the form and nature of Luxembourg's safeguard measure on Bt-176 maize. We start by recalling the arguments of the Parties on this matter.

7.2910 The **United States** argues that the measure was enacted by ministerial "decree", a form of measure explicitly mentioned in Annex A(1) of the *SPS Agreement*.

7.2911 **Argentina** notes that the measure was adopted in the form of an "arrêté ministériel", which is defined as a "written decision by an administrative authority". The term "décret" is defined as "a decision by the governmental authority by which the effects are similar to those of laws". According to Argentina, an "arrêté ministériel" is similar in nature to a decree, which is one of the measures listed in Annex A.

7.2912 The **Panel** recalls that the second paragraph of Annex A(1) addresses the form and nature of measures which may qualify as SPS measures. In respect of the form of SPS measures, we have indicated earlier in this report that the reference in the second paragraph to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form and that SPS measures may in principle take many different legal forms. Furthermore, in respect of the nature of SPS measures, we have indicated earlier that the reference in the same paragraph to "requirements" is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered "requirements". The second example would constitute a negative requirement.

7.2913 We note that Luxembourg's safeguard measure on Bt-176 maize was implemented through an "arrêté ministériel", or a Ministerial Order, to prohibit the commercialization of Bt-176 maize on Luxembourg's territory. Annex A(1) does not specifically refer to "Ministerial Orders". As we have pointed out, this fact alone does not necessarily mean that Luxembourg's safeguard measure is not an SPS measure, since no specific legal form is prescribed. Luxembourg's decision clearly is a measure attributable to Luxembourg's Government. It is also not in dispute that the decision is legally binding. We therefore consider that, for the purposes of Annex A(1), Luxembourg's decision may be assimilated to measures adopted in the form of "laws", "decrees" or "regulations".

7.2914 In respect of the nature of Luxembourg's measure, we note that the decision prohibits the marketing of Bt-176 maize. As indicated above, we are of the view that a prohibition of the marketing of a particular product (within a particular territory) may be considered a "requirement" for the purposes of Annex A(1).

7.2915 We therefore conclude that the safeguard measure taken by Luxembourg with respect to Bt-176 maize qualifies as an SPS measure within the meaning of Annex A(1) as far as its form and nature are concerned.

Conclusion

7.2916 We have now considered Luxembourg's safeguard measure in terms of its purpose, its form and its nature. In relation to each of these issues, we have found that Luxembourg's measure satisfies the definition of the term "SPS measure" set out in Annex A(1). In the light of this, we come to the overall conclusion that the safeguard measure taken by Luxembourg with respect to Bt-176 maize constitutes an "SPS measure" within the meaning of Annex A(1).

7.2917 At this juncture, we could go on and address the question of whether, in view of its multiple purposes, Luxembourg's safeguard measure could be considered to embody more than one SPS measure. However, neither the United States nor Argentina or the European Communities have argued that to the extent any of the safeguard measures at issue falls to be assessed under the *SPS Agreement*, it should be deemed to constitute more than one SPS measure. In their submissions to the Panel, the Parties treated the relevant safeguard measures as constituting one SPS measure each. In the light of this, like the Parties, we will treat Luxembourg's safeguard measure as constituting one single SPS measure. We will revisit this issue, however, if our disposition of the relevant claims under the *SPS Agreement* (and, where appropriate, any implementing action to be taken in view of our disposition of particular claims) were to depend on, and be affected by, whether we treat Luxembourg's safeguard measure as constituting a single SPS measure or as embodying more than one SPS measure.

Effect on international trade

7.2918 We now turn to the issue of whether Luxembourg's safeguard measure on Bt-176 maize is a measure that affects international trade, and that is therefore subject to the provisions of the *SPS Agreement*. We recall that according to Article 1.1 of the *SPS Agreement*, the *SPS Agreement* applies to all SPS measures which "may, directly or indirectly, affect international trade." Accordingly, for Luxembourg's safeguard measure on Bt-176 maize to be subject to the *SPS Agreement*, it must be a measure which may, directly or indirectly, affect international trade. We recall the Parties' arguments on this matter.

7.2919 The **United States** argues that the measure adopted by Luxembourg prohibits the "use and sale" of Bt-176 maize, thereby effectively blocking the importation of the product. The measure as such therefore affects international trade.

7.2920 **Argentina** notes that since the safeguard measure prevents access of Bt-176 maize to Luxembourg's territory, resulting in the absence of imports of this product, the measure can be said to affect international trade.

7.2921 The **Panel** notes that the arguments of the parties regarding the effects on trade of Luxembourg's safeguard measure on Bt-176 maize are the same as their arguments with respect to Austria's safeguard measure on T25 maize. We recall our reasoning and conclusions with respect to Austria's measure on T25 maize in paragraphs 7.2603-7.2609 above. Therefore, in view of the fact that Luxembourg's safeguard measure prohibits imports of Bt-176 maize, we have no difficulty concluding that the safeguard measure applied by Luxembourg is an SPS measure which may affect international trade within the meaning of Article 1.1 of the *SPS Agreement* and, as such, is subject to the provisions of the *SPS Agreement*.

Overall conclusions

7.2922 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that Luxembourg's safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that Luxembourg's safeguard measure on Bt-176 maize is an SPS measure within the meaning of Annex A(1) and Article 1.1 of the *SPS Agreement*.

(b) Preliminary issue: The relationship between Article 5.1 and Article 5.7 of the *SPS Agreement*

7.2923 We have determined above that the *SPS Agreement* is applicable to all safeguard measures which are being challenged. If we were to follow the Complaining Parties' approach, we would now proceed to examine the consistency of the relevant safeguard measures with Article 5.1 of the *SPS Agreement*, which requires that these safeguard measures be based on a risk assessment, as appropriate to the circumstances. The European Communities objects to this manner of proceeding, arguing that the safeguard measures at issue, to the extent they fall within the scope of the *SPS Agreement*, fall to be assessed under Article 5.7 of the *SPS Agreement*, to the exclusion of Article 5.1. Article 5.7 stipulates that in cases where relevant scientific evidence is insufficient, SPS measures may be provisionally adopted on the basis of available pertinent information.

7.2924 The European Communities presents two arguments in support of its contention that the safeguard measures must not be assessed under Article 5.1. *First*, the European Communities argues that the safeguard measures are provisional measures, and that, for this reason, the applicable provision is Article 5.7, and not Article 5.1. *Secondly*, the European Communities argues, more broadly, that the relationship between Article 5.1 and Article 5.7 is one of exclusion, and that Article 5.7 is not an exception to Article 5.1. We will address these arguments below and will then determine whether to assess the safeguard measures under Article 5.1, as requested by the Complaining Parties.

(i) "Provisionally adopted" SPS measures

7.2925 It is useful to begin our consideration of the EC argument concerning "provisionally adopted" SPS measures by setting out the text of relevant provisions.

7.2926 Article 2.2 provides:

> "Members shall ensure that any sanitary or phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5."

7.2927 Article 5.1 provides:

> "Members shall ensure that their sanitary or phytosanitary measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health, taking into account risk assessment techniques developed by the relevant international organizations."

7.2928 Article 5.7 provides:

> "In cases where relevant scientific evidence is insufficient, a Member may provisionally adopt sanitary or phytosanitary measures on the basis of available

> pertinent information, including that from the relevant international organizations as well as from sanitary or phytosanitary measures applied by other Members. In such circumstances, Members shall seek to obtain the additional information necessary for a more objective assessment of risk and review the sanitary or phytosanitary measure accordingly within a reasonable period of time."

7.2929 In relation to Article 5.7, the Appellate Body has found that there are four requirements which a Member must meet in order to adopt and maintain a provisional SPS measure as contemplated in Article 5.7. These requirements are:[1799]

(a) the measure is imposed in respect of a situation where "relevant scientific evidence is insufficient";

(b) the measure is adopted "on the basis of available pertinent information";

(c) the Member which adopted the measure "seek[s] to obtain the additional information necessary for a more objective assessment of risk"; and

(d) the Member which adopted the measure "review[s] the … measure accordingly within a reasonable period of time".

7.2930 The **European Communities** argues that Article 5.7 contains specific rules regarding provisional measures, and that it is therefore by reference to these rules, not the rules in Article 5.1, that the safeguard measures must be assessed. Regarding Article 5.7, the European Communities submits that it applies only to provisional measures. In the European Communities' view, if, objectively, an SPS measure is "provisionally adopted", it falls within the scope of Article 5.7. The European Communities considers that the Appellate Body in *Japan – Apples* confirmed this when it stated that "[w]hen a panel reviews a measure claimed by a Member to be provisional, that panel must assess whether 'relevant scientific evidence is insufficient'".[1800] In the European Communities' view, this statement indicates that the provisionality is the "demarcation line" between Article 5.1 and Article 5.7.

7.2931 The European Communities considers that Article 5.1 also supports its view. According to the European Communities, Article 5.1 concerns risk assessments to be carried out for SPS measures other than provisional SPS measures. The European Communities contends that for provisional SPS measures the first sentence of Article 5.7 requires an "assessment", but not a "risk assessment" as that term is defined in the *SPS Agreement*. The European Communities points out in this connection that the second sentence of Article 5.7 refers to a "more objective assessment", which in the European Communities' view means an assessment that is more objective than that to be carried out on the basis of the first sentence of Article 5.7. Thus, the European Communities maintains that the first sentence of Article 5.7 implies the need for an "assessment", but one which is different from the risk assessment envisaged in Article 5.1.

7.2932 The European Communities further submits that its view that provisional measures are not subject to Article 5.1 does not imply that provisional measures are not subject to a full set of controls under the *SPS Agreement*. Rather, in the European Communities' view, there are two "parallel universes" in the *SPS Agreement*, one for definitive measures and another for provisional measures. According to the European Communities, provisional measures must comply with the requirements of

[1799] Appellate Body Reports, *Japan – Agricultural Products II*, para. 89; *Japan – Apples*, para. 176.
[1800] Appellate Body Report, *Japan – Apples*, para. 179.

Article 5.7, as well as with those of Articles 2.1[1801], 2.3[1802] and 2.4[1803] of the *SPS Agreement*. The European Communities considers that these provisions contain rules and obligations that are analogous to those set out in Articles 2.2 and 5.1 to 5.6 for definitive measures.

7.2933 Having regard to the present dispute, the European Communities asserts that all of the safeguard measures at issue are provisional measures within the meaning of Article 5.7. The European Communities notes in this regard that the text of the applicable EC legislation provides that member States may "provisionally restrict" (Article 16 of Directive 90/220) or "temporarily restrict" (Article 12 of Regulation 258/97) the use of a biotech product which has received EC-wide marketing approval. The European Communities further argues that the European Court of Justice has confirmed that measures adopted based on the aforementioned legislation are temporary measures.[1804] Finally, the European Communities submits that the provisional nature of the safeguard measures is also reflected in the text of these measures as well as the national laws on which these measures are based.

7.2934 The **United States** argues that in order to be covered by Article 5.7, a measure must meet each of the criteria set out in that paragraph. The mere label of a measure as "provisional" is not sufficient to bring it within the scope of Article 5.7. Regarding the safeguard measures at issue, the United States also notes that none of these measures satisfies the four criteria set out in Article 5.7. Specifically, the evidence is sufficient to perform a risk assessment, because the EC itself has conducted positive risk assessments for each product subject to a member State measure. Secondly, the EC's own scientific committees have confirmed that the member State measures are not based on "available pertinent information." Third, there is no information in the record that the Member States have sought to perform risk assessments that would support their bans. Fourth, the EC argument that "measures are constantly subject to review"[1805] does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption.

7.2935 **Canada** argues that neither in the text of the *SPS Agreement* nor in relevant jurisprudence is there a basis for the European Communities' bifurcation of the SPS regime on the basis of whether measures are "definitive" or "provisional". Neither in *Japan – Agricultural Products II* nor in *Japan – Apples* did the panels or the Appellate Body characterize provisionality as an *a priori* condition to be met for Article 5.7 to apply. In Canada's view, this strongly suggests that, for Article 5.7 to apply, it is not relevant whether the measure in question is expressed in provisional terms. What matters,

---

[1801] Article 2.1 provides:

Members have the right to take sanitary and phytosanitary measures necessary for the protection of human, animal or plant life or health, provided that such measures are not inconsistent with the provisions of this Agreement.

[1802] Article 2.3 provides:

Members shall ensure that their sanitary and phytosanitary measures do not arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, including between their own territory and that of other Members. Sanitary and phytosanitary measures shall not be applied in a manner which would constitute a disguised restriction on international trade.

[1803] Article 2.4 provides:

Sanitary or phytosanitary measures which conform to the relevant provisions of this Agreement shall be presumed to be in accordance with the obligations of the Members under the provisions of GATT 1994 which relate to the use of sanitary or phytosanitary measures, in particular the provisions of Article XX(b).

[1804] The European Communities refers to Case C-236/01, *Monsanto Agricoltura Italia SpA and Others v. Presidenza del Consiglio dei Ministri and Others*, judgement of 9 September 2003, para. 109.

[1805] EC replies to Panel questions, para. 324.

according to Canada, is whether there is evidence to demonstrate that each of the conditions set out in Article 5.7 has been fulfilled. Canada submits in this regard that the first condition, which concerns the sufficiency of relevant scientific evidence, is qualitatively different from the other conditions. Canada considers that the first condition represents a logical threshold – a textual bridge – between Article 2.2 and Article 5.7.

7.2936 Regarding the present dispute, Canada notes that it is true that the EC legislation indicates that safeguard measures are meant to be temporary. Canada submits, however, that when one considers the five safeguard measures challenged by Canada, the provisional quality of safeguard measures is not obvious, as none of the five measures in question has been in place less than 45 months, and some have been in place for more than five years.

7.2937 **Argentina** argues that Article 5.7 is not applicable to any measure which is labelled or deemed "provisional". Rather, Article 5.7 establishes a specific requirement that a Member must meet if it wishes provisionally to adopt an SPS measure: relevant scientific evidence must be insufficient. Argentina considers, therefore, that for a measure to be covered by Article 5.7, what matters is not whether that measure is designed to be provisional or definitive, but whether there is sufficient relevant scientific evidence. Only in such cases may a Member provisionally adopt an SPS measure on the basis of available pertinent information.

7.2938 The **European Communities** responds that the sufficiency or insufficiency of scientific evidence cannot be the "demarcation line" between Article 5.1 and Article 5.7 in view of the statement by the Appellate Body in *Japan – Agricultural Products II* that insufficiency of relevant scientific evidence is one of four requirements set out in Article 5.7 and that "[t]hese four requirements are clearly cumulative in nature and are equally important for the purposes of determining consistency with this provision".[1806] According to the European Communities, this statement confirms that none of the four requirements has a special role to play in the demarcation of the respective scopes of Articles 5.1 and 5.7, and that these requirements are relevant to the question of consistency with Article 5.7, not to the question of the "demarcation line" to be drawn between Articles 5.1 and 5.7.

7.2939 The **Panel** recalls the European Communities' argument that, for the purposes of the Panel's analysis of the safeguard measures, the relevant provision is Article 5.7 rather than Article 5.1. We first turn to examine this argument in the light of Article 5.7 itself. The first sentence of Article 5.7 provides in relevant part that "[i]n cases where relevant scientific evidence is insufficient, a Member may provisionally adopt sanitary or phytosanitary measures on the basis of available pertinent information". The first sentence follows a classic "if – then" logic: if a certain condition is met (*in casu*, insufficiency of relevant scientific evidence), a particular right is conferred (*in casu*, the right provisionally to adopt an SPS measure based on available pertinent information). Thus, it is clear that Article 5.7 is applicable whenever the relevant condition is met, that is to say, in every case where relevant scientific evidence is insufficient.[1807] The provisional adoption of an SPS measure is not a condition for the applicability of Article 5.7. Rather, the provisional adoption of an SPS measure is permitted by the first sentence of Article 5.7.

[1806] Appellate Body Report, *Japan – Agricultural Products II*, para. 89

[1807] When we refer to the "applicability of Article 5.7", we address the issue of whether or not the right conferred by the first sentence of Article 5.7 is, in principle, available to a Member. In a specific case, a Member must, of course, satisfy the various requirements set forth in Article 5.7 if it wishes to benefit from the right conferred by Article 5.7.

7.2940 If the provisional adoption of an SPS measure had been intended as a condition for the applicability of Article 5.7, the first sentence of Article 5.7 would, in our view, have opened with a different phrase, such as "In cases where a Member provisionally adopts an SPS measure […]". Also, we note that in *Japan – Apples* the Appellate Body stated that "the application of Article 5.7 is triggered not by the existence of scientific uncertainty, but by the insufficiency of scientific evidence".[1808] The Appellate Body made no mention of any additional "triggering factors".

7.2941 The European Communities draws our attention to the statement by the Appellate Body in *Japan – Apples* that "[w]hen a panel reviews a measure claimed by a Member to be provisional, that panel must assess whether 'relevant scientific evidence is insufficient'".[1809] According to the European Communities, this statement indicates that the provisional nature of a measure is what determines whether a measure falls within the scope of Article 5.7. We do not agree. The European Communities' interpretation is at odds with the aforementioned statement by the Appellate Body in *Japan – Apples* that "the application of Article 5.7 is triggered [...] by the insufficiency of scientific evidence". Reading the two statements by the Appellate Body harmoniously, we think that the statement identified by the European Communities must be understood as referring to a situation where a measure is claimed to be a provisional measure within the meaning of Article 5.7. In fact, the Appellate Body in *Japan – Apples* pointed out that "Japan claimed, in the alternative, that its measure is a provisional measure consistent with Article 5.7".[1810] In any event, we note that the Appellate Body in *Japan – Apples* did not begin its Article 5.7 analysis by examining whether the measure at issue was provisional, as claimed by Japan.

7.2942 The European Communities identifies another statement by the Appellate Body which it considers supports its position. In *Japan – Agricultural Products II*, the Appellate Body stated that "[the] four requirements [contained in Article 5.7] are clearly cumulative in nature and are equally important for the purposes of determining consistency with this provision".[1811] The European Communities submits that this statement confirms that the requirement that relevant scientific evidence be insufficient cannot be accorded a special role in the demarcation of the respective scopes of Articles 5.1 and 5.7. Here again, we consider that the European Communities' argument is at odds with the subsequent statement by the Appellate Body in *Japan – Apples* that "the application of Article 5.7 is triggered [...] by the insufficiency of scientific evidence". Moreover, we note that in *Japan – Agricultural Products II* the Appellate Body was addressing the issue of *consistency* with Article 5.7, not *applicability* of Article 5.7. It is correct to say that for the specific purposes of determining *consistency* with Article 5.7, all four requirements are "equally important", for if any one of these requirements is not met, a Member is not acting consistently with the provisions of Article 5.7.[1812]

7.2943 The European Communities considers that its view regarding Article 5.7 is consistent with the provisions of Article 5.1. In the European Communities' view, Article 5.1 prescribes risk assessment only for SPS measures other than provisionally adopted SPS measures. Article 5.1 requires Members to "ensure that their [SPS] measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health". We note, however, that Article 5.1 does not qualify the term "SPS measures". Thus, the text of Article 5.1 provides no basis for the EC argument that Article 5.1 prescribes risk assessment only for SPS measures other than provisionally adopted SPS measures.

[1808] Appellate Body Report, *Japan – Apples*, para. 184.
[1809] Appellate Body Report, *Japan – Apples*, para. 179.
[1810] *Ibid.*, para. 170.
[1811] Appellate Body Report, *Japan – Agricultural Products II*, para. 89
[1812] We also address this issue below at paras. 7.3216-7.3220.

7.2944 Notwithstanding the lack of textual basis in Article 5.1, the European Communities argues that provisionally adopted SPS measures should not be considered to be subject to Article 5.1 because the first sentence of Article 5.7 also requires Members to carry out an "assessment". According to the European Communities, the "assessment" required by the first sentence of Article 5.7 is different from a "risk assessment" as that term is defined in the *SPS Agreement*.[1813] Even assuming the European Communities' argument regarding the required "assessment" were correct[1814], it is apparent from the text of Article 5.7 that such an "assessment" would only be necessary for SPS measures which were provisionally adopted in respect of situations where "relevant scientific evidence [was] insufficient". Article 5.7 is not applicable to SPS measures which were provisionally adopted in respect of situations where relevant scientific evidence was *not* insufficient. Therefore, even accepting the EC argument, Article 5.7 would not assist the European Communities in establishing that Article 5.1 does not apply to any provisionally adopted SPS measures, as first it would need to be established that these measures were adopted in respect of situations where relevant scientific evidence was insufficient.

7.2945 In response to a question from the Panel, the European Communities stated that the provisions of Article 2.2 confirm that provisionality is the "demarcation line" between Articles 5.1 and 5.7. The European Communities points out that Article 2.2 refers to SPS measures which are "maintained" while Article 5.7 refers to SPS measures which have been "provisionally adopted". The European Communities concludes from this that definitive measures fall to be assessed under Articles 2.2 and 5.1 while provisional measures fall to be assessed under Article 5.7. In our view, the verb "maintain" in Article 2.2 does not support the conclusion that only definitive measures are subject to Article 2.2. It is not apparent to us why a provisional measure could not likewise be "maintained" within the meaning of Article 2.2. The fact that Article 5.7, which is part of the context of Article 2.2, refers to SPS measures which have been "provisionally adopted", and that Article 2.2 does not explicitly refer to such measures, does not imply that any measure which has been "provisionally adopted" is excluded, *a priori*, from the scope of application of Article 2.2. Indeed, by its terms, Article 2.2 is applicable to "any" SPS measures.

7.2946 The European Communities advances another argument based on Article 2.2. The European Communities argues that the sufficiency or insufficiency of scientific evidence cannot have been intended as a "demarcation line" between Articles 2.2 and 5.1, on the one hand, and Article 5.7, on the other hand, because the word "sufficient" has different meanings in the context of Article 2.2 and Article 5.7. We see no force in this argument. Our view that Article 5.7 is applicable in every case where relevant scientific evidence is insufficient is based on the clause "[i]n cases where relevant scientific evidence is insufficient" in Article 5.7. The Appellate Body in *Japan – Apples* has clarified the meaning of the word "insufficient" as it appears in Article 5.7.[1815]

7.2947 The European Communities also puts forward the argument that Articles 2.1, 2.3 and 2.4 of the *SPS Agreement* serve to demonstrate that there are two "parallel universes" in the *SPS Agreement*, one for definitive measures and another for provisional measures. While we have no difficulty accepting that the "basic rights and obligations" set out in these provisions are in principle applicable to provisional SPS measures, we see nothing in the text of these provisions which would suggest that they are applicable exclusively to provisional SPS measures. In our view, the provisions in question are applicable also to definitive SPS measures. We note in this regard that Article 2 is captioned "Basic Rights and Obligations". In the light of this, we do not think that these provisions serve to

[1813] To recall, the second sentence of Article 5.7 refers to "a *more objective* assessment of risk" (emphasis added).

[1814] We further address this issue below at para. 7.2992.

[1815] Appellate Body Report, *Japan – Apples*, para. 179.

demonstrate that the *SPS Agreement* sets out separate and special regimes – "parallel universes", in the European Communities' parlance – for provisional SPS measures and for definitive SPS measures.

7.2948 For all these reasons, we are unable to accept the European Communities' argument that since the safeguard measures at issue are provisionally adopted SPS measures, they fall to be assessed under Article 5.7, to the exclusion of Article 5.1. The safeguard measures may or may not have been provisionally adopted. If they were provisionally adopted, this fact alone would not exclude the applicability of Article 5.1.

(ii) Article 5.7 of the SPS Agreement – right or exception from the "general obligation" under Article 5.1?

7.2949 We now examine the second argument put forward by the European Communities in support of its view that the safeguard measures must not be assessed under Article 5.1. To recall, the second argument is that the relationship between Article 5.1 and Article 5.7 is one of exclusion, not exception. In developing its argument, the European Communities made reference to Articles 3.1 and 3.3 of the *SPS Agreement*. The text of these provisions is set out below.

7.2950 Article 3.1 provides:

> "To harmonize sanitary and phytosanitary measures on as wide a basis as possible, Members shall base their sanitary or phytosanitary measures on international standards, guidelines or recommendations, where they exist, except as otherwise provided for in this Agreement, and in particular in paragraph 3."

7.2951 Article 3.3 provides:

> "Members may introduce or maintain sanitary or phytosanitary measures which result in a higher level of sanitary or phytosanitary protection than would be achieved by measures based on the relevant international standards, guidelines or recommendations, if there is a scientific justification, or as a consequence of the level of sanitary or phytosanitary protection a Member determines to be appropriate in accordance with the relevant provisions of paragraphs 1 through 8 of Article 5."[1816]

7.2952 The **European Communities** argues that the relationship between Articles 3.1 and 3.3 of the *SPS Agreement* is one of exclusion, not exception.[1817] The European Communities notes that Article 2.2 contains wording substantially identical to that of Article 3.1. According to the European Communities, it necessarily follows that the relationship between Article 2.2 and Article 5.7 is also one of exclusion. In other words, Article 2.2 excludes from its scope of application the kinds of situations covered by Article 5.7. The European Communities further notes that in *EC – Hormones* the Appellate Body stressed that Article 2.2 and Article 5.1 must be constantly read together.[1818] The European Communities deduces from this that the relationship between Article 5.1 and Article 5.7 must, equally, be one of exclusion. Thus, in the European Communities' view, Article 5.7 is an autonomous right, and not an exception to Articles 2.2 and 5.1.

[1816] (*original footnote*) For the purposes of paragraph 3 of Article 3, there is a scientific justification if, on the basis of an examination and evaluation of available scientific information in conformity with the relevant provisions of this Agreement, a Member determines that the relevant international standards, guidelines or recommendations are not sufficient to achieve its appropriate level of sanitary or phytosanitary protection.

[1817] The European Communities refers to Appellate Body Report, *EC – Hormones*, para. 104.

[1818] The European Communities refers to Appellate Body Report, *EC – Hormones*, para. 180.

7.2953 In support of its view that Article 5.7 is not an exception to Article 2.2, the European Communities further argues that the text of Article 5.7 is incorporated by reference into the text of Article 2.2. The European Communities considers that Article 5.7 is therefore part of Article 2, which is entitled "Basic Rights and Obligations". In the European Communities' view, Article 5.7 thus sets out basic rights and obligations of equivalent status to the basic rights and obligations set out in Article 2.

7.2954 The European Communities notes that none of the Complaining Parties has presented a claim of violation under Article 5.7. The European Communities submits that in view of this circumstance, and given the fact that, in its view, the safeguard measures are provisional measures falling within the scope of application of Article 5.7, it is irrelevant whether the safeguard measures meet the four requirements of Article 5.7. By bringing a claim of inconsistency with Article 5.1, the European Communities maintains, the Complaining Parties have simply invoked the wrong provision. The European Communities considers that there is therefore no basis for the Panel to conclude that the safeguard measures are inconsistent with Article 5.1.

7.2955 Moreover, the European Communities considers that if the Panel nonetheless were to determine that the safeguard measures did not meet one of the requirements of Article 5.7, *e.g.*, because there was sufficient scientific evidence, the Panel would need to conclude that the provisional measure in question is inconsistent with Article 5.7, and not that Article 2.2 or Article 5.1 becomes the relevant applicable provision. The European Communities contends that this has been confirmed by the Appellate Body in *Japan – Agricultural Products II* when it stated that "[w]henever one of [the] requirements [of Article 5.7] is not met, the measure at issue is inconsistent with Article 5.7".[1819]

7.2956 The **United States** argues that Article 5.7 does not provide a basis for a claim of an alleged breach of a WTO obligation, but acts as a defence to shield measures that would otherwise violate Articles 2.2 and 5.1. The United States submits that Article 5.7 provides an exception to Article 2.2 as well as Article 5.1, as these two articles "should constantly be read together".[1820] The United States points out that in *Japan – Agricultural Products II* and *Japan – Apples* the responding party invoked Article 5.7 to defend the challenged measure. The complaining party did not assert Article 5.7 as an independent claim of violation in either dispute, nor did the panels in these disputes suggest that the complaining party should have invoked Article 5.7.

7.2957 With regard to the issue of burden of proof, the United States is not arguing in this dispute that the responding party has the burden of proof to show that Article 5.7 applies to a particular SPS measure. The United States considers that in the present dispute it has established that the member State safeguard measures are inconsistent with Articles 2.2 and 5.1. In the United States' view, this necessarily means that Article 5.7 does not apply. Moreover, by showing that each of the products subject to a member State safeguard measure was subject to positive risk assessments by the European Communities' own scientists, the United States has met any burden of proof to show that scientific evidence was not "insufficient" and that Article 5.7 does not apply.

7.2958 **Canada** argues that equating the relationship between Articles 2.2 and 5.1, and Article 5.7, with the relationship between Articles 3.1 and 3.3 is inappropriate because the purposes, and therefore the relationships between these articles, respectively, are quite different. Articles 3.1 and 3.3 represent "separate but equal" tracks to follow in adopting an SPS measure. A Member can adopt a measure that is based on a relevant international standard, where such a standard exists. Alternatively, a Member can adopt a measure in accordance with the provisions of Article 3.3, where

[1819] Appellate Body Report, *Japan – Agricultural Products II*, para. 89 (emphasis omitted).
[1820] The United States refers to Appellate Body Report, *EC – Hormones*, para. 180.

it seeks a level of protection that is higher than the level of protection implied by the international standard. Article 3.3 is not merely a qualified exemption from the basic obligation in Article 3.1. It is the expression of the autonomous right of Members to establish their own appropriate levels of protection.

7.2959 Canada argues that in contrast, Articles 2.2 and 5.7 are not "separate but equal" tracks for Members to follow. Canada submits that Article 5.7 does not exist as an option that can be freely chosen by the Member concerned in place of Articles 2.2 and 5.1. Canada points out that unlike Article 3.3, Article 5.7 is a temporary solution. Ultimately, Article 5.7 must give way to the basic obligation in Article 2.2. Canada further argues that the application of Article 5.7 logically only arises where it has been determined that a measure is maintained without sufficient scientific evidence, which, unless justified under Article 5.7, would amount to a violation of Article 2.2. For these reasons, Canada considers that Article 5.7 operates as an exception to Articles 2.2 and 5.1. Therefore, Canada maintains, it is only if a challenged measure is found by a panel to be inconsistent with Article 2.2 and/or Article 5.1 that Article 5.7 comes into play, provided the importing Member invokes the provision as a source of justification for maintaining the challenged measure. Canada considers that it would be the Member invoking Article 5.7 that would have the initial burden of demonstrating a prima facie case.

7.2960 **Argentina** argues that Article 5.7 operates as a defence for measures which would otherwise be inconsistent with Articles 2.2 and 5.1. Argentina considers that when a Member meets the conditions set out in Article 5.7, it is entitled to adopt and maintain a measure under Article 5.7, and to depart from the general conditions set out in Article 2.2. In Argentina's view, a failure to meet the first condition of Article 5.7 – namely, that relevant scientific evidence must be insufficient – does not lead to an infringement of Article 5.7. Rather, it would prevent the relevant Member from departing from the general conditions set out in Article 2.2. According to Argentina, it is up to the responding party to invoke a defence under Article 5.7 and to meet the burden of establishing that defence.

7.2961 The **Panel** finds it appropriate to begin its examination of the relationship between Article 5.1 and Article 5.7 by examining the relationship between Article 2.2 and Article 5.7. It should be noted in this regard that Article 5.1 and Article 2.2 should "constantly be read together"[1821], and that Article 2.2 is an important part of the context of Article 5.1.

Relationship between Article 2.2 and Article 5.7

7.2962 The European Communities argues that Article 5.7 is not an exception to Article 2.2 in the sense that it could be invoked as an affirmative defence to a claim of violation under Article 2.2. Rather, the European Communities maintains, Article 5.7 establishes an autonomous right of the importing Member. The European Communities further submits that in cases where Article 5.7 is applicable, it is for the complaining party to establish that the importing Member has acted inconsistently with Article 5.7.

7.2963 In *EC – Tariff Preferences*, the Appellate Body was called on to determine whether the Enabling Clause constituted a right or an exception to Article I:1 of the GATT 1994. In that context, the Appellate Body made the following statement:

> "We recall that the Appellate Body has addressed the allocation of the burden of proof in similar situations. In cases where one provision permits, in certain circumstances, behaviour that would otherwise be inconsistent with an obligation in

[1821] Appellate Body Report, *EC – Hormones*, para. 180.

> another provision, and one of the two provisions refers to the other provision, the Appellate Body has found that the complaining party bears the burden of establishing that a challenged measure is inconsistent with the provision permitting particular behaviour *only* where one of the provisions suggests that the obligation is not applicable to the said measure. Otherwise, the permissive provision has been characterized as an exception, or defence, and the onus of invoking it and proving the consistency of the measure with its requirements has been placed on the responding party. However, this distinction may not always be evident or readily applicable."[1822]

7.2964 As an illustration of a case of two WTO provisions where the "permissive provision" was characterized by the Appellate Body as a right rather than an exception, the Appellate Body cited a paragraph in its report in *EC – Hormones*.[1823] The paragraph in question addresses the relationship between Article 3.1 and Article 3.3 of the *SPS Agreement*. The paragraph states in relevant part that:

> "Article 3.1 of the *SPS Agreement* simply excludes from its scope of application the kinds of situations covered by Article 3.3 of that Agreement, that is, where a Member has projected for itself a higher level of sanitary protection than would be achieved by a measure based on an international standard. Article 3.3 recognizes the autonomous right of a Member to establish such higher level of protection, provided that that Member complies with certain requirements in promulgating SPS measures to achieve that level. The general rule in a dispute settlement proceeding requiring a complaining party to establish a *prima facie* case of inconsistency with a provision of the *SPS Agreement* before the burden of showing consistency with that provision is taken on by the defending party, is *not* avoided by simply describing that same provision as an 'exception'."[1824]

7.2965 Later in the same report, the Appellate Body found that:

> "[T]his right of a Member to establish its own level of sanitary protection under Article 3.3 of the *SPS Agreement* is an autonomous right and *not* an 'exception' from a 'general obligation' under Article 3.1."[1825]

7.2966 Returning to the general test enunciated by the Appellate Body in *EC – Tariff Preferences*, we note that, indeed, the relationship between Article 3.1 and Article 3.3 may be described as one where "one provision [namely, Article 3.3] permits, in certain circumstances, behaviour that would otherwise be inconsistent with an obligation in another provision [namely, the obligation in Article 3.1 to base SPS measures on international standards], [where] one of the two provisions [namely, Article 3.1] refers to the other provision, [and] where one of the provisions [namely, Article 3.1] suggests that the obligation [in Article 3.1 to base SPS measures on international standards] is not applicable" to measures falling within the scope of Article 3.3. With regard to this last element, we note that Article 3.1 contains the clause "except as otherwise provided for in this Agreement, and in particular in paragraph 3".

7.2967 The European Communities submits that we should conceive of the relationship between Article 2.2 and Article 5.7 in the same way that the Appellate Body conceived of the relationship between Article 3.1 and Article 3.3. The European Communities notes in this regard that there are

---

[1822] Appellate Body Report, *EC – Tariff Preferences*, para. 88 (footnotes omitted).
[1823] *Ibid.*, footnote 189.
[1824] Appellate Body Report, *EC – Hormones*, para. 104.
[1825] *Ibid.*, para. 172.

significant textual similarities between Article 3.1 and Article 2.2. Indeed, whereas Article 3.1 contains the clause "except as otherwise provided for in this Agreement, and in particular in paragraph 3", Article 2.2 contains the closely similar clause "except as provided for in paragraph 7 of Article 5". It is clear from the Appellate Body's statement in *EC – Tariff Preferences* that in the context of Article 3.1, the relevant clause played an important part in the Appellate Body's determination of whether Article 3.3 constituted a right or an exception. As a result, we agree with the European Communities that we may in principle attach similar weight to the corresponding clause in Article 2.2, provided there is also a correspondence of the other elements highlighted by the Appellate Body in its statement in *EC – Tariff Preferences*.

7.2968 Evaluating the relationship between Article 2.2 and Article 5.7 in the light of the general test provided by the Appellate Body in *EC – Tariff Preferences*, we consider that the relationship in question is one where "one provision [namely, Article 5.7] permits, in certain circumstances, behaviour [namely, the provisional adoption of SPS measures in cases where scientific evidence is insufficient on the basis of available pertinent information] that would otherwise be inconsistent with an obligation in another provision [namely, the obligation in Article 2.2 not to maintain SPS measure without sufficient scientific evidence], [where] one of the two provisions [namely, Article 2.2] refers to the other provision, [and] where one of the provisions [namely, Article 2.2, and in particular the clause "except as provided for in paragraph 7 of Article 5"] suggests that the obligation [in Article 2.2 not to maintain SPS measure without sufficient scientific evidence] is not applicable" to measures falling within the scope of Article 5.7.

7.2969 Thus, we find the general test provided by the Appellate Body in *EC – Tariff Preferences* to be applicable, and application of that test leads us to the conclusion that Article 5.7 should be characterized as a right and not an exception from a general obligation under Article 2.2.[1826] In other words, we consider that in the same way that "Article 3.1 of the *SPS Agreement* [...] excludes from its scope of application the kinds of situations covered by Article 3.3 of that Agreement"[1827], Article 2.2 excludes from its scope of application the kinds of situations covered by Article 5.7. As we will explain further below, characterizing Article 5.7 as a right rather than as an exception has implications for the allocation of the burden of proof.

7.2970 We have said that Article 2.2 excludes from its scope of application the kinds of situations covered by Article 5.7. We recall in this connection that Article 2.2 contains three distinct obligations. It is therefore important to note that the Appellate Body did not say that Article 5.7 operates as a qualified exemption from the first and second obligations in Article 2.2, *i.e.*, the obligation to ensure that SPS measures are applied only to the extent necessary to protect human, animal or plant life or health, and the obligation to ensure that they are based on scientific principles. In the present case, it is not necessary, however, to examine the legal issue of whether the phrase "except as provided for in paragraph 7 of Article 5" relates only to the third obligation contained in Article 2.2 – the obligation not to maintain SPS measures without sufficient scientific evidence – or whether it relates to all three obligations laid down in Article 2.2.

[1826] Regarding our use of the term "right", we note that the Appellate Body's test in *EC – Tariff Preferences* does not provide a term to characterize the permissive provision in the kind of relationship we found to exist between Article 2.2 and Article 5.7. However, as we have noted, the Appellate Body referred to the relationship between Articles 3.1 and 3.3 as an illustration of the relevant kind of relationship. We have also pointed out that in *EC – Hormones*, the Appellate Body referred to the permissive provision, Article 3.3, as an "autonomous right", noting also that Article 3.3 does not constitute an exception from a general obligation under Article 3.1.

[1827] Appellate Body Report, *EC – Hormones*, para. 104.

7.2971 We note that Article 5.7 makes clear that SPS measures adopted and maintained pursuant to Article 5.7 are meant to be temporary in nature.[1828] In our view, the fact that Article 2.2 only temporarily excludes from its scope of application the kinds of situations covered by Article 5.7 does not detract from our characterization of Article 5.7 as a right. Where a right is conferred, it does not cease to be a right merely because it has been conferred on a temporary basis. Moreover, there is nothing unusual about the temporary inapplicability of a WTO provision. One need look no further than Article 14 of the *SPS Agreement*, which provides for specific transitional periods for least developed country Members and other developing country Members. During the applicable transitional periods, these Members are entitled to the non-application of some or all other provisions of the *SPS Agreement.*

7.2972 The view that Article 5.7 is not an exception in the nature of an affirmative defence is also consistent with the statement by the Appellate Body in *Japan – Agricultural Products II* that "Article 5.7 operates as a *qualified* exemption from the obligation under Article 2.2 not to maintain SPS measures without sufficient scientific evidence".[1829] Had the Appellate Body been of the view that Article 5.7 operates as an exception under which an importing Member could justify an inconsistency with an applicable obligation, it would, in our view, have been more natural and appropriate to use the term "exception" rather than the term "exemption", as the term "exemption" connotes freedom from, and hence inapplicability of, an obligation.[1830]

7.2973 We stress that Article 5.7 does not establish an absolute or unqualified right. In *Japan – Agricultural Products II*, the Appellate Body made clear that there are four cumulative requirements in Article 5.7 which must be met in order for a Member to adopt and maintain a provisional SPS measure consistently with Article 5.7.[1831] We think that these requirements are the reason why the Appellate Body emphasised that "Article 5.7 operates as a *qualified* exemption from the obligation under Article 2.2 not to maintain SPS measures without sufficient scientific evidence".[1832]

7.2974 In concrete terms, characterizing Article 5.7 as a qualified right rather than an exception means that if a challenged SPS measure was adopted and is maintained consistently with the four cumulative requirements of Article 5.7, the situation is "as provided for in paragraph 7 of Article 5" (Article 2.2), and the obligation in Article 2.2 not to maintain SPS measures without sufficient scientific evidence is not applicable to the challenged measure. Conversely, if a challenged SPS measure is not consistent with one of the four requirements of Article 5.7, the situation is not "as provided for in paragraph 7 of Article 5" (Article 2.2), and the relevant obligation in Article 2.2 is applicable to the challenged measure, provided there are no other elements which render Article 2.2 inapplicable.

7.2975 The European Communities draws our attention to the statement by the Appellate Body in *Japan – Agricultural Products II* that "[w]henever one of [the] requirements [of Article 5.7] is not

[1828] The first sentence of Article 5.7 refers to SPS measures being "provisionally adopted" on the basis of available pertinent information, and the Appellate Body has noted that the requirements set out in the second sentence of Article 5.7 highlight the provisional nature of measures adopted pursuant to Article 5.7. Appellate Body Report, *Japan – Apples*, footnote 318.

[1829] Appellate Body Report, *Japan – Agricultural Products II*, para. 80 (emphasis in original).

[1830] The adjective "exempt" means "free from an obligation or liability imposed on others". *The Concise Oxford Dictionary*, 10th ed, J. Pearsall (ed.) (Clarendon Press, 1999), p. 498.

[1831] Appellate Body Report, *Japan – Agricultural Products II*, para. 89. *See also* Appellate Body Report, *Japan – Apples*, para. 176. We identify the four cumulative requirements contained in Article 5.7 above at para. 2.

[1832] Appellate Body Report, *Japan – Agricultural Products II*, para. 80 (emphasis in original).

met, the measure at issue is inconsistent with Article 5.7".[1833] The European Communities argues that in view of this statement, if a challenged SPS measure is not consistent with one of the four requirements of Article 5.7, the Panel should find that the challenged measure violates Article 5.7, and not that the relevant obligation in Article 2.2 is applicable to the measure in question. We do not consider that the aforementioned statement by the Appellate Body supports the European Communities' argument. To say, as the Appellate Body did, that a measure is "inconsistent" with Article 5.7 when the relevant requirements are not satisfied is not tantamount to saying that Article 2.2 is inapplicable to that measure. Indeed, as we have pointed out, the Appellate Body in *Japan – Agricultural Products II* also stated that Article 5.7 operates as a qualified exemption from the obligation under Article 2.2 not to maintain SPS measures without sufficient scientific evidence. Moreover, the ordinary meaning of the clause "except as provided for in paragraph 7 of Article 5" in Article 2.2 indicates that Article 2.2 would be applicable in a situation where a measure meets some, but not all, of the requirements of Article 5.7.

7.2976 Characterizing Article 5.7 as a qualified right and not an exception also has implications for the allocation of the burden of proof concerning the issue of the consistency of an SPS measure with Article 5.7. According to the Appellate Body's statement in *EC – Tariff Preferences*, in cases where the permissive provision constitutes a right rather than an exception, "the complaining party bears the burden of establishing that a challenged measure is inconsistent with the provision permitting particular behaviour".[1834] And in *EC – Sardines*, the Appellate Body observed that "[i]n *EC – Hormones*, we found that a 'general rule-exception' relationship between Articles 3.1 and 3.3 of the *SPS Agreement* does not exist, with the consequence that the complainant had to establish a case of inconsistency with *both* Articles 3.1 and 3.3".[1835] We deduce from these two statements that in cases where a complaining party alleges that an SPS measure is inconsistent with the obligation in Article 2.2 not to maintain SPS measures without sufficient scientific evidence, it is incumbent on the complaining party, and not the responding party, to demonstrate that the challenged SPS measure is inconsistent with at least one of the four requirements set forth in Article 5.7. If such non-compliance is demonstrated, then, and only then, does the relevant obligation in Article 2.2 apply to the challenged SPS measure.

7.2977 Our view of the nature of the relationship between Article 2.2 and Article 5.7 and of the proper allocation of the burden of proof under these provisions is consistent with that of the panel in *Japan – Agricultural Products II*. In that case, the United States as the complaining party claimed that the challenged measure was inconsistent, *inter alia*, with the obligation in Article 2.2 not to maintain SPS measures without sufficient scientific evidence. After reaching the provisional conclusion that the challenged measure was inconsistent with Article 2.2, the panel noted that Japan, the responding party, was invoking Article 5.7 in support of its measure. Recalling the text of Article 2.2, and notably the clause "except as provided for in paragraph 7 of Article 5", the panel then stated that in view of Japan's invocation of Article 5.7 it needed to examine whether the challenged measure was a measure meeting the requirements in Article 5.7. The panel noted that "[i]f the [challenged measure] meets these requirements, we cannot find that it violates Article 2.2".[1836] The panel then went on to analyse the measure in the light of the requirements of Article 5.7, finding that "the United States [as the complaining party] has established a presumption that Japan did not comply with the requirements in the second sentence of Article 5.7. We also consider that Japan has not been

[1833] Appellate Body Report, *Japan – Agricultural Products II*, para. 89 (emphasis omitted).

[1835] Appellate Body Report, *EC – Sardines*, para. 275 (emphasis in original).
[1836] Panel Report, *Japan – Agricultural Products II*, para. 8.48.

able to rebut this presumption".[1837] In the light of this finding, the panel then reached the overall and final conclusion that the challenged measure was inconsistent with Article 2.2.[1838]

7.2978 We note that in a later case, *Japan – Apples*, the panel confronted a very similar situation. In that case, the United States as the complaining party also claimed that the challenged measure was inconsistent with the obligation in Article 2.2 not to maintain SPS measures without sufficient scientific evidence. Japan as the responding party contested this claim, but argued, in the alternative, that its measure was consistent with the requirements of Article 5.7. The panel recalled the approach followed by the panel in *Japan – Agricultural Products II*, stating that it agreed with that approach and that it would therefore make no final findings with respect to the consistency of the measure at issue with Article 2.2 until it had completed its analysis under Article 5.7.[1839] However, contrary to the approach of the panel in *Japan – Agricultural Products II*, the panel in *Japan – Apples* determined that "the burden [was] on Japan, as the party invoking Article 5.7, to make a prima facie case in support of its position".[1840] The panel did not elaborate further on why it had decided to place this burden of proof on Japan. Following the approach it had outlined, the panel then determined, on a provisional basis, that the challenged measure was inconsistent with Article 2.2. The panel next examined Japan's alternative argument under Article 5.7, finding that Japan had failed to establish that its measure was justified under Article 5.7. In view of this finding, the panel confirmed its provisional conclusion under Article 2.2, finding that the challenged measure was inconsistent with Article 2.2.[1841]

7.2979 In relation to the approach followed by the panel in *Japan – Apples*, it is important to point out that the Appellate Body in that same case noted that "[t]he Panel's assignment of the burden of proof to Japan to make a *prima facie* case of consistency with Article 5.7 is not challenged on appeal".[1842] We take this statement as a reservation expressed by the Appellate Body in respect of the panel's assignment of the burden of proof to Japan. In any event, as we have stated above, and for the reasons stated above, we consider that it is incumbent on the complaining party to establish a prima facie case of inconsistency with both Articles 2.2 and 5.7.

7.2980 Before proceeding to analyse the relationship between Article 5.1 and Article 5.7, we wish to address two arguments presented by Canada. First of all, Canada invokes basic logic in support of its position that Article 5.7 should be considered as an exception. In Canada's view, it is logically necessary to determine first whether a measure is maintained without sufficient evidence within the meaning of Article 2.2. Canada submits that only if a measure is maintained without sufficient evidence, the question arises whether maintaining that measure is nonetheless justifiable under Article 5.7. Canada's argument is based on the premise that Article 2.2 is applicable in the kinds of situations covered by Article 5.7. However, such a premise does not comport well with the text of Article 2.2. Indeed, the clause "except as provided for in paragraph 7 of Article 5" in Article 2.2 suggests the opposite of what Canada is assuming, namely, that the relevant obligation in Article 2.2 is *not* applicable in situations covered by Article 5.7. If, as we believe, Article 2.2 was not intended to apply in the situations covered by Article 5.7, it made entire sense for the drafters to include the aforementioned exclusionary clause in the text of Article 2.2. Conversely, if, as Canada argues, Article 5.7 was intended to constitute an affirmative defence to a claim of violation under Article 2.2, it was unnecessary to include the aforementioned exclusionary clause in the text of Article 2.2. The

[1837] *Ibid.*, para. 8.58.

[1839] Panel Report, *Japan – Apples*, para. 8.201.
[1840] *Ibid.*, para. 8.212.
[1841] *Ibid.*, paras. 8.199, 8.222 and 8.224.
[1842] Appellate Body Report, *Japan – Apples*, footnote 316.

"logical" way of giving expression to such an intention would have been for Article 2.2 not to include the aforementioned exclusionary clause, and for Article 5.7 to state that "notwithstanding the provisions of Article 2.2, in cases where relevant scientific evidence is insufficient, Members may provisionally adopt SPS measures on the basis of available pertinent information".[1843] Thus, while our view accounts for, and gives meaning and effect to, all of the terms used in Article 2.2, Canada's view renders the exclusionary clause effectively redundant. We recall in this regard that in interpreting Article 2.2, we must give meaning and effect to all of its terms – "*ut res magis valeat quam pereat*" – and must not adopt an interpretation which would result in rendering some of its terms effectively redundant.[1844]

7.2981 In any event, the logic argued for by Canada could also be said to apply to the relationship between Article 3.1 and Article 3.3. Thus, by the same token, it could be said that it is only once it has been determined that an SPS measure is not based on an existing international standard that it becomes relevant to ask whether a Member may nevertheless depart from that standard to achieve a higher level of protection. Yet the Appellate Body found that Article 3.3 is not an exception to a "general obligation" in Article 3.1.

7.2982 The second argument put forward by Canada which we wish to comment on is Canada's argument that, for the purposes of interpreting the relationship between Articles 2.2 and 5.7, any reliance on the Appellate Body's interpretation in *EC – Hormones* of the relationship between Article 3.1 and Article 3.3 would be misplaced and inappropriate. According to Canada, Article 3.1 and Article 3.3 give Members the free choice of basing their SPS measures either on an international standard or on a stricter national standard. In contrast, Canada maintains, Members do not have the option of either maintaining SPS measures with sufficient scientific evidence, as contemplated in Article 2.2, or of maintaining SPS measures on the basis of available pertinent information, as contemplated in Article 5.7. As an initial matter, we note that Articles 3.1 and 3.3 are part of the context of Articles 2.2 and 5.7. Moreover, we consider that there is an undeniable structural and textual similarity between Articles 3.1 and 3.3 and Articles 2.2 and 5.7. Both pairs of articles are linked to each other through a textual cross-reference, and Article 3.1 contains an "except as provided for" clause which is textually almost identical to the corresponding clause in Article 2.2. It is primarily this structural and textual similarity of Articles 3.1 and 3.3, coupled with the fact that these provisions, and their mutual relationship, have already been interpreted by the Appellate Body, which renders them relevant to, and hence has factored in, our examination of the relationship between Article 2.2 and Article 5.7.

7.2983 Thus, our view of the relationship between Articles 2.2 and 5.7 is not reliant on the premise that the relationship between Articles 3.1 and 3.3, on the one hand, and Articles 2.2 and 5.7, on the other hand, is the same in all respects. Indeed, we agree with Canada that there are important substantive differences. A Member can, subject to compliance with applicable requirements, choose whether to base an SPS measure on a relevant international standard in line with Article 3.1 or, alternatively, to avail itself of the qualified right not to do so provided in Article 3.3. In contrast, in cases where the relevant scientific evidence is insufficient, *e.g.*, because none is available, a Member who wishes nonetheless to take a precautionary SPS measure could not meet the requirement in Article 2.2 to ensure that this measure "is not maintained without sufficient scientific evidence". This further strengthens our conviction that Article 5.7 should be viewed as a qualified exemption from the relevant obligation in Article 2.2, confirming the right of Members to take measures which are "necessary for the protection of human, animal or plant life or health" in situations where the available scientific evidence is "insufficient". Therefore, while recognizing the existence of substantive

[1843] *See*, for a similar argument, Appellate Body Report, *US – Upland Cotton*, para. 609.
[1844] *See also* Appellate Body Report, *US – Gasoline*, p. 23.

differences between Articles 3.1 and 3.3, on the one hand, and Articles 2.2 and 5.7, on the other hand, we do not consider that these differences support Canada's view that Article 5.7 constitutes an exception to Article 2.2 in the nature of an affirmative defence.

Relationship between Article 5.1 and Article 5.7

7.2984 We now turn to examine the relationship between Article 5.1 and Article 5.7. We recall at the outset that Article 5.1 requires Members to base their SPS measures on a risk assessment, whereas pursuant to Article 5.7, in cases where relevant scientific evidence is insufficient, Members may provisionally adopt SPS measures on the basis of available pertinent information. The European Communities submits that we should view the relationship between Article 5.1 and Article 5.7 in the same way that we view the relationship between Article 2.2 and Article 5.7. Or as the European Communities also put it, Article 5.7 is not an exception from a general obligation under Article 5.1, but an autonomous right.

7.2985 We recall that in accordance with the guidance provided by the Appellate Body in *EC – Tariff Preferences*, we could characterize Article 5.7 as a right in relation to Article 5.1 if the relationship between Article 5.1 and Article 5.7 is one "where one provision permits, in certain circumstances, behaviour that would otherwise be inconsistent with an obligation in another provision, [where] one of the two provisions refers to the other provision, [and] where one of the provisions suggests that the obligation is not applicable to the said measure".[1845] We will therefore examine below whether the relationship between Article 5.1 and Article 5.7 meets these various elements of the general test articulated by the Appellate Body.

7.2986 We consider first whether Article 5.7 permits, in certain circumstances, what would otherwise be inconsistent with Article 5.1. We note in this regard the statement by the panel in *Australia – Salmon* that "Article 5.7 allows for an exception to the obligation to base sanitary measures on a risk assessment, namely 'in cases where relevant scientific evidence is insufficient'".[1846] This statement clearly suggests that Article 5.7 permits what Article 5.1 prohibits. This statement also suggests that Article 5.7 constitutes an exception, although it is less than clear that the panel conceived of Article 5.7 as an exception in the nature of an affirmative defence. As the panel did not explain why it described Article 5.7 as an exception, we are bound to recall the above-quoted statement by the Appellate Body in *EC – Hormones* that characterizing a treaty provision as an "exception" does not, by itself, place the burden of proof on the responding party.[1847]

7.2987 Looking at the first sentence of Article 5.7, we note that, by its terms, it does not require that Members provisionally adopting SPS measures perform a risk assessment as defined in Annex A(4) to the *SPS Agreement*, and that they base their measure on the completed risk assessment as contemplated in Article 5.1. The first sentence of Article 5.7 requires that in cases where relevant scientific evidence is insufficient, SPS measures be adopted "on the basis of available pertinent information".

7.2988 We note that the second sentence of Article 5.7 obligates Members maintaining SPS measures under Article 5.7 to seek to obtain the additional information necessary for "a more objective assessment of risk", and to review their measures "accordingly". We understand the phrase "a more objective assessment of risk", taken as a whole, to refer to a risk assessment which satisfies the definition provided in Annex A(4) – or at least which is closer to satisfying the definition in

[1845] Appellate Body Report, *EC – Tariff Preferences*, para. 88.
[1846] Panel Report, *Australia – Salmon*, para. 8.57.
[1847] Appellate Body Report, *EC – Hormones*, para. 104.

Annex A(4) than consideration of "available pertinent information". This also appears to be the Appellate Body's view, for it stated in *Japan – Agricultural Products II* that:

> "Article 5.7 states that the additional information is to be sought in order to allow the Member to conduct 'a more objective assessment of risk'. Therefore, the information sought must be germane to conducting *such a risk assessment*, i.e., the evaluation of the likelihood of entry, establishment or spread of, *in casu*, a pest, according to the SPS measures which might be applied."[1848]

7.2989 It is clear from this statement that by "such a risk assessment" the Appellate Body meant "a more objective assessment of risk". We consider that the use of "more" objective invokes a movement in a certain direction, that is, towards the eventual "objective" assessment of risk as defined in Annex A(4), *i.e.*, an evaluation of the likelihood of entry, establishment or spread of a pest, according to the SPS measures which might be applied.

7.2990 According to the Appellate Body, "'relevant scientific evidence' will be 'insufficient' within the meaning of Article 5.7 if the body of available scientific evidence does not allow, in quantitative or qualitative terms, the performance of an adequate assessment of risks as required under Article 5.1 and as defined in Annex A to the *SPS Agreement*".[1849] Thus, if a Member may provisionally adopt an SPS measure on the basis of available pertinent information in situations where the scientific evidence is insufficient for an adequate risk assessment, as required by Article 5.1 and as defined in Annex A(4), it makes sense to require, as the second sentence of Article 5.7 does, that that Member seek to obtain "the additional information necessary" for such a risk assessment. Once a Member has obtained the additional information necessary for a risk assessment which meets the definition of Annex A(4), it will be in a position to comply with its obligation in Article 5.1 to base its SPS measure on a risk assessment which satisfies the definition of Annex A(4).

7.2991 Based on the foregoing considerations, we think the second sentence of Article 5.7 does not support the view that SPS measures which have been provisionally adopted pursuant to Article 5.7 can be maintained only if they are based on a risk assessment as required under Article 5.1 and as defined in Annex A(4). However, there is one element of the second sentence of Article 5.7 which we need to examine further.

7.2992 The second sentence of Article 5.7 refers to "a *more objective* assessment of risk" (emphasis added). The element "more objective" suggests that SPS measures provisionally adopted pursuant to the first sentence of Article 5.7 must also be based on a risk assessment, namely, a risk assessment which takes into account available pertinent information. It follows that if the first sentence of Article 5.7 required a risk assessment, it would necessarily be different in nature from the kind of risk assessment envisaged in Annex A(4). In other words, any risk assessment which might be required by the first sentence of Article 5.7 would not need to meet the definition of a risk assessment contained in Annex A(4). The above-mentioned interpretation by the Appellate Body of the phrase "[i]n cases where relevant scientific evidence is insufficient" also supports this view. For if the right conferred by the first sentence of Article 5.7 only arises in cases where the scientific evidence is insufficient for an adequate risk assessment as required by Article 5.1 and as defined in Annex A(4), then the kind of risk assessment which the first sentence might require by definition could not meet the standard set out in Annex A(4).

[1848] Appellate Body Report, *Japan – Agricultural Products II*, para. 92 (emphasis added).
[1849] Appellate Body Report, *Japan – Apples*, para. 179.

7.2993 In the light of the above, we consider that subject to compliance with the requirements set out in Article 5.7, SPS measures may be provisionally adopted and maintained under Article 5.7 even if these measures are not based on a risk assessment as defined in Annex A(4). Accordingly, we conclude that Article 5.7 permits Members to do, in certain circumstances, what they would not be permitted to do under Article 5.1.

7.2994 The next issue for consideration is whether either Article 5.1 or Article 5.7 refers to the other provision. The first thing to be noted with regard to this issue is that neither Article 5.1 nor Article 5.7 contains an explicit cross-reference to the other provision. Our previous discussion of the relationship between Article 5.1 and Article 5.7 shows, however, that Article 5.7 contains implicit references to Article 5.1. *First*, the second sentence of Article 5.7 refers to "a more objective risk assessment", a phrase which we have construed to refer to a risk assessment within the meaning given to that term in Annex A(4). We have also noted that only Article 5.1 requires a risk assessment as defined in Annex A(4). *Secondly*, we have noted earlier that according to the Appellate Body, relevant scientific evidence is "insufficient" within the meaning of the first sentence of Article 5.7 if it does not allow the performance of an adequate assessment of risks as required under Article 5.1 and as defined in Annex A(4). Thus, through its interpretation of the phrase "[i]n cases where relevant scientific evidence is insufficient", the Appellate Body has made explicit a reference to Article 5.1 which in its view is implicit in Article 5.7. Indeed, the Appellate Body justified its interpretation on the basis that there is "a link or relationship between the first requirement under Article 5.7 and the obligation to perform a risk assessment under Article 5.1".[1850] In view of these elements, we conclude that Article 5.7 should be considered to refer to Article 5.1.

7.2995 The last element we need to address in accordance with the general test set out in *EC – Tariff Preferences* is whether either Article 5.1 or Article 5.7 suggests that the obligation in Article 5.1 to base SPS measures on a risk assessment is not applicable to measures falling within the scope of Article 5.7. We begin by noting that unlike Article 2.2, Article 5.1 does not explicitly say that its provisions apply "except as provided for in paragraph 7 of Article 5". However, Article 5.7 opens with the phrase "[i]n cases where relevant scientific evidence is insufficient". As mentioned by us before, the Appellate Body opined that "'relevant scientific evidence' will be 'insufficient' within the meaning of Article 5.7 if the body of available scientific evidence does not allow, in quantitative or qualitative terms, the performance of an adequate assessment of risks as required under Article 5.1 and as defined in Annex A to the *SPS Agreement*".[1851] Accordingly, if the right conferred by the first sentence of Article 5.7 only arises in cases where the scientific evidence is insufficient for an adequate risk assessment as defined in Annex A(4), and if, as the Appellate Body suggests, Article 5.1 requires such a risk assessment, then the logical conclusion to be drawn is that the obligation in Article 5.1 to base SPS measures on a risk assessment was not intended to be applicable to measures falling within the scope of Article 5.7. Indeed, "[i]n cases where relevant scientific evidence is insufficient", it is impossible, under the Appellate Body's interpretation of that phrase, for Members to meet the obligation to base their SPS measures on a risk assessment as defined in Annex A(4). We find it unreasonable to assume that Members would accept, even in principle, an obligation with which they cannot comply. In our view, the phrase "[i]n cases where relevant scientific evidence is insufficient" should, therefore, be taken to suggest that the obligation in Article 5.1 is not applicable to measures falling within the scope of Article 5.7.

7.2996 In addition, we think the clause "except as provided for in paragraph 7 of Article 5" in Article 2.2 also suggests that the obligation in Article 5.1 is not applicable to measures falling within the scope of Article 5.7. We recall in this regard that in *EC – Hormones* the Appellate Body agreed

[1850] *Ibid.*
[1851] *Ibid.*

with a statement by the panel in that case that Article 5.1 may be viewed as a specific application of the basic obligations contained in Article 2.2.[1852] If Article 5.1 is properly viewed as a specific application of the obligations provided for in Article 2.2, it follows that Article 5.1 cannot be applicable in situations where Article 2.2 is not applicable. We have explained above that the clause "except as provided for in paragraph 7 of Article 5" exempts the kinds of situations covered by Article 5.7 from the obligation in Article 2.2 to ensure that SPS measures are not maintained without sufficient scientific evidence. Since Article 5.1 is not applicable in situations where Article 2.2 is not applicable, the clause "except as provided for in paragraph 7 of Article 5" in Article 2.2 necessarily implies that Article 5.1 cannot be applicable in situations covered by Article 5.7.

7.2997 From our analysis above, it is clear that the general test stated by the Appellate Body in *EC – Tariff Preferences* can be applied also to the relationship between Article 5.1 and Article 5.7. Our application of that test has shown that this relationship meets all the elements which according to the Appellate Body support characterizing Article 5.7 as a right *vis-à-vis* Article 5.1. Furthermore, we think it would be incongruous to reach the conclusion that Article 5.7 is a right *vis-à-vis* Article 2.2, but an exception *vis-à-vis* Article 5.1. For these reasons, we conclude that Article 5.7 should be characterized as a right also in relation to Article 5.1, rather than as an exception from a "general obligation" under Article 5.1. In our view, Article 5.7 operates as a qualified exemption from the obligation under Article 5.1 to base SPS measures on a risk assessment.

7.2998 We have already stated the main implications of characterizing Article 5.7 as a qualified right rather than as an exception in our discussion of the relationship between Article 2.2 and Article 5.7. Nonetheless, for clarity, it is useful to do so again given that we are concerned here with the relationship between Article 5.1 and Article 5.7. Thus, in terms of applicability of Article 5.1, characterizing Article 5.7 as a right means that if a challenged SPS measure was adopted and is maintained consistently with the four cumulative requirements of Article 5.7, the obligation in Article 5.1 to base SPS measures on a risk assessment is not applicable to the challenged measure. Conversely, if a challenged SPS measure is not consistent with one of the four requirements of Article 5.7, the aforementioned obligation in Article 5.1 is applicable to that measure, provided there are no other elements which render Article 5.1 inapplicable.

7.2999 We note in this context that in relation to the safeguard measures at issue in this dispute, the European Communities has advanced the argument that in the event the Panel deemed Article 5.1 applicable, the phrase "as appropriate to the circumstances" in Article 5.1 would send the Panel right back to Article 5.7, because, in the European Communities' view, the safeguard measures in question are provisional measures, and the circumstances are that the scientific evidence is insufficient. The European Communities has not explained how the phrase "as appropriate to the circumstances" would "send the Panel back" to Article 5.7. We note that the European Communities' argument is premised on the applicability of Article 5.1. In view of the assumptions posited by the European Communities – provisional adoption of the safeguard measures in a situation where relevant scientific evidence is insufficient – Article 5.1 would be applicable only if the safeguard measures are not maintained consistently with the second sentence of Article 5.7. We fail to see how in such a case, that is, in a

[1852] Appellate Body Report, *EC – Hormones*, para. 180. *See also* Appellate Body Report, *Japan – Agricultural Products II*, para. 82. It appears that the Appellate Body views Article 5.1 as a specific application of the second and third obligation in Article 2.2, *i.e.*, the obligation to base SPS measures on scientific principles and the obligation not to maintain SPS measures without sufficient scientific evidence. In *Australia – Salmon*, the Appellate Body agreed with the panel in that case that in the event an SPS measure is not based on a risk assessment as required in Article 5.1, this measure can be presumed, more generally, not to be based on scientific principles or to be maintained without sufficient scientific evidence within the meaning of Article 2.2. Appellate Body Report, *Australia – Salmon*, para. 138.

case where the right conferred by Article 5.7 could not be validly asserted, the phrase "as appropriate to the circumstances" in Article 5.1 could "send the Panel back" to Article 5.7.

7.3000 We now turn to the implications of characterizing Article 5.7 as a qualified right rather than as an exception for the allocation of the burden of proof concerning the issue of the consistency of an SPS measure with Article 5.7. In our view, the implication is that in cases where a complaining party alleges that an SPS measure is inconsistent with Article 5.1, it is incumbent on the complaining party, and not the responding party, to demonstrate that the challenged measure is inconsistent with at least one of the four requirements set forth in Article 5.7. If such non-compliance is demonstrated, then, and only then, is Article 5.1 applicable to the challenged SPS measure. Accordingly, we think that when a complaining party presents a claim of violation under Article 5.1, the burden is on the complaining party to establish a prima facie case of inconsistency with both Articles 5.1 and 5.7.

7.3001 We recognize that previous panels have found inconsistencies with Article 5.1 without specifically examining whether the complaining party had established a prima facie case of inconsistency with both Articles 5.1 and 5.7.[1853] In our view, this reflects the fact that in these cases the responding party did not invoke the provisions of Article 5.7 in response to a claim of violation under Article 5.1. In other words, in previous cases, the responding parties did not contest that the relevant measure fell to be assessed under Article 5.1 as opposed to Article 5.7. Since we are confronted in this case with a different situation, it would be improper for us to place the burden of establishing a prima facie case of inconsistency with Article 5.7 on the responding party on the grounds that panels in the past did not explicitly require of the complaining party that it establish a prima facie case of inconsistency with both Articles 5.1 and 5.7. The fact that responding parties in the past did not contest the applicability of Article 5.1 does not, and should not, preclude the responding party in the present case from doing so and thus asserting the right conferred on it by Article 5.7.

7.3002 Additionally, we note that if we had determined that Article 5.7 is an exception from a "general obligation" under Article 5.1, the burden would be on the responding party to demonstrate that the challenged measure is consistent with all of the requirements set forth in Article 5.7. In contrast, in the context of a claim under Article 2.2, it is, according to our view, incumbent on the complaining party to establish a prima facie case of inconsistency with Article 5.7. If we were to accept such a situation, a complaining party could unilaterally determine whether to assume the burden of establishing a prima facie case of inconsistency with Article 5.7. If it wished to avoid that burden, all it would need to do is to present a claim of violation under Article 5.1 rather than under Article 2.2. This, we think, is a further reason for conceiving of the relationship between Article 5.1 and Article 5.7 in the same way as of the relationship between Article 2.2 and Article 5.7.

(iii) Conclusion

7.3003 We have now completed our analysis of the two arguments presented by the European Communities in support of its contention that the safeguard measures must not be assessed under Article 5.1. Regarding the first argument, we have found that even if the European Communities were correct in asserting that the safeguard measures at issue in this dispute are provisional measures, this fact alone would not render Article 5.1 inapplicable.

7.3004 Regarding the second argument, we have determined that Article 5.7 does not provide for an exception from Article 5.1, but establishes a qualified right. We have said that, on this view of the

[1853] *But see*, Panel Report, *Australia – Salmon*, para. 8.57, where the panel intimated, in the context of an inquiry under Article 5.1, that the challenged measure was not consistent with Article 5.7.

relationship between Article 5.1 and Article 5.7, if an SPS measure challenged under Article 5.1 was adopted and is maintained consistently with the cumulative requirements of Article 5.7, the obligation in Article 5.1 to base SPS measures on a risk assessment is not applicable to the challenged measure. In such a case, the complaining party would not have invoked the "wrong" provision, in the sense that it should have brought a challenge under Article 5.7 instead of Article 5.1. The complaining party would have invoked the "correct" provision, but the complaining party's claim under Article 5.1 could not succeed as long as the responding party complies with the requirements of Article 5.7.

7.3005 In the present case, the Complaining Parties are challenging the safeguard measures under Article 5.1. It is clear from the previous paragraph that, in such circumstances, it is both necessary and appropriate to examine the consistency of the safeguard measures with Article 5.7 within the context, and as part, of an examination of the consistency of the same measures with Article 5.1. Therefore, unlike the European Communities, we consider that we may, and indeed must, assess the safeguard measures under Article 5.1.[1854] Accordingly, in the next section, we will address the issue of the consistency of the individual safeguard measures with Article 5.1.

7.3006 Concerning the structure of our Article 5.1 analysis, one possibility would be to examine first whether the Complaining Parties have met their burden of establishing a prima facie case of inconsistency with Article 5.7 in respect of the relevant safeguard measures. However, in the specific circumstances of this case, the critical legal issue in our view is whether the relevant safeguard measures meet the requirements set out in the text of Article 5.1, not whether they are consistent with Article 5.7. Therefore, consistent with the order of analysis followed by the panels in *Japan – Agricultural Products II* and *Japan – Apples* when examining the consistency of measures with Articles 2.2 and 5.7, we prefer to begin our Article 5.1 analysis by examining whether the relevant safeguard measures meet the requirements set out in the text of Article 5.1, notably the requirement to base SPS measures on a risk assessment.

7.3007 Under this approach, should we find that a relevant safeguard measure meets the requirements set out in the text of Article 5.1, there would be no need to examine the Complaining Parties' claims under Article 5.1 further, as their claims would then fail even if we were satisfied that the safeguard measure is not consistent with Article 5.7 and that Article 5.1 therefore applies to the safeguard measure. Should we find, however, that the safeguard measure does not meet the requirements set out in the text of Article 5.1, we would need to go on to examine whether this measure is consistent with the requirements of Article 5.7. If the safeguard measure were consistent with the requirements of Article 5.7, Article 5.1 would not be applicable and we would consequently need to conclude that the European Communities has not acted inconsistently with its obligations under Article 5.1. Conversely, if the safeguard measure were inconsistent with the requirements of Article 5.7, Article 5.1 would be applicable and, in view of the assumed fact that the safeguard measure does not meet the requirements set out in the text of Article 5.1, we would need to conclude that the European Communities has acted inconsistently with its obligations under Article 5.1.

(c) Consistency with Article 5.1 of the *SPS Agreement* (initial assessment)

7.3008 As indicated, in this section, we will make an initial assessment of the consistency of the relevant safeguard measures with Article 5.1 of the *SPS Agreement*. Specifically, we will examine whether the safeguard measures meet the requirements set out in the text of Article 5.1. We begin this task by addressing a number of general arguments put forward by the Parties.

[1854] For clarity, we should mention that our assessment of the safeguard measures under Article 5.1 might lead us to conclude that Article 5.1 is not applicable.

(i) General

7.3009 To recall, Article 5.1 of the *SPS Agreement* provides:

> "Members shall ensure that their sanitary or phytosanitary measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health, taking into account risk assessment techniques developed by the relevant international organizations."

7.3010 Annex A(4) of the *SPS Agreement* provides the following definition of the term "risk assessment":

> "*Risk assessment* – The evaluation of the likelihood of entry, establishment or spread of a pest or disease within the territory of an importing Member according to the sanitary or phytosanitary measures which might be applied, and of the associated potential biological and economic consequences; or the evaluation of the potential for adverse effects on human or animal health arising from the presence of additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs."

7.3011 We have already determined that the relevant safeguard measures are "SPS measures". As such, they are subject to the provisions of Article 5.1. Thus, the safeguard measures must be based on an appropriate risk assessment.

7.3012 The **United States** claims that the safeguard measures are not based on a risk assessment and are, therefore, inconsistent with Article 5.1. Although the member States have offered reasons for their measures, they did not put forth a risk assessment as defined in Annex A(4) of the *SPS Agreement*. The member States have expressed concerns about the potential adverse effects of the relevant products, or biotech products in general, but there is no evidence that these objections were based on any risk assessments. The only risk assessments put forth for the banned products are those conducted by the member States to which the product applications were originally submitted, and by the European Communities' own scientific committees. These risk assessments were favourable to the products, and did not raise any concerns with respect to human health or the environment. Given that the information provided by the member States in support of their measures was rejected by the EC scientific committees, which reaffirmed their initial favourable risk assessment, it cannot be argued that the safeguard measures bear a "rational relationship" to these risk assessments. The United States contends that by failing to put forth their own risk assessments, or to provide sufficient information to overturn the European Communities' earlier positive assessments, the member States have violated Article 5.1.

7.3013 **Canada** similarly argues that the safeguard measures are not based on a risk assessment, and therefore violate Article 5.1. Although the member States have presented reasons when notifying their safeguard measures to the Commission, they did not file any supporting scientific evidence or analysis that meets the definition of a risk assessment set out in the *SPS Agreement*. Canada notes that while the notifications to the Commission pointed to the shortcomings in the risk assessments done as part of the approval process, or put forward general concerns with respect to risks to human health or the environment arising from the banned varieties of biotech products, they did not present a comprehensive analysis of the available scientific evidence. Furthermore, the risk assessments undertaken by the member States where the products were originally filed and by the EC scientific committees both supported the approval of the product applications. The EC scientific committees also rejected in each case the reasons presented by the member States to justify the safeguard measures. Therefore, it cannot be argued that the risk assessments available sufficiently support or

reasonably warrant the safeguard measures, nor that there is a rational relationship between these risk assessments and the member States measures.

7.3014 **Argentina** also argues that the member States measures are inconsistent with Article 5.1 and Annex A(4) of the *SPS Agreement*. It notes that the member States have failed to perform a risk assessment within the meaning of the *SPS Agreement*. The safeguard measures, it argues, have been adopted and maintained without reference to any type of scientific evidence, and in spite of the scientific committee opinions which "disqualified" the member State measures as lacking any scientific basis.

7.3015 The **European Communities** argues that Article 5.1 does not expressly require a "risk assessment". It requires only that Members take into account risk assessment techniques developed by the relevant international organizations.[1855] According to the European Communities, these risk assessment techniques generally recognize that in certain circumstances, namely in the case of the adoption of provisional measures, only an assessment, and not a "risk assessment" within the meaning of the *SPS Agreement*, is necessary. The European Communities argues, in the alternative, that the member States' safeguard measures are based on risk assessments within the meaning of the *SPS Agreement*, as can be inferred from the history of each safeguard measure as well as the sequence of events which led the member States to adopt and maintain those measures.[1856] In its response to a question from the Panel, the European Communities notes that "[a] risk assessment was carried out at the time when the original […] consent was given" for the product, and that such risk assessment "can serve, at least temporarily, as a basis both for the original Community consent, and for the Member States provisional [safeguard] measures".[1857]

7.3016 The European Communities further contends that the requirement that an SPS measure be "based on" a risk assessment does not necessarily mean that this measure must "conform to" the risk assessment. The same risk assessment may "sufficiently warrant", or "reasonably support", more than one possible SPS measure, depending, *inter alia*, on the specific circumstances of the legislator. There may be both a mainstream scientific opinion on which responsible and representative governments may base themselves, and divergent scientific views on the basis of which equally responsible and representative governments may act. In other words, the same risk assessment can reasonably support divergent responses by equally responsible and representative governments. The European Communities also notes that in any event, the member States have made their own risk assessments, and that further risk assessments may be forthcoming.[1858]

7.3017 **Canada** disagrees with the EC argument that Article 5.1 does not expressly require a "risk assessment", but only that Members take into account risk assessment techniques developed by relevant international organizations. That Article 5.1 creates a clear obligation on Members to base their measures on a risk assessment is supported by the definition of the term "risk assessment" in Annex A(4), as well as relevant jurisprudence.[1859] Canada further notes that it fails to see how the risk assessments that formed the basis for the European Communities' approval of the products can serve as the basis for both the original Community consent and for the member States' safeguard measures.

[1855] EC reply to Panel question No. 107.
[1856] EC first written submission, para. 610.
[1857] EC reply to Panel question No. 107.
[1858] *Ibid.*
[1859] Canada argues that relevant jurisprudence supports the interpretation that Article 5.1 creates a clear obligation on the Members to base their measures on a risk assessment, and that it, together with Article 2.2, is "essential for the maintenance of the delicate and carefully negotiated balance in the *SPS Agreement* between the shared, but sometimes competing, interests of promoting international trade and of protecting the life and health of human beings" (Appellate Body Report, *EC – Hormones*, para. 177).

The publicly available scientific opinions do not equivocate in their conclusions, nor do they present diverging views on the potential risks associated with these products.

7.3018 Canada notes that while the Appellate Body has recognized in *EC – Hormones* that a risk assessment can reflect diverging views, and that responsible and representative governments may act in good faith on the basis of divergent opinions, it did not say that "the same risk assessment can reasonably support divergent responses by equally responsible and representative governments" in cases where the risk assessments do not contain divergent views. This must be all the more true when the contrast between the two risk management options, i.e. full approval or complete ban of the product, is as stark as in this case. Finally, with regard to the European Communities' suggestion that the member States have conducted their own risk assessment and that such assessments may be forthcoming, Canada notes that the European Communities has failed to present any evidence of such assessments having been undertaken.

7.3019 The **Panel** recalls that pursuant to Article 5.1, Members must "base" their SPS measures on a "risk assessment". To determine whether an SPS measure is consistent with Article 5.1, we must therefore address two distinct issues: (i) whether there is a "risk assessment" within the meaning of the *SPS Agreement*; and (ii) whether the measure is "based on" this risk assessment.

7.3020 In relation to the first issue, i.e., the issue of whether a risk assessment was carried out, we note the European Communities' argument that Article 5.1 does not expressly require a "risk assessment" within the meaning of the *SPS Agreement*, but only requires that Members take into account risk assessment techniques developed by relevant international organizations.

7.3021 To the extent the European Communities is arguing that there is no requirement to assess "risks", we disagree. By its own terms, Article 5.1 requires Members to base their SPS measures on an appropriate assessment "of the risks to human, animal or plant life or health".[1860] The immediate context of Article 5.1 confirms this view. Article 5 is captioned "*Assessment of Risk* and Determination of the Appropriate Level of Sanitary and Phytosanitary Protection" (emphasis added). Moreover, Articles 5.2 and 5.3 of the *SPS Agreement* specify relevant factors to be taken into account by Members "in the assessment of risks" and "in assessing the risk to animal or plant life or health". Finally, Article 5.7 of the *SPS Agreement* provides that in circumstances where relevant scientific evidence is insufficient and a Member has adopted a provisional SPS measure based on available pertinent information, it must seek to obtain the additional information necessary for a more objective assessment of "risk".

7.3022 As the European Communities points out, Article 5.1 provides that Members must base their SPS measures on an appropriate assessment of risks, "taking into account risk assessment techniques developed by relevant international organizations". In our view, the phrase "taking into account risk assessment techniques developed by relevant international organizations" does not address the issue of whether risks are to be assessed, but rather how risks are to be assessed. This is clear from the reference to "techniques" of risk assessment. Contrary to the European Communities, we therefore do not consider that the phrase in question supports the view that no assessment of risks is required. To the contrary, the phrase in question would, in our view, be unnecessary if there were no requirement to assess risks.

7.3023 The European Communities asserts that risk assessment techniques developed by the relevant international organizations generally recognize that in circumstances where provisional SPS measures

[1860] In *Japan – Apples*, the Appellate Body referred to an "obligation to conduct an assessment of 'risk'". Appellate Body Report, *Japan – Apples*, para. 202.

are adopted, an assessment is required, but not a "risk assessment" as that term is defined in the *SPS Agreement*. It is not clear to us what the European Communities means by "an assessment". If it means to say that some type of assessment of risks would be required, but not an assessment which meets the definition of the term "risk assessment" provided in Annex A(4), we see no basis for such an argument. It is well established in WTO jurisprudence that the Annex A(4) definition is applicable to Article 5.1.[1861] Moreover, since the definition of the term "risk assessment" in Annex A(4) does not itself provide for a particular risk assessment "technique", we have difficulty seeing how a particular risk assessment "technique" developed by an international organization could render inapplicable the general definition of the term "risk assessment" in Annex A(4). In any event, the European Communities has not identified the risk assessment techniques which it says support its assertion that a "risk assessment" within the meaning of Annex A(4) is not required in the case of provisional SPS measures. We therefore do not examine this argument further.

7.3024 We have said that, in our view, an assessment of risks is required. We recall in this respect that Article 5.1 of the *SPS Agreement* does not require a Member to conduct its own risk assessment. As noted by the Appellate Body in *EC - Hormones*, "Article 5.1 does not insist that a Member that adopts a sanitary measure shall have carried out its own risk assessment. It only requires that the SPS measure be 'based on an assessment, as appropriate to the circumstances [...]'. The SPS measure might well find its objective justification in a risk assessment carried out by another Member, or an international organization".[1862] Thus, an SPS measure may be based on a risk assessment conducted by another Member, or an international organization.

7.3025 In the present case, the relevant member State safeguard measures might therefore be supported by a risk assessment carried out by these member States in respect of the product subject to their safeguard measures, or by a risk assessment performed by another entity.

7.3026 Regarding the possibility of there being a risk assessment performed by an entity other than the member State adopting a particular safeguard measure, we note that assessments were carried out in respect of the relevant products before their approval. Before their approval, assessments were performed by the CA of the member State to which the product application was originally submitted – the "lead CA"[1863]- and by the relevant EC scientific committee. Furthermore, after the approval of the product, these assessments were reviewed by the relevant EC scientific committee on the basis of the information provided by the member State adopting the safeguard measure.

7.3027 It is common ground among the Parties that the assessments carried out by the lead CA and by the EC scientific committees constitute "risk assessments" within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*. It is apparent from the assessments provided to us that they evaluated the likelihood of potential adverse effects on human health and/or the environment, as well as the associated potential consequences, according to the proposed use of the specific biotech product under consideration.[1864] These assessments were of a qualitative and not quantitative nature, however the WTO jurisprudence has clearly established that the *SPS Agreement* does not require that risk assessments be of a quantitative nature in order to satisfy the definition in Annex A(4). We therefore

[1861] *See, e.g.*, Appellate Body Reports, *Japan – Apples*, para. 196; *Australia – Salmon*, para. 121.

[1862] Appellate Body Report, *EC - Hormones*, para. 190.

[1863] We note that for none of the nine safeguard measures at issue the member State adopting the safeguard measure acted as the lead member State during the relevant approval procedure.

[1864] We note that the assessments by the relevant EC scientific committees which reviewed these committees' earlier assessments in the light of information provided by the member States taking safeguard measures are generally in the nature of supplemental assessments. Thus, the review assessments need to be read in conjunction with the earlier (original) assessments.

agree with the Parties that risk assessments within the meaning of Annex A(4) and Article 5.1 have been conducted in respect of the products subject to the safeguard measures by the lead CA and by the relevant EC scientific committee. Below, we will examine for each safeguard measure whether, in addition, other risk assessments have been conducted in respect of these same products, and in particular whether the EC member States applying safeguard measures have carried out their own risk assessment.

7.3028 Once we have determined that one or more risk assessments exist in respect of a product subject to one of the relevant safeguard measures – and we have already found in the previous paragraph that such risk assessments exist – we must go on to analyse any claims that the relevant safeguard measure is "based on" one or more of these risk assessments. With respect to the issue of whether an SPS measure is "based on" a risk assessment, we note that this requirement has been interpreted as meaning that there must be a rational relationship between a risk assessment and the SPS measure taken, or in other words, that the results of the risk assessment must "sufficiently warrant" or "reasonably support" the SPS measure at issue.[1865]

7.3029 Consistent with the foregoing considerations, we will determine below, for each safeguard measure, whether there exists a "risk assessment" upon which the safeguard measure is "based". Before undertaking this task, however, we must address one further issue. The issue to be addressed is whether the maintenance of the relevant safeguard measures may be justified both by reference to risk assessments which were carried out before these measures were adopted and by reference to risk assessments which were carried out after these measures were adopted.

7.3030 Article 5.1 does not explicitly speak to this specific issue. We recall that Article 5.1 requires Members to ensure that their SPS measures "are based on" an assessment, "as appropriate to the circumstances", of risks to animal, plant or human life or health. Regarding the requirement that SPS measures be "based on" a risk assessment, it is clear to us that SPS measures must be "based on", or "sufficiently warranted" or "reasonably supported" by, a risk assessment throughout the period of time for which these measures are maintained.[1866] In our view, both a risk assessment carried out before the adoption of a particular safeguard measure and a risk assessment carried out after its adoption could "sufficiently warrant", or "reasonably support", the maintenance of that measure.

7.3031 Also relevant to our inquiry is the requirement that a risk assessment be "appropriate to the circumstances". The phrase "as appropriate to the circumstances" is unqualified as far as its temporal scope is concerned. Notably, Article 5.1 does not say "as appropriate to the circumstances existing at the time of adoption of such measures", or "as appropriate to the circumstances existing at the time of the assessment". We think it may be inferred from the absence of any temporal limitation that at any given time, SPS measures must be based on an assessment of risks which is appropriate to the circumstances existing at that time. Indeed, this is consistent with the fact that relevant circumstances may change over time.[1867] A change in relevant circumstances may have an impact on a completed

[1865] Appellate Body Report, *EC - Hormones*, paras. 193-194.

[1866] This view is consistent with the following finding by the panel in *Australia – Salmon*:

> We note Australia's statement that its policy of allowing imports of salmon products heat-treated in accordance with the 1988 Conditions will be reviewed and that for these purposes an import risk analysis is scheduled. It is possible that this risk analysis provides a rational basis for the measure at issue. However, *as of today* and on the basis of the risk assessment before us, we do not detect such a basis. (Panel Report, *Australia – Salmon*, para. 8.100 (emphasis added).)

[1867] Article 2.2 also contains separate requirements supporting this view, stating that Members shall ensure that their measures are 1) "based on scientific principles" and 2) "not maintained without sufficient scientific evidence".

risk assessment, and in some cases the impact may be such as to affect the continued relevance of a completed risk assessment and the validity of its conclusions.[1868] If and when a change in relevant circumstances affects the continued relevance and validity of a completed risk assessment, that assessment would, in our view, no longer constitute an assessment "appropriate to the circumstances".[1869]

7.3032 We note that the Appellate Body observed that the phrase "as appropriate to the circumstances" provides Members with "a certain degree of flexibility in meeting the requirements of Article 5.1".[1870] However, this statement did not relate to a situation such as the one we are considering here where relevant circumstances change over time. We see nothing in the ordinary meaning of the phrase "as appropriate to the circumstances", or in the aforementioned observation by the Appellate Body, to contradict our view that a change in relevant circumstances could in some cases render a completed risk assessment no longer "appropriate to the circumstances".

7.3033 This approach is also supported by the context of Article 5.1. Article 5.6 provides that "when establishing or *maintaining* [SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or phytosanitary protection" (emphasis added). We have previously observed that one of the purposes of a risk assessment is to allow the importing Member to determine the measure to be applied, if any, for achieving its appropriate level of protection. Thus, if a Member could maintain under Article 5.1 a significantly trade-restrictive SPS measure on the basis of a risk assessment which is no longer appropriate to the circumstances (*e.g.*, due to new scientific evidence which affects the continued relevance and validity of the risk assessment in question), and a risk assessment appropriate to the circumstances would establish that essentially no risk in fact exists, then that Member would be "maintaining" an SPS measure which *ex hypothesi* is more trade-restrictive than required to achieve its appropriate level of protection, contrary to the requirements of Article 5.6. Irrespective of whether the trade-restrictive measure could be challenged under Article 5.6, we consider that it would be improper to interpret Article 5.1 so as to allow the Member to maintain its trade-restrictive measure, as such an interpretation would frustrate an important purpose of a risk assessment, which is "to serve as a basis for regulatory actions"[1871]. The determination of a measure which is not more trade-restrictive than required to achieve a Member's appropriate level of protection is a relevant "regulatory action".

7.3034 In the present case, the Complaining Parties are challenging the maintenance by the European Communities of the relevant safeguard measures. Thus, in accordance with our interpretation of Article 5.1 we must examine whether, on the date of establishment of this Panel, each safeguard measure was based on an assessment of risks which was appropriate to the circumstances existing at that time. Since what is being challenged is the maintenance of each safeguard measure, it is of no

[1868] In our view, the state of scientific knowledge is one example of a circumstance which is relevant to the assessment of risks and which is subject to change over time. Indeed, evolution of science may result in new and/or better scientific evidence becoming available, and such evidence may have an effect on the continued relevance and validity of the conclusions of an existing risk assessment.

[1869] It should be noted in this context that, in our view, a completed risk assessment which meets the definition of Annex A(4) and is consistent with the requirements of Articles 5.2 and 5.3 of the *SPS Agreement* would not cease to satisfy that definition or these requirements merely because there was a change in relevant circumstances and that change affected the continued relevance of that risk assessment. To provide a simple example: A risk assessment within the meaning of Annex A(4) which has not been updated over time continues to be a risk assessment within the meaning of Annex A(4). However, as we have said, such a risk assessment may no longer be "appropriate to the circumstances" in the sense of Article 5.1.

[1870] Appellate Body Report, *EC – Hormones*, para. 129.

[1871] Panel Report, *Japan – Apples*, para. 7.12.

particular importance whether a specific risk assessment which is claimed to serve as a basis for a safeguard measure was performed before or after the adoption of that safeguard measure. What matters is that the relevant risk assessment was appropriate to the circumstances existing at the time this Panel was established. In the light of this, in our analysis of whether there are risk assessments on which individual safeguard measures were based at the relevant time, we will consider assessments which were carried out before these measures were adopted as well as assessments which were carried out after these measures were adopted.

(ii) Austria – T25 maize

7.3035 The Panel commences its analysis of individual safeguard measures with Austria's measure on T25 maize. The first issue we will address is whether the documents Austria relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3036 We first recall that in the Reasons document, Austria presented various concerns in support of its safeguard measure on T25 maize, including, *inter alia*, the fact that the product had not been examined under realistic conditions as far as the use of herbicide is concerned, and that no monitoring programme was foreseen to assess the long-term effects of T25 maize.[1872] With respect to its concern regarding the assessment of long-term effects, Austria invoked the need to protect sensitive areas, referring to a study by Hoppichler entitled "Concepts of GMO-Free Environmentally Sensitive Areas", which was commissioned by the Austrian Federal Ministry of Women's Affairs and Consumer Protection (hereafter the "Hoppichler study ").[1873] This study appears to be the only scientific evidence which Austria relied on at the time of adoption of its safeguard measure.

7.3037 As also noted earlier, Austria invoked further concerns in the January 2004 document, namely, with respect to risks related to allergenicity and toxicity, the potential environmental impact of *Bt* toxin as well as antibiotic resistance marker genes.[1874] In relation to the January 2004 document, we recall that our task is to assess whether the Austrian safeguard measure was based on a risk assessment as of 29 August 2003, when this Panel was established. A risk assessment completed after August 2003 in our view would not assist the European Communities in rebutting the Complaining Parties' claim that Austria's safeguard measure was not based on a risk assessment in August 2003. However, we note that one of the studies mentioned by Austria in the January 2004 document was published in March 2003, and we therefore take it into account. The study in question is a joint study by the Federal Ministry of the Environment ("Umweltbundesamt GmbH") and IFF/IFZ – Inter-University Research Centre for Technology, Work and Culture, entitled "*Toxicology and Allergology of GM Products: Investigations into practice and recommendations on the standardization of risk assessment of genetically modified food*" (hereinafter the "March 2003 document").[1875]

7.3038 Having identified the documents which Austria relies on to justify its safeguard measure, we can now go on to determine whether any of these documents constitutes a "risk assessment" within the meaning of the *SPS Agreement*.

[1872] Exhibit EC-160/At. 3.
[1873] Exhibit EC-160/At. 5.
[1874] Exhibit EC-158/At. 30.
[1875] Exhibit EC-158/At. 41_trans.

7.3039 We recall that Austria justified its safeguard measures by reference to concerns relating to the spread of pollen to cultivated surrounding fields, long-term ecological effects, the potential development of antibiotic resistance and allergenicity and toxicity. We have determined that to the extent Austria's measure is applied to address concerns over the spread of pollen to cultivated surrounding fields, long-term ecological effects and the development of antibiotic resistance, it falls within the scope of Annex A(1)(a) and/or (d) of the *SPS Agreement*. The first clause of Annex A(4) to the *SPS Agreement* provides the following definition for the "risk assessment" to be carried out for measures which have purposes falling within the scope of Annex A(1)(a) or (d):

> "*Risk assessment* – The evaluation of the likelihood of entry, establishment or spread of a pest or disease within the territory of an importing Member according to the sanitary or phytosanitary measures which might be applied, and of the associated potential biological and economic consequences."

7.3040 Based on this definition, the Appellate Body in *Australia – Salmon* found that a risk assessment must:[1876]

> "1) *identify* the diseases [or pests] whose entry, establishment or spread a Member wants to prevent on its territory, as well as the potential biological and economic consequences associated with the entry, establishment or spread of these diseases;
>
> 2) evaluate the *likelihood* of entry, establishment or spread of these diseases [or pests], as well as the associated potential biological and economic consequences; and
>
> 3) evaluate the likelihood of entry, establishment or spread of these diseases [or pests] *according to the SPS measures which might be applied*."

7.3041 We begin our analysis of Austria's Reasons document. In this document, Austria alleges that T25 maize was not examined under realistic conditions of the use of the herbicide and of correspondent agricultural practices; that there was no monitoring programme to assess the long-term effects of biotech plants and herbicides, and in particular with respect to the protection of environmentally sensitive areas; that there were no special measures to monitor the possible spread of pollen to fields in the surroundings cultivated with conventional maize (co-existence); and that regional ecological aspects were not differentiated as far as resistance development is concerned. We note that the Reasons document highlights concerns related to the lack of a monitoring programme for possible long term environmental impacts associated with herbicide use on GM plants and the spread of pollen from GM cultivated fields to fields in surrounding areas. Regarding the concern over the spread of pollen, the Reasons document includes references to possibilities of associated risks, but it does not provide an evaluation of the likelihood of such risks occurring. For example, the document states that the spread of pollen is "mostly regarded as safe."[1877] On the other hand, the Reasons document does not make explicit claims regarding the risks associated with the long-term environmental impacts of herbicide use in conjunction with GM crops in ecologically sensitive areas, but rather refers to the Hoppichler study for discussion of these risks.

[1876] Appellate Body Report, *Australia-Salmon*, para. 121 (bracketed text added).
[1877] Exhibit EC-160/At. 3.

7.3042 The Hoppichler study focuses on the protection of environmentally-sensitive areas. Based on the evidence submitted to us[1878], we understand that Austria is seeking to prevent the cultivation and other uses of GMOs on its territory due to possible long-term ecological risks associated with GMOs, particularly in fragile areas. In addition, the study argues that "multiple releases and the marketing of GMOs are irreversible processes, and [...] products of organic agriculture will also contain GMOs even if they are produced strictly on the basis of organic guidelines."[1879]

7.3043 In considering the Hoppichler study, we recall that the Commission requested the SCP to analyse the information provided by Austria, including the aforementioned study, in order to determine whether this information may "constitute relevant scientific evidence, which would cause the SCP to consider that this product constitutes a risk to human health and the environment."[1880] In response, the SCP prepared an opinion which notes that the Hoppichler study "does not contain any new scientific information which is relevant to the original scientific risk assessment that [the SCP] published in 1998. Rather the document contains arguments for the establishment of GMO-free environmentally-sensitive areas and summarises surveyed opinions of people who may be confronted professionally with any environmental effects of the release of GMOs." We understand this statement to indicate that the SCP did not view this study as a risk assessment.

7.3044 We also note that the Hoppichler study does not indicate relative probability of the potential risks it identifies, but rather makes reference to possibilities of risks or simply to the inability to determine probabilities. For example, the document states that "there are possibilities of direct risks which can be assessed within some limits according to the status of science and technology".[1881] In addition, the study cites two analyses regarding environmental risk assessment of releasing GMOs. A quote from the first analysis indicates that "the ecological impact of transgenic grasses *may be* pervasive" (emphasis added).[1882] The second analysis is said to demonstrate that "the contamination of natural gene pools through synthetic genes is incalculable in principle in predictive risk assessment".[1883] This statement highlights the lack of estimated risk associated with gene flow from GMOs.

7.3045 Regarding these references to possibilities of risks, we recall that the Appellate Body in *Australia – Salmon* stated that:

> "[I]t is not sufficient that a risk assessment conclude that there is a *possibility* of entry, establishment or spread of diseases and associated biological and economic consequences. A proper risk assessment of this type must evaluate the 'likelihood' i.e., the 'probability', of entry, establishment or spread of diseases and associated biological and economic consequences."[1884]

7.3046 Given the lack of evaluation of likelihood in the Hoppichler study, we consider that the study does not meet the definition of a risk assessment as provided in Annex A(4), and therefore does not constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

[1878] We note that the European Communities provided a summary of the Hoppichler study in English (Exhibit EC-160/At. 5).
[1879] Exhibit EC-160/At. 5, p. 8.
[1880] Exhibits US-56; CDA-77; ARG-45 and -46.
[1881] Exhibit EC-160/At. 5, p. 4.
[1882] Exhibit EC-160/At. 5, p. 4.
[1883] Exhibit EC-160/At. 5, p. 4.
[1884] Appellate Body Report, *Australia – Salmon*, paras. 123-124.

7.3047 We now turn to determine whether any of the relevant documents relied on by Austria contains a risk assessment with regard to Austria's concerns over the development of antibiotic resistance and allergencity and toxicity. We recall in this respect our earlier finding that to the extent Austria's measure is applied to address such concerns, it falls within the scope of Annex A(1)(b) the *SPS Agreement*. The second clause of Annex A(4) to the *SPS Agreement* provides the following definition for the "risk assessment" to be carried out for measures which have purposes falling within the scope of Annex A(1)(b):

> "*Risk assessment*: [...] the evaluation of the potential for adverse effects on human or animal health arising from the presence of additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs."

7.3048 We note that, unlike for the definition of risk assessment contained in the first clause of Annex A(4), WTO jurisprudence provides little guidance on the meaning of key concepts contained in the definition provided in the second clause. The Appellate Body merely observed in this respect that the first clause is substantially different from the second clause, and that the second clause requires "only" the evaluation of the "potential" for adverse effects on human or animal health arising from the presence of certain substances in foods, whereas the first clause requires an evaluation of the "likelihood" of entry, establishment or spread of a pest or disease and of the associated biological and economic consequences.[1885] We note that the dictionary defines the term "potential" as "the possibility of something happening [...] in the future".[1886]

7.3049 In this context, one relevant document to be examined is the Austrian study on toxicology and allergology of biotech products of March 2003. This study reviews the assessment under Regulation 258/97 of toxic and allergenic risks of food containing or consisting of GMOs. The objective of the study was to investigate risk assessment practices for food derived from biotech plants, and to make proposals to "concretise and standardise the toxicological and allergological risk assessment."[1887] We consider that this study evaluates risk assessment *procedures*, and not the potential for adverse effects on human or animal health arising from the consumption of specific foods containing or consisting of GMOs. We therefore think that the March 2003 study does not meet the definition of a risk assessment as provided in Annex A(4).

7.3050 Regarding Austria's concern about the development of antibiotic resistance, we recall that this concern was raised in the January 2004 document.[1888] However, none of the supporting documents which were provided to the Panel contains a discussion of risks associated with this specific concern in the context of the product at issue. The Austrian study on toxicology and allergology of biotech products of March 2003 reviews procedures for the assessment of risks of food containing or consisting of GMOs; the issue of antibiotic resistance is not included in the analysis. Thus, we are not aware of any pre-August 2003 document which addresses the issue of antibiotic resistance and which meets the definition of a risk assessment provided in Annex A(4).

7.3051 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Austria to justify its safeguard measure are not in themselves risk assessments within the meaning of Annex A(4) and Article 5.1.

[1885] Appellate Body Report, *Australia – Salmon*, footnote 69.

[1886] *The Concise Oxford Dictionary*, 10th edn, J. Pearsall (ed.) (Oxford University Press, 1999), p. 1120.

[1887] Exhibit EC-158/At. 41, p. 19.

[1888] Exhibit EC-158/At. 30.

7.3052 In connection with the documents relied on by Austria, we should also note the European Communities' argument that Austria's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. According to the European Communities, the phrase "as appropriate to the circumstances" makes it clear that Members have a certain degree of flexibility in meeting the requirements of Article 5.1.[1889] The European Communities submits that the circumstances in the case of the Austrian safeguard measure include the fact that, from Austria's perspective, relevant scientific evidence was or is insufficient.

7.3053 We need not determine whether relevant scientific evidence was or is insufficient for Austria, and if so, whether this would be a relevant circumstance. Even if this were the case, the flexibility which the phrase "as appropriate to the circumstances" may in some situations provide does not relieve Austria from the requirement in Article 5.1 to base its safeguard measure on a risk assessment which meets the definition of Annex A(4).[1890] All of the Annex A(4) definition of the term "risk assessment" which are applicable to Austria's safeguard measure, must, in our view, be met. It is useful to recall in this respect that the Appellate Body in *Australia – Salmon* observed that an evaluation of the likelihood of entry, establishment or spread of a pest could be done both quantitatively and qualitatively.[1891] Moreover, in circumstances where there is little available scientific evidence, the phrase "as appropriate to the circumstances" may provide a measure of flexibility in terms of how (but not whether) the applicable elements of the Annex A(4) definition, including the likelihood evaluation, are satisfied. In the case at hand, we have answered in the negative the question of whether the documents which Austria relied on satisfy the applicable elements of the Annex A(4) definition of the term "risk assessment". Therefore, we see no need to examine further the European Communities' argument in relation to the phrase "as appropriate to the circumstances".

7.3054 We have found above that none of the documents relied on by Austria constitute risk assessments. However, the European Communities contends that there is a document other than the documents relied on by Austria which constitutes a risk assessment for T25 maize. The document in question is the "[r]isk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1892] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to that conducted by the SCP.[1893] In any event, we have noted above that it is not in dispute that both of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3055 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the SCP were no longer "appropriate to the circumstances". We also recall in this regard that the SCP confirmed its original risk assessment after reviewing the information relied on by Austria. In the light of this, and in view of our findings below with regard to whether the Austrian safeguard measure is "based on" these risk assessments, we do not need to examine this issue further.

[1889] In support of its statement, the European Communities refers to the Appellate Body report on *EC – Hormones*, para. 129.

[1890] We note in this context the statement by the panel in *Australia – Salmon* to the effect that the phrase "as appropriate to the circumstances" "cannot [...] annul or supersede the substantive obligation resting on Australia to base the sanitary measure in dispute [...] on a risk assessment". Panel Report, *Australia – Salmon*, para. 8.57.

[1891] Appellate Body Report, *Australia – Salmon*, para. 124.

[1892] EC reply to Panel question No. 107.

[1893] Exhibits EC-160/At. 2; CDA-75 and 87; US-56 (referencing original SCP assessment); ARG-45 and 46 (referencing original SCP assessment).

"Based on"

7.3056 As noted, it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or that conducted by the SCP. In our analysis below, we will examine whether, at the time of establishment of this Panel, the Austrian safeguard measure was "based on" either of these risk assessments.

7.3057 The European Communities presents two main arguments to support its assertion that the Austrian safeguard measure is based on a risk assessment pursuant to Article 5.1. The first argument of the European Communities is that responsible and representative governments may act either on the basis of mainstream scientific opinion or on the basis of a divergent scientific view. Regarding Austria's safeguard measure on T25 maize, the European Communities submits that Austria acted on the basis of new scientific information, which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment.

7.3058 The Panel notes that in *EC - Hormones*, the Appellate Body observed that a "[r]isk assessment could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view".[1894] It then went on to state that "responsible and representative governments may act in good faith on the basis of what, at a given time, may be a divergent opinion coming from qualified and respected sources. By itself, this does not necessarily signal the absence of a reasonable relationship between the SPS measure and the risk assessment, especially where the risk involved is life-threatening in character and is perceived to constitute a clear and imminent threat to public health and safety."[1895]

7.3059 It is important to recall that this statement related to a hypothetical situation where divergent views were expressed as part of, and in, the same risk assessment. In the case at hand, we are not aware, and have not been made aware, of any divergent views that would be expressed in the risk assessments of the lead CA and SCP concerning T25 maize. Therefore, we are presented here with a situation that is different from that described by the Appellate Body in *EC – Hormones*. Furthermore, we note that the contributions of the Panel's experts do not support the view that the potential risks arising from the deliberate release of T25 maize and the other biotech products subject to this dispute can be considered to be risks that are "life-threatening in character" or that "constitute a clear and imminent threat to public health and safety".[1896]

7.3060 Where a given risk assessment sets out a divergent opinion[1897] and this opinion comes from qualified and respected sources, it can be reasonably said that an SPS measure which reflects the divergent opinion is "based on" the risk assessment in question inasmuch as the divergent opinion is expressed in that risk assessment. In contrast, where a given risk assessment sets out a single opinion, it cannot be reasonably said that an SPS measure is "based on" *that* risk assessment if the relevant SPS measure reflects a divergent opinion which is not expressed in the risk assessment in question. *Ex hypothesi*, the opinion expressed in that risk assessment would not "sufficiently warrant", or "reasonably support", the SPS measure taken.

7.3061 In the case of the Austrian safeguard measure, the European Communities asserts that new scientific information became available and that this new information justified Austria's differing

[1894] Appellate Body Report, *EC - Hormones*, para. 194.
[1895] Appellate Body Report, *EC - Hormones*, paras. 193-194.
[1896] *Ibid.*
[1897] We use the term "divergent opinion" or "divergent assessment" to refer to an opinion or assessment which argues for, and supports, a significantly different overall conclusion.

assessment of the risks. Even assuming this were the case, however, this would not alter the fact that we are unaware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP. Therefore, it would be clear that, on the date of establishment of this Panel, Austria's safeguard measure would not have been based on these existing risk assessments, but on its own modified version of these assessments, namely, its divergent assessment.

7.3062 Even if the alleged divergent assessment by Austria in a number of respects did not depart from the existing risk assessments, Austria's safeguard measure could not, for that reason alone, be considered to be based on these risk assessments if these assessments reached a different overall conclusion. To be clear, we are not suggesting that Members cannot rely in part on an existing risk assessment which sets out a single opinion. But to the extent they disagree with some or all of the conclusions contained in such an assessment, it would in our view be necessary for Members to explain, by reference to the existing assessment, how and why they assess the risks differently, and to provide their revised or supplemental assessment of the risks. The European Communities or Austria did not do so in relation to the safeguard measure on T25 maize.

7.3063 Since we are unable to accept the European Communities' first argument in support of its view that the Austrian safeguard measure is based on the risk assessments conducted by the lead CA and the SCP, we must go on to examine the European Communities' second argument. The second argument of the European Communities is that the risk assessment carried out before Community-wide marketing approval was given, can serve, at least temporarily, as a basis for both the Community-wide marketing approval and Austria's provisional safeguard measure. In other words, the European Communities contends that the same risk assessment can "sufficiently warrant", or "reasonably support", more than one type of SPS measure, or, as the European Communities puts it, one and the same risk assessment may justify "divergent responses by equally responsible and representative governments".[1898]

7.3064 As a general matter, the Panel agrees with the European Communities that a particular risk assessment might conceivably serve as a basis for different types of SPS measures. Indeed, there may be a range of measures that may be rationally related to a given risk assessment, at least in cases where a risk is determined to exist.[1899] In the present case, the risk assessments conducted by the lead CA and by the SCP with regard to T25 maize were favourable.[1900] These assessments concluded that there was no evidence that T25 maize presents any greater risk to human health or the environment than its conventional (non-biotech) counterpart. Yet, the safeguard measure which Austria allegedly adopted on the basis of these risk assessments provides for a complete prohibition of the product.[1901] In our view, the favourable findings of the risk assessments in question do not naturally lead to the conclusion that what is arguably the strictest type of SPS measure, *i.e.*, a complete prohibition, was warranted in Austria's case to protect human health and the environment. To the contrary, these findings strongly suggest that this type of measure was not sufficiently warranted.

7.3065 The European Communities asserts that each of the safeguard measures at issue in this dispute is based on the precautionary principle. We would agree that the fact that a Member has

[1898] *See* EC reply to Panel question No. 107.

[1899] While there may be a variety of SPS measures that would be rationally related to a given risk assessment, some of these measures may be inconsistent with Article 5.6 of the *SPS Agreement*. In other words, there may be SPS measures which are rationally related to a risk assessment, but more trade-restrictive than required to achieve a Member's appropriate level or protection.

[1900] Exhibits EC-160/At. 2; CDA-75 and 87; US-56 (referencing original SCP risk assessment); ARG-45 and 46 (referencing original SCP risk assessment).

[1901] As we have noted, the prohibition is subject to an exception which applies in cases where the products are meant to be immediately re-exported after handling and repackaging (Exhibit EC-160/At. 3_trans).

decided to follow a precautionary approach could have a bearing on a panel's assessment of whether an SPS measure is "based on" a risk assessment as required by Article 5.1. We consider that if there are factors which affect scientists' level of confidence in a risk assessment they have carried out[1902], a Member may in principle take this into account in determining the measure to be applied for achieving its appropriate level of protection from risks.[1903] Thus, there may conceivably be cases where a Member which follows a precautionary approach, and which confronts a risk assessment that identifies uncertainties[1904] or constraints, would be justified in applying (i) an SPS measure even though another Member might not decide to apply any SPS measure on the basis of the same risk assessment, or (ii) an SPS measure which is stricter than the SPS measure applied by another Member to address the same risk. However, even if a Member follows a precautionary approach, its SPS measures need to be "based on" (*i.e.*, "sufficiently warranted" or "reasonably supported" by) a risk assessment. Or, to put it another way, such an approach needs to be applied in a manner consistent with the requirements of Article 5.1.[1905]

7.3066 In the case of Austria's safeguard measure on T25 maize, the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, much less explained why, in view of any such uncertainties or constraints, Austria's prohibition is warranted by the relevant risk assessments. Therefore, the European Communities' argument about the precautionary approach does not persuade us that Austria's safeguard measure is "sufficiently warranted" by the favourable risk assessments which were performed with regard to T25 maize. In other words, if Austria's safeguard measure reflects a precautionary approach, we consider, based on the evidence before us, that Austria did not implement that approach in a manner consistent with the requirements of Article 5.1.

7.3067 We note the European Communities' argument that "based on" does not mean "conform to". To the extent the European Communities means to argue that Members are free to adopt any kind of SPS measure provided there exists a risk assessment for the product subject to the SPS measure, we

---

[1902] *E.g.*, a limited body of relevant scientific evidence may be such a factor.

[1903] This view is consistent with risk assessment techniques established by relevant international organizations. For instance, the *Working Principles for Risk Analysis for Application in the Framework of the Codex Alimentarius* state that "[t]he report of the risk assessment should indicate any constraints, uncertainties, assumptions and their impact on the risk assessment. Minority opinions should also be recorded. The responsibility for resolving the impact of uncertainty on the risk management decision lies with the risk manager, not the risk assessors". Codex Alimentarius Commission, *Working Principles for Risk Analysis for Application in the Framework of the Codex Alimentarius* (adopted in June/July 2003), Section III, Codex Procedural Manual, 14th edition, 2004, para. 25. Along similar lines, the Codex *Principles for the Risk Analysis of Foods Derived from Modern Biotechnology* state that "[r]isk managers should take into account the uncertainties identified in the risk assessment and implement appropriate measures to manage these uncertainties". Codex Alimentarius Commission, *Principles for the Risk Analysis of Foods Derived from Modern Biotechnology* (adopted in June/July 2003), CAC/GL 44-2003, para. 18. Similarly, the IPPC's ISPM #11 (2001) states in relevant part that "[t]he uncertainty noted in the assessments of economic consequences and probability of introduction should also be considered and included in the selection of a pest management option". IPPC, ISPM #11: *Pest Risk Analysis for Quarantine Pests*, April 2001, para. 3. The quoted passage stayed the same in the 2004 version of ISPM #11, which applies specifically to living modified organisms.

[1904] We are not referring here to the theoretical uncertainty which inevitably remains because science can never provide absolute certainty that a product will never have adverse effects on human health or the environment. The Appellate Body has made it clear that this theoretical uncertainty is not the kind of risk which is to be assessed under Article 5.1. Appellate Body Report, *EC – Hormones*, para. 186.

[1905] We recall that according to the Appellate Body, the precautionary principle "has not been written into the *SPS Agreement* as a ground for justifying SPS measures that are otherwise inconsistent with the obligations of Members set out in particular provisions of that Agreement". Appellate Body Report, *EC – Hormones*, para. 124.

disagree. It is correct that the Appellate Body in *EC – Hormones* has said that the expression "based on" as it appears in Article 3.1 of the *SPS Agreement*[1906] does not mean "conform to".[1907] However, the Appellate Body also said in *EC – Hormones* that in the specific context of Article 5.1, the expression "based on" should be interpreted to mean "sufficiently warranted by", "reasonably supported by" or "rationally related to".[1908] As we have said, in the case of Austria's safeguard measure on T25 maize, there exists no apparent rational relationship between that measure, which imposes a complete prohibition, and risk assessments which found no evidence that T25 maize presents any greater risk to human health or the environment than its conventional (non-biotech) counterpart.[1909] At any rate, if we were to allow Austria effectively to ignore favourable risk assessments, we would turn these assessments into documents without any substantive importance and the conduct of these assessments into a mere formality. Yet, the requirement in Article 5.1 to "base" an SPS measure on a risk assessment is plainly a substantive requirement, and not simply a formal requirement to accompany an SPS measure by a risk assessment.[1910]

7.3068 In view of the foregoing considerations, while not rejecting the European Communities' second argument generally, we do not agree with the European Communities that Austria's safeguard measure can be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize.

7.3069 Accordingly, since we are of the view that Austria's safeguard measure cannot be considered to be "based on" the existing (original) risk assessments, and recalling also that no other risk assessment which might reasonably support Austria's safeguard measure has been provided to us, we find that the Austrian measure prohibiting the placing on the market of T25 maize is not based on a risk assessment pursuant to Article 5.1.[1911]

Overall conclusions

7.3070 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment.

[1906] Article 3.1 states in relevant part that "Members shall base their [SPS] measures on international standards, guidelines or recommendations, where they exist [...]".

[1907] Appellate Body Report, *EC - Hormones*, para. 166.

[1908] *Ibid.*, para. 193.

[1909] We note that the Appellate Body in *EC – Hormones* confronted a comparable situation. Specifically, the Appellate Body found that scientific reports which concluded that the use of certain hormones for growth promotion purposes was safe did not rationally support an import prohibition maintained by the European Communities. Appellate Body Report, *EC - Hormones*, paras. 196-197.

[1910] We note that the Appellate Body in *EC – Hormones* also characterized the requirement that an SPS measure be "based on" a risk assessment as a "substantive requirement". Appellate Body Report, *EC - Hormones*, para. 193.

[1911] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment.

7.3071 In view of our findings in the previous paragraph with regard to DS291 (United States), DS292 (Canada) and DS293 (Argentina), it is necessary to examine, in addition, whether the Austrian safeguard measure on T25 maize is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the Austrian safeguard measure on T25 maize with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(iii) Austria – Bt-176 maize

7.3072 The Panel turns to its analysis of Austria's measure on Bt-176 maize. The first issue we will address is whether the documents Austria relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3073 We recall from the Reasons document that Austria's concerns with respect to Bt-176 maize were related in particular to the issues of gene transfer (development of antibiotic resistance) and the development of resistance to *Bt* toxin.[1912] With respect to each of these concerns, Austria presented the scientific reasons for its decision to prohibit Bt-176 maize.[1913]

7.3074 We note that Austria provided additional scientific evidence to the Commission in May 1997 in support of its safeguard measure on Bt-176 maize.[1914] In particular, Austria provided two studies concerning the development of resistance to *Bt* toxin arising from the circumstance that transgenic crops producing insecticidal proteins from *Bt* are being grown commercially (hereafter the "March and April 1997 studies").[1915]

[1912] Exhibit EC-158/At. 7.

[1913] We note that Austria's Reasons document makes reference to a number of scientific studies in support of its safeguard measure. However, since these studies were not submitted to the Panel as evidence, we cannot determine whether any of these studies constitutes in itself a risk assessment on which the safeguard measure might be based. We do note, however, that many of these studies predate the original EC risk assessment and would presumably have been known to and taken into account in the context of that risk assessment.

[1914] Exhibit EC-158/At. 10.

[1915] Exhibit EC-158/Ats. 11-12.

7.3075 Furthermore, in the January 2004 document, Austria invoked recent scientific findings concerning risks related to allergenicity and toxicity, the potential environmental impact of *Bt* toxin, including effects on non-target organisms, as well as antibiotic resistance marker genes.[1916] In relation to the January 2004 document, we recall that our task is to assess whether the Austrian safeguard measure was based on a risk assessment as of 29 August 2003, when this Panel was established. A risk assessment completed after August 2003 in our view would not assist the European Communities in rebutting the Complaining Parties' claim that Austria's safeguard measure was not based on a risk assessment in August 2003. However, we note that one of the studies mentioned by Austria in the January 2004 document was published in March 2003, and we therefore take it into account. The study in question is a joint study by the Federal Ministry of the Environment ("Umweltbundesamt GmbH") and IFF/IFZ – Inter-University Research Centre for Technology, Work and Culture, entitled "*Toxicology and Allergology of GM Products: Investigations into practice and recommendations on the standardization of risk assessment of genetically modified food*" (hereinafter the "March 2003 document").[1917]

7.3076 Having identified the documents which Austria relies on to justify its safeguard measure, we can now go on to determine whether any of these documents constitutes a "risk assessment" within the meaning of the *SPS Agreement*. As with Austria's safeguard measure for T25 maize, given the concerns raised by Austria in the context of Bt-176 maize, we consider that both the first and the second clause of Annex A(4) to the *SPS Agreement* define the "risk assessment" to be carried out for Austria's measure on Bt-176 maize.

7.3077 We begin our analysis with Austria's Reasons document. We note that the Reasons document highlights concerns related to the development of antibiotic resistance and the impacts of the development of insect resistance to Bt toxin. Furthermore, we note that Austria makes reference in the Reasons document to the original risk assessments undertaken by the Scientific Committee for Food (SCF), the Scientific Committee for Animal Nutrition (SCAN) and the Scientific Committee on Pesticides (SCPE). While noting that all the scientific comments and arguments presented in the opinions of these scientific committees are "valid and well taken"[1918], Austria asserts that new scientific results raise questions about the possibility of a conclusive evaluation of the mechanism of gene transfer, as well as the development of resistance to Bt toxin. With regard to these new scientific results, Austria notes that " possible risks are very hard to assess and should be avoided at the present state of the scientific discussion."[1919] In a similar vein, the Reasons document states that "[t]here are adequate maize-products already available which do not comprise these restrictions and by this there is no reason to accept risks which are difficult to assess".[1920] Elsewhere, the Reasons document states that "[t]he impact of a transfer of the *bla* gene to bacteria of humans or animals can not be fully evaluated".[1921] These statements serve to demonstrate that Austria did not "assess" the alleged risks identified in the Reasons document. Therefore, we do not consider that the Reasons document constitutes an "assessment" of risks within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.

7.3078 We now turn to the two scientific studies that Austria provided to the Commission in May 1997 in support of its safeguard measure on Bt-176 maize.[1922] These studies focused on the

[1916] Exhibit EC-158/At. 30.
[1917] Exhibit EC-158/At. 41_trans.
[1918] Exhibit 158/At. 7, p. 5.
[1919] *Ibid.*
[1920] *Ibid*.
[1921] Exhibit 158/At. 7, p. 6.
[1922] Exhibit EC-158/At. 10.

development of resistance to Bt toxin due to the commercial production of transgenic Bt crops (studies published in the National Academy of Science from March and April 1997).[1923] Both of these studies examine the mechanism through which insects develop resistance to Bt toxin. The first study describes a technique for estimating the likelihood that a particular population of insects would develop resistance to Bt toxin, while the second uses genetic analysis to show that a single insect gene can confer resistance to several different strains of the Bt toxin. The first study focuses on insects feeding on Bt cotton; the second examines the genetics underlying the evolution of resistance through feeding studies of insects on Bt toxins in dust form. While the results of these studies may be of relevance to the assessment of the risks of the potential development of resistance to Bt-176 maize, neither study assesses the likelihood of this risk. For this reason, we do not consider that the March 1997 and April 1997 studies meet the definition of a risk assessment as provided in Annex A(4). We therefore consider that these studies cannot be considered risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3079 We recall that the European Communities provided as evidence a study by Austria on toxicological and allergological risks related to biotech products (the March 2003 document).[1924] As we noted above with respect to T25 maize, we consider that this study evaluates risk assessment *procedures*, and not the potential for adverse effects on human or animal health arising from the consumption of specific foods containing or consisting of GMOs.[1925] We therefore think that this March 2003 study does not constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3080 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Austria to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3081 Furthermore, in connection with the documents relied on by Austria, we should also note the European Communities' argument that Austria's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the Austrian safeguard measure include the fact that, from Austria's perspective, relevant scientific evidence was or is insufficient. We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3052-7.3053 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3082 We have found above that none of the documents relied on by Austria with regard to its safeguard measure on Bt-176 maize constitute risk assessments. However, the European Communities contends that there is a document other than the documents relied on by Austria which constitutes a risk assessment for Bt-176. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1926] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or any of the risk assessments which were conducted by the Scientific Committee for Pesticides (SCPE), the Scientific Committee for Animal

[1923] Exhibit EC-158/Ats. 11-12.
[1924] *See supra*, para. 7.3037.
[1925] *See supra*, para. 7.3049.
[1926] EC reply to Panel question No. 107.

Nutrition (SCAN) or the SCF.[1927] In any event, we have noted above that it is not in dispute that all of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3083 In addition, we recall that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the risk assessments which were conducted by the SCPE, the SCAN or the SCF were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether the Austrian safeguard measure on Bt-176 maize is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3084 We now turn to the question of whether, at the time of establishment of this Panel, the Austrian safeguard measure on Bt-176 maize was "based on" either the risk assessment of the lead CA or any of those conducted by the SCPE, the SCAN or the SCF.[1928]

7.3085 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Austria's safeguard measure on Bt-176 maize and the risk assessment performed by the lead CA and the risk assessments which were conducted by the SCPE, the SCAN or the SCF in relation to Bt-176. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the risk assessments which were conducted by the SCPE, the SCAN or the SCF with regard to Bt-176 maize;

(b) the European Communities or Austria did not explain, by reference to these risk assessments, how and why Austria assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, Austria's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Austria's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that Bt-176 maize will give rise to any adverse effects on human or animal health and the environment.

7.3086 Thus, in view of our conclusion that Austria's safeguard measure on Bt-176 maize cannot be considered to be "based on" the risk assessment performed by the lead CA or the risk assessments

[1927] Exhibits EC-158/Ats. 1-3; EC-158/At. 4; EC-158/At. 5; EC-158/At. 6.

[1928] As noted, we must examine as part of our analysis whether the safeguard measure is based on any of those risk assessments, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or those conducted by the SCPE, the SCAN or the SCF.

which were conducted by the SCPE, the SCAN or the SCF in relation to Bt-176 maize, and recalling the fact that no other risk assessment which might reasonably support Austria's safeguard measure has been provided to us, we find that the Austrian safeguard measure is not based on a risk assessment pursuant to Article 5.1.[1929]

Overall conclusions

7.3087 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on Bt-176 maize is not based on a risk assessment.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on Bt-176 maize is not based on a risk assessment.

7.3088 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS293 (Argentina), it is necessary to examine, in addition, whether the Austrian safeguard measure on Bt-176 maize is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the Austrian safeguard measure on Bt-176 maize with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(iv) Austria – MON810 maize

7.3089 We now turn to the analysis of Austria's measure on MON810 maize. The first issue we will address is whether the documents Austria relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3090 We recall from the Reasons document that Austria's concerns with respect to MON810 maize were related in particular to undesired effects on non-target organisms and the development of resistance to *Bt* toxin in insects.[1930] In relation to each of these concerns, Austria refers to the results of recent scientific studies. We note that only the following scientific studies invoked by Austria in the Reasons document in support of its safeguard measure on MON810 maize were submitted to the Panel:

[1929] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

[1930] Exhibit EC-159/At. 3.

(i) Study by Losey (1999), "Transgenic pollen harms monarch larvae"[1931];

(ii) Study by Hilbeck *et al.* (1998), "Toxicity of Bacillus thuringiensis Cry1Ab Toxin to the Predator Chrysoperla carnea (Neuroptera: Chrysopidae)"[1932];

(iii) Study by Hilbeck *et al.* (1998), "Effects of transgenic Bacillus thuringiensis corn-fed prey on mortality and development time of immature Chrysoperla carnea (Neuroptera: Chrysopidae)"[1933].

7.3091 Furthermore, we recall that in the January 2004 document, Austria invoked scientific findings concerning risks related to allergenicity and toxicity, the potential environmental impact of *Bt* toxin, as well as antibiotic resistance marker genes.[1934] In relation to the document of January 2004, we recall that our task is to assess whether the Austrian safeguard measure was based on a risk assessment as of 29 August 2003, when this Panel was established. A risk assessment completed after August 2003 in our view would not assist the European Communities in rebutting the Complaining Parties' claim that Austria's safeguard measure was not based on a risk assessment in August 2003. However, we note that one of the studies mentioned by Austria in the January 2004 document was published in March 2003, and we therefore take it into account. The study in question is a joint study by the Federal Ministry of the Environment ("Umweltbundesamt GmbH") and IFF/IFZ – Inter-University Research Centre for Technology, Work and Culture, entitled "*Toxicology and Allergology of GM Products: Investigations into practice and recommendations on the standardization of risk assessment of genetically modified food*" (hereinafter the "March 2003 document").[1935]

7.3092 As with Austria's safeguard measures on T25 maize and Bt-176 maize, given the concerns raised by Austria in the context of MON810 maize, we consider that both the first and the second clause of Annex A(4) to the *SPS Agreement* provide definitions for the "risk assessment" to be carried out for Austria's measure on MON810 maize.

7.3093 We begin our analysis with Austria's Reasons document. In this document, Austria points to new scientific evidence which, according to Austria, raises uncertainty with respect to the potential risks related to MON810 maize, in particular regarding the effects on non-target organisms and the development of resistance in insects. According to Austria, this new scientific evidence raises doubts with regard to the safety of MON810 maize for human health or the environment.

7.3094 However, nothing in the Reasons document indicates that Austria carried out a new assessment of the alleged risks in the light of the scientific evidence mentioned by Austria. We recall in this connection that a risk assessment must evaluate the likelihood or probability of particular risks, or evaluate the potential for adverse effects on animal health arising from the presence of certain substances in food, beverages or feedstuffs.[1936] The Reasons document refers to possibilities of risks arising in respect of MON810 maize, but it does not itself evaluate the potential for adverse health effects or the likelihood of the risk of establishment, entry or spread of a pest. For example, Austria notes that reservations concern the "[p]ossible undesired effects of the Bt toxin on non-target

[1931] Exhibit EC-158/At. 24.
[1932] Exhibit EC-158/At. 26.
[1933] Exhibit EC-158/At. 27.
[1934] Exhibit EC-158/At. 30.
[1935] Exhibit EC-158/At. 41_trans.
[1936] We note that "evaluate" is defined as "form an idea of the amount, number or value of; assess", *Concise Oxford English Dictionary*, Eleventh Ed. 2004, p. 493.

organisms and the possible development of resistance in insects".[1937] The document highlights studies of undesired effects on non-target organisms related to the consumption of Bt maize but does not itself make an evaluation of the potential for adverse health effects or the likelihood of these undesired effects occurring in the event that MON810 maize were to be introduced.[1938] The Reasons document also identified one study which noted that "further effects on the food chain [of consumption of Bt pollen by monarch butterflies] are possible."[1939] Yet, there is no evaluation of the potential for adverse health effects or the likelihood of such effects occurring.

7.3095 Furthermore, we note that with respect to one of the risks identified in the Reasons document, namely the development of resistance to Bt toxin in insects, the Reasons document states that "[t]he risk for related groups of insects [...] cannot be assessed conclusively based on the available data."[1940] This statement further confirms that Austria did not "evaluate" or "assess" the alleged risk.

7.3096 Accordingly, we are of the view that the Reasons document does not meet the definition of a risk assessment as provided in Annex A(4). We therefore consider that the Reasons document cannot be considered a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3097 We now turn to the scientific studies referred to by Austria in its Reasons document. Each of these studies describes aspects of Bt toxin impacts on insects. The study by Losey, entitled "Transgenic pollen harms monarch larvae"[1941], describes results from a laboratory experiment in which monarch butterfly caterpillars were fed Bt maize pollen. The study focuses on a variety of Bt maize other than MON810 maize. Furthermore, while the Losey study notes that results on larvae consumption and growth rates have "potentially profound implications for the conservation of monarch butterflies" there is no attempt to evaluate these potential implications, rather the study notes that the experimental results point to possible environmental outcomes. For example, in arguing that monarch butterfly caterpillars are at risk from the production of Bt maize, the study states that "[t]he large land area covered by corn in this region *suggests* that a substantial portion of available milkweeds *may be* within range of corn pollen deposition".[1942] Hence, we do not consider that the Losey study in itself constitutes a risk assessment within the meaning of either the first or the second clause of Annex A(4) and Article 5.1.

7.3098 The second study, by Hilbeck *et al.*, on "[t]oxicity of Bacillus thuringiensis Cry1Ab Toxin to the Predator Chrysoperla carnea (Neuroptera: Chrysopidae)"[1943] described a feeding study in which insects were fed a liquid diet containing Bt toxins, rather than being fed Bt plants directly. Thus, we do not consider that this study evaluated the potential for adverse effects associated with the insects eating MON810 maize plants. In addition, in its conclusion it notes that "trials investigating predation efficiency and predator performance under field conditions are necessary before conclusions regarding the potential ecological relevance of the results presented [...] can be drawn."[1944] Hence, like the Losey study, the study by Hilbeck *et al.* does not evaluate the likelihood of an outcome in the field. Accordingly, as with the Losey study, we do not consider that the Hilbeck *et al*. study in itself constitutes a risk assessment within the meaning of either the first or the second clause of Annex A(4) and Article 5.1, although we accept that it may be of relevance for a risk assessment.

[1937] Exhibit EC-159/At. 3_trans p. 5.
[1938] Exhibit EC-159/At. 3_trans pp. 5-6.
[1939] Exhibit EC-159/At. 3_trans p. 6.
[1940] Exhibit EC-159/At. 3_trans p. 8.
[1941] Exhibit EC-158/At. 24.
[1942] Exhibit EC- 158/At. 24 (emphasis added).
[1943] Exhibit EC-158/At. 26.
[1944] Exhibit EC-158/26 p. 7.

7.3099 The third study, also by Hilbeck *et al.*, concerns "[e]ffects of transgenic Bacillus thuringiensis corn-fed prey on mortality and development time of immature *Chrysoperla carnea* (Neuroptera: Chrysopidae)".[1945] This study used a maize hybrid containing a gene from *Bacillus thuringiensis*. The study provides information regarding the impact on non-maize eating insects of eating herbivorous insects raised on Bt maize and thus is aimed at evaluating non-target impacts of Bt crop cultivation. While this study concludes that, in this experiment, differences in mortality exist for insect predators fed prey raised on Bt versus non-Bt maize, the study notes that "[n]o conclusions can be drawn at this point as to how results from [...] laboratory trials might translate in the field".[1946] This statement, in our view, implies that this study *per se* cannot be said to evaluate the alleged risks identified by Austria in its Reasons document. In addition, given the lack of conclusions concerning how the laboratory trials might translate in the field noted above, we do not consider that the second Hilbeck study provides an evaluation of the potential for adverse effects on insect health from the presence of Bt toxin in food or feedstuffs. Therefore, we do not consider that this study in itself constitutes a risk assessment within the meaning of either the first or the second clause of Annex A(4) and Article 5.1, although we accept that it may be of relevance for a risk assessment.

7.3100 Finally, we recall that the European Communities provided as evidence a study by Austria on toxicological and allergological risks related to biotech products (the March 2003 document).[1947] As we noted above with respect to T25 maize, we consider that this study evaluates risk assessment *procedures*, and not the potential for adverse effects on human or animal health arising from the consumption of specific foods containing or consisting of GMOs. We therefore think that this March 2003 study does not constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3101 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Austria to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3102 Furthermore, in connection with the documents relied on by Austria, we should also note the European Communities' argument that Austria's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the Austrian safeguard measure include the fact that, from Austria's perspective, relevant scientific evidence was or is insufficient. We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3031-7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3103 We have found above that none of the documents relied on by Austria with regard to its safeguard measure on MON810 maize constitute risk assessments. However, the European Communities contends that there is a document other than the documents relied on by Austria which constitutes a risk assessment for MON810 maize. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1948] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to that conducted by the SCP.[1949] In

[1945] Exhibit EC-158/At. 27.
[1946] Exhibit EC-158/At. 27 p. 485.
[1947] *See supra*, para. 7.3069.
[1948] EC reply to Panel question No. 107.
[1949] Exhibits EC-159/Ats. 1-2; CDA-82; US-55 (referencing original SCP risk assessment); ARG–44 (referencing original SCP risk assessment).

any event, we have noted above that it is not in dispute that both of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1

7.3104 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the SCP were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether the Austrian safeguard measure on MON810 maize is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3105 We now turn to the question of whether, at the time of establishment of this Panel, the Austrian safeguard measure on MON810 maize was "based on" either the risk assessment of the lead CA or that conducted by the SCP.[1950]

7.3106 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Austria's safeguard measure on MON810 maize and the risk assessments performed by the lead CA and the SCP in relation to MON810 maize. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP with regard to MON810 maize;

(b) the European Communities or Austria did not explain, by reference to these risk assessments, how and why Austria assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, Austria's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Austria's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that MON810 maize is likely to cause adverse effects on human or animal health and the environment.

7.3107 Thus, in view of our conclusion that Austria's safeguard measure on MON810 maize cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCP in relation to MON810 maize, and recalling the fact that no other risk assessment which might reasonably

[1950] We recall that we must examine as part of our analysis whether the safeguard measure is based on either risk assessment, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or that conducted by the SCP.

support Austria's safeguard measure has been provided to us, we find that the Austrian safeguard measure is not based on a risk assessment pursuant to Article 5.1.[1951]

Overall conclusions

7.3108 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on MON810 maize is not based on a risk assessment.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on MON810 maize is not based on a risk assessment.

7.3109 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS293 (Argentina), it is necessary to examine, in addition, whether the Austrian safeguard measure on MON810 maize is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the Austrian safeguard measure on MON810 maize with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(v) France – MS1/RF1 oilseed rape (EC-161)

7.3110 We now turn to the analysis of France's measure on MS1/RF1 oilseed rape (EC-161). The first issue we will address is whether the documents France relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3111 We recall from the Reasons document that the main concerns of France were related to the risk of contamination of traditional oilseed rape by genetically modified oilseed rape; the likelihood of transfer of the herbicide-tolerance gene to adventitious flora; and the overall impact on the environment or long-term ecological effects of MS1/RF1 oilseed rape (EC-161).[1952] With respect to France's concerns related to gene flow and pollen dispersal, we note that France makes reference to a number of scientific studies. However, these studies were not submitted as evidence to the Panel. We therefore cannot determine whether any of these studies constitutes a risk assessment on which the safeguard measure on MS1/RF1 oilseed rape (EC-161) is based.

[1951] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

[1952] Exhibits EC-161/At. 2 and EC-162/At. 5.

7.3112 We further recall that the decision by France to extend the suspension of the authorization for placing on the market of MS1/RF1 oilseed rape (EC-161) in July 2001 and July 2003 were allegedly based on the conclusions of opinions delivered by the BEC in 2001 and 2003, respectively. We note that the BEC delivered a further opinion on MS1/RF1 oilseed rape (EC-161) on 13 February 2004.[1953] We recall that we must assess whether the French safeguard measure on MS1/RF1 oilseed rape (EC-161) was based on a risk assessment as of August 2003, when this Panel was established. Since the 2004 opinion of the BEC was delivered after the time of establishment of the Panel, we do not take it into account as part of our analysis.

7.3113 Having identified the documents which France relies on to justify its safeguard measure, we can now go on to determine whether any of these documents constitutes a "risk assessment" within the meaning of the *SPS Agreement*. We recall our previous conclusion that France's concerns fall within the scope of Annex A(1)(a) and/or (d). We consider, therefore, that the first clause of Annex A(4) to the *SPS Agreement* provides the relevant definition for the "risk assessment" to be carried out for France's measure on MS1/RF1 oilseed rape (EC-161) and consider that the requirements for such a risk assessment, as clarified by the Appellate Body in *Australia–Salmon*, apply.

7.3114 The Panel begins its analysis with France's Reasons document. In this document, France points to new scientific evidence which, according to France, raises uncertainty with respect to the potential risks related to MS1/RF1 oilseed rape (EC-161), in particular regarding the environmental effects associated with out-crossing between MS1/RF1 oilseed rape (EC-161) and other plants. According to France, this new scientific evidence raises doubts with regard to the environmental safety of MS1/RF1 oilseed rape (EC-161).

7.3115 We note that nothing in the Reasons document indicates that France has made a new assessment of the alleged risks in the light of the scientific evidence invoked by France. Indeed, we are of the view that the statement in the Reasons document that "these possible developments in agronomic practices must be assessed in terms of their overall impact on the environment"[1954] implies that France is calling for further study rather than presenting a new assessment. Furthermore, the Reasons document notes that a prohibition of MS1/RF1 oilseed rape (EC-161) is justified "pending a clear and full scientific report on these issues".[1955] Consequently, we are of the view that the Reasons document does not itself constitute an "assessment" of risks within the meaning of Annex A(4) and Article 5.1.[1956]

7.3116 We also note that while the Reasons document refers to the likelihood of risks arising in respect of MS1/RF1 oilseed rape (EC-161), the document does not "evaluate" the likelihood of the risk of establishment, entry or spread of a pest (*in casu*, hybrid plants) "according to the [SPS] measures which might be applied". It is merely concluded that "dispersal into the environment [of herbicide tolerance transgenes] is likely".[1957] The discussion in the Reasons document cannot therefore be said to meet the definition of a risk assessment as defined in Annex A(4).

[1953] Exhibit EC-161/At. 10.
[1954] Exhibit EC-161/At. 2 p. 3.
[1955] *Ibid.*, p. 4.
[1956] We note that in its Reasons document, France refers to numerous scientific studies. However, these studies were not submitted to the Panel as evidence. Therefore, we can not evaluate in detail whether any of these documents would constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.
[1957] Exhibit EC-161/At. 2, p. 2.

7.3117 Turning to the BEC opinions, we recall that the BEC apparently issued an opinion in 2001 which allegedly supported France's decision to prolong the safeguard measure for a further two years. As we noted earlier, it is not clear to the Panel whether this opinion of the BEC was submitted to us as evidence. An undated report by the BEC has been provided.[1958] This document makes reference to the French decision to take a safeguard measure in November 1998, and to production data in 2000. The document addresses concerns with regard to both genetically modified sugar beet and oilseed rape. For the sake of our analysis, we will assume that this document is the 2001 opinion of the BEC (hereafter "the 2001 BEC report"). According to this report, the BEC "proceeded to make an expert appraisal of the scientific information which was available for assessing the impacts on the environment of genetically modified oilseed rape and beet plants which were tolerant to a herbicide".[1959] In this context, reference is made to documents appended to the opinion, however these documents were not provided to the Panel. The 2001 BEC report identifies some possible ecological and agronomic impacts of herbicide tolerant oilseed rape. These include the "possible proliferation of the tolerant plants in the ecosystem"; the "possible development of adventitious flora [...]"; and possible changes in the ability of farmers to carry out weed control.[1960]

7.3118 We note that the 2001 BEC report purports to provide some evaluation of likelihood with respect to the "ability of oilseed rape to hybridize".[1961] Specifically, the report indicates that "the hybridizations which have been observed in England and in certain countries in the north of Europe are very unlikely in France".[1962] The report indicates that the studies in France focussed on "the analysis of the probability" of obtaining three types of hybrids, involving wild radish (*Raphanus raphanistrum*), short-pod mustard (*Hirschfeldia incana*) and wild mustard (*Sinapis arvensis*). The report indicates that "oilseed rape hybridizes rarely with wild radish, even more rarely with short-pod mustard and not at all with wild mustard".[1963] With respect to consequences for the environment, the report states: "In the case of genes for tolerance to a herbicide, and in natural environments, there is no information which leads one to suppose that the ability of plants, which have received these genes, to multiply and invade environments should be different from that of any other oilseed rape plant which has escaped from farmed land or from that of any other wild-type crucifer."[1964]

7.3119 The 2001 BEC report goes on to identify a number of areas for further study.[1965] Finally, the report contains the following "general conclusion": "The Biomolecular Engineering Committee is of the opinion that, even if cultivating genetically modified oilseed rapes which are tolerant to herbicides does not present any direct risks for the environment, a transitional phase of two years would make it possible, by carrying out experiments on areas of different scale, to validate the forms of management which are proposed for weed control and for coexistence between two methods of agriculture."[1966]

7.3120 With reference to the requirements for a risk assessment as clarified by the Appellate Body in *Australia–Salmon*[1967], the Panel notes that unlike the Reasons document, the 2001 BEC report does appear to provide some evaluation of the likelihood of entry, establishment or spread of one of the "pests" of concern, that is of hybrids between herbicide tolerant oilseed rape and some wild plants.

[1958] Exhibit EC-161/At. 6, with translations of the summary and body of this document apparently submitted as EC-161/Ats. 7 and 8, respectively. None of these submissions are dated.
[1959] Exhibit EC-161/At. 8, p.5.
[1960] *Ibid*., p.5.
[1961] *Ibid*., p.9
[1962] *Ibid*.
[1963] *Ibid*.
[1964] *Ibid*., p. 10.
[1965] *Ibid*., p. 11.
[1966] Exhibit EC-161/At. 8, p. 19.
[1967] *See supra*, para. 7.3040.

However, this is addressed, in the context of the BEC report, with respect to all herbicide tolerant oilseed rape varieties and not specifically those which are genetically modified. Furthermore, we note that the 2001 BEC report does not provide any analysis of the associated potential biological and economic consequences of these hybrids, nor does it purport to evaluate the likelihood of entry, establishment or spread of these hybrids according to the SPS measures which might be applied. Consequently, we do not consider that the 2001 BEC report fulfils all of the criteria of a risk assessment in accordance with the definition in Annex A(4).

7.3121 The decision by France in July 2003 to further prolong its safeguard measure on MS1/RF1 oilseed rape (EC-161) was allegedly supported by another opinion of the BEC issued in July 2003 (hereafter "the 2003 BEC report").[1968] We note that the 2003 BEC report refers to the concerns identified by France at the time the safeguard measure was first taken. The 2003 BEC report points to some new elements of information and to on-going research which it indicates may shed new light on some of the conclusions of the 2001 BEC report.[1969] However, the 2003 BEC report does not contain any evaluation of new information. Rather, the report calls for further analysis and for the organization of a scientific workshop to consider whether this information might affect the opinions contained in the 2001 BEC report.[1970] We note that this workshop, which was held in November 2003, resulted in the issuance of another report by the BEC in February 2004. As we have previously indicated, we will not take into account the BEC opinion of February 2004.[1971]

7.3122 In the light of the foregoing, we conclude that the above-mentioned documents relied on by France to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3123 Furthermore, in connection with the documents relied on by France, we should also note the European Communities' argument that France's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the French safeguard measure include the fact that, from France's perspective, relevant scientific evidence was or is insufficient. We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in 7.3031-7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3124 We have found above that none of the documents relied on by France with regard to its safeguard measure on MS1/RF1 oilseed rape (EC-161) constitute risk assessments. However, the European Communities contends that there is a document other than the documents relied on by France which constitutes a risk assessment for MS1/RF1 oilseed rape (EC-161). The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1972] As we understand it, the European Communities in this instance is referring to the risk assessment conducted by the lead CA. This is because the Commission did not consult the SCP before approving MS1/RF1 oilseed rape (EC-161).[1973] As we have noted above, it is not in dispute that the lead CA's assessment constitutes a risk assessment within the meaning of Annex A(4) and Article 5.1.

[1968] Exhibit EC-161/At. 9.
[1969] Exhibit EC-161/At. 9 p. 1.
[1970] Exhibit EC-161/At. 9 p. 3.
[1971] *See supra*, para. 7.3112.
[1972] EC reply to Panel question No. 107.
[1973] The SCP was only established in 1997. Exhibits US-61; CDA-69.

7.3125 In addition, we recall that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessment conducted by the lead CA was no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is "based on" this risk assessment, we do not need to examine this issue further.

"Based on"

7.3126 We now turn to the question of whether, at the time of establishment of this Panel, the French safeguard measure on MS1/RF1 oilseed rape (EC-161) was "based on" the risk assessment of the lead CA.

7.3127 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to France's safeguard measure on MS1/RF1 oilseed rape (EC-161) and the risk assessment performed by the lead CA in relation to T25 maize. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP with regard to MS1/RF1 oilseed rape (EC-161);

(b) the European Communities or France did not explain, by reference to these risk assessments, how and why France assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, France's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between France's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that MS1/RF1 oilseed rape (EC-161) is likely to cause any adverse effects on human health and the environment.

7.3128 Thus, in view of our conclusion that France's safeguard measure on MS1/RF1 oilseed rape (EC-161) cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCP in relation to MS1/RF1 oilseed rape (EC-161), and recalling the fact that no other risk assessment which might reasonably support France's safeguard measure has been provided to us, we find that the French safeguard measure is not based on a risk assessment pursuant to Article 5.1.[1974]

[1974] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the French safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

Overall conclusions

7.3129 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not based on a risk assessment.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not based on a risk assessment.

7.3130 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS292 (Canada), it is necessary to examine, in addition, whether the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the French safeguard measure on MS1/RF1 oilseed rape (EC-161) with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(vi) France – Topas oilseed rape

7.3131 We now turn to the analysis of France's measure on Topas oilseed rape. The first issue we will address is whether the documents France relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3132 We note that France relied on the same documents with respect to its safeguard measure on Topas oilseed rape as for its measure on MS1/RF1 oilseed rape (EC-161). We recall our analysis of the relevant documents relied on by France in respect of its safeguard measure on MS1/RF1 oilseed rape (EC-161) above. Based on a review of these documents, we found that none constituted a risk assessment within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*. Consistent with our analysis above, we also find in the case of the French safeguard measure on Topas oilseed rape that none of the documents relied on by France constitute a risk assessment.

7.3133 Furthermore, in connection with the documents relied on by France, we should also note the European Communities' argument that France's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the French safeguard measure include the fact that, from France's perspective, relevant scientific evidence was or is insufficient. We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3031-7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3134 We have found above that none of the documents relied on by France with regard to its safeguard measure on Topas oilseed rape constitute risk assessments. However, the European Communities contends that there is a document other than the documents relied on by France which constitutes a risk assessment for Topas oilseed rape. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1975] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to that conducted by the SCP.[1976] In any event, we have noted above that it is not in dispute that both of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3135 In addition, we recall that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the SCP were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether the French safeguard measure on Topas oilseed rape is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3136 We now turn to the question of whether, at the time of establishment of this Panel, the French safeguard measure on Topas oilseed rape was "based on" either the risk assessment of the lead CA or that conducted by the SCP.[1977]

7.3137 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply *mutatis mutandis*, to France's safeguard measure on Topas oilseed rape and the risk assessments performed by the lead CA and the SCP in relation to Topas oilseed rape. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP with regard to Topas oilseed rape;

(b) the European Communities or France did not explain, by reference to these risk assessments, how and why France assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, France's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between France's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that Topas

[1975] EC reply to Panel question No. 107.
[1976] Exhibits EC-162/At. 1; CDA-63; US-62 (referencing original SCP risk assessment).
[1977] We recall that we must examine as part of our analysis whether the safeguard measure is based on either risk assessment, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or that conducted by the SCP.

oilseed rape is likely to cause adverse effects on human or animal health and the environment.

7.3138 Thus, in view of our conclusion that France's safeguard measure on Topas oilseed rape cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCP in relation to Topas oilseed rape, and recalling the fact that no other risk assessment which might reasonably support France's safeguard measure has been provided to us, we find that the French safeguard measure is not based on a risk assessment pursuant to Article 5.1.[1978]

Overall conclusions

7.3139 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on Topas oilseed rape is not based on a risk assessment.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on Topas oilseed rape is not based on a risk assessment.

7.3140 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS292 (Canada), it is necessary to examine, in addition, whether the French safeguard measure on Topas oilseed rape is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the French safeguard measure on Topas oilseed rape with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(vii) Germany – Bt-176 maize

7.3141 We now turn to Germany's safeguard measure on Bt-176 maize. We recall that we must determine whether Germany's measure is "based on" a risk assessment pursuant to Article 5.1. In this context, the first issue we will address is whether the documents Germany relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3142 We recall that Germany (Robert Koch Institute) notified its decision to prohibit Bt-176 maize to the Commission in a letter dated 4 April 2000.[1979] In this letter, Germany explained the reasons for

[1978] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the French safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

[1979] Exhibit EC-158/At. 21. We note that the concerns of Germany were also set out in an earlier letter addressed by the Robert Koch Institute to the Commission on 2 March 2000 (Exhibit EC-158/At. 19_trans), as

adopting its safeguard measure on Bt-176 maize. The letter refers to the following scientific studies in support of Germany's safeguard measure:

(i) Study by Losey (1999), "Transgenic pollen harms monarch larvae"[1980];
(ii) Study by Hilbeck *et al.* (January 1999), "Prey-mediated effects of Cry1Ab toxin and protoxin and Cry2A protoxin on the predator *Chrysoperla carnea*"[1981];
(iii) Study by Hilbeck *et al.* (1998), "Toxicity of *Bacillus thuringiensis* Cry1Ab Toxin to the Predator *Chrysoperla carnea* (Neuroptera: Chrysopidae)"[1982];
(iv) Study by Hilbeck *et al.* (1998), "Effects of transgenic *Bacillus thuringiensis* corn-fed prey on mortality and development time of immature *Chrysoperla carnea* (Neuroptera: Chrysopidae)"[1983];
(v) Study by Saxena *et al.* (1999), "Insecticidal toxin in root exudates from *Bt* corn"[1984];
(vi) Öko-Institut e. V. (Dec. 1999) – Study on the "Therapeutical relevance of antibiotics in connection with the use of antibiotic resistance genes in transgenic plants"[1985].

7.3143 Having determined the documents relied on by Germany with respect to its safeguard measure on Bt-176 maize, we must now determine whether one or more of these documents constitutes a "risk assessment" within the meaning of the *SPS Agreement*.

7.3144 We recall our conclusions that the concerns identified by Germany, relating to possible effects on non-target organisms, the development of resistance to Bt toxins in insects, the possible adverse effects of Bt toxin in the soil and potential for development of antibiotic resistance, fall within the scope of Annex A(1)(a), (b) and/or (d) of the *SPS Agreement*. Both clauses of Annex A(4) to the *SPS Agreement* define the "risk assessment" to be carried out for SPS measures which have these types of purposes. As discussed earlier, Germany's concern relating to potential increased development of antibiotic resistance could also fall within the scope of Annex A(1)(b) of the *SPS Agreement*. The second clause of Annex A(4) to the *SPS Agreement* defines the "risk assessment" to be carried out for SPS measures which fall within the scope of Annex A(1)(b).

7.3145 We begin our analysis with Germany's Reasons document. That document includes references to possibilities of risks, but does not evaluate the potential or likelihood of such risks occurring. For example, the document states that "it cannot be excluded that unacceptable adverse effects on other lepidoptera species and on some other insects would occur."[1986] Similarly, the document states that "an ecologically unacceptable development of resistance may occur in the event of unrestricted cultivation"[1987] of Bt maize. With regard to possible effects of Bt-toxin on soil micro-organisms, the Reasons document states that these effects "cannot be excluded".[1988] Finally, the Reasons document notes that increased development of antibiotic resistance following uptake of the antibiotic resistance gene contained in Bt-176 maize "cannot [be] excluded".[1989] As noted by us

---

[1987] *Ibid*., p. 2.
[1988] *Ibid*.
[1989] *Ibid*.

above, the Appellate Body in *Australia – Salmon* clarified that a risk assessment as defined in the first clause of Annex A(4) must evaluate the likelihood or probability of relevant risks.[1990]

7.3146 Regarding the concern over the possible development of antibiotic resistance, we further note the statement in the Reasons document to the effect that on the basis of current knowledge, unacceptable adverse effects are not to be expected in view of the already widespread resistance in bacteria to the relevant antibiotics, if, as the EC approval decision envisages, the quantity of Bt-176 maize seeds which may be sown is limited to 12 tonnes/year.[1991] Thus, the Reasons document suggests that there is only a small potential for adverse effects on human or animal health arising from the presence of ARMG in Bt-176 maize. However, the Reasons document does not itself contain and provide the information necessary to an evaluation of the potential for adverse effects on human or animal health. Accordingly, we consider that the Reasons document constitutes, not a complete, self-contained, scientific evaluation of the potential for adverse effects, but only part of such an evaluation. Hence, we are of the view that the Reasons document on its own does not meet the definition of a risk assessment as provided in the second clause of Annex A(4).

7.3147 We now turn to the scientific studies which Germany relied on in respect of its safeguard measure. The first four of these studies relate to impacts of Bt toxins on insects while the fifth examines the use of antibiotic resistance marker genes in transgenic plants. We recall that we have previously examined the Losey study as well as the two 1998 Hilbeck *et al*. studies in the context of our consideration of Austria's safeguard measure on MON810 maize. We recall our conclusions that none of these studies evaluate the potential or likelihood of the occurrence of the adverse effect identified in Germany's Reasons document. We do not consider, therefore, that any of these three studies in themselves constitute a risk assessment, although we accept that they may be of relevance for an eventual risk assessment.

7.3148 The 1999 Hilbeck *et al.* document describes laboratory feeding experiments which were carried out to study the effects of insects feeding on other insects which had had an artificial diet containing Bt proteins. While the study's conclusions highlight the importance of assessing the non-target impacts of Bt toxins, it does not do this in the context of the Bt-176 maize. In particular, this study does not provide an evaluation of the likelihood of risks associated with the insects eating Bt-176 maize plants. Nor does it evaluate the likelihood of an outcome in the field. For example, the study notes "field studies must be conducted to assess the ecological consequences"[1992] of the study's results. We do not consider, therefore, that this study in and of itself constitutes a risk assessment, although we accept that it may be of relevance for an eventual risk assessment.

7.3149 The fifth study, by Saxena *et al.*, examines the potential for Bt toxin to be released into the soil from the roots of Bt maize. The study used a variety of Bt maize called NK4640Bt which differs from the variety which is subject to the German safeguard measure. While the study measured the toxin released into the soil surrounding the roots of maize plants, the authors note that they have "no indication of how soil communities might be affected by Bt toxin in [...] the field" and that "[f]urther investigations will be necessary to shed light on what might happen underground".[1993] Thus, this study neither purports to evaluate the potential consequences associated with the release of Bt exudates into the soil, nor provides information specifically related to the product at issue in this safeguard measure, Bt-176 maize. Therefore, we do not consider that this study, by itself, meets the definition of a risk assessment as provided in Annex A(4).

[1990] Appellate Body Report, *Australia – Salmon*, paras. 123-124.
[1991] Exhibit EC-158/At. 21, p. 3.
[1992] Exhibit EC-158/At. 25 p. 11.
[1993] Exhibit EC-158/At. 28, p. 480.

7.3150 The final study, by the Öko-Institut e.V., provides an overview of the types of antibiotics which could be affected by the possible development of resistance to antibiotics due to the use of antibiotic resistance marker genes in transgenic plants. The study describes the therapeutic importance of a variety of antibiotics, but does not evaluate the likelihood that the consumption of transgenic plants in general, much less of Bt-176 maize specifically, will lead to the spread of diseases due to the development of resistance to the relevant antibiotics. The authors state that "the wide dispersal of [antibiotic resistance] genes via agriculture, animal feeding and in the human food chain provides an additional path for the development of antibiotic resistance" and that "this risk is not negligible" as outside hospitals the resistance problem was still smaller.[1994] The study further states that "particularly worrying" is the fact that "there are indications" that the transfer rate of antibiotic resistance in soils can be furthered by herbicide use.[1995] The study goes on to say that because herbicide applications are the rule in agriculture and because many ARMG in transgenic plants were transferred together with herbicide resistance genes, this "possibly creates conditions which could [...] have a promoting influence on the development of resistance".[1996] The study therefore recommends that ARMG should not be used any more.

7.3151 Hence, the study by the Öko-Institut asserts that there is a potential for adverse effects on human or animal health from the presence of ARMG in transgenic plants used as or in food/feed. However, it does not "evaluate" that potential. Indeed, the study devotes only a few paragraphs to transgenic plants containing ARMG as an additional source of possible development of antibiotic resistance. Moreover, the study does not evaluate the likelihood of spread of diseases due to the presence of ARMG in transgenic plants. As indicated, the study refers to possibilities, but it does not determine likelihoods. We therefore do not consider that this study meets the definition of a risk assessment as provided in Annex A(4).

7.3152 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Germany to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3153 Furthermore, in connection with the documents relied on by Germany, we should also note the European Communities' argument that Germany's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the German safeguard measure include the fact that, from Germany's perspective, relevant scientific evidence was or is insufficient. We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3031 and 7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3154 We have found above that the documents provided by the Parties in relation to Germany's safeguard measure on Bt-176 maize on which Germany relied on do not constitute a risk assessment. However, the European Communities contends that there is a document other than the documents relied on by Germany which constitutes a risk assessment for Bt-176 maize. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[1997] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to any of the risk assessments which were conducted by the Scientific Committee for Pesticides (SCPE),

[1994] Exhibit EC-158/At. 29, p. 28.
[1995] *Ibid*.
[1996] *Ibid*.
[1997] EC reply to Panel question No. 107.

the Scientific Committee for Animal Nutrition (SCAN) or the SCF.[1998] In any event, we have noted above that it is not in dispute that these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3155 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the risk assessments which were conducted by the SCPE, the SCAN or the SCF were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether Germany's safeguard measure is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3156 We now turn to the question of whether, at the time of establishment of this Panel, the German safeguard measure on Bt-176 maize was "based on" either the risk assessment of the lead CA or any of those conducted by the SCPE, the SCAN or the SCF.[1999]

7.3157 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Germany's safeguard measure on Bt-176 maize and the risk assessment performed by the lead CA and the risk assessments which were conducted by the Scientific Committee for Pesticides (SCPE), the Scientific Committee for Animal Nutrition (SCAN) or the SCF in relation to Bt-176 maize. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and those which were conducted by the SCPE, the SCAN or the SCF with regard to Bt-176 maize;

(b) the European Communities or Germany did not explain, by reference to these risk assessments, how and why Germany assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, Germany's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Germany's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that Bt-176 maize will give rise to any adverse effects on human or animal health and the environment.

[1998] Exhibit EC-158/Ats. 1-3; EC-158/At. 4; EC-158/At. 5; EC-158/At. 6.

[1999] We recall that we must examine as part of our analysis whether the safeguard measure is based on any of those risk assessments, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or those conducted by the SCPE, the SCAN or the SCF.

7.3158 Thus, in view of our conclusion that Germany's safeguard measure on Bt-176 maize cannot be considered to be "based on" the risk assessment performed by the lead CA or the risk assessments which were conducted by the SCPE, the SCAN or the SCF in relation to Bt-176 maize, and recalling the fact that no other risk assessment which might reasonably support Germany's safeguard measure has been provided to us, we find that the German safeguard measure is not based on a risk assessment pursuant to Article 5.1.[2000]

Overall conclusions

7.3159 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the German safeguard measure on Bt-176 maize is not based on a risk assessment.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the German safeguard measure on Bt-176 maize is not based on a risk assessment.

7.3160 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS293 (Argentina), it is necessary to examine, in addition, whether the German safeguard measure on Bt-176 maize is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the German safeguard measure on Bt-176 maize with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(viii) Greece – Topas oilseed rape

7.3161 We now turn to the Greek safeguard measure on Topas oilseed rape. We recall that we must determine whether Greece's measure is "based on" a risk assessment pursuant to Article 5.1. In this context, the first issue we will address is whether the documents Greece relies on to justify its safeguard measure meet the definition of a risk assessment.

"Risk assessment"

7.3162 We start by recalling the documents on record in respect of this safeguard measure. We recall that Greece notified its Ministerial Decision to prohibit Topas oilseed rape to the Commission in a document dated 3 November 1998 (hereafter the "Reasons document"). In this document, Greece explained the reasons for adopting its safeguard measure on Topas oilseed rape. [2001]

[2000] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the German safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

[2001] Exhibit EC-162/At. 4

7.3163 Furthermore, in a letter of 3 March 2004 to the Commission, Greece provides further justification for its safeguard measure on Topas oilseed rape.[2002] In relation to this letter, we recall that our task is to assess whether the Greek safeguard measure was based on a risk assessment as of 29 August 2003, when this Panel was established. A risk assessment completed after August 2003 in our view would not assist the European Communities in rebutting the Complaining Parties' claim that the Greek safeguard measure was not based on a risk assessment in August 2003. We note that the March 2004 letter makes reference to two scientific studies. The first study was not submitted to the Panel. It is from the European Environment Agency and is entitled "Genetically Modified Organisms: The significance of gene flow through pollen transfer" and dated 21 March 2002. According to the March 2004 letter, the study characterizes oilseed rape as a high risk crop as far as gene transfer between crops and wild relative species is concerned. The second study is from the UK Advisory Committee on Releases to the Environment (ACRE) and is dated January 2004.[2003] According to the letter, the study concerns spring oilseed rape and confirms the March 2002 study. The ACRE study apparently refers to adverse effects on biodiversity, a significant decrease of the wild weed population and harmful effects on the higher levels of the food chain of the crop in question as compared to conventional crops. Considering that the first study was not submitted to us and that the second study dates from after August 2003, we do not review these studies with a view to determining whether they constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3164 Finally, we note that in a letter of 17 March 2004 to the Commission, Greece refers to additional documents in support of its safeguard measure on Topas oilseed rape.[2004] The following documents were submitted to us and will be taken into account:

(i) Study by the Office of the Gene Technology Regulator (July 2002), "The biology and ecology of canola (Brassica napus)"[2005];
(ii) Several studies that constitute part of the Farm Scale Evaluations of spring-sown genetically modified crops (October 2003)[2006];
(iii) Study by Wilkinson *et al.* (2003), "Hybridization Between *Brassica napus* and *B. rapa* on a National Scale in the United Kingdom"[2007].

7.3165 Having determined the documents relied on by Greece with respect to its safeguard measure on Topas oilseed rape, we must now determine whether any of these documents constitutes a "risk assessment" within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.

7.3166 As with Austria's safeguard measure for T25 maize, given the concerns raised by Greece in the context of Topas oilseed rape relating to environmental risks and consumer health, we consider that both the first and the second clause of Annex A(4) to the *SPS Agreement* define the "risk assessment" to be carried out for Greece's measure on Topas oilseed rape.

7.3167 We start our examination with the Reasons document notified by Greece in respect of its safeguard measure on Topas oilseed rape. The Reasons document alleges risks for the natural environment of Greece from spillage of seeds of Topas oilseed rape during transport. Specifically, the

[2002] Exhibit EC-162/At. 6_transl.
[2003] Exhibit EC-40.
[2004] Exhibit EC-162/At. 7.
[2005] Exhibit EC-162/At. 13.
[2006] Exhibit EC-162/At. 9-11. Although the Farm Scale Evaluations were published in October 2003, they contain the results of evaluations conducted over the 3-year period from 2000-2002.
[2007] Exhibit EC-162/At. 12.

Reasons document asserts that "it is certain that the seeds will escape into the environment and will give viable plants".[2008] It also asserts that "it is certain that [...] there will arise hybrid plants [weeds] bearing the glufosinate tolerance gene".[2009] It further asserts that glufosinate tolerant weeds "will" have a selective advantage over other weeds and consequently "will" dominate.[2010] Also, "there exists the risk" that, following the release of other herbicide tolerant GM plants, multiresistant weeds will arise.[2011] Finally, the resistant weeds "will" spread not only in the agricultural environment but also in the natural environment.[2012] As noted above, the Appellate Body in *Australia – Salmon* clarified that a risk assessment must evaluate the likelihood or probability of particular risks.[2013] The Reasons document reaches conclusions regarding the likelihood of the spread of certain pests, but it reaches these conclusions without any prior "evaluation" of relevant data and information. The relevant passages in the Reasons document are only a few paragraphs long and no results from studies or tests are contained in, or annexed to, the document. Additionally, we note that the Reasons document does not evaluate the likelihood of the spread of pests according to the SPS measures which might be applied. The document only addresses the likelihood of risks in the situation where no SPS measure is applied, *i.e.*, where Topas oilseed rape is released into the environment. For these reasons, we are of the view that the discussion in the Reasons document of potential environmental risks does not constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3168 The Reasons document further notes that some of the wild plant varieties at issue are collected and consumed in Greece as food. Greece points out in this regard that if out-crossing were to confer on these wild plant varieties the herbicide resistance trait, the consequences of the consumption of these varieties would be unpredictable. Greece observes that these consequences have not been considered in the original risk assessment prior to the approval of Topas oilseed rape. Thus, while the Reasons document refers to unspecified adverse effects on human health arising from the consumption of hybrid plants, it does not provide any evaluation of the potential for such adverse effects to occur. We therefore do not consider that the discussion in the Reasons document of potential risks for the health of consumers constitutes a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3169 We now turn to the scientific studies relied on by Greece in respect of its safeguard measure. The first study, by the Office of the Gene Technology Regulator, focuses on the biology and ecology of a particular variety of oilseed rape – canola, or *Brassica napus* – and highlights the potential for outcrossing between this type of plant and its weedy relatives. The study states that while "the probability of outcrossing appears to be low", the biology of canola "ensures that a substantial number of outcrossed seeds can still be produced".[2014] Thus, the study evaluates the likelihood of outcrossing from canola. However, it does not do so for Topas oilseed rape, but for canola in general, including for canola which is not genetically modified. Also, consistent with its stated objective of addressing the biology and ecology of canola, the study does not evaluate the likelihood of the entry, establishment or spread of undesired cross-breeds according to the SPS measures which might be applied. We therefore do not consider that this study meets the definition of a risk assessment as provided in Annex A(4).

[2008] Exhibit EC-162/At. 4.
[2009] *Ibid*.
[2010] *Ibid*.
[2011] *Ibid*.
[2012] *Ibid*.
[2013] Appellate Body Report, *Australia – Salmon*, paras. 123-124.
[2014] Exhibit EC-162/At. 13 p. 13.

7.3170 The second set of studies report results from the Farm Scale Evaluations (FSEs) conducted in the United Kingdom. The first of these studies, by Squire *et al.*, summarizes the methods and results of the FSEs. This study emphasizes the difficulty of predicting the impact of growing GM crop varieties which are tolerant to herbicides (hereafter "GMHT crops"), due to the uncertainty about farmer management decisions. The study notes that "predictions [...] are particularly difficult since what happens will be strongly affected by the preference of farmers and by current economics."[2015] Another FSE study, by Haughton *et al.*, reports results regarding the impacts of the management of GMHT varieties on arthropods with particular reference to the weed vegetation that supports them. The study summarizes the effects on arthropods across a variety of GMHT crops, and notes that "the effects were indirect and related to herbicide management".[2016] The third study referenced by Greece, by Hawes *et al.*, seeks to determine whether differences in weed populations and biomass due to the impact of GMHT cropping result in changes in population trends of particular insects. The study's conclusions notes that "commercialization of GMHT crops would [...] be likely to have a range of effects on plant and invertebrate functional groups in the long-term".[2017] Each of these studies discusses GMHT crops in general rather than focusing specifically on the Topas oilseed rape, and none of these studies evaluates the likelihood of adverse effects from the entry, establishment or spread of GMHT crops according to the SPS measures which might be taken by Greece to reduce any potential risks. We therefore do not consider that these studies meets the definition of a risk assessment as provided in Annex A(4).

7.3171 The Wilkinson *et al.* study reports results regarding hybridization between two varieties of oilseed rape, *Brassica napus* and *B. rapa.*[2018] The study provides an estimate of GM hybrid abundance for the United Kingdom and notes that its findings help "set targets for strategies to eliminate hybridization and represent the first step toward quantitative risk assessment on a national scale."[2019] It also states that the presence of GM hybrids is not a risk in itself and does not imply inevitable ecological change. It notes that hybrid fitness and other factors affecting the likelihood of ecological change should also be assessed.[2020] These statements serve to demonstrate that the study does not take into account all factors that are relevant to an evaluation of the likelihood of environmental change caused by gene flow. Accordingly, we consider that the study does not constitute a risk assessment as defined in Annex A(4) and required by Article 5.1. We also note that the study does not claim that the estimates it provides are valid outside mainland Britain. We therefore do not consider that this study meets the definition of a risk assessment as provided in Annex A(4).

7.3172 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Greece to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3173 Furthermore, in connection with the documents relied on by Greece, we should also note the European Communities' argument that Greece's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the Greek safeguard measure include the fact that, from Greece's perspective, relevant scientific evidence was or is insufficient. We recall our previous

[2015] Exhibit EC-162/At. 9 p. 1795.
[2016] Exhibit EC-162/At. 10 p. 1875.
[2017] Exhibit EC-162/At. 11 p. 1912.
[2018] We understand from the application for the deliberate release of this product that *Brassica napus* is the species of oilseed rape which has been modified to produce Topas oilseed rape.
[2019] Exhibit EC-162/At. 12, p. 457.
[2020] *Ibid*., p. 459.

consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3031-7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3174 We have found above that the documents provided by the Parties in relation to Greece's safeguard measure on Topas oilseed rape on which Greece relied do not constitute a risk assessment. However, the European Communities contends that there is a document other than the documents relied on by Greece which constitutes a risk assessment for Topas oilseed rape. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[2021] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to that conducted by the SCP.[2022] In any event, we have noted above that it is not in dispute that both of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1

7.3175 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the SCP were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether Greece's safeguard measure is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3176 We now turn to the question of whether, at the time of establishment of this Panel, the Greek safeguard measure on Topas oilseed rape was "based on" either the risk assessment of the lead CA or that conducted by the SCP.[2023]

7.3177 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Greece's safeguard measure on Topas oilseed rape and the risk assessments performed by the lead CA and the SCP in relation to Topas oilseed rape. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP with regard to Topas oilseed rape;

(b) the European Communities or Greece did not explain, by reference to these risk assessments, how and why Greece assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such

[2021] EC reply to Panel question No. 107.
[2022] Exhibits EC-162/At. 1; CDA-63; US-70 (referencing original SCP risk assessment).
[2023] We recall that we must examine as part of our analysis whether the safeguard measure is based on either risk assessment, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or that conducted by the SCP.

uncertainties or constraints, Greece's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Greece's safeguard measure, which imposes a prohibition, and risk assessments which we understand found no evidence that Topas oilseed rape will give rise to any adverse effects on human or animal health and the environment.

7.3178 Thus, in view of our conclusion that Greece's safeguard measure on Topas oilseed rape cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCP in relation to Topas oilseed rape, and recalling the fact that no other risk assessment which might reasonably support Greece's safeguard measure has been provided to us, we find that the Greek safeguard measure is not based on a risk assessment pursuant to Article 5.1.[2024]

Overall conclusions

7.3179 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Greek safeguard measure on Topas oilseed rape is not based on a risk assessment.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Greek safeguard measure on Topas oilseed rape is not based on a risk assessment.

7.3180 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS292 (Canada), it is necessary to examine, in addition, whether the Greek safeguard measure on Topas oilseed rape is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the Greek safeguard measure on Topas oilseed rape with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(ix) Italy – T25 maize, MON810 maize, MON809 maize, Bt-11 maize (EC-163)

7.3181 We now turn to the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). We recall that we must determine whether Italy's measure is "based on" a risk assessment pursuant to Article 5.1. In this context, the first issue we will address is whether the documents Italy relies on to justify its safeguard measure meet the definition of a risk assessment.

[2024] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Greek safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

"Risk assessment"

7.3182 We start by summarizing the documents on record in respect of this safeguard measure. We recall that Italy issued a decree on 4 August 2000 suspending the trade and use of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163).[2025] As stated in the Decree, the decision by Italy to apply a safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) was based on opinions issued by the Italian Superior Council of Health and Superior Institute of Health. We recall that only the 28 July 2000 opinion of the Superior Institute of Health referred to in the Italian Decree was provided to the Panel.[2026] The relevant conclusions of the opinion of the Superior Institute of Health set out in the Decree were summarized above.

7.3183 Having determined the documents relied on by Italy with respect to its safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), we must now determine whether any of these documents constitutes a "risk assessment" within the meaning of the *SPS Agreement*.

7.3184 We recall that the concerns identified by Italy relate to the protection of human health from potential risks associated with the consumption of the relevant GM maize products as well as potential risks arising from the "environmental release" of the relevant GMOs or their products. Regarding the latter category of risks, we consider that the first clause of Annex A(4) to the *SPS Agreement* provides the applicable definition for the "risk assessment" to be carried out for Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). Regarding the former category of risks – risks associated with the consumption of the relevant GM maize products – we consider that the second clause of Annex A(4) to the *SPS Agreement* provides the applicable definition. We note that, unlike for the definition of risk assessment contained in the first clause of Annex A(4), WTO jurisprudence provides little guidance on the meaning of key concepts contained in the definition provided in the second clause. The Appellate Body merely observed in this respect that the first clause is substantially different from the second clause, and that the second clause requires "only" the evaluation of the "potential" for adverse effects on human or animal health arising from the presence of certain substances in foods, whereas the first clause requires an evaluation of the "likelihood" of entry, establishment or spread of a pest or disease and of the associated biological and economic consequences.[2027] We note that the dictionary defines the term "potential" as "the possibility of something happening [...] in the future".[2028]

7.3185 We start with the Decree notified by Italy in respect of its safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). This Decree makes reference to "an exposé by an environmentalist association regarding to the simplified authorization procedure for the placing on the market"[2029] of these four maize products, and assertions by the environmentalist association that the condition of "substantial equivalence" required for the use of the simplified procedure was not met for these products. The Decree also makes reference to an opinion by the Italian Superior Institute of Health which it says found (i) that residues of genetically modified components (proteins) remain in the four products in question and (ii) that the technical documentation available does not examine the relevant GMOs in comparison to their conventional counterparts with regard to the presence of these components. Although the Decree reports the

[2025] Exhibit EC-157/At. 1.
[2026] Exhibit EC-157/At. 2.
[2027] Appellate Body Report, *Australia – Salmon*, footnote 69.
[2028] *The Concise Oxford Dictionary*, 10th edn, J. Pearsall (ed.) (Oxford University Press, 1999), p. 1120.
[2029] Exhibit EC-157/At. 1.

ultimate conclusion of the Italian Superior Institute of Health that "there are no apparent risks to the health of humans or livestock from the consumption of derivatives of the aforementioned GMOs"[2030], the Decree states that this conclusion was reached in a context in which there were inadequacies in the applicable risk assessment procedures. The Decree further states that since it had been established that residues of modified components remain in the four products, the information available from the simplified procedure was also inadequate with regard to the risks arising from "environmental release" of the GMOs in question, or their products.

7.3186 In our view, it is clear that the Decree does not itself provide an "evaluation" of the potential for adverse effects on human or animal health arising from the presence of certain substances/components (toxins, additives, etc.) in the four products in question. Similarly, the Decree does not itself evaluate the likelihood of the establishment or spread of a pest due to the "environmental release" of the relevant GMOs or their products. We therefore consider that the Decree is not in itself a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3187 We turn next to the opinion by the Italian Superior Institute of Health of July 2000.[2031] In assessing the possible food safety risks associated with the consumption of the four maize products, the Institute comments on composition (noting an expressed presence of protein deriving from the genetic modifications), toxicity of the products of "extraneous" genes (including Bt toxin), herbicide residues and antibiotic resistance. The report concludes that "in the light of current scientific knowledge it is this Institute's opinion that there are no risks to human or animal health due to the consumption of derivatives of the GMOs indicated in the table".[2032] Finally, the Institute declined to express an opinion regarding the risk of possible "environmental release" of the GMOs in question, or of their products.

7.3188 In considering the Institute's opinion, we note that in relation to herbicide residues, the Institute stated that this issue would need to be "evaluated" by the Phyto-pharmaceutical Commission in order to determine whether regulatory action would be appropriate. Thus, it is apparent that the Institute's opinion does not itself evaluate the potential for any adverse effects. Regarding toxicity and antibiotic resistance, we note that the opinion draws conclusions regarding the potential for adverse effects from the results of available studies and tests. These studies and tests are not annexed to the opinion, however. The opinion merely indicates their results and critical conclusions.[2033] Hence, it is clear that the text of the opinion does not itself contain and provide all the information necessary to an evaluation of the potential for the relevant adverse effects to occur. Accordingly, we consider that the Institute's opinion constitutes, not a complete, self-contained, scientific evaluation of the potential for adverse effects on human or animal health due to toxicity and the development of antibiotic resistance, but only part of such an evaluation. We are therefore of the view that the Institute's opinion does not meet the definition of a risk assessment as provided in the second clause of Annex A(4). Moreover, since none of the studies or tests referenced or mentioned in the opinion were provided to us, we cannot, and do not, express a view on whether the opinion and these studies and tests taken together would satisfy the Annex A(4) definition of a "risk assessment".

7.3189 Regarding potential risks arising from the "environmental release" of the relevant GMOs or their products, we recall that the Institute's opinion explicitly states that it does not address such risks.

[2030] *Ibid*.
[2031] Exhibit EC-157/At. 2.
[2032] *Ibid*.
[2033] It is pertinent to note that that the entirety of the discussion concerning toxicity and antibiotic resistance extends over no more than one page.

It follows that the opinion does not provide an assessment of such risks which would meet the definition of Annex A(4).

7.3190 In the light of the foregoing, we conclude that the above-mentioned documents relied on by Italy to justify its safeguard measure are not risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3191 Furthermore, in connection with the documents relied on by Italy, we should also note the European Communities' argument that Italy's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of the Italian safeguard measure include the fact that, from Italy's perspective, relevant scientific evidence was or is insufficient We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" in paragraphs 7.3052-7.3053 above and consider that our conclusions there apply *mutatis mutandis* to this measure.

7.3192 We have found above that the documents provided by the Parties in relation to Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) on which Italy relied do not constitute a risk assessment. However, the European Communities contends that there is a document other than the documents relied on by Italy which constitutes a risk assessment for T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[2034] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or to those conducted by the SCP.[2035] In any event, we have noted above that it is not in dispute that both of these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3193 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the SCP were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether Italy's safeguard measure is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3194 We now turn to the question of whether, at the time of establishment of this Panel, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) was "based on" either the risk assessment of the lead CA or those conducted by the SCP.[2036]

7.3195 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the

[2034] EC reply to Panel question No. 107.

[2035] Exhibits EC-159/Ats. 1-2; EC-160/At. 1-2; EC-163/At. 1; CDA-82, CDA-83, CDA-84 and CDA-85; US-68 (referencing original SCP risk assessments); ARG-47 (referencing original SCP risk assessments).

[2036] We recall that we must examine as part of our analysis whether the safeguard measure is based on either risk assessment, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or those conducted by the SCP.

SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) and the risk assessments performed by the lead CA and the SCP in relation to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCP with regard to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163);

(b) the European Communities or Italy did not explain, by reference to these risk assessments, how and why Italy assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such uncertainties or constraints, Italy's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Italy's safeguard measure, which imposes a prohibition, and risk assessments which we understand found no grounds for considering that the use of T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) endangers human health or the environment.

7.3196 Thus, in view of our conclusion that Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCP in relation to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) and recalling the fact that no other risk assessment which might reasonably support Italy's safeguard measure has been provided to us, we find that the Italian safeguard measure is not based on a risk assessment pursuant to Article 5.1.[2037]

7.3197 We add that even if the favourable opinion[2038] by the Superior Institute of Health of July 2000 was considered to provide a risk assessment regarding the concerns over toxicity and development of antibiotic resistance, Italy's decision to prohibit the marketing of the four GM maize products at issue could not, in our view, be said to be based on the Institute's favourable opinion. The reasons which we have given above in relation to the risk assessments performed by the lead CA or the SCP apply, *mutatis mutandis*, also to the Institute's opinion.

[2037] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Italian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

[2038] We recall that the Institute's conclusion was to the effect that there are no risks to human health due to the consumption of these products.

Overall conclusions

7.3198 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not based on a risk assessment.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not based on a risk assessment.

(iii) DS293 (Argentina)[2039]

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize and Bt-11 maize (EC-163) is not based on a risk assessment.

7.3199 In view of our findings in the previous paragraph with regard to DS291 (United States), DS292 (Canada) and DS293 (Argentina), it is necessary to examine, in addition, whether the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(x) Luxembourg – Bt-176 maize

7.3200 We now turn to Luxembourg's safeguard measure on Bt-176 maize. We recall that we must determine whether Luxembourg's measure is "based on" a risk assessment pursuant to Article 5.1. In this context, the first issue we will address is whether the document Luxembourg relies on to justify its safeguard measure meet the definition of a risk assessment.

[2039] We recall that unlike the complaints by the other Complaining Parties, Argentina's complaint with regard to the Italian safeguard measure covers only three products subject to the Italian decree of August 2000, *i.e.*, T25 maize, MON810 maize and Bt-11 maize.

"Risk assessment"

7.3201 We recall that only one document was submitted by the Parties in relation to Luxembourg's safeguard measure on Bt-176 maize, namely the Reasons document.[2040] Thus, we must determine whether this document constitutes a "risk assessment" within the meaning of the *SPS Agreement*.

7.3202 As with Austria's safeguard measure for Bt-176 maize, given the concerns raised by Luxembourg in the context of Bt-176 maize, we consider that both the first and the second clause of Annex A(4) to the *SPS Agreement* define the "risk assessment" to be carried out for Luxembourg's measure on Bt-176 maize.

7.3203 In the Reasons document, Luxembourg alleges that Bt-176 maize poses risks in relation to the development of antibiotic resistance and the development of insect resistance to Bt toxin. Regarding the development of antibiotic resistance, the Reasons document refers to scientific advice from EC scientific committees and other scientific experts. Although Luxembourg acknowledges that these experts indicated that there was only a small risk that antibiotic resistance would develop due to gene transfer to bacteria in the gut of humans or animals, Luxembourg insists that a small risk exists, notably in situations where the maize in question is used as animal feed, and argues that there is a need for further study regarding the mechanism of gene transfer.

7.3204 With regard to the development of insect resistance to Bt toxin, the Reasons document refers to the "possible" emergence of insects resistant to the Bt toxin as "a real risk factor".[2041] It emphasizes the lack of understanding of the long-term impacts of Bt toxin on the evolution of insect resistance. It also refers to a case of development of insect resistance in the United States in the wake of the introduction of GM cotton with an insecticidal trait. The Reasons document argues in this respect that as long as the causes of the insect resistance in the United States have not been elucidated, Bt maize should not be cultivated.

7.3205 Thus, the Reasons document calls for, but does not itself provide, further evaluation of the mechanism of gene transfer which might lead to the development of antibiotic resistance and of the risk of development of insects resistant to Bt toxin. More particularly, the Reasons document does not make a further evaluation of the likelihood of the spread of diseases or target insects. Nor does it make a further evaluation of the potential for adverse effects on human or animal health arising from the presence of ARMG in food. Given this, we consider that the Reasons document does not meet the definition of a risk assessment as provided in Annex A(4).

7.3206 In the light of the foregoing, we conclude that the Reasons document, being the document relied on by Luxembourg to justify its safeguard measure, does not constitute a risk assessment within the meaning of Annex A(4) and Article 5.1.

7.3207 Furthermore, in connection with the document relied on by Luxembourg, we should also note the European Communities' argument that Luxembourg's safeguard measure was based on an assessment "appropriate to the circumstances" within the meaning of Article 5.1. The European Communities submits that the circumstances in the case of Luxembourg's safeguard measure include the fact that, from Luxembourg's perspective, relevant scientific evidence was or is insufficient We recall our previous consideration of the European Communities' argument based on the phrase "appropriate to the circumstances" within the meaning of Article 5.1 in paragraphs 7.3031-7.3032 above, and consider that our conclusions there apply *mutatis mutandis* to this measure.

[2040] Exhibit EC-158/At. 9.
[2041] *Ibid*.

7.3208 We have found above that the only document which was provided by the Parties in relation to Luxembourg's safeguard measure on Bt-176 maize and which Luxembourg relied on does not constitute a risk assessment. However, the European Communities contends that there is a document other than the document relied on by Luxembourg which constitutes a risk assessment for Bt-176. The document in question is the "risk assessment [which] was carried out at the time when the original Community consent was given" (hereafter the "original risk assessment").[2042] It is not clear from this assertion whether the European Communities is referring to the risk assessment conducted by the lead CA or any of the risk assessments which were conducted by the Scientific Committee for Pesticides (SCPE), the Scientific Committee for Animal Nutrition (SCAN) or the SCF.[2043] In any event, it is not in dispute that these documents constitute risk assessments within the meaning of Annex A(4) and Article 5.1.

7.3209 In addition, we note that none of the Parties has argued that, on the date of establishment of this Panel, the risk assessments conducted by the lead CA and the risk assessments which were conducted by the SCPE, the SCAN or the SCF were no longer "appropriate to the circumstances". In the light of this, and in view of our findings below with regard to whether Luxembourg's safeguard measure is "based on" these risk assessments, we do not need to examine this issue further.

"Based on"

7.3210 We now turn to the question of whether, at the time of establishment of this Panel, Luxembourg's safeguard measure on Bt-176 maize was "based on" either the risk assessment of the lead CA or that conducted by the SCPE, the SCAN or the SCF.[2044]

7.3211 We note that the European Communities' arguments in respect of this issue were the same as those it presented in the context of Austria's safeguard measure on T25 maize. We have addressed these arguments above and have reached the conclusion that Austria's safeguard measure on T25 maize cannot be considered to be "based on" the risk assessments performed by the lead CA and the SCP in relation to T25 maize. This conclusion, and the reasoning supporting it, also apply, *mutatis mutandis*, to Luxembourg's safeguard measure on Bt-176 maize and the risk assessments performed by the lead CA and the SCPE, the SCAN and the SCF in relation to Bt-176 maize. This is because, as in the case of Austria's safeguard measure on T25 maize:

(a) we are not aware of any divergent opinions expressed in the risk assessments which were conducted by the lead CA and the SCPE, the SCAN or the SCF with regard to Bt-176 maize;

(b) the European Communities or Luxembourg did not explain, by reference to these risk assessments, how and why Luxembourg assessed the risks differently, and did not provide a revised or supplemental assessment of the risks;

(c) the European Communities has not identified possible uncertainties or constraints in the risk assessments in question, and has not explained why, in view of any such

[2042] EC reply to Panel question No. 107.

[2043] Exhibits EC-158/Ats. 1-3; EC-158/At. 4; EC-158/At. 5; EC-158/At. 6.

[2044] As noted, we must examine as part of our analysis whether the safeguard measure is based on either risk assessment, as it is not clear whether the original risk assessment referred to by the European Communities is the risk assessment conducted by the lead CA or that conducted by the SCPE, the SCAN or the SCF.

uncertainties or constraints, Luxembourg's prohibition is warranted by the relevant risk assessments; and

(d) there is no apparent rational relationship between Luxembourg's safeguard measure, which imposes a prohibition, and risk assessments which found no evidence that Bt-176 maize will give rise to any adverse effects on human or animal health and the environment.

7.3212 Thus, in view of our conclusion that Luxembourg's safeguard measure on Bt-176 maize cannot be considered to be "based on" the risk assessments performed by the lead CA or the SCPE, the SCAN or the SCF in relation to Bt-176 maize, and recalling the fact that no other risk assessment which might reasonably support Luxembourg's safeguard measure has been provided to us, we find that Luxembourg's safeguard measure is not based on a risk assessment pursuant to Article 5.1.[2045]

Overall conclusions

7.3213 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, Luxembourg's safeguard measure on Bt-176 maize is not based on a risk assessment.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, Luxembourg's safeguard measure on Bt-176 maize is not based on a risk assessment.

7.3214 In view of our findings in the previous paragraph with regard to DS291 (United States) and DS293 (Argentina), it is necessary to examine, in addition, whether Luxembourg's safeguard measure on Bt-176 maize is consistent with the requirements of Article 5.7 of the *SPS Agreement*. It is only once we have completed this additional examination that we can come to a final conclusion regarding the consistency of Luxembourg's safeguard measure on Bt-176 maize with Article 5.1 of the *SPS Agreement*. We undertake the necessary examination under Article 5.7 in the next section.

(d) Consistency with Article 5.7 of the *SPS Agreement* and final conclusion regarding consistency with Article 5.1 of the *SPS Agreement*

7.3215 We have found above that none of the relevant safeguard measures meets the requirements set out in the text of Article 5.1. As we have said, in view of this finding, it is necessary to go on to examine whether the safeguard measures are consistent with the requirements of Article 5.7 of the *SPS Agreement*.

[2045] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, Luxembourg's safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

7.3216 To recall, Article 5.7 provides as follows:

> "In cases where relevant scientific evidence is insufficient, a Member may provisionally adopt sanitary or phytosanitary measures on the basis of available pertinent information, including that from the relevant international organizations as well as from sanitary or phytosanitary measures applied by other Members. In such circumstances, Members shall seek to obtain the additional information necessary for a more objective assessment of risk and review the sanitary or phytosanitary measure accordingly within a reasonable period of time."

7.3217 We have explained earlier that if we were to find that a safeguard measure is consistent with the requirements of Article 5.7, Article 5.1 would not be applicable and we would consequently need to conclude that the European Communities has not acted inconsistently with its obligations under Article 5.1. Conversely, if we were to find that a safeguard measure is inconsistent with the requirements of Article 5.7, Article 5.1 would be applicable and, in view of our finding that none of the safeguard measures meets the requirements set out in the text of Article 5.1, we would need to conclude that the European Communities has acted inconsistently with its obligations under Article 5.1 in respect of the relevant measure.

7.3218 Before embarking on an examination of the individual safeguard measures under Article 5.7, it is well to recall that the Appellate Body in *Japan – Agricultural Products II* found that there are four requirements in Article 5.7 that must be met in order for a Member to adopt and maintain a provisional SPS measure. More specifically, the Appellate Body stated that:[2046]

> "Pursuant to the first sentence of Article 5.7, a Member may provisionally adopt an SPS measure if this measure is:
>
> (1) imposed in respect of a situation where "relevant scientific information is insufficient"; and
>
> (2) adopted "on the basis of available pertinent information".
>
> Pursuant to the second sentence of Article 5.7, such a provisional measure may not be maintained unless the Member which adopted the measure:
>
> (1) "seek[s] to obtain the additional information necessary for a more objective assessment of risk"; and
>
> (2) 'review[s] the … measure accordingly within a reasonable period of time'."

7.3219 Furthermore, we note that, according to the Appellate Body, the four requirements contained in Article 5.7 are "clearly cumulative in nature".[2047] In other words, "[w]henever one of these four requirements is not met, the measure at issue is inconsistent with Article 5.7."[2048]

7.3220 The Appellate Body further stated that Article 5.7 reflects the precautionary principle, and that the precautionary principle as such has not been written into the *SPS Agreement* as a ground for

[2046] Appellate Body Report, *Japan – Agricultural Products II*, para. 89. *See also* Appellate Body Report, *Japan – Apples*, para. 176. We note regarding the first requirement that the Appellate Body referred to "relevant scientific information" instead of "relevant scientific evidence".

[2047] Appellate Body Report, *Japan – Agricultural Products II*, para. 89.

[2048] *Ibid*.

justifying an SPS measure that is otherwise inconsistent with that Agreement.[2049] The European Communities asserts that each of the safeguard measures at issue in this dispute is based on the precautionary principle. Since we examine below whether the relevant safeguard measures are consistent with the requirements of Article 5.7, in view of the aforementioned statement by the Appellate Body, we see no need separately to examine the European Communities' argument that these measures are based on the precautionary principle.

7.3221 With this in mind, we now turn to examine the first member State safeguard measure, Austria's safeguard measure on T25 maize. As always, we begin with a summary of the Parties' main arguments.

(i) Austria – T25 maize

7.3222 The **United States** argues that the Austrian safeguard measure on T25 maize fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on T25 maize. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by Austria did not warrant any change in the earlier risk assessment. *Third*, Austria has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Austria has sought to perform a risk assessment that would support its measure on T25 maize. *Finally*, the United States alleges that neither Austria nor the Commission have reviewed the Austrian safeguard measure within a reasonable period of time.

7.3223 **Canada** argues that a review of the Austrian safeguard measure and the factual and scientific circumstances surrounding its adoption and maintenance reveal that the measure fails to satisfy any of the four elements of Article 5.7. *First*, the measure was not imposed in respect of a situation where relevant scientific information was insufficient. The opinion of the European Communities' own scientific experts demonstrate that there was sufficient scientific evidence to conduct a complete and objective risk assessment. In Canada's view, what was insufficient was the scientific evidence put forward by the European Communities or Austria to support the safeguard measure. *Second*, the measure was not adopted on the basis of "available pertinent information", since this would include the scientific opinions of the lead CA and of the relevant EC scientific committee, which all confirmed the safety of the product.

7.3224 With respect to the *third* element of Article 5.7, the requirement that the Member seek to obtain the additional information necessary for a more objective assessment of risk, Canada notes that this element is irrelevant in this case, given the sufficiency of the scientific evidence available from the European Communities' own sources. *Finally*, with regard to the fourth requirement, namely that the measure must be reviewed within a reasonable period of time, Canada recalls that the European Communities' own legislation requires that such a review take place. However, given the absence of "pertinent information" to support the safeguard measure, Canada draws the conclusion that the measure would have been lifted if such a review had been conducted. Furthermore, according to the Appellate Body, what constitutes a "reasonable period of time" will be influenced by the emergence of the additional information necessary to make a more objective assessment of the risk. In Canada's view, new or additional information was not necessary in the present case to conduct a risk assessment, as sufficient scientific evidence was in existence even at the time the safeguard measure was taken.

[2049] Appellate Body Report, *EC – Hormones*, para. 124.

7.3225 **Argentina** argues that the Austrian safeguard measure does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on T25 maize, including one which specifically rejected the information provided by Austria in support of the measure. *Second*, Austria did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Austria has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Austria did not review its safeguard measure.

7.3226 The **European Communities** argues that the Austrian safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised".[2050]

7.3227 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2051] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3228 Applying these considerations to the Austrian safeguard measure on T25 maize, the European Communities submits that, having regard to the specific concerns of Austria's legislators in adopting that measure, Austria's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3229 Furthermore, the European Communities contends that Austria has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Austria and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

[2050] EC first written submission, para. 604.

[2051] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

7.3230 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2052] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2053] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, *e.g.* life-terminating, damage to human health are concerned".[2054] The European Communities differentiates the present case from *Japan-Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2055]

7.3231 The **Panel** notes that in presenting arguments with respect to the four requirements of Article 5.7, the Parties started with the first requirement, *i.e.* whether the Austrian safeguard measure was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". The Panel, too, will begin its analysis with the first requirement.[2056]

"Insufficiency of relevant scientific evidence"

7.3232 We recall that pursuant to the first requirement, a Member must not provisionally adopt an SPS measure except in a case "where relevant scientific evidence is insufficient". Before examining the Austrian safeguard measure in the light of this requirement, we need to address two issues: (i) whether the sufficiency of the scientific evidence must be assessed by reference to Austria's appropriate level of sanitary or phytosanitary protection and (ii) whether the sufficiency of the scientific evidence is to be judged at the time of adoption of the Austrian safeguard measure or at the

[2052] We recall that the US argument that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures be reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2053] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2054] Appellate Body Report, *EC – Hormones*, para. 124.

[2055] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the *Japan – Apples* case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2056] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

time of review by this Panel, *i.e.*, at the time this Panel's terms of reference were fixed. We will examine these issues in turn.

Relevance of the appropriate level of sanitary or phytosanitary protection from risks

7.3233 We recall the European Communities' contention in paragraph 7.3227 above that in assessing the sufficiency of relevant scientific evidence, regard must be had to the protection goals pursued by legislators. In considering this contention, we recall as an initial matter that the Appellate Body in *Japan – Apples* clarified the meaning of the phrase "where relevant scientific evidence is insufficient". According to the Appellate Body, the notion of "insufficiency" implies a relationship between the scientific evidence and something else. On that basis, the Appellate Body determined that "'relevant scientific evidence' will be 'insufficient' within the meaning of Article 5.7 if the body of available scientific evidence does not allow, in quantitative or qualitative terms, the performance of an adequate assessment of risks as required under Article 5.1 and as defined in Annex A to the *SPS Agreement*".[2057] It appears that in the Appellate Body's view scientific evidence could be considered to be insufficient in qualitative terms for instance when it is inconclusive or unreliable.[2058]

7.3234 The European Communities argues that the concept of "insufficiency" in Article 5.7 is "relational" and must, therefore refer to the matters of concern to the legislator. We are not persuaded by this argument. While the Appellate Body has said that the notion of "insufficiency" implies a "relationship" between the scientific evidence and something else, it nowhere said that the notion of "insufficiency" implies a relationship between the scientific evidence and the matters of concern to the legislator. The Appellate Body identified, and acknowledged the existence of, only one relevant relationship: that between the scientific evidence and the obligation to perform a risk assessment under Article 5.1.

7.3235 We note that the Appellate Body in *Japan – Apples* referred to the insufficiency of available scientific evidence to perform an "adequate" assessment of risks. The European Communities appears to rely on the Appellate Body's use of the term "adequate", for it argues that an "adequate" assessment of risks is one which is "adequate for the purposes of the legislator". The Appellate Body failed to define or explain the term "adequate". Moreover, the term "adequate" nowhere appears in Article 5.1, Article 5.7 or Annex A(4). In these circumstances, we are not convinced that we should attach much significance to this term.[2059] Indeed, the term "adequate" may have been intended as nothing more than a reference to the definition in Annex A(4). On this view, a risk assessment would be "adequate" if it meets the standard and definition provided in Annex A(4).

7.3236 If we were nonetheless to try to give independent meaning to the term "adequate", the second sentence of Article 5.7 appears to us to be instructive. That sentence makes clear that in circumstances where relevant scientific evidence is insufficient and a Member has provisionally adopted an SPS measure, the Member concerned must seek to obtain the additional information necessary for a "more objective assessment of risk". We have observed earlier that we take the phrase "a more objective assessment of risk", considered as a whole, to refer to a risk assessment which satisfies the definition provided in Annex A(4), or at least which is closer to satisfying the definition in Annex A(4) than consideration of "available pertinent information". Also, Article 5.1 requires SPS measures to be based on a risk assessment within the meaning of Annex A(4). On that basis, it can be

[2057] Appellate Body Report, *Japan – Apples*, para. 179.
[2058] *Ibid.*, para. 185.
[2059] This view is supported by the fact that three paragraphs later in its report on *Japan – Apples*, the Appellate Body dropped the term "adequate", referring only to "an assessment of risks, as required under Article 5.1 and as defined in Annex A". Appellate Body Report, *Japan – Apples*, para. 182.

argued that the Appellate Body's reference to "an *adequate* assessment of risks as required by Article 5.1 and as defined in Annex A" (emphasis added) should be understood as a reference to "a *more objective* assessment of risks as required by Article 5.1 and as defined in Annex A".

7.3237 Clearly, neither of the two above-noted interpretations of the term "adequate" supports the conclusion that in referring to an "adequate" risk assessment, the Appellate Body intended to suggest that a risk assessment had to be adequate for the purposes of a Member's legislator. The two above-noted interpretations support the conclusion that, in the view of the Appellate Body, relevant scientific evidence is insufficient within the meaning of Article 5.7 if the body of available scientific evidence does not allow, in quantitative or qualitative terms, the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). At any rate, this is the interpretation of the concept of "insufficiency" in Article 5.7 which we believe to be correct.

7.3238 The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. We would agree that it must be determined on a case-by-case basis whether the body of available scientific evidence is insufficient to permit the performance of a risk assessment. But we are not convinced that the protection goals pursued by a legislator are relevant to such a determination. The protection goals of a legislator may have a bearing on the question of which risks a Member decides to assess with a view to taking regulatory action, if necessary. And a legislator's protection goals are certainly relevant to the determination of the measure – or as the European Communities puts it, the "actions" – to be taken for achieving a Member's level of protection against risk. Yet there is no apparent link between a legislator's protection goals and the task of assessing the existence and magnitude of potential risks.

7.3239 We note that the European Communities defines a risk assessment which is adequate for the purposes of a Member's legislator as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised".[2060] We have already expressed the view that the question to be answered in an Article 5.7 inquiry is not whether relevant scientific evidence permits the performance of a risk assessment adequate for the purposes of a legislator, but whether it permits the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). Nonetheless, we must examine whether the kind of risk assessment the European Communities considers adequate is consistent with the kind of risk assessment required under Article 5.1 and defined in Annex A(4).

7.3240 We note in this respect that a risk assessment as required under Article 5.1 and as defined in Annex A(4) may set forth diverging scientific opinions coming from qualified and respected sources and, to that extent, need not necessarily inform a Member "unequivocally" about risks. A risk assessment as defined in Annex A(4) should normally address the "degree of precision", or level of confidence, with which the relevant risks can be, or have been, assessed and the circumstances in which the assessment may need to be "revised".[2061] Also, the "passage of time" may be a limiting

[2060] *Ibid.*

[2061] It is instructive to note what is stated in this regard in pertinent risk assessment techniques developed by relevant international organizations. Thus, the Codex *Working Principles for Risk Analysis for Application in the Framework of the Codex Alimentarius* provide that "[c]onstraints, uncertainties and assumptions having an impact on the risk assessment should be explicitly considered at each step in the risk assessment and documented in a transparent manner". Codex Alimentarius Commission, *Working Principles for Risk Analysis for Application in the Framework of the Codex Alimentarius* (adopted in June/July 2003),

factor which might warrant a revision of an existing risk assessment. However, where a risk assessment has been performed, and that risk assessment meets the standard and definition of Annex A(4), it does not cease to be a risk assessment within the meaning of Annex A(4) merely because a particular Member judges that the risks have not been assessed with a "sufficient" degree of precision, that the assessment has not "withstood" the passage of time, and that it is "likely" that the assessment may need to be revised at some point in the future. If there are factors which affect scientists' level of confidence in a risk assessment they have carried out[2062], this may be taken into account by a Member in determining the measure to be applied for achieving its appropriate level of protection from risks. Thus, consistent with the foregoing remarks, we consider that it would be improper to apply the European Communities' definition of an "adequate" risk assessment for the purposes of an analysis of whether relevant scientific evidence is insufficient to perform a risk assessment. We observe that this view is consistent with risk assessment techniques established by relevant international organizations. For instance, the *Working Principles for Risk Analysis for Application in the Framework of the Codex Alimentarius* state that "[t]he report of the risk assessment should indicate any constraints, uncertainties, assumptions and their impact on the risk assessment. Minority opinions should also be recorded. The responsibility for resolving the impact of uncertainty on the risk management decision lies with the risk manager, not the risk assessors".[2063] Along similar lines, the Codex *Principles for the Risk Analysis of Foods Derived from Modern Biotechnology* state that "[r]isk managers should take into account the uncertainties identified in the risk assessment and implement appropriate measures to manage these uncertainties".[2064] Similarly, the IPPC's ISPM #11 (2001) states in relevant part that "[t]he uncertainty noted in the assessments of economic consequences and probability of introduction should also be considered and included in the selection of a pest management option".[2065] The quoted passage stayed the same in the 2004 version of ISPM #11, which applies specifically to living modified organisms.

7.3241 Based on its view that a risk assessment must be adequate for the purposes of a Member's legislator, the European Communities argues that a Member with a high appropriate level of protection may justifiably consider that the available body of scientific evidence is insufficient to permit the assessment of risks with a degree of precision which it would find adequate, while a Member with a lower appropriate level of protection may consider that the same body of evidence is sufficient to perform an adequate risk assessment. In other words, the European Communities argues that in determining whether relevant scientific evidence is insufficient within the meaning of Article 5.7, regard must be had to a Member's appropriate level of protection.

Section III, Codex Procedural Manual, 14th edition, 2004, para. 23. Similarly, the IPPC's ISPM #11 (2001) states in relevant part that "[e]stimation of the probability of introduction of a pest and of its economic consequences involves many uncertainties. [...] It is important to document the areas of uncertainty and the degree of uncertainty in the assessment, and to indicate where expert judgement has been used". IPPC, ISPM #11 : *Pest Risk Analysis for Quarantine Pests*, April 2001, para. 2.4. The quoted passage stayed the same in the 2004 version of ISPM #11, which applies specifically to living modified organisms. Finally, the principles of risk assessment of the OIE *Terrestrial Animal Health Code* provide in relevant part that "[r]isk assessments should document the uncertainties, the assumptions made, and the effect on these on the final risk estimate". OIE, *Terrestrial Animal Health Code*, 2002, Article 1.3.2.3, para. 5.

[2062] *E.g.*, a limited body of relevant scientific evidence may be such a factor.

[2063] Codex Alimentarius Commission, *Working Principles for Risk Analysis for Application in the Framework of the Codex* Alimentarius (adopted in June/July 2003), Section III, Codex Procedural Manual, 14th edition, 2004, para. 25.

[2064] Codex Alimentarius Commission, *Principles for the Risk Analysis of Foods Derived from Modern Biotechnology* (adopted in June/July 2003), CAC/GL 44-2003, para. 18.

[2065] IPPC, ISPM #11: *Pest Risk Analysis for Quarantine Pests*, April 2001, para. 3.

7.3242 There can be no doubt that a Member's appropriate level of protection is relevant to determining the SPS measure to be applied, if any, to protect that Member from risks. Article 5.3 of the *SPS Agreement* refers to the determination of "the measure to be applied for achieving the appropriate level of sanitary or phytosanitary protection from [...] risk", and Article 5.6 relates to the establishment or maintenance of "[SPS] measures to achieve the appropriate level of sanitary or phytosanitary protection".

7.3243 In contrast, the definition of the term "risk assessment" in Annex A(4) does not indicate that a Member's appropriate level of protection is pertinent to an assessment of the existence and magnitude of risks.[2066] Also, Annex A(5) to the *SPS Agreement* states that the concept of the appropriate level of protection is referred to by some Members as the concept of the "acceptable level of risk". We do not think that scientists need to know a Member's "acceptable level of risk" in order to assess objectively the existence and magnitude of a risk.[2067] Furthermore, neither Article 5.2[2068] nor Article 5.3[2069] suggests that a Member's appropriate level of protection may be relevant to the assessment of risks.

7.3244 We note that Article 5.1 provides that SPS measures must be based on an assessment of risks which is "appropriate to the circumstances". The European Communities appears to suggest that an importing Member's appropriate level of protection is a relevant circumstance within the meaning of Article 5.1.[2070] In our view, an importing Member may not reject an existing risk assessment which meets the definition of Annex A(4) as not "appropriate to [its] circumstances" on the basis that this risk assessment indicates constraints or uncertainties, and that this would not enable the Member concerned to determine "with a sufficient degree of precision" whether a particular type of measure would in fact achieve its appropriate level of protection. As we have said, if there are factors which affect scientists' level of confidence in a risk assessment they have carried out, an importing Member may take this into account in determining the measure to be applied for achieving its appropriate level of protection.[2071]

7.3245 Finally, we note the European Communities' argument that the phrase "within a reasonable period of time" in the second sentence of Article 5.7 supports its view that the importing Member's appropriate level of protection is relevant to determining whether available scientific evidence is

[2066] We note that Annex A(4) in part defines a "risk assessment" as "the evaluation of the likelihood of entry, establishment or spread of a pest or disease within the territory of an importing Member according to the sanitary or phytosanitary measures which might be applied". We are not convinced that a Member's appropriate level of protection is relevant to identifying "the sanitary or phytosanitary measures which might be applied". In any event, even if this were the case, we do not see how this could affect whether an assessment of the existence and magnitude of risks could be carried out.

[2067] We note in this regard that in *Australia – Salmon* the Appellate Body also underlined the importance of distinguishing carefully "between the evaluation of 'risk' in a risk assessment and the determination of the appropriate level of protection". Appellate Body Report, *Australia – Salmon*, para. 125.

[2068] Article 5.2 provides that "[i]n the assessment of risks, Members shall take into account available scientific evidence; relevant processes and production methods; relevant inspection, sampling and testing methods; prevalence of specific diseases or pests; existence of pest- or disease-free areas; relevant ecological and environmental conditions; and quarantine or other treatment".

[2069] Article 5.3 provides in relevant part that "[i]n assessing the risk to animal or plant life or health [...], Members shall take into account as relevant economic factors: the potential damage in terms of loss of production or sales in the event of the entry, establishment or spread of a pest or disease; the costs of control or eradication in the territory of the importing Member; and the relative cost-effectiveness of alternative approaches to limiting risks".

[2070] EC reply to Panel question No. 107.

[2071] It should also be recalled that to the extent a risk assessment sets out a minority opinion from a qualified and respected source, an importing Member may also be justified in basing a measure to achieve its appropriate level of protection on that minority opinion.

insufficient within the meaning of Article 5.7 to perform a risk assessment. The second sentence of Article 5.7 requires that Members seek to obtain the information necessary for a more objective assessment of risk and review provisional SPS measures accordingly within a reasonable period of time. In *Japan – Agricultural Products II*, the Appellate Body stated that what constitutes a "reasonable period of time" depends, *inter alia*, on the difficulty of obtaining the information necessary for a more objective assessment of risk.[2072] We think that in cases where additional information obtained by a Member is objectively sufficient to perform "a more objective assessment of risk", the phrase "review [...] within a reasonable period of time" would not provide a justification for delaying the performance of such an assessment on the grounds that an assessment incorporating the additional information would not allow the importing Member to determine "with a sufficient degree of precision" whether a measure different from its provisional measure would achieve its appropriate level of protection. Here again, we consider that if there are factors which affect scientists' level of confidence in "a more objective assessment of risk" they have performed, the importing Member may take this into account when reviewing its provisional measure in the light of the "more objective assessment". Thus, we are unable to accept the European Communities' argument concerning the phrase "within a reasonable period of time".

7.3246 Based on the above considerations, we are unable to agree with the European Communities that in the context of Article 5.7 the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. More particularly, we do not agree that we need to have regard to Austria's appropriate level of protection in examining whether relevant scientific evidence was sufficient to perform a risk assessment for T25 maize as required under Article 5.1 and as defined in Annex A(4).

Time at which insufficiency of relevant scientific evidence is to be assessed

7.3247 We now turn to analyse the second issue, *i.e.*, whether the insufficiency of relevant scientific evidence, which is a prerequisite for invoking the exception under Article 5.7, is to be judged at the time of adoption of the Austrian safeguard measure or at the time this Panel's terms of reference were fixed.

7.3248 The first sentence of Article 5.7 provides that "[i]n cases where relevant scientific evidence is insufficient", a Member may provisionally "adopt" an SPS measure on the basis of available pertinent information. Thus, the text of the first sentence establishes a clear link between the required insufficiency of relevant scientific evidence and the adoption of a provisional SPS measure which is based on available pertinent information.

7.3249 The second sentence of Article 5.7 provides that "[i]n such circumstances", *i.e.*, in circumstances where an SPS measure has been provisionally adopted consistently with the requirements of the first sentence of Article 5.7, the relevant Member must seek to obtain the additional information necessary for a more objective assessment of risk and review the measure accordingly within a reasonable period of time. It is apparent from the conjunction "[i]n such circumstances" as well as the nature of the requirements laid down in the second sentence of Article 5.7 that that sentence establishes under what conditions an SPS measure which has been provisionally adopted may be maintained.

7.3250 The Appellate Body appears to share the view that the first sentence of Article 5.7 is concerned with the adoption of provisional SPS measures while the second sentence is concerned with the maintenance of such measures. In *Japan – Agricultural Products II*, the Appellate Body

[2072] Appellate Body Report, *Japan – Agricultural Products II*, para. 93.

stated that "[p]ursuant to the first sentence of Article 5.7, a Member may provisionally *adopt* an SPS measure if this measure [meets the two requirements set out in the first sentence]" and that "[p]ursuant to the second sentence of Article 5.7, such a provisional measure may not be *maintained* unless the Member which adopted the measure [complies with the two requirements set out in the second sentence]".[2073] Subsequently, in *Japan – Apples*, the Appellate Body confirmed that the two requirements set out in the second sentence of Article 5.7 "relate to the *maintenance* of a provisional [SPS] measure and highlight the *provisional* nature of measures adopted pursuant to Article 5.7".[2074]

7.3251 Reinforcing our view that the first sentence of Article 5.7 relates to the adoption of provisional SPS measures, but not to their maintenance, is the immediate context of Article 5.7. Article 5.6 provides in relevant part that "when *establishing or maintaining* [SPS] measures to achieve the appropriate level of [...] protection, Members shall ensure that such measures are not more trade-restrictive than required" (emphasis added). Likewise, Article 5.8 stipulates in relevant part that "[w]hen a Member has reason to believe that a specific [SPS] measure *introduced or maintained* by another Member is constraining [...] its exports and the measure is not based on the relevant international standards, guidelines or recommendations [...], an explanation of the reasons for such [SPS] measure may be requested and shall be provided" (emphasis added). Since Articles 5.6 and 5.8 explicitly refer to the "maintenance" of SPS measures in addition to the "establishment" or "introduction" of SPS measures, we think it may be justifiably assumed that the absence of a reference to the "maintenance" of a provisional SPS measure in the first sentence is intentional, and that "maintenance" is indeed covered by the second sentence of Article 5.7.

7.3252 Article 2.2 of the *SPS Agreement* is also part of the context of the first sentence of Article 5.7. To recall, Article 2.2 states in part that SPS measures may not be "*maintained* without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5" (emphasis added). We note the absence of a reference to the "adoption" of SPS measures without sufficient scientific evidence. Logic suggests that if an SPS measure may not be maintained without sufficient scientific evidence, it may also not be adopted without sufficient scientific evidence. This view draws support from the first sentence of Article 5.7, which explicitly refers to the "adoption" of provisional SPS measures. We recall in this respect that Article 5.7 provides for a qualified exemption from the obligation under Article 2.2 not to maintain SPS measures without sufficient scientific evidence. Having said this, we do not consider that, conversely, it may be deduced from the reference to the "maintenance" of an SPS measure in Article 2.2 that the first sentence of Article 5.7 implies a reference to the "maintenance" of a provisional SPS measure. As we have noted, we think that the second sentence of Article 5.7 sets forth the applicable requirements relating to the maintenance of a provisional SPS measure. Moreover, we have noted that in marked contrast with the first sentence of Article 5.7, other provisions of the same Article – we have identified Article 5.6 and Article 5.8 – explicitly refer to both the establishment, or introduction, of SPS measures in addition to their maintenance.

7.3253 Since the phrase "[i]n cases where relevant scientific evidence is insufficient" is part of the first sentence of Article 5.7, and since the above considerations lead us to conclude that the requirements contained in the first sentence relate only to the adoption of a provisional SPS measure, we are of the view that a determination of whether a particular case is a case "where relevant scientific evidence is insufficient" must be made by reference to the time the relevant provisional SPS measure was adopted.

7.3254 Consideration of the alternative view strengthens rather than undermines our view. Indeed, if it were assumed that, contrary to our view, it is to be assessed at the time of review by a panel whether

[2073] Appellate Body Report, *Japan – Agricultural Products II*, para. 89 (emphasis added).
[2074] Appellate Body Report, *Japan – Apples*, footnote 318 (emphasis in original).

"relevant scientific evidence is insufficient", the second sentence of Article 5.7 would effectively become redundant. If a Member invoking the exception set out in Article 5.7 had to demonstrate that at the time of review by a panel relevant scientific evidence was insufficient to perform a risk assessment as required under Article 5.1 and as defined in Annex A(4), there would be no apparent need to require that Member to seek to obtain additional information and to review its provisional SPS measure; the Member concerned would have every incentive to do so even in the absence of a requirement as it might be called on to defend its measure at any time.[2075] What is more, if that Member succeeded in demonstrating that relevant scientific evidence was insufficient, we fail to see what purpose would be served by requiring that Member to demonstrate, in addition, that at some earlier point in time it had sought additional information and reviewed its measure.

7.3255 We have concluded that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted. This conclusion warrants some elaboration, to avoid possible misinterpretation. *First of all*, we are not suggesting that evidence which establishes that, at some point between the time of adoption of a provisional SPS measure and the time a panel's terms of reference were fixed, relevant scientific evidence became sufficient, or was still insufficient, to perform a risk assessment as required under Article 5.1 and as defined in Annex A(4), is *a priori* irrelevant to an Article 5.7 inquiry. To the contrary, such evidence may be relevant to an inquiry under the second sentence of Article 5.7. It may shed light on whether the Member invoking the exception under Article 5.7 has complied with the requirement to "seek to obtain the additional information necessary for a more objective risk assessment". Alternatively, such evidence may be relevant to a determination of whether the Member invoking the exception under Article 5.7 has conducted a "review" of its provisional measure "within a reasonable period of time".

7.3256 *Secondly*, there is no incongruity between our approach to the European Communities' claim under Article 5.7 and our approach to the Complaining Parties' claim under Article 5.1 and their consequential claim under Article 2.2. It is true that in analysing these latter claims, we have reviewed the situation as it existed at the time the Panel's terms of reference were fixed. However, our approach to Article 5.7 is in keeping with, and gives meaning to, the two sentences of Article 5.7. As we see it, a Member maintaining a provisional SPS measure cannot make a successful claim of justification under Article 5.7 if that measure has not been adopted consistently with the requirements of the first sentence of Article 5.7. Furthermore, if in our analysis we reach the issue of whether the Austrian safeguard measure meets the requirements of the second sentence of Article 5.7, which relates to the maintenance of a provisional SPS measure, we will examine this issue in the light of the situation as it existed when our terms of reference were set. In other words, in the context of any inquiry under the second sentence of Article 5.7, we will follow the approach we adopted in respect of the Complaining Parties' claims under Article 5.1 and 2.2.

7.3257 *Thirdly*, our approach does not have as a consequence that a provisional SPS measure which has been adopted consistently with the requirements of the first sentence of Article 5.7 may be maintained indefinitely. The requirement in the second sentence of Article 5.7 that a Member "review" a provisional SPS measure in our view implies that once sufficient relevant scientific evidence has been obtained and a risk assessment meeting the definition of Annex A(4) has been

[2075] In contrast, if, as we think, the sufficiency of scientific evidence is to be assessed at the time a provisional SPS measure was adopted, a Member which could demonstrate that, at the time it adopted its provisional SPS measure, relevant scientific evidence was insufficient would not have an obvious incentive to seek additional information and review its measure in the absence of a requirement to do so. Our view gives purpose to the inclusion of such explicit requirements in the second sentence of Article 5.7.

carried out[2076], the provisional SPS measure must be withdrawn or modified if it cannot be "based on" the risk assessment in question. We note in this regard that the dictionary defines the noun "review" as "a formal assessment of something with the intention of instituting change if necessary".[2077] We also recall that the Appellate Body in *Japan – Apples* observed that the requirement to review provisional SPS measures "highlights the *provisional* nature of measures adopted pursuant to Article 5.7".[2078] This observation implies that a Member is required to withdraw or modify a provisional measure if the review establishes that the measure is no longer justified. Indeed, were it otherwise, the requirement to review a provisional SPS measure would be inconsequential and meaningless.

(ii) Austria's safeguard measure on T25 maize

7.3258 Turning now to Austria's safeguard measure on T25 maize, we note the Complaining Parties' argument that relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the Austrian safeguard measure, since a risk assessment was conducted by the SCP on the basis of the information provided by Austria in support of its measure.

7.3259 We recall that Austria adopted its safeguard measure on T25 maize in April 2000. Following Austria's notification of the measure, the Commission requested the SCP to analyse the information provided by Austria in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health or the environment. The SCP in its opinion of November 2000 concluded that the information provided by Austria did not constitute new scientific information which would change the original risk assessment which it had carried out in the context of the EC approval procedure concerning T25 maize.[2079] Thus, as we understand it, the SCP effectively reviewed its original risk assessment in the light of the information presented by Austria and confirmed its original risk assessment. [2080]

7.3260 We have found above that both the SCP opinions delivered in the context of relevant EC approval procedures – the original assessments– and the SCP opinions delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.[2081] We recall in this regard that the European Communities does not suggest otherwise.[2082] In the light of this, we agree with the

[2076] We recall that a risk assessment as required under Article 5.1 and as defined in Annex A(4) could also be carried out by another Member or an international organization.

[2077] *The Concise Oxford Dictionary*, 10th edn, J. Pearsall (ed.) (Oxford University Press, 1999), p. 1225.

[2078] Appellate Body Report, *Japan – Apples*, footnote 318 (emphasis in original).

[2079] Exhibits US-56; CDA-77 and 87; ARG-45 and ARG-46.

[2080] Exhibits US-56 (referencing original SCP assessment); CDA-75 and -87; ARG-45 and -46 (referencing original SCP assessment).

[2081] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2082] It is pertinent to recall in this context that in defending the Austrian safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Austria acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessment. However, the fact that Austria may have disagreed with the SCP's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "[c]ould set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*,

Complaining Parties that the SCP's review assessment of T25 maize, and the SCP's original assessment of T25 maize (which, as noted, was confirmed by the SCP's review assessment), serves to demonstrate that at the time of adoption of the Austrian safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the Complaining Parties have established a presumption that Austria's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2083]

7.3261 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Austria's safeguard measure on T25 maize was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3262 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the Austrian safeguard measure on T25 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that the Austrian safeguard measure on T25 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment, the Panel reaches the final conclusion

---

para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the SCP's original and review assessments of T25 maize are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2083] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that the Austrian safeguard measure on T25 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on T25 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(iii) Austria – Bt-176 maize

7.3263 We now turn to Austria's safeguard measure applied with respect to Bt-176 maize. We note the arguments of the Parties in respect of this measure.

7.3264 The **United States** argues that the Austrian safeguard measure on Bt-176 maize fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on Bt-176 maize. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCF and the Scientific Committee for Pesticides, Food and Animal Nutrition (SCPE) reviewed the safeguard measure and concluded that the information provided by Austria did not warrant any change in the earlier risk assessment. *Third*, Austria has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Austria has sought to perform a risk assessment that would support its measure on Bt-176 maize. *Finally*, the United States alleges that neither Austria nor the Commission have reviewed the Austrian safeguard measure within a reasonable period of time.

7.3265 **Argentina** argues that the Austrian safeguard measure does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on Bt-176 maize, including one which specifically rejected the information provided by Austria in support of the measure. *Second*, Austria did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Austria has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Austria did not review its safeguard measure.

7.3266 The **European Communities** argues that the Austrian safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a

reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2084]

7.3267 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2085] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3268 Applying these considerations to the Austrian safeguard measure on Bt-176 maize, the European Communities submits that, having regard to the specific concerns of Austria's legislators in adopting that measure, Austria's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3269 *Second*, the European Communities contends that Austria has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Austria and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3270 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2086] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstance may justify a Member requiring a relatively long period of time to review its provisional measure.[2087] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2088] The European Communities differentiates the present case from *Japan-Apples*, arguing that GMO technology is still at the frontiers of science and its future

[2084] EC first written submission, para. 604.

[2085] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

[2086] We recall that the US arguments that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2087] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2088] Appellate Body Report, *EC – Hormones*, para. 124.

consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2089]

"Insufficiency of relevant scientific evidence"

7.3271 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2090] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Argentina argue in this regard that in the case of Austria's safeguard measure on Bt-176 maize, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the Austrian safeguard measure, since risk assessments were conducted by EC scientific committees on the basis of the information provided by Austria in support of its measure.

7.3272 We recall that Austria adopted its safeguard measure on Bt-176 maize in February 1997. Following Austria's notification of the measure, the Commission requested the SCF, the Scientific Committee for Animal Nutrition (SCAN) and the Scientific Committee for Pesticides (SCPE) to analyse the information provided by Austria in support of its measure in order to determine whether this information would cause these Committees to consider that the product constituted a risk to human health or the environment. The SCF in its opinion of March 1997, the SCAN in its opinion of April 1997 and the SCPE in its opinion of May 1997 concluded that the information provided by Austria did not constitute new scientific information which would change the original risk assessments which they had carried out in the context of the EC approval procedure concerning Bt-176 maize.[2091]

7.3273 We have found above that both the opinions by EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of

[2089] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2090] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2091] Exhibits US-57, -58 and -66; ARG-43.

Annex A(4) and Article 5.1 of the *SPS Agreement*.[2092] We recall in this regard that the European Communities does not suggest otherwise[2093]. In the light of this, we agree with the United States and Argentina that the 1997 SCF, SCAN and SCPE review assessments of Bt-176 maize, and the SCF, SCAN and SCPE original assessments of Bt-176 maize (which, as noted, were confirmed by the review assessments), serve to demonstrate that at the time of adoption of the Austrian safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Argentina have established a presumption that Austria's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities[2094].

7.3274 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Austria's safeguard measure on Bt-176 maize was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3275 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the Austrian safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion

[2092] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2093] It is pertinent to recall in this context that in defending the Austrian safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Austria acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessments. It may be that in making this argument the European Communities meant to refer to the original risk assessments by the SCF, the SCAN and the SCPE. However, the fact that Austria may have disagreed with these' original assessments, and possibly also with the subsequent review assessment by the SCP, would not imply that these committees' assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the original and review assessments of Bt-176 maize are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2094] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that the Austrian safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(iv) Austria – MON810 maize

7.3276 We now turn to Austria's safeguard measure applied with respect to MON810 maize. We note the arguments of the Parties in respect of this measure.

7.3277 The **United States** argues that the Austrian safeguard measure on MON810 maize fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on MON810 maize. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by Austria did not warrant any change in the earlier risk assessment. *Third*, Austria has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Austria has sought to perform a risk assessment that would support its measure on MON810 maize. *Finally*, the United States alleges that neither Austria nor the Commission have reviewed the Austrian safeguard measure within a reasonable period of time.

7.3278 **Argentina** argues that the Austrian safeguard measure does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on MON810 maize, including one which specifically rejected the information provided by Austria in support of the measure. *Second*, Austria did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Austria has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Austria did not review its safeguard measure.

7.3279 The **European Communities** argues that the Austrian safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European

Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2095]

7.3280 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2096] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3281 Applying these considerations to the Austrian safeguard measure on MON810 maize, the European Communities submits that, having regard to the specific concerns of Austria's legislators in adopting that measure, Austria's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3282 *Second*, the European Communities contends that Austria has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Austria and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3283 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2097] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstance may justify a Member requiring a relatively long period of time to review its provisional measure.[2098] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2099] The European Communities differentiates the present case from

[2095] EC first written submission, para. 604.

[2096] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

[2097] We recall that the United States' argument that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2098] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2099] Appellate Body Report, *EC – Hormones*, para. 124.

Japan - Apples, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2100]

"Insufficiency of relevant scientific evidence"

7.3284 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2101] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Argentina argue in this regard that in the case of Austria's safeguard measure on MON810 maize, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the Austrian safeguard measure, since risk assessments were conducted by the EC scientific committees on the basis of the information provided by Austria in support of its measure.

7.3285 We recall that Austria adopted its safeguard measure on MON810 maize in June 1999. Following Austria's notification of the measure, the Commission requested the SCP to analyse the information provided by Austria in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health or the environment. The SCP in its opinion of September 1999 concluded that the information provided by Austria did not constitute new scientific information which would change the original risk assessment which it had carried out in the context of the EC approval procedure concerning MON810 maize.[2102] Thus, as we understand it, the SCP effectively reviewed its original risk assessment in the light of the information presented by Austria and confirmed its original risk assessment.

7.3286 We have found above that both the opinions by the EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of

[2100] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the *Japan – Apples* case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2101] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2102] Exhibits US-55 and ARG-44.

Annex A(4) and Article 5.1 of the *SPS Agreement*.[2103] We recall in this regard that the European Communities does not suggest otherwise.[2104] In the light of this, we agree with the United States and Argentina that the SCP's 1999 review assessment of MON810 maize, and the SCP's original assessment of MON810 maize (which, as noted, were confirmed by the review assessments), serve to demonstrate that at the time of adoption of the Austrian safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Argentina have established a presumption that Austria's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2105]

7.3287 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Austria's safeguard measure on MON810 maize was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3288 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the Austrian safeguard measure on MON810 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on MON810 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

[2103] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2104] It is pertinent to recall in this context that in defending the Austrian safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Austria acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessment. However, the fact that Austria may have disagreed with the SCP's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the SCP's original and review assessments of MON810 maize are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2105] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Austrian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that the Austrian safeguard measure on MON810 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Austrian safeguard measure on MON810 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(v) France – MS1/RF1 oilseed rape (EC-161)

7.3289 We now turn to France's safeguard measure applied with respect to MS1/RF1 oilseed rape (EC-161). We note the arguments of the Parties in respect of this measure.

7.3290 The **United States** argues that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on MS1/RF1 oilseed rape (EC-161). *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by France did not warrant any change in the earlier risk assessment. *Third*, France has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that France has sought to perform a risk assessment that would support its measure on MS1/RF1 oilseed rape (EC-161). *Finally*, the United States alleges that neither France nor the Commission have reviewed the French safeguard measure within a reasonable period of time.

7.3291 **Canada** argues that a review of the French safeguard measure and the factual and scientific circumstances surrounding its adoption and maintenance reveal that the measure fails to satisfy any of the four elements of Article 5.7. *First*, the measure was not imposed in respect of a situation where relevant scientific information was insufficient. The opinion of the European Communities' own scientific experts demonstrate that there was sufficient scientific evidence to conduct a complete and objective risk assessment. In Canada's view, what was insufficient was the scientific evidence put forward by the European Communities or France to support the safeguard measure. *Second*, the measure was not adopted on the basis of "available pertinent information", since this would include the scientific opinions of the lead CA and of the relevant EC scientific committee, which all confirmed the safety of the product.

7.3292 With respect to the *third* element of Article 5.7, the requirement that the Member seek to obtain the additional information necessary for a more objective assessment of risk, Canada notes that this element is irrelevant in this case, given the sufficiency of the scientific evidence available from the European Communities' own sources. *Finally*, with regard to the fourth requirement, namely that the measure must be reviewed within a reasonable period of time, Canada recalls that the European Communities' own legislation requires that such a review take place. However, given the absence of "pertinent information" to support the safeguard measure, Canada draws the conclusion that the measure would have been lifted if such a review had been conducted. Furthermore, according to the Appellate Body, what constitutes a "reasonable period of time" will be influenced by the emergence

of the additional information necessary to make a more objective assessment of the risk. In Canada's view, new or additional information was not necessary in the present case to conduct a risk assessment, as sufficient scientific evidence was in existence even at the time the safeguard measure was taken.

7.3293 The **European Communities** argues that the French safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2106]

7.3294 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2107] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3295 Applying these considerations to the French safeguard measure on MS1/RF1 oilseed rape (EC-161), the European Communities submits that, having regard to the specific concerns of France's legislators in adopting that measure, France's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3296 *Second*, the European Communities contends that France has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both France and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3297 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and

[2106] EC first written submission, para. 604.

[2107] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

member State levels.[2108] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2109] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2110] The European Communities differentiates the present case from *Japan-Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2111]

"Insufficiency of relevant scientific evidence"

7.3298 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2112] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Canada argue in this regard that in the case of France's safeguard measure on MS1/RF1 oilseed rape (EC-161), relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the French safeguard measure, since risk assessment were conducted by EC scientific committees on the basis of the information provided by France in support of its measure.

[2108] We recall that the United States' argument that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2109] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2110] Appellate Body Report, *EC – Hormones*, para. 124.

[2111] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2112] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

7.3299 We recall that France adopted its safeguard measure on MS1/RF1 oilseed rape (EC-161) in November 1998. Following France's notification of the measure, the Commission requested the SCP to analyse the information provided by France in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health and the environment. The SCP in its opinion of May 1999 concluded that the information provided by France did not change the environmental assessment provided by the SCP in 1998 in the context of the approval procedure concerning a similar hybrid oilseed rape, MS8/RF3 oilseed rape.[2113] Thus, as we understand it, the SCP effectively reviewed its earlier risk assessment for MS8/RF3 oilseed rape in the light of the information presented by France and confirmed that assessment.

7.3300 We have found above that both the opinions by the EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.[2114] We recall in this regard that the European Communities does not suggest otherwise.[2115] In the light of this, we agree with the United States and Canada that the SCP's 1999 review assessment of MS1/RF1 oilseed rape (EC-161), serves to demonstrate that at the time of adoption of the French safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Canada have established a presumption that France's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2116]

7.3301 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that France's safeguard measure on MS1/RF1 oilseed rape (EC-161) was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

[2113] We recall that the SCP was not consulted by the Commission before MS1/RF1 oilseed rape was approved, hence the SCP's reliance on the assessment concerning MS8/RF3 oilseed rape. Exhibits US-61 and CDA-69.

[2114] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2115] It is pertinent to recall in this context that in defending the French safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that France acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessment with regard to MS8/RF3 oilseed rape. However, the fact that France may have disagreed with the SCP's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the relevant SCP assessments of MS1/RF1 oilseed rape are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2116] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the French safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

Overall conclusions

7.3302 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on MS1/RF1 oilseed rape (EC-161) is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(vi) France – Topas oilseed rape

7.3303 We now turn to France's safeguard measure applied with respect to Topas oilseed rape. We recall the arguments of the Parties in respect of this measure.

7.3304 The **United States** argues that the French safeguard measure on Topas oilseed rape fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on Topas oilseed rape. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by France did not warrant any change in the earlier risk assessment. *Third*, France has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that France has sought to perform a risk assessment that would support its measure on Topas oilseed rape. *Finally*, the United States alleges that neither France nor the Commission have reviewed the French safeguard measure within a reasonable period of time.

7.3305 **Canada** argues that a review of the French safeguard measure and the factual and scientific circumstances surrounding its adoption and maintenance reveal that the measure fails to satisfy any of the four elements of Article 5.7. *First*, the measure was not imposed in respect of a situation where relevant scientific information was insufficient. The opinion of the European Communities' own

scientific experts demonstrate that there was sufficient scientific evidence to conduct a complete and objective risk assessment. In Canada's view, what was insufficient was the scientific evidence put forward by the European Communities or France to support the safeguard measure. *Second*, the measure was not adopted on the basis of "available pertinent information", since this would include the scientific opinions of the lead CA and of the relevant EC scientific committee, which all confirmed the safety of the product.

7.3306 With respect to the *third* element of Article 5.7, the requirement that the Member seek to obtain the additional information necessary for a more objective assessment of risk, Canada notes that this element is irrelevant in this case, given the sufficiency of the scientific evidence available from the European Communities' own sources. *Finally*, with regard to the fourth requirement, namely that the measure must be reviewed within a reasonable period of time, Canada recalls that the European Communities' own legislation requires that such a review take place. However, given the absence of "pertinent information" to support the safeguard measure, Canada draws the conclusion that the measure would have been lifted if such a review had been conducted. Furthermore, according to the Appellate Body, what constitutes a "reasonable period of time" will be influenced by the emergence of the additional information necessary to make a more objective assessment of the risk. In Canada's view, new or additional information was not necessary in the present case to conduct a risk assessment, as sufficient scientific evidence was in existence even at the time the safeguard measure was taken.

7.3307 The **European Communities** argues that the French safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2117]

7.3308 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2118] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

[2117] EC first written submission, para. 604.

[2118] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

7.3309 Applying these considerations to the French safeguard measure on Topas oilseed rape, the European Communities submits that, having regard to the specific concerns of France's legislators in adopting that measure, France's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3310 *Second*, the European Communities contends that France has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both France and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3311 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2119] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2120] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2121] The European Communities differentiates the present case from *Japan - Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2122]

[2119] We recall that the US arguments that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2120] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2121] Appellate Body Report, *EC – Hormones*, para. 124.

[2122] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

"Insufficiency of relevant scientific evidence"

7.3312 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2123] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Canada argue in this regard that in the case of France's safeguard measure on Topas oilseed rape, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the French safeguard measure, since a risk assessment was conducted by the SCP on the basis of the information provided by France in support of its measure.

7.3313 We recall that France adopted its safeguard measure on Topas oilseed rape in November 1998. Following France's notification of the measure, the Commission requested the SCP to analyse the information provided by France in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health or the environment. The SCP in its opinion of May 1999 concluded that the information provided by France did not constitute new scientific information which would change the original risk assessment carried out by the SCP in the context of the EC approval procedure concerning Topas oilseed rape.[2124] Thus, as we understand it, the SCP effectively reviewed its original risk assessment in the light of the information presented by France and confirmed its original risk assessment.

7.3314 We have found above that both the SCP opinions delivered in the context of relevant EC approval procedures – the original assessments – and the SCP opinions delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*. [2125] We recall in this regard that the European Communities does not suggest otherwise.[2126] In the light of this, we agree with the United States and Canada that the SCP's 1999 review assessment of Topas oilseed rape and the SCP's original assessment of Topas oilseed rape (which, as noted, was confirmed by the SCP's review

[2123] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2124] Exhibits US-62; CDA-65.

[2125] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2126] It is pertinent to recall in this context that in defending the French safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that France acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessment. However, the fact that France may have disagreed with the SCP's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the SCP's original and review assessments of Topas oilseed rape are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

assessment), serve to demonstrate that at the time of adoption of the French safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Canada have established a presumption that France's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2127]

7.3315 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that France's safeguard measure on Topas oilseed rape was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3316 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the French safeguard measure on Topas oilseed rape is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on Topas oilseed rape is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that the French safeguard measure on Topas oilseed rape is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the French safeguard measure on Topas oilseed rape is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(vii) Germany – Bt-176 maize

7.3317 We now turn to Germany's safeguard measure applied with respect to Bt-176 maize. We recall the arguments of the Parties in respect of this measure.

[2127] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the French safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

7.3318 The **United States** argues that the German safeguard measure on Bt-176 maize fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on Bt-176 maize. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by Germany did not warrant any change in the earlier risk assessment. *Third*, Germany has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Germany has sought to perform a risk assessment that would support its measure on Bt-176 maize. *Finally*, the United States alleges that neither Germany nor the Commission have reviewed the German safeguard measure within a reasonable period of time.

7.3319 **Argentina** argues that the German safeguard measure does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on Bt-176 maize, including one which specifically rejected the information provided by Germany in support of the measure. *Second*, Germany did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Germany has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Germany did not review its safeguard measure.

7.3320 The **European Communities** argues that the German safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2128]

7.3321 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2129] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

[2128] EC first written submission, para. 604.

[2129] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

7.3322 Applying these considerations to the German safeguard measure on Bt-176 maize, the European Communities submits that, having regard to the specific concerns of Germany's legislators in adopting that measure, Germany's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3323 *Second*, the European Communities contends that Germany has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Germany and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3324 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2130] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstance may justify a Member requiring a relatively long period of time to review its provisional measure.[2131] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2132] The European Communities differentiates the present case from *Japan-Apples*: arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2133]

[2130] We recall that the United States' arguments that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. *See* US second written submission, para. 100.

[2131] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2132] Appellate Body Report, *EC – Hormones*, para. 124.

[2133] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

"Insufficiency of relevant scientific evidence"

7.3325 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2134] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Argentina argue in this regard that in the case of Germany's safeguard measure on Bt-176 maize, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the German safeguard measure, since a risk assessment was conducted by the SCP on the basis of the information provided by Germany in support of its measure.

7.3326 We recall that Germany adopted its safeguard measure on Bt-176 maize in March 2000. Following Germany's notification of the measure, the Commission requested the SCP to analyse the information provided by Germany in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health or the environment. The SCP in its opinion of September 2000 concluded that the information provided by Germany did not constitute new scientific information which would change the original risk assessment which the SCPE had carried out in the context of the EC approval procedure concerning Bt-176 maize.[2135] Thus, as we understand it, the SCP effectively reviewed its original risk assessment in the light of the information presented by Germany and confirmed its original risk assessment.

7.3327 We have found above that both the opinions by the EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.[2136] We recall in this regard that the European Communities does not suggest otherwise.[2137] In the light of this, we agree with the United States and Argentina that the SCP's 2000 review assessment of Bt-176 maize, and the SCPE's original

[2134] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2135] Exhibits US-66; ARG-43.

[2136] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2137] It is pertinent to recall in this context that in defending the German safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Germany acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCPE's original risk assessment. However, the fact that Germany may have disagreed with the SCPE's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the SCP's original and review assessments of Bt-176 maize are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

assessment of Bt-176 maize (which, as noted, was confirmed by the SCP's review assessment), serve to demonstrate that at the time of adoption of the German safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Argentina have established a presumption that Germany's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2138]

7.3328 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Germany's safeguard measure on Bt-176 maize was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3329 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the German safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the German safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that the German safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the German safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(viii) Greece – Topas oilseed rape

7.3330 We now turn to Greece's safeguard measure applied with respect to Topas oilseed rape. We recall the arguments of the Parties in respect of this measure.

[2138] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the German safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure

7.3331 The **United States** argues that the Greek safeguard measure on Topas oilseed rape fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on Topas oilseed rape. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCP reviewed the safeguard measure and concluded that the information provided by Greece did not warrant any change in the earlier risk assessment. *Third*, Greece has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Greece has sought to perform a risk assessment that would support its measure on Topas oilseed rape. *Finally*, the United States alleges that neither Greece nor the Commission have reviewed the Greek safeguard measure within a reasonable period of time.

7.3332 **Canada** argues that a review of the Greek safeguard measure and the factual and scientific circumstances surrounding its adoption and maintenance reveal that the measure fails to satisfy any of the four elements of Article 5.7. *First*, the measure was not imposed in respect of a situation where relevant scientific information was insufficient. The opinion of the European Communities' own scientific experts demonstrate that there was sufficient scientific evidence to conduct a complete and objective risk assessment. In Canada's view, what was insufficient was the scientific evidence put forward by the European Communities or France to support the safeguard measure. *Second*, the measure was not adopted on the basis of "available pertinent information", since this would include the scientific opinions of the lead CA and of the relevant EC scientific committee, which all confirmed the safety of the product.

7.3333 With respect to the *third* element of Article 5.7, the requirement that the Member seek to obtain the additional information necessary for a more objective assessment of risk, Canada notes that this element is irrelevant in this case, given the sufficiency of the scientific evidence available from the European Communities' own sources. *Finally*, with regard to the fourth requirement, namely that the measure must be reviewed within a reasonable period of time, Canada recalls that the European Communities' own legislation requires that such a review take place. However, given the absence of "pertinent information" to support the safeguard measure, Canada draws the conclusion that the measure would have been lifted if such a review had been conducted. Furthermore, according to the Appellate Body, what constitutes a "reasonable period of time" will be influenced by the emergence of the additional information necessary to make a more objective assessment of the risk. In Canada's view, new or additional information was not necessary in the present case to conduct a risk assessment, as sufficient scientific evidence was in existence even at the time the safeguard measure was taken.

7.3334 The **European Communities** argues that the Greek safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.[2139]

[2139] EC first written submission, para. 604.

7.3335 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2140] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3336 Applying these considerations to the Greek safeguard measure on Topas oilseed rape, the European Communities submits that, having regard to the specific concerns of Greece's legislators in adopting that measure, Greece's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3337 *Second*, the European Communities contends that Greece has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Greece and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3338 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2141] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2142] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2143] The European Communities differentiates the present case from *Japan - Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere

[2140] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

[2141] We recall that the US arguments that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption. US second written submission, para. 100.

[2142] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2143] Appellate Body Report, *EC – Hormones*, para. 124.

theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2144]

"Insufficiency of relevant scientific evidence"

7.3339 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2145] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Canada argue in this regard that in the case of Greece's safeguard measure on Topas oilseed rape, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of the Greek safeguard measure, since a risk assessment was conducted by the SCP on the basis of the information provided by Greece in support of its measure.

7.3340 We recall that Greece adopted its safeguard measure on Topas oilseed rape in September 1998. Following Greece's notification of the measure, the Commission requested the SCP to analyse the information provided by Greece in support of its measure in order to determine whether this information would cause the SCP to consider that the product constituted a risk to human health or the environment. The SCP in its opinion of May 1999 concluded that the information provided by Greece did not constitute new scientific information which would change the original risk assessment carried out by the SCP in the context of the EC approval procedure concerning Topas oilseed rape.[2146] Thus, as we understand it, the SCP effectively reviewed its original risk assessment in the light of the information presented by Greece and confirmed its original risk assessment.

7.3341 We have found above that both the SCP opinions delivered in the context of relevant EC approval procedures – the original assessments – and the SCP opinions delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.[2147] We recall in this regard that the European Communities does not suggest otherwise.[2148] In the light of this, we agree with the

[2144] The European Communities notes in its first written submission (para. 608) that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2145] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2146] Exhibits US-70; CDA-73.

[2147] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2148] It is pertinent to recall in this context that in defending the Greek safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Greece acted on the basis of new scientific information which presented a view divergent from the mainstream scientific

United States and Canada that the SCP's 1999 review assessment of Topas oilseed rape, and the SCP's original assessment of Topas oilseed rape (which, as noted, was confirmed by the SCP's review assessment), serve to demonstrate that at the time of adoption of the Greek safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the United States and Canada have established a presumption that Greece's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2149]

7.3342 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Greece's safeguard measure on Topas oilseed rape was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3343 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the Greek safeguard measure on Topas oilseed rape is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Greek safeguard measure on Topas oilseed rape is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that the Greek safeguard

---

opinion reflected in the original risk assessment. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessment. However, the fact that Greece may have disagreed with the SCP's original assessment, and possibly also with the SCP's subsequent review assessment, would not imply that the SCP's review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the SCP's original and review assessments of Topas oilseed rape are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2149]In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Greek safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

measure on Topas oilseed rape is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Greek safeguard measure on Topas oilseed rape is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ix) Italy – T25 maize, MON810 maize, MON809 maize, Bt-11 maize (EC-163)

7.3344 We now turn to Italy's safeguard measure applied with respect to T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163). We recall the arguments of the Parties in respect of this measure.

7.3345 The **United States** argues that the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on the products concerned. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCF reviewed the safeguard measure and concluded that the information provided by Italy did not warrant any change in the earlier risk assessment. *Third*, Italy has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Italy has sought to perform a risk assessment that would support its measure on the products concerned. *Finally*, the United States alleges that neither Italy nor the Commission have reviewed the French safeguard measure within a reasonable period of time.

7.3346 **Canada** argues that a review of the Italian safeguard measure and the factual and scientific circumstances surrounding its adoption and maintenance reveal that the measure fails to satisfy any of the four elements of Article 5.7. *First*, the measure was not imposed in respect of a situation where relevant scientific information was insufficient. The opinion of the European Communities' own scientific experts demonstrate that there was sufficient scientific evidence to conduct a complete and objective risk assessment. In Canada's view, what was insufficient was the scientific evidence put forward by the European Communities or Italy to support the safeguard measure. *Second*, the measure was not adopted on the basis of "available pertinent information", since this would include the scientific opinions of the lead CA and of the relevant EC scientific committee, which all confirmed the safety of the product.

7.3347 With respect to the *third* element of Article 5.7, the requirement that the Member seek to obtain the additional information necessary for a more objective assessment of risk, Canada notes that this element is irrelevant in this case, given the sufficiency of the scientific evidence available from the European Communities' own sources. *Finally*, with regard to the fourth requirement, namely that the measure must be reviewed within a reasonable period of time, Canada recalls that the European Communities' own legislation requires that such a review take place. However, given the absence of "pertinent information" to support the safeguard measure, Canada draws the conclusion that the measure would have been lifted if such a review had been conducted. Furthermore, according to the Appellate Body, what constitutes a "reasonable period of time" will be influenced by the emergence of the additional information necessary to make a more objective assessment of the risk. In Canada's view, new or additional information was not necessary in the present case to conduct a risk assessment, as sufficient scientific evidence was in existence even at the time the safeguard measure was taken.

7.3348 **Argentina** argues that the Italian safeguard measure[2150] does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on the products concerned, including one which specifically rejected the information provided by Italy in support of the measure. *Second*, Italy did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Italy has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Italy did not review its safeguard measure.

7.3349 The **European Communities** argues that the Italian safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.

7.3350 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific evidence is insufficient, and that a measure is warranted.[2151] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3351 Applying these considerations to the Italian safeguard measure on the products concerned, the European Communities submits that, having regard to the specific concerns of Italy's legislators in adopting that measure, Italy's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3352 *Second*, the European Communities contends that Italy has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European

[2150] We recall that unlike the complaints by the other Complaining Parties, Argentina's complaint with regard to the Italian safeguard measure covers only three products subject to the Italian decree of August 2000, *i.e.*, T25 maize, MON810 maize and Bt-11 maize.

[2151] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

Communities argues that both Italy and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3353 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2152] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2153] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2154] The European Communities differentiates the present case from *Japan-Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2155]

"Insufficiency of relevant scientific evidence"

7.3354 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2156] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The Complaining Parties argue in this regard that in the case of Italy's safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163), relevant scientific evidence could not

[2152] We recall that the United States' argument that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption.

[2153] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2154] Appellate Body Report, *EC – Hormones*, para. 124.

[2155] The European Communities notes that "[t]he present case is, for example, very different from the circumstances of the Japan – Apples case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case. GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2156] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

have been insufficient to conduct a risk assessment at the time of adoption of the Italian safeguard measure, since a risk assessment was conducted by the SCF on the basis of the information provided by Italy in support of its measure.

7.3355 We recall that Italy adopted its safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) in August 2000. Following Italy's notification of the measure, the Commission requested the SCF to analyse the information provided by Italy in support of its measure in order to determine whether this information would cause the SCF to consider that the products in question constituted a risk to human health. The SCF in its opinion of September 2000 concluded that the information provided by Italy did not provide grounds for considering that the use of the products in question endangers human health. Thus, as we understand it, the SCF effectively confirmed the original risk assessments carried out by the SCP in the context of the EC approval procedures concerning the products concerned.

7.3356 We have found above that both the opinions by the EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*. [2157] We recall in this regard that the European Communities does not suggest otherwise.[2158] In the light of this, we agree with the Complaining Parties that the SCF's 2000 review assessment of the products concerned[2159], and the SCF's original assessment of the products concerned (which, as noted, was confirmed by the SCF's review assessment), serve to demonstrate that at the time of adoption of the Italian safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that the Complaining Parties have established a presumption that Italy's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2160]

7.3357 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been

[2157] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2158] It is pertinent to recall in this context that in defending the Italian safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Italy acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessments. It may be that in making this argument the European Communities meant to refer to the SCP's original risk assessments. However, the fact that Italy may have disagreed with the SCP's original risk assessments, and possibly also with the SCF's subsequent review assessment, would not imply that these review and original assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the original and review assessments of the products concerned are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2159] Exhibits US-68; CDA-86 and ARG-47.

[2160] In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, the Italian safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure.

established that Italy's safeguard measure on the products concerned was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3358 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel finds that the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that the Italian safeguard measure on T25 maize, MON810 maize and Bt-11 maize (EC-163) is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, the Italian safeguard measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize (EC-163) is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(x) Luxembourg – Bt-176 maize

7.3359 We now turn to Luxembourg's safeguard measure applied with respect to Bt-176 maize. We recall the arguments of the Parties in respect of this measure.

7.3360 The **United States** argues that Luxembourg's safeguard measure on Bt-176 maize fails to meet any of the four requirements set out in Article 5.7. *First*, the scientific evidence is sufficient to perform a risk assessment, since the European Communities itself has conducted positive risk assessments on Bt-176 maize. *Second*, the safeguard measure was not adopted on the basis of "available pertinent information". The SCF and the Scientific Committee for Pesticides reviewed the safeguard measure and concluded that the information provided by Luxembourg did not warrant any change in the earlier risk assessment. *Third*, Luxembourg has not sought "to obtain the additional information necessary for a more objective assessment of risk", and there is no information on record that Luxembourg has sought to perform a risk assessment that would support its measure on Bt-176 maize. *Finally*, the United States alleges that neither Luxembourg nor the Commission have reviewed Luxembourg's safeguard measure within a reasonable period of time.

7.3361 **Argentina** argues that Luxembourg's safeguard measure does not meet any of the four requirements of Article 5.7. *First*, the scientific evidence was not insufficient, since at least two positive scientific opinions were expressed on Bt-176 maize, including one which specifically rejected the information provided by Luxembourg in support of the measure. *Second*, Luxembourg did not base its measure on the "available pertinent information", since it disregarded the positive scientific opinions of the scientific committee. *Third*, Luxembourg has not sought to obtain further information necessary for a more objective risk assessment, because the information provided in this case is not consistent with the positive scientific opinions given by the scientific committee. *Finally*, with respect to the fourth requirement of Article 5.7, Argentina notes that Luxembourg did not review its safeguard measure.

7.3362 The **European Communities** argues that Luxembourg's safeguard measure meets the four requirements of Article 5.7. *First*, the European Communities asserts that relevant scientific evidence was insufficient. According to the European Communities, the concept of "insufficiency" in Article 5.7 is "relational" and must therefore refer to the matters of concern to the legislator. Specifically, "insufficient" means "insufficient" for the production of a risk assessment adequate for the purposes of the legislator who must decide whether a measure should be applied, provisionally or otherwise, for one of the reasons enumerated in Annex A(1) of the *SPS Agreement*. The European Communities defines a risk assessment which is adequate as one which has been "delivered by a reputable source, [which] unequivocally informs the legislator about what the risk is with a sufficient degree of precision, and [which] has withstood the passage of time and is unlikely to be revised.

7.3363 In support of its view, the European Communities submits that the sufficiency of the evidence cannot be examined in a vacuum, but has to be examined in relation to the protection goals sought by legislators. The European Communities argues that it is artificial to suppose that there is some kind of magic moment at which the available science becomes sufficient for all purposes. In the European Communities' view, the actions of a legislator in response to available scientific evidence are a function of what that particular legislator is concerned about. Thus, in the European Communities' view, the higher the level of acceptable risk, the more likely it is that the legislator may conclude, within a relatively short period of time, that the scientific evidence is sufficient and that no provisional measure is therefore necessary. The lower the level of acceptable risk, the more likely it may be that the legislator may continue to consider, for a relatively long period of time, that the scientific

evidence is insufficient, and that a measure is warranted.[2161] In other words, according to the European Communities, the sufficiency of the scientific evidence must be examined in relation to the level of acceptable risk of the legislators.

7.3364 Applying these considerations to the Luxembourg safeguard measure on Bt-176 maize, the European Communities submits that, having regard to the specific concerns of Luxembourg's legislators in adopting that measure, Luxembourg's legislators were entitled to conclude that relevant scientific evidence was insufficient for their purposes.

7.3365 Furthermore, the European Communities contends that Luxembourg has adopted and maintained its safeguard measure on the basis of "available pertinent information", which includes, *inter alia*, the information contained in the original notification, as well as the various relevant scientific discussions, papers and opinions. With respect to the *third* requirement of Article 5.7, the European Communities argues that both Luxembourg and the European Communities are engaged in an ongoing process by which they are seeking to obtain additional information necessary for a more objective assessment of the risk through ongoing research and the constant development of science.

7.3366 Finally, the European Communities notes that the measure is subject to a process of review within a reasonable period of time, and that such review is still ongoing both at Community and member State levels.[2162] According to the European Communities, the determination of what constitutes a "reasonable period of time" pursuant to Article 5.7 depends on all the circumstances. In the present case, for instance, assessments are being made of long-term effects, in relation to changes that may have a permanent effect, and that are being introduced at an exponential rate as compared to the past. These circumstances may justify a Member requiring a relatively long period of time to review its provisional measure.[2163] The European Communities finds support for this view in the Appellate Body's statement that "responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned".[2164] The European Communities differentiates the present case from *Japan-Apples*, arguing that GMO technology is still at the frontiers of science and its future consequences (compared to a case like fire blight) are highly uncertain – and potentially more far-reaching. The European Communities argues that the relevant risks are more than the mere theoretical uncertainty that always remains simply because science can never provide absolute certainty that a given substance will never have adverse effects.[2165]

[2161] The European Communities considers that this analysis is confirmed by the words "reasonable period of time" in Article 5.7.

[2162] We recall that the US arguments that a requirement that measures be "constantly subject to review" does not meet the requirement that the measures are in fact reviewed within a reasonable period of time of their adoption.

[2163] The European Communities submits that the present case is very different, for example, from that before the panel in *Japan – Apples*.

[2164] Appellate Body Report, *EC – Hormones*, para. 124.

[2165] The European Communities notes that "[t]he present case is, for example, very different from the circumstances of the *Japan – Apples* case. That case concerned a disease (fire blight) with a relatively narrow spectrum of possible consequences (compared to GMOs generally). The panel found that the disease had been known and studied for some 200 years – the GMO techniques with which this case is concerned are far more recent than that. The panel also found that there was a high quantity and quality of scientific evidence expressing strong and increasing confidence in the conclusion. In other words, the matter could fairly be described as no longer being at the frontiers of science, but rather to have passed into the realms of conventional scientific wisdom – an operational hypothesis unlikely to be disturbed other than by some revolutionary and currently totally unforeseeable new scientific discovery. That is not at all the circumstances of the present case.

"Insufficiency of relevant scientific evidence"

7.3367 The **Panel** will begin its analysis with the first requirement of Article 5.7.[2166] In other words, we will consider whether the safeguard measure in question was imposed in respect of a situation where "relevant scientific evidence [was] insufficient". Initially, we recall that we do not agree with the European Communities that in the context of Article 5.7, the insufficiency of relevant scientific evidence must be assessed by reference to the appropriate level of protection of the importing Member. We also recall our view that the sufficiency of relevant scientific evidence should be assessed at the time a provisional measure was adopted, not at the time of review by this Panel. The United States and Argentina argue in this regard that in the case of Luxembourg's safeguard measure on Bt-176 maize, relevant scientific evidence could not have been insufficient to conduct a risk assessment at the time of adoption of Luxembourg's safeguard measure, since risk assessments were apparently conducted by EC scientific committees on the basis of the information provided by Luxembourg in support of its measure.[2167]

7.3368 We recall that Luxembourg adopted its safeguard measure on Bt-176 maize in February 1997. Following Luxembourg's notification of the measure, the Commission apparently did not request the Scientific Committee for Pesticides (SCPE), the Scientific Committee for Animal Nutrition (SCAN) and the SCF to analyse the information provided by Luxembourg in support of its measure in order to determine whether this information would cause these Committees to consider that the product constituted a risk to human health or the environment. However, in response to a question from the Panel, the European Communities indicated that the Commission relied on the opinions provided by these committees in relation to Austria's safeguard measure on Bt-176 maize.[2168] To recall, the SCF in its opinion of March 1997, the SCAN in its opinion of April 1997 and the SCPE in its opinion of May 1997 concluded that the information provided by Austria did not constitute new scientific information which would change the original risk assessments which they had carried out in the context of the EC approval procedure concerning Bt-176 maize.[2169]

7.3369 We have found above that both the opinions by EC scientific committees which were delivered in the context of relevant EC approval procedures – the original assessments – and the opinions by EC scientific committees which were delivered after the adoption of the relevant member State safeguard measures – the review assessments – are risk assessments within the meaning of Annex A(4) and Article 5.1 of the *SPS Agreement*.[2170] We recall in this regard that the European Communities does not suggest otherwise. [2171] In the light of this, we consider that the 1997 SCF,

---

GMO technology is still at or close to the frontiers of science and its future consequences (compared to a case like fire blight) highly uncertain – and potentially much more far reaching."

[2166] We note that the panel in *Japan – Apples* also began its inquiry with the first requirement, an approach not faulted by the Appellate Body. Panel Report, *Japan – Apples*, para. 8.214.

[2167] The United States and Argentina have provided a document indicating that EC scientific committees were consulted on Luxembourg's safeguard measure. Exhibits US-107; ARG-6. The United States has indicated, however, that it was unable to locate any opinion by an EC scientific committee on Luxembourg's safeguard measure.

[2168] EC reply to Panel question No. 106.

[2169] Exhibits US-57, -58 and -66; ARG-43.

[2170] We recall that the review assessments are generally in the nature of supplemental assessments and thus need to be read in conjunction with the original assessments.

[2171] It is pertinent to recall in this context that in defending the Austrian safeguard measure against the Complaining Parties' claims under Article 5.1, the European Communities essentially argued that Austria acted on the basis of new scientific information which presented a view divergent from the mainstream scientific opinion reflected in the original risk assessments. It may be that in making this argument the European Communities meant to refer to the original risk assessments by the SCF, the SCAN and the SCPE. However,

SCAN and SCPE review assessments of Bt-176 maize, and the SCF, SCAN and SCPE original assessments of Bt-176 maize (which, as noted, were confirmed by the review assessments), serve to demonstrate that at the time of adoption of Luxembourg's safeguard measure, the body of available scientific evidence permitted the performance of a risk assessment as required under Article 5.1 and as defined in Annex A(4). We consider, therefore, that these review assessments establish a presumption that Luxembourg's safeguard measure was imposed in respect of a situation where relevant scientific evidence was not insufficient. This presumption has not been effectively rebutted by the European Communities.[2172]

7.3370 As we pointed out above, the Appellate Body found that whenever one of the requirements of Article 5.7 is not met, the measure at issue is inconsistent with this provision. Thus, as it has been established that Luxembourg's safeguard measure on Bt-176 maize was not adopted consistently with the first requirement of Article 5.7, we conclude that that measure is inconsistent with Article 5.7.

Overall conclusions

7.3371 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel finds that Luxembourg's safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, Luxembourg's safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel finds that Luxembourg's safeguard measure on Bt-176 maize is not consistent with Article 5.7 of the *SPS Agreement*.

---

the fact that Austria may have disagreed with these' original assessments, and possibly also with the subsequent review assessment by the SCP, would not imply that these committees' assessments are not risk assessments as required under Article 5.1 and as defined in Annex A(4). The Appellate Body has made it clear that a risk assessment as required under Article 5.1 "could set out both the prevailing view representing the 'mainstream' of scientific opinion, as well as the opinions of scientists taking a divergent view". Appellate Body Report, *EC – Hormones*, para. 184. Thus, the mere fact that the scientists taking a divergent view do not agree with the majority view does not necessarily mean that the majority view is based on a risk assessment which does not meet the standard and definition set out in Annex A(4). In any event, as noted, the European Communities does not argue that the original and review assessments of Bt-176 maize are not risk assessments as required under Article 5.1 and as defined in Annex A(4).

[2172]In view of this finding, it is not necessary to revisit the issue of whether, given its multiple purposes, Luxembourg's safeguard measure should be treated as constituting one or more SPS measures. Thus, like the Parties, we will continue to treat this measure as constituting one single SPS measure

> In view of this finding, as well as the Panel's previous finding that, contrary to the provisions of Article 5.1 of the *SPS Agreement*, Luxembourg's safeguard measure on Bt-176 maize is not based on a risk assessment, the Panel reaches the final conclusion that, by maintaining the measure in question, the European Communities has acted inconsistently with its obligations under Article 5.1.

(e) Consistency with Article 5.6 of the *SPS Agreement*

7.3372 The Panel now turns to address Canada's and Argentina's claims of inconsistency under Article 5.6 of the *SPS Agreement*.

7.3373 We recall that Article 5.6 provides:

> "Without prejudice to paragraph 2 of Article 3, when establishing or maintaining sanitary or phytosanitary measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or phytosanitary protection, taking into account technical and economic feasibility."

7.3374 **Canada** argues the EC member State safeguard measures are inconsistent with Article 5.6 because they are more trade-restrictive than required to achieve the EC's appropriate level of protection. The fact that Article 2.2 includes the phrase that measures should be "applied only to the extent necessary to protect human, animal or plant life or health" highlights the relationship between Article 2.2 and Article 5.6. Given this relationship, and the fact that Article 5.6 is a more specific expression of the general obligation found in the clause in Article 2.2, a measure that is found to be in violation of Article 5.6 must also be presumed to violate Article 2.2. Therefore, these measures must also be presumed to violate Article 2.2.

7.3375 **Argentina** argues that (a) the EC member States had alternative sanitary or phytosanitary measures available, other than bans; (b) it was possible to achieve an appropriate level of protection using these alternative measures; and (c) these alternative measures would have been significantly less restrictive than a ban on biotech agricultural products already approved by the European Communities. Therefore, Argentina contends that the bans at the level of some member States violate Article 5.6 of the *SPS Agreement*. Argentina also argues, however, that in the interests of procedural economy a finding by the Panel that the relevant member State safeguard measures are inconsistent with Articles 5.1 and 2.2 will obviate the need for a further finding by the Panel that the safeguard measures are inconsistent with Article 5.6.

7.3376 The **European Communities** argues that Article 5.6 is not relevant to the specific rule provided for in Article 5.7. The appropriate level of protection referred to in Article 5.6 refers to that established pursuant to Article 5.1. Even if Article 5.6 were relevant to the application of Article 5.7, the necessity of the measure would have to be judged by reference to the insufficiency of scientific evidence, and the reasonable period of time necessary. Furthermore, because the appropriate level of protection of the Community and the member States differs, even if they agreed on the science underlying the measure, they might still disagree on the measures to be taken.

(i) Evaluation

7.3377 The **Panel** recalls that it has already reached the conclusion that the safeguard measures being challenged by Canada and Argentina, respectively, are inconsistent with Article 5.1 in that they are not based on a risk assessment. In view of our findings on Canada's and Argentina's claims under

Article 5.1, we cannot presume that the import prohibitions made effective through the relevant safeguard measures could eventually, that is after appropriate implementing action, be maintained as they are. In these circumstances, we see no need to examine, and offer additional findings on, whether the existing safeguard measures are also inconsistent with Article 5.6. Accordingly, we exercise judicial economy with regard to Canada's and Argentina's claims under Article 5.6.

(ii) Overall conclusions

7.3378 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with Article 5.6 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 5.6.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with Article 5.6 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 5.6.

(f) Consistency with Article 5.5 of the *SPS Agreement*

7.3379 The Panel next proceeds to address Canada's and Argentina's claims of inconsistency under Article 5.5 of the *SPS Agreement*.

7.3380 We recall that Article 5.5 provides in relevant part:

> "With the objective of achieving consistency in the application of the concept of appropriate level of sanitary or phytosanitary protection against risks to human life or health, or to animal and plant life or health, each Member shall avoid arbitrary or unjustifiable distinctions in the levels it considers to be appropriate in different situations, if such distinctions result in discrimination or a disguised restriction on international trade."

7.3381 **Canada** notes that its claim under Article 5.5 is presented in the alternative, that is in the event that the relevant member States' appropriate level of protection is that reflected in these member States' safeguard measures. Canada argues that the product-specific marketing bans meet all three elements that are required to establish a violation of Article 5.5. *First*, the European Communities has adopted different appropriate levels of sanitary and phytosanitary protection in "different situations" that are comparable.[2173] Canada notes that the European Communities has adopted different appropriate levels of sanitary and phytosantiary protection in at least three different situations: (i) EC-approved biotech products that are subject to the EC member State national measures; (ii) other EC-approved biotech products; and (iii) non-biotech varieties of the products in item. *Second*, those

[2173] Article 5.5 of the *SPS Agreement*. *See also*, Appellate Body Report, *EC – Hormones*, para. 214.

different appropriate levels of protection are "arbitrary or unjustifiable."[2174] *Third*, the measures embodying those differences, the product-specific marketing bans, result in "discrimination or a disguised restriction on international trade.

7.3382 **Argentina** argues that the bans on the safeguard measures by EC member States are inconsistent with Article 5.5 of the *SPS Agreement* since the three "elements" in Article 5.5 have been shown to have been violated cumulatively. Furthermore, the effect of the bans imposed by some member States on the biotechnology-producing countries is significant and adverse, inasmuch as it falls unfairly on imports. Argentina also argues, however, that in the interests of procedural economy a finding by the Panel that the relevant member State safeguard measures are inconsistent with Articles 5.1 and 2.2 will obviate the need for a further finding by the Panel that the safeguard measures are inconsistent with Article 5.5.

7.3383 The **European Communities** argues that Article 5.7 contains an express rule that effectively excludes Article 5.5. The European Communities considers that the member State measures to which Canada refers must be assessed by reference to Article 5.7 rather than Article 5.5. There is no basis for concluding that the member States have acted inconsistently with Article 5.5. Furthermore, the European Communities observes that consistency with Article 5.5 of the *SPS Agreement* should be evaluated in the context of the conduct of the European Communities. The European Communities has not behaved in an arbitrary manner or made unjustifiable distinctions such as those referred to in Article 5.5.

(i) Evaluation

7.3384 The **Panel** recalls that it has already reached the conclusion that the safeguard measures being challenged by Canada and Argentina, respectively, are inconsistent with Article 5.1 in that they are not based on a risk assessment. In view of our findings on Canada's and Argentina's claims under Article 5.1, we cannot presume that the import prohibitions made effective through the relevant safeguard measures could eventually, that is after appropriate implementing action, be maintained as they are. In these circumstances, we see no need to examine, and offer additional findings on, whether the European Communities acted inconsistently with its obligations under Article 5.5 in respect of the existing safeguard measures which embody particular levels of protection. Accordingly, we exercise judicial economy with regard to Canada's and Argentina's claims under Article 5.5.

(ii) Overall conclusions

7.3385 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with Article 5.5 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 5.5.

[2174] *Ibid.*

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with Article 5.5 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 5.5.

(g) Consistency with Article 2.2 of the *SPS Agreement*

7.3386 The Panel now addresses the Complaining Parties' claims of inconsistency under Article 2.2 of the *SPS Agreement*.

7.3387 We recall that Article 2.2 provides:

> "Members shall ensure that any sanitary or phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5."

7.3388 The **United States** argues that a violation of Article 5.1 can be presumed to imply a violation of the more general provision of Article 2.2. The only risk assessments put forth for the banned products are the positive scientific assessments rendered by member States to which the products were submitted, and then by the European Communities' own scientific committees. In the case of each member State ban, these favourable assessments were reaffirmed when the scientific committees considered and rejected the information provided by the member States. Thus, the member State measures do not bear a "rational relationship" to the European Communities' positive risks assessment, and are not "based on" a risk assessment, in violation of Article 5.1 and thus Article 2.2.

7.3389 **Canada** argues that a violation of Article 5.1 can be presumed to imply a violation of the more general provision of Article 2.2.[2175] Canada has already argued that the product-specific marketing bans are not "based on" risk assessments and are therefore inconsistent with Article 5.1. It can therefore be presumed that the product-specific marketing bans also violate the requirements of Article 2.2 that SPS measures be based on "scientific principles" and "not maintained without sufficient scientific evidence". Canada argues that since the product-specific marketing bans are inconsistent with Article 5.6 because they are more trade-restrictive than required to achieve the European Communities' appropriate level of protection, these measures must also be presumed to violate Article 2.2.

7.3390 **Argentina** argues that the inconsistency of the member State bans with Article 2 arises due to an inconsistency between these bans and Article 5. In addition, the lack of rational relationship between the member State safeguard measures and the scientific evidence renders these measures inconsistent with Article 2.2.[2176] The member State bans are not supported by scientific evidence. Furthermore, Article 2.2 requires that a measure be applied "only to the extent necessary," while also requires that it be based on "sufficient scientific evidence," whether it is to be implemented or to be maintained. Consequently, the member State bans also conflict with Article 2.2, and cannot be justified under the exception of Article 5.7.

[2175] Canada refers to, *e.g.*, Appellate Body Report, *Australia – Salmon*, paras. 137-138.
[2176] Argentina refers to Appellate Body Report, *Japan – Agricultural Products*, para. 73.

7.3391 The **European Communities** argues that Article 2.2 excludes from its scope of application the kinds of situations covered by Article 5.7.[2177] Article 5.7, rather than Article 2.2, is the provision to which Canada should have referred in order to properly understand the justification for the member State measures. "Necessity" can only be judged within a relevant time frame, taking into account any insufficiency in scientific evidence. Scientific principles include the principle that conclusions should be based on repeatable experiment, observation and the collection of data over time. Measures adopted on the basis of Article 5.7 are based on scientific principles, because they are based on the need to allow sufficient time for sufficient scientific evidence to be collected. There is therefore no basis for the Panel to conclude that the member State measures are inconsistent with Article 2.2 of the *SPS Agreement*.

7.3392 The **Panel** begins its examination by recalling that Article 2.2 contains three distinct requirements: (i) the requirement that SPS measures be applied only to the extent necessary to protect human, animal or plant life or health, (ii) the requirement that SPS measures be based on scientific principles, and (iii) the requirement that SPS measures not be maintained without sufficient scientific evidence. It is appropriate to analyse separately the first requirement, on the one hand, and the second and third requirements, on the other hand.

(i) First requirement of Article 2.2

7.3393 Canada and Argentina allege that the safeguard measures they are challenging are inconsistent with the first requirement of Article 2.2.

7.3394 We recall that we have already reached the conclusion that the safeguard measures being challenged by Canada and Argentina, respectively, are inconsistent with Article 5.1 in that they are not based on a risk assessment. In view of our findings on Canada's and Argentina's claims under Article 5.1, we cannot presume that the import prohibitions made effective through the relevant safeguard measures could eventually, that is after appropriate implementing action, be maintained as they are. In these circumstances, we see no need to examine, and offer additional findings on, whether the existing safeguard measures are also inconsistent with the first requirement in Article 2.2. Accordingly, we exercise judicial economy with regard to Canada's and Argentina's claims under the first requirement in Article 2.2.

(ii) Second and third requirements of Article 2.2

7.3395 All three Complaining Parties allege that the safeguard measures they are challenging are inconsistent with the second and third requirements of Article 2.2.

7.3396 Here as well, we begin by recalling that we have already reached the conclusion that the safeguard measures challenged by the Complaining Parties are inconsistent with Article 5.1 in that they are not based on a risk assessment. In *Australia – Salmon*, the Appellate Body agreed with the panel in that case that in the event an SPS measure is not based on a risk assessment as required in Article 5.1, this measure can be presumed, more generally, not to be based on scientific principles or not to be maintained without sufficient scientific evidence within the meaning of Article 2.2. The Appellate Body concluded on that basis that "by maintaining an import prohibition on fresh, chilled or frozen ocean-caught Pacific salmon, in violation of Article 5.1, Australia has, by implication, also

[2177] The European Communities refers to Appellate Body Report, *EC – Hormones*, para. 104, in respect of Articles 3.1 and 3.3 of the *SPS Agreement.* The European Communities notes that Article 3.1 contains language essentially identical to that in Article 2.2.

acted inconsistently with Article 2.2 of the *SPS Agreement*".[2178] We consider that the same logic and presumption are applicable in the present case. Accordingly, we find that by maintaining the challenged safeguard measures inconsistently with Article 5.1, the European Communities has, by implication, also acted inconsistently with the second and third requirements in Article 2.2.

(iii) Article 5.7

7.3397 We have determined above that the relevant safeguard measures are inconsistent, by implication, with the second and third requirements in Article 2.2. Before coming to a final conclusion, however, we address whether the safeguard measures are consistent with the requirements of Article 5.7 of the *SPS Agreement*.

7.3398 We have found earlier that the safeguard measures at issue are not consistent with Article 5.7. This finding applies also to our analysis under Article 2.2, and so we confirm it here. Accordingly, there can be no doubt that the second and third requirements in Article 2.2 are applicable to the safeguard measures.[2179] This in turn confirms that these measures are contrary to Article 2.2, inasmuch as they are inconsistent, by implication, with the second and third requirements in Article 2.2.

(iv) Overall conclusions

7.3399 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that by applying, inconsistently with Article 5.1 of the *SPS Agreement*, the safeguard measures which the United States is challenging, the European Communities has, by implication, also acted inconsistently with the second and third requirements in Article 2.2 of the *SPS Agreement*.

(ii) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes as follows:

(a) It is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with the first requirement of Article 2.2 of the *SPS Agreement*. Accordingly, the Panel offers no findings with regard to the first requirement in Article 2.2 of the *SPS Agreement*.

(b) By applying, inconsistently with Article 5.1 of the *SPS Agreement*, the safeguard measures which Canada is challenging, the European Communities

[2178] Appellate Body Report, *Australia – Salmon*, paras. 137-138.

[2179] We recall that, earlier, we have left open whether Article 5.7 acts as a qualified exemption from the second requirement in Article 2.2. In view of our finding that none of the safeguard measures are consistent with Article 5.7, the issue is without practical significance for our analysis under Article 2.2, and so we do not address it further.

has, by implication, also acted inconsistently with the second and third requirements in Article 2.2 of the *SPS Agreement*.

(iii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes as follows:

(a) It is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with the first requirement of Article 2.2 of the *SPS Agreement*. Accordingly, the Panel offers no findings with regard to the first requirement in Article 2.2 of the *SPS Agreement*.

(b) By applying, inconsistently with Article 5.1 of the *SPS Agreement*, the safeguard measures which Argentina is challenging, the European Communities has, by implication, also acted inconsistently with the second and third requirements in Article 2.2 of the *SPS Agreement*.

(h) Consistency with Article 2.3 of the *SPS Agreement*

7.3400 The Panel finally addresses Canada's and Argentina's claims of inconsistency under Article 2.3 of the *SPS Agreement*.

7.3401 We recall that Article 2.3 provides:

> "Members shall ensure that their sanitary and phytosanitary measures do not arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, including between their own territory and that of other Members. Sanitary and phytosanitary measures shall not be applied in a manner which would constitute a disguised restriction on international trade."

7.3402 **Canada** notes that in *Australia-Salmon*, the Panel stated that a violation of Article 5.5 "can be presumed to imply a violation of the more general Article 2.3".[2180] In the case at hand, Canada has demonstrated that the EC member State national measures are inconsistent with the European Communities obligations under Article 5.5. By implication, therefore, these measures also violate Article 2.3.

7.3403 **Argentina** argues that as the member State bans have been shown to be inconsistent with Article 5.5, they also violate Article 2.3. Argentina also argues, however, that in the interests of procedural economy a finding by the Panel that the relevant member State safeguard measures are inconsistent with Articles 5.1 and 2.2 will obviate the need for a further finding by the Panel that the safeguard measures are inconsistent with Article 2.3.

7.3404 The **European Communities** argues that since the member State measures are not inconsistent with Article 5.5, they are not inconsistent with Article 2.3.

[2180] Canada refers to Panel Report, *Australia – Salmon*, para. 8.109. According to Canada, the Appellate Body upheld this statement. *See* Appellate Body Report, *Australia – Salmon*, para. 178.

(i) Evaluation

7.3405 The **Panel** recalls that it has already reached the conclusion that the safeguard measures being challenged by Canada and Argentina, respectively, are inconsistent with Article 5.1 in that they are not based on a risk assessment. In view of our findings on Canada's and Argentina's claims under Article 5.1, we cannot presume that the import prohibitions made effective through the relevant safeguard measures could eventually, that is after appropriate implementing action, be maintained as they are. In these circumstances, we see no need to examine, and offer additional findings on, whether the existing safeguard measures are also inconsistent with Article 2.3. Accordingly, we exercise judicial economy with regard to Canada's and Argentina's claims under Article 2.3.

(ii) Overall conclusions

7.3406 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with Article 2.3 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 2.3.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with Article 2.3 of the *SPS Agreement*. Accordingly, the Panel offers no findings under Article 2.3.

3. Analysis of the safeguard measures in the light of the *TBT Agreement*

7.3407 The Panel now turns to address Canada's and Argentina's claims of inconsistency under the *TBT Agreement*. The United States did not present claims under the *TBT Agreement*.

7.3408 **Canada** considers that the safeguard measures it is challenging are SPS measures and that, as such, they are not subject to the requirements of the *TBT Agreement*. Canada argues, however, that if the Panel decides that the safeguard measures at issue are not SPS measures, then Canada submits, in the alternative, that these measures are "technical regulations", as that term is defined in the *TBT Agreement*, and therefore subject to the requirements of that Agreement. Furthermore, in Canada's view, these measures are inconsistent with Article 2.1, Article 2.2, and Articles 2.9.1, 2.9.2 and 2.9.3 of the *TBT Agreement.*

7.3409 Furthermore, Canada states that to the extent that the Panel determines that parts of the measure at issue are covered by the *TBT Agreement* in addition to the *SPS Agreement*, Canada's TBT claims are to be considered cumulative rather than alternative, *vis-à-vis* its SPS claims.

7.3410 **Argentina** considers that the Panel should examine the measures Argentina is challenging under the *SPS Agreement*. However, if the Panel concludes that it should not examine these measures under the *SPS Agreement*, Argentina submits, in the alternative, that the safeguard measures at issue

are "technical regulations", as that term is defined in the *TBT Agreement*, and therefore subject to the requirements of that Agreement. Furthermore, in Argentina's view, by instituting bans on specific biotech products, these measures have violated Articles 2.1, 2.2, 2.9.1, 2.9.2 and 2.9.4 of the *TBT Agreement*.

7.3411 The **European Communities** considers that, given the reasons on which the relevant safeguard measures are based, they fall in part within the scope of the *SPS Agreement* and in part outside the scope of the *SPS Agreement*. The European Communities does not agree, however, that the relevant safeguard measures are subject to the provisions of the *TBT Agreement*. In the European Communities' view, these measures are not "technical regulations" within the meaning of the *TBT Agreement*. For this and other reasons, the European Communities considers that these measures cannot be inconsistent with Article 2 of that Agreement.

(a) Evaluation

7.3412 The Panel begins its examination with Canada's claims. Canada has stated that if the Panel determines that parts of the relevant safeguard measures are covered by the *TBT Agreement* in addition to the *SPS Agreement*, Canada's claims under the *TBT Agreement* are to be considered cumulative rather than alternative. We have found, however, that each of the safeguard measures challenged by Canada constitutes in its entirety an "SPS measure" within the meaning of Annex A(1) of the *SPS Agreement* and hence falls to be assessed under that Agreement. In view of this finding and Article 1.5 of the *TBT Agreement*[2181], we do not consider that parts of the relevant safeguard measures are covered by the *TBT Agreement.* Consequently, we should treat Canada's claims under Articles 2.1, 2.2 and 2.9 of the *TBT Agreement* as alternative claims. Since Canada's alternative claims are relevant only in the event that we decide that the relevant safeguard measures are not subject to the *SPS Agreement*, and since this is not what we have decided, we see no need to address Canada's alternative claims under Articles 2.1, 2.2 and 2.9 of the *TBT Agreement* further.

7.3413 Argentina's claims under the *TBT Agreement* are presented in the alternative, in the event the Panel finds that the relevant safeguard measures should not be examined under the *SPS Agreement*. We have found, however, that each of the safeguard measures challenged by Argentina should be assessed in the light of the *SPS Agreement*. In these circumstances, we see no need to address Argentina's alternative claims under Articles 2.1, 2.2 and 2.9 of the *TBT Agreement* further.

(b) Overall conclusions

7.3414 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with Articles 2.1, 2.2 or 2.9 of the *TBT Agreement*. Accordingly, the Panel offers no findings under Article 2.1, 2.2 or 2.9 of the *TBT Agreement*.

[2181] We recall that Article 1.5 states that the provisions of the *TBT Agreement* do not apply to SPS measures within the meaning of Annex A(1) of the *SPS Agreement*.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with Articles 2.1, 2.2 or 2.9 of the *TBT Agreement*. Accordingly, the Panel offers no findings under Article 2.1, 2.2 or 2.9 of the *TBT Agreement*.

4. Analysis of the safeguard measures in the light of the GATT 1994

7.3415 The Panel now turns to address the Complaining Parties' claims of inconsistency under the GATT 1994. Canada and Argentina have presented claims under Article III:4 of the GATT 1994. The United States and Canada have presented claims under Article XI:1 of the GATT 1994. The Panel first addresses the claims under Article III:4.

(a) Consistency with Article III:4 of the GATT 1994

7.3416 Article III:4 of the GATT 1994 provides in relevant part:

> "The products of the territory of any contracting party imported into the territory of any other contracting party shall be accorded treatment no less favourable than that accorded to like products of national origin in respect of all laws, regulations and requirements affecting their internal sale, offering for sale, purchase, transportation, distribution or use."

7.3417 **Canada** claims that Austria's safeguard measure on T25 maize, France's safeguard measures on Topas oilseed rape and MS1/RF1 oilseed rape (EC-161), and Italy's safeguard measure on MON810 maize, MON809 maize, Bt-11 (EC-163) and T25 maize fall within the scope of the GATT 1994 and are inconsistent with the European Communities' obligations under Article III:4.[2182]

7.3418 According to Canada, these four safeguard measures all are "laws, regulations or requirements laws, regulations or requirements affecting the internal sale, offering for sale, purchase, and distribution" of the biotech products concerned; the biotech products subject to these safeguard measures are "like" domestically produced non-biotech products in the light of four criteria put forth by the Appellate Body; and the imported biotech products concerned are accorded treatment less favourable than that accorded like non-biotech products of national origin. Therefore, Canada argues that the four safeguard measures constitute a violation of the European Communities' national treatment obligations under Article III:4.

7.3419 **Argentina** claims that Austria's safeguard measures on T25 maize, Bt-176 and MON810 maize, Germany's safeguard measure on Bt-176 maize, Italy's safeguard measure on MON810 maize, Bt-11 (EC-163) and T25 maize, and Luxembourg's safeguard measure on Bt-176 maize fall within the scope of the GATT 1994 and are inconsistent with the European Communities' obligations under Article III:4.

7.3420 According to Argentina, the biotech products subject to the safeguard measures and non-biotech agricultural products are "like" within the meaning of Article III:4 of the GATT 1994; the

[2182] Austria's measure on T25 maize, France's measures on Topas and MS1/RF1 oilseed rape, and Italy's measure on MON810, MON809, Bt-11 and T25 maize.

safeguard measures at issue are a "law, regulation or requirement" affecting "their [the products'] internal sale, offering for sale, purchase, transportation, distribution, or use"; and the treatment accorded to the imported (biotech) product is "less favourable" than accorded to the ("non-biotech") domestic product.

(i) Evaluation

7.3421 The **Panel** notes that Canada's claim under Article III:4 concerns four of the five safeguard measures challenged by Canada, namely, (i) Austria – T25 maize, (ii) France – MS1/RF1 oilseed rape (EC 161), (iii) France – Topas oilseed rape, and (iv) Italy – Bt-11 maize (EC-163), MON809 maize, MON810 maize and T25 maize. Argentina's claim under Article III:4 concerns all six safeguard measures challenged by Argentina.

7.3422 We recall that we have already reached the conclusion that the aforementioned safeguard measures being challenged by Canada and Argentina, respectively, are inconsistent with Article 5.1 and, by implication, the second and third requirements in Article 2.2 of the *SPS Agreement*. In these circumstances, we see no need to examine, and offer additional findings on, whether the relevant safeguard measures are also inconsistent with Article III:4. Accordingly, as did previous panels in similar situations[2183], we exercise judicial economy with regard to Canada's and Argentina's claims under Article III:4.

(ii) Overall conclusions

7.3423 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS292 (Canada)

With reference to DS292, and having regard to the arguments and evidence presented by Canada and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Canada are inconsistent with Article III:4 of the GATT 1994. Accordingly, the Panel offers no findings under Article III:4.

(ii) DS293 (Argentina)

With reference to DS293, and having regard to the arguments and evidence presented by Argentina and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by Argentina are inconsistent with Article III:4 of the GATT 1994. Accordingly, the Panel offers no findings under Article III:4.

(b) Consistency with Article XI:1 of the GATT 1994

7.3424 The Panel now turns to address the United States' and Canada's claim under Article XI:1 of the GATT 1994.

[2183] Panel Reports, *EC – Hormones (US)*, para. 8.272; *EC – Hormones (Canada)*, para. 8.275.

7.3425 Article XI:1 of the GATT 1994 provides:

> "No prohibitions or restrictions other than duties, taxes or other charges, whether made effective through quotas, import or export licences or other measures, shall be instituted or maintained by any contracting party on the importation of any product of the territory of any other contracting party or on the exportation or sale for export of any product destined for the territory of any other contracting party."

7.3426 The **United States** claims that the Greek safeguard measure on Topas oilseed rape violates Article XI:1 of the GATT 1994. According to the United States, the terms of the Greek measure make it unambiguously clear that the measure is an "import ban": "We prohibit the importing into the territory of Greece of seeds of the genetically modified rape-plant line bearing reference number C/UK/95/M5/1", and therefore, as an import ban, the Greek measure is a prima facie violation of Article XI:1.

7.3427 **Canada** claims that Greece's safeguard measure violates Article XI:1. According to Canada, as an import ban, the Greek ministerial decision constitutes an "other measure" provided for by Article XI of the GATT 1994, and, by the terms of that measure, Greece has both instituted and is maintaining a complete import prohibition on Topas oilseed rape seeds, contrary to Article XI:1.

(i) Evaluation

7.3428 The **Panel** notes that the United States' claim under Article XI:1 concerns one of the nine safeguard measures challenged by it, namely, Greece – Topas oilseed rape. Canada's claim under Article XI:1 is in respect of the same Greek safeguard measure.

7.3429 We recall that we have already reached the conclusion that the aforementioned safeguard measures being challenged by the United States and Canada, respectively, are inconsistent with Article 5.1 and, by implication, the second and third requirements in Article 2.2 of the *SPS Agreement*. In these circumstances, we see no need to examine, and offer additional findings on, whether the relevant safeguard measures are also inconsistent with Article XI:1. Accordingly, as did previous panels in similar situations[2184], we exercise judicial economy with regard to the United States' and Canada's claims under Article XI:1.

(ii) Overall conclusions

7.3430 In the light of the above, the Panel reaches the following overall conclusions:

(i) DS291 (United States)

With reference to DS291, and having regard to the arguments and evidence presented by the United States and the European Communities, the Panel concludes that it is not necessary to make findings on whether the safeguard measures which are being challenged by the United States are inconsistent with Article XI:1 of the GATT 1994. Accordingly, the Panel offers no findings under Article XI:1.

[2184] Panel Reports, *EC – Hormones (Canada)*, para. 8.275; *Australia – Salmon*, para. 8.185; *Japan – Apples*, paras. 8.328-8.329.
